Exhaust Ducting, Frame Rail-Mounted, Removal and Installation

Removal

NOTE: Refer to the following figures for typical exhaust ducting installations:

For vehicles with a single stationary outboard-mounted muffler, see **Fig. 1**.

For vehicles with dual stationary outboard-mounted mufflers, see **Fig. 2**.

For vehicles with a single cab and frame rail-mounted muffler see **Fig. 3**.

1. Park the vehicle, shut down the engine, apply the parking brakes, and chock the tires.
2. Loosen the V-clamp that holds the exhaust pipe to the rear of the turbocharger, and remove the pipe from the turbocharger.
3. Open the U-bolt tube clamps that hold the ducting to the frame-rail-mounted brackets, and remove the ducting from the clamps.
4. Loosen the clamp that holds the ducting to the bottom (inlet) of the muffler, and disconnect the ducting from the muffler.

Fig. 2, Exhaust Piping for Dual Stationary Outboard-Mounted Mufflers

5. Remove the wide-band clamps as needed to remove the ducting from the vehicle. Remove the ducting from the vehicle.

Installation

1. Position the ducting on the vehicle.
2. Connect the engine turbo pipe to the turbocharger, and tighten the V-clamp 85 lbf·in (940 N·cm).
3. Connect the ducting to the frame rail-mounted brackets, and tighten the U-bolt tube clamps 24 lbf·ft (33 N·m).
4. Connect the ducting to the bottom of each muffler, and tighten the muffler inlet clamp 33 lbf·ft (45 N·m).

8. Muffler

Fig. 3, Exhaust Piping for Cab and Frame-Rail Mounted Muffler, Century Class Conventional

5. Install a new flexpipe as follows:

   5.1 Position the flexpipe according to the flow-direction indicators on the tubing. See **Fig. 4**.

   Connect one end of the new flexpipe to the exhaust pipe.

   5.2 Make sure the flow-direction indicators on the flexpipe are straight and taut. They also serve as installation guides to indicate the correct amount of pipe extension.

6. Install the wide-band exhaust clamps that were loosened or removed. For instructions, refer to **Subject 120**.
7. After installing and tightening the wide-band clamps, remove the flow-direction indicators from the flexpipe.
8. Remove the chocks from the tires.

Exhaust Ducting, Frame Rail-Mounted, Removal and Installation

2. Flow-Direction Indicator

Fig. 4, Exhaust Flexpipe

Exhaust Stack, Removal and Installation

Removal

1. Park the vehicle, shut down the engine, apply the parking brakes, and chock the tires.
2. *If working with a cab and frame-rail-mounted muffler,* loosen the five nuts that clamp the cab-mounted muffler bracket around the top of the muffler and the stack.

   If working with any other vertical muffler, loosen the saddle clamps at the top of the muffler.
3. Lift the stack out of the muffler.

Installation

1. Insert the stack into the top of the muffler.
2. Secure the stack to the muffler.

   If working with a cab and frame-rail-mounted muffler, tighten the four large nuts in the cab-mounted muffler bracket 74 lbf·ft (100 N·m) and the small nut 24 lbf·ft (33 N·m).

   If working with any other vertical muffler, tighten the saddle clamps at the top of the muffler 24 lbf·ft (33 N·m).
3. Remove the chocks from the tires.

Exhaust Stack Removal and Installation, Coronado

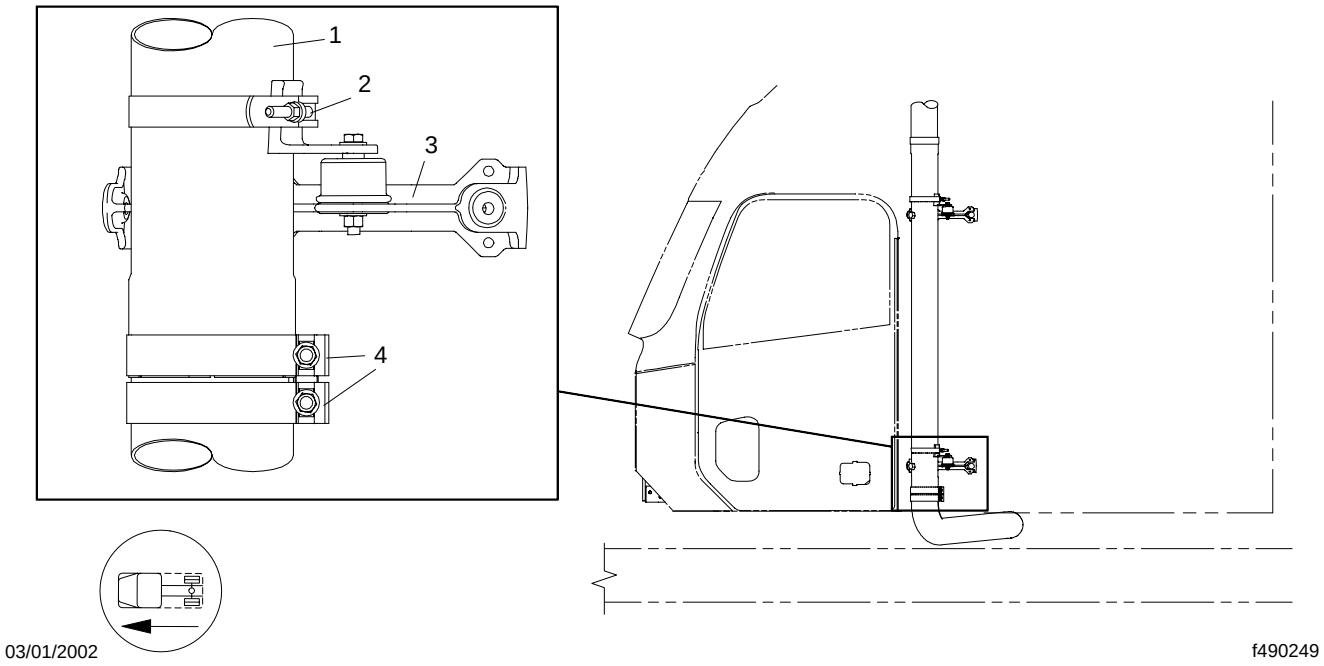
Refer to **Fig. 1** when performing the following procedures.

Removal

1. Park the vehicle, shut down the engine, apply the parking brakes, and chock the tires.
2. Remove the heat shield. For instructions, see **Subject 140**.
3. Loosen the wide-band clamp securing the stack to the muffler connector tube.
4. Loosen the nuts on the upper and lower bands that secure the stack to the mounting brackets on the cab.
5. Slide the clamps from the bracket, lift and remove the stack.

Installation

1. Insert the stack into the top of the connector tube. Make sure the clamps are around the stack for mounting in the next step.
2. Place the clamps around the mounting brackets on the cab and tighten the nuts 22 lbf·ft (30 N·m).
3. Using a level, make sure the exhaust stack is verticle. If not rotate the stack at the mounting backets.
4. Tighten the wide-band clamp at the connector tube 50 lbf·ft (68 N·m).
5. Install the heat shield. For instructions, see **Subject 140**.
6. Remove the chocks from the tires.



1. Exhaust Stack
2. Mounting Clamp
3. Mounting Bracket
4. Wide-Band Clamp (securing connector pipe to exhaust stack)

Heat Shield Removal and Installation, Argosy and S/T

Removal

1. Park the vehicle, shut down the engine, apply the parking brakes, and chock the tires.
2. Note the position of the heat shield and heat shield mounting bands.
3. Remove the bolts that hold the ends of the shield mounting bands together.
4. Remove the heat shield and mounting bands from the muffler

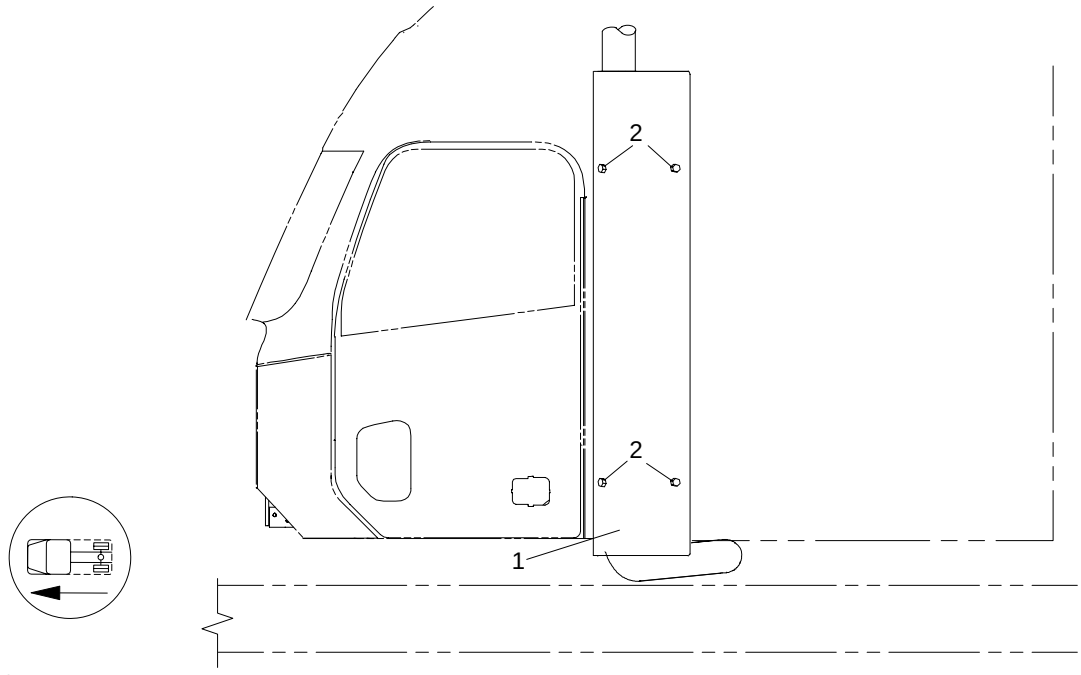
Installation

1. Position the heat shield and heat shield mounting bands on the muffler.
2. Use the bolts and nuts to connect the ends of the bands, and tighten the bolts until the mounting bands are tight around the muffler.
3. Remove the chocks from the tires.

Heat Shield Removal and Installation, Coronado

Removal

1. Park the vehicle, shut down the engine, apply the parking brakes, and chock the tires.
2. Remove the four capscrews that secure the exhaust stack shield to the mounting brackets on the cab. Remove the lower bolts first. See **Fig. 1**.
3. Remove the shield.



1. Heat Shield
2. Mounting Bolts

Fig. 1, Exhaust Stack Heat Shield

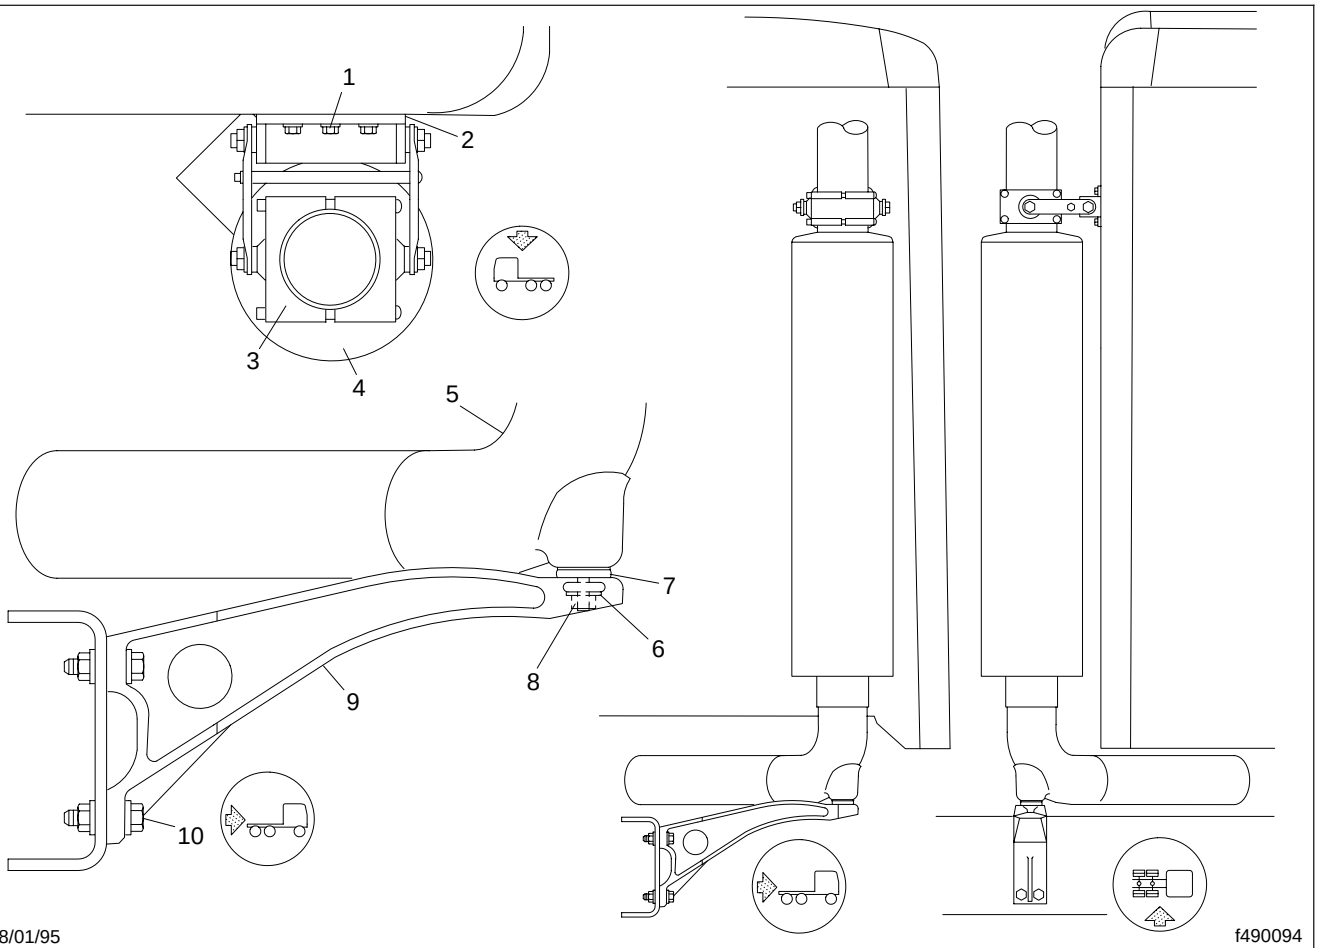
Installation

1. Position the heat shield over the mounting brackets.
2. Install the four capscrews that secure the shield to the mounting brackets. See **Fig. 1**.
3. Remove the chocks from the tires.

Cab and Frame-Rail Mounted Muffler

See **Fig. 1** for an overview of the cab and frame-rail mounted muffler.

Removal

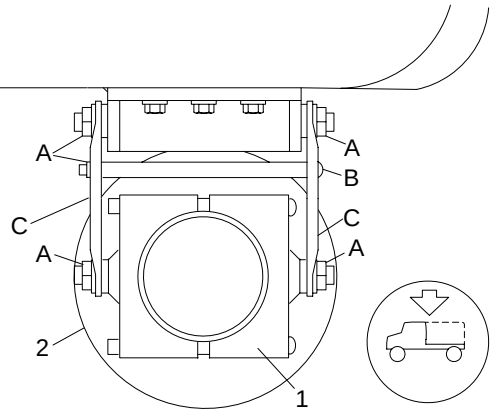


1. Capscrew 5/16–18, Stainless Steel; Washer
2. Gasket
3. Upper Muffler Mounting Bracket (Shackle Assembly)
4. Muffler
5. Muffler Pipe Elbow
6. Flatwasher
7. Isolator
8. Nut, 1/2–13, Grade C
9. Lower Muffler Mounting Bracket
10. Capscrew, 5/8–11 x 1.75, Grade 8; Nut; Washers

Fig. 1, Cab and Frame-Rail Mounted Muffler, Century Class Conventional

1. Park the vehicle, shut down the engine, apply the parking brakes, and chock the tires.
2. Remove the top stack. For instructions, refer to **Subject 110**.
3. Loosen the band at the bottom of the muffler.
4. Remove the five nuts, one bolt, and two shackle brackets on the upper muffler mounting bracket as shown in **Fig. 2**.
5. Lift the muffler from the muffler pipe elbow, and remove the muffler from the vehicle.

Muffler Replacement



01/10/2000 f490153

A. Remove these nuts.
B. Remove this bolt.
C. Remove these shackle brackets.

1. Upper Muffler Mounting Bracket (Shackle Assembly)
2. Muffler

Fig. 2, Removing the Muffler, Century Class Conventional

Installation

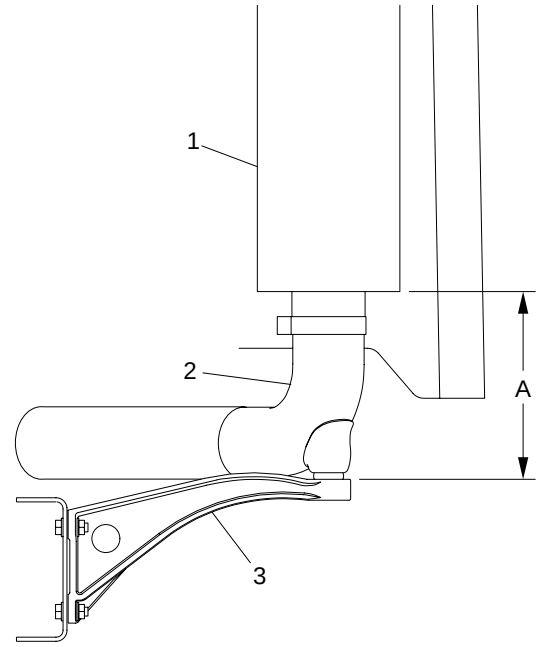
1. Position the muffler on the muffler pipe elbow. The elbow should slip up, inside the muffler inlet pipe. The distance from the bottom edge of the muffler to the mounting point on the top of the chassis-mounted lower bracket should be 13 to 13-1/2 inches (330 to 343 mm). See **Fig. 3**.

   If the installation is correct, the upper shackle assembly arms should be horizontal within ±5 degrees.

2. Position the clamp around the muffler and muffler pipe elbow, and tighten the clamp 50 lbf·ft (68 N·m).
3. Position the top of the muffler in the upper muffler mounting bracket.
4. Install the shackle brackets on the upper muffler mounting bracket. One end of each shackle bracket is keyed. Position the keyed end of the shackle bracket on the stud closest to the cab.

⚠ CAUTION

Be sure that the keyed end of the shackle bracket is aligned with the mating shoulder. If the keyed shackle bracket is not aligned with the mating shoulder, damage to the shoulder may occur.



11/03/98 f490169

Fig. 3, Muffler-to-Bracket Measurement

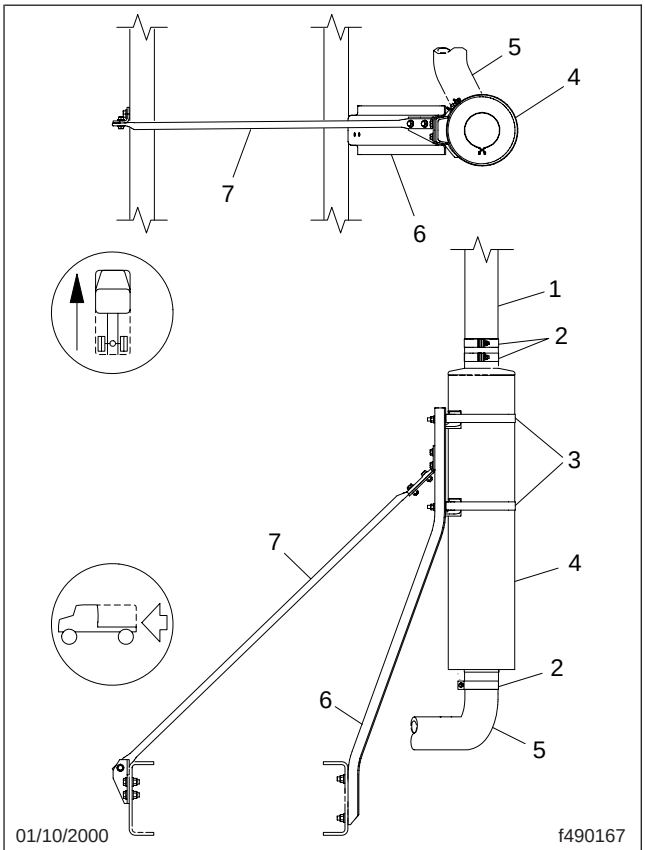
5. Install the bolt and nuts, and tighten the large nuts 64 lbf·ft (87 N·m). Tighten the small nut 24 lbf·ft (33 N·m).
6. Install the top stack. For instructions, refer to **Subject 110**.
7. Remove the chocks from the tires.

Frame-Rail Mounted Muffler

See **Fig. 4** for an overview of the frame-rail mounted muffler.

Removal

1. Park the vehicle, shut down the engine, apply the parking brakes, and chock the tires.



1. Top Stack
2. Accuseal® Clamp, 5-Inch
3. Muffler Band
4. Muffler
5. Muffler Clamp
6. Exhaust Pipe from Engine
7. Muffler Mounting Upright
8. Muffler Mounting Brace

Fig. 4, Frame-Rail Mounted Muffler, Argosy COE

2. Remove the top stack. For instructions, refer to **Subject 110**.
3. Remove the heat shield from the muffler. See **Subject 130** for instructions.
4. Loosen the clamp at the bottom of the muffler.
5. Loosen the two muffler bands that hold the muffler to the muffler mounting upright.
6. Lift the muffler straight up and remove it from the vehicle.

Installation

1. Put the muffler in place against the mounting upright.
2. Install the muffler bands onto the muffler and the muffler mounting brackets. Tighten the bands 22 lbf·ft (30 N·m).
3. Install the heat shield. See **Subject 130** for instructions
4. Install the top stack. See **Subject 110** for instructions.
5. Connect the exhaust pipe from the engine to the bottom of the muffler. Tighten the band 50 lbf·ft (68 N·m).
6. Remove the chocks from the tires.

Coronado Muffler

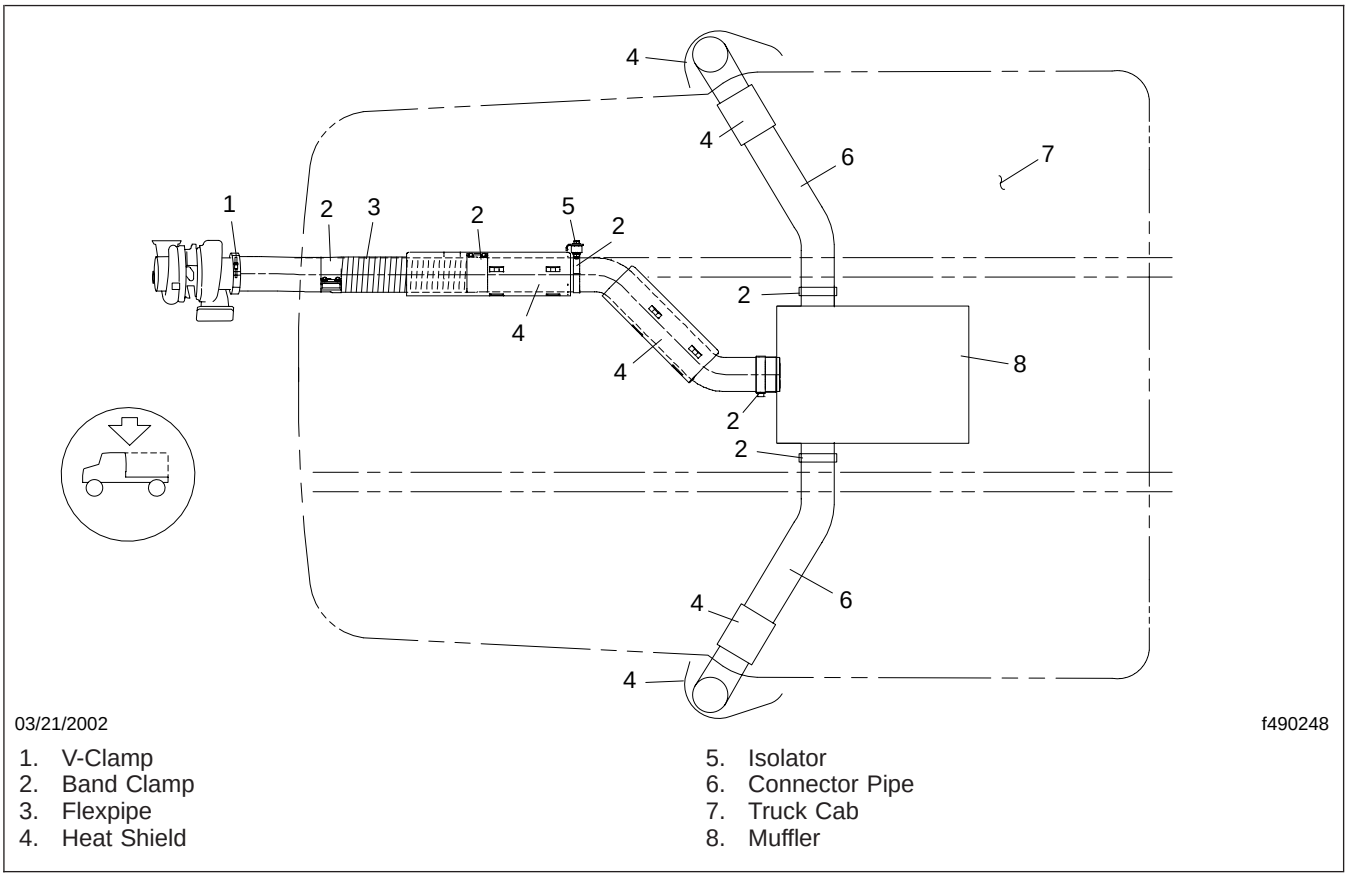
See **Fig. 5** of for an overview of the Coronado exhaust system.

Removal

1. Park the vehicle, shut down the engine, apply the parking brakes, and chock the tires.
2. Remove the exhaust stacks on each side of the vehicle. For instructions, see **Subject 120**.
3. Remove the two connector pipes from the muffler to the exhaust stacks.
   - 3.1 Loosen the clamps that secure the connector pipes to the muffler.
   - 3.2 Remove the pipes from the sides of the vehicle carefully. Avoid damaging the ends of the pipes.
4. Remove the muffler.

   NOTE: Perform these steps from underneath the vehicle.
   - 4.1 Loosen the clamp at the front of the muffler, where the connecting pipe from the engine meets the muffler.
   - 4.2 Loosen the two straps that support the muffler, allowing the muffler to slide forward and backward.
   - 4.3 Slide the muffler from the connecting pipe.

Muffler Replacement



1. V-Clamp
2. Band Clamp
3. Flexpipe
4. Heat Shield
5. Isolator
6. Connector Pipe
7. Truck Cab
8. Muffler

Fig. 5, Exhaust System, Coronado

4.4 While supporting the muffler, remove the nuts and bolts from the straps that secure the muffler to the bottom of the cab.

4.5 Rotate and remove the muffler downward, between the frame rail and driveshaft and away from the vehicle.

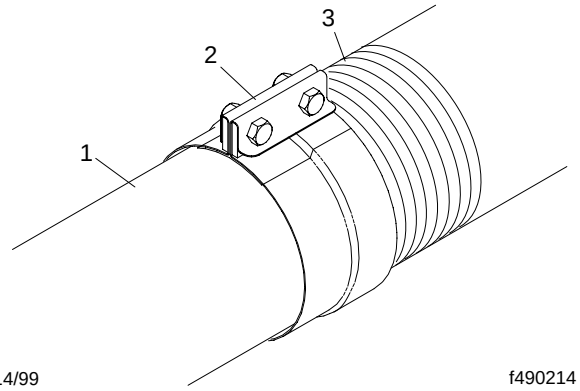
Installation

1. From underneath the vehicle, position the muffler over the driveline, behind the connecting pipe.
2. Install the nuts and bolts on the straps to secure the muffler under the vehicle. Leave the straps loose to allow the muffler to move forward and backward.
3. Install the engine connecting pipe on the muffler, position the clamp and tighten the nuts 50 lbf·ft (68 N·m).
4. Tighten the nuts on the straps that secure the muffler to the vehicle.
5. Install the connector pipes on the side of the muffler. Position and tighten the clamps at the muffler 50 lbf·ft (68 N·m).
6. Install the exhaust stack. For instructions, see **Subject 120**.
7. Install the heat shield. For instructions, see **Subject 140**.
8. Remove the chocks from the tires.

Replacement

Refer to **Fig. 1** while performing the following procedure.

1. Remove and discard the leaking or damaged wide-band exhaust clamp.
2. Insert one end of the flexpipe into the large-diameter side of the exhaust clamp until it contacts the step in the center of the clamp.
3. Insert about 3 inches (76 mm) of the exhaust piping into the small-diameter side of the exhaust clamp.



1. Exhaust Tubing
2. Exhaust Clamp
3. Flexpipe

Fig. 1, Wide-Band Exhaust Clamp

4. Make sure again that the end of the flexpipe is up against the step at the middle of the exhaust clamp.
5. Tighten snugly the hexbolt on the large-diameter (flexpipe) side of the clamp.
6. Tighten the hexbolt on the small-diameter side of the clamp 45 lbf·ft (61 N·m).
7. Tighten the hexbolt on the large-diameter side of the clamp 45 lbf·ft (61 N·m).
8. Check the hexbolt on the small-diameter side of the clamp. If needed, tighten 45 lbf·ft (61 N·m).
9. If a new flexpipe was installed, remove the flow-direction indicators from it.
10. Run the engine, and check for leaks. If needed, remove and install the exhaust clamp again.

Muffler Elbow, Removal and Installation

Removal

1. Park the vehicle, shut down the engine, apply the parking brakes, and chock the tires.
2. Remove the muffler. For instructions, refer to **Subject 150**.
3. Remove the nut, flatwasher, and isolator located underneath the muffler elbow. Remove the muffler elbow. See **Fig. 1**.

Installation

1. Attach a new wide-band clamp to the horizontal flex pipe, but do not tighten.
2. Place the isolator on the muffler elbow stud.
3. Place the muffler elbow on the lower muffler mounting bracket.
4. Attach the muffler elbow to the horizontal flex pipe by placing the horizontal flex pipe over the muffler elbow.
5. Place the flatwasher and nut on the muffler elbow stud. Tighten the nut to 68 ± 8 lbf·ft (92 ± 11 N·m).
6. Place the band clamp over the muffler elbow, but do not tighten.
7. Position the muffler on the muffler elbow. The elbow should slip up, inside the muffler inlet pipe. The distance from the bottom edge of the muffler to the mounting point on the top of the chassis-mounted lower bracket should be 13 to 13-1/2 inches (330 to 343 mm). See **Fig. 2**.

   If the installation is correct, the upper shackle assembly arms should be horizontal within ±5 degrees.
8. Position the band clamp around the muffler and muffler elbow, and tighten the band clamp 50 lbf·ft (68 N·m).
9. Install the shackle brackets on the upper muffler mounting bracket. One end of each shackle bracket is keyed. Position the keyed end of the shackle bracket on the stud closest to the cab. See **Fig. 1**.

⚠ CAUTION

Be sure that the keyed end of the shackle bracket is aligned with the mating shoulder. If the keyed shackle bracket is not aligned with the mating shoulder, damage to the shoulder may occur.

10. Position the top of the muffler in the upper muffler mounting bracket.
11. Install the bolt and nuts on the upper muffler mounting bracket, and tighten the large nuts 64 lbf·ft (87 N·m). Tighten the small nut 24 lbf·ft (33 N·m).
12. Tighten the wide-band clamp. For instructions, refer to **Subject 120**.
13. Remove the chocks from the tires.

Muffler Elbow, Removal and Installation

Fig. 2, Muffler-to-Bracket Measurement

General Information

The aftertreatment system (ATS), introduced to meet the requirements of the EPA07 emission control regulations, includes all the piping and equipment between the turbocharger outlet and the tip of the exhaust pipe. It resembles the exhaust system on pre-EPA07 vehicles, but includes an aftertreatment device (ATD) instead of a muffler (see **Fig. 1**), and other equipment. Monitoring and operation of the ATS is controlled by an electronic control module (ECM).

ways chassis-mounted, but can be mounted either vertically or horizontally. ATS exhaust piping is stainless steel.

Inside the ATD, the exhaust first passes through the diesel oxidation catalyst (DOC) where combustion gases are chemically broken down to water and carbon dioxide, then through the (DPF), where solid particles are trapped. The trapped particles are almost completely vaporized in the DPF in regeneration, sometimes shortened to the term, "regen." The soot from engine oil additives which cannot be vaporized is burned to ash and held in the DPF until it eventu-

7. DPF V-Band Mounting Clamps
8. Sensor Housing
9. DPF Outlet Temperature Sensor (connection to sensor housing not shown)
10. Exhaust Outlet Marmon Fitting
11. DPF Outlet Pressure Sensor
12. DPF Substrate Tubes

Fig. 1, ATD Components (typical)

EPA07 emissions regulations limit NOx to just over 1 gram per brake horsepower hour (g/bhp-hr) and particulate matter cannot exceed 0.01 g/bhp-hr. EPA07 engines require ultralow sulphur diesel (ULSD) fuel, for low emissions and long life of the diesel particulate filter (DPF), a honeycomb soot filter inside the ATD.

Engine manufacturers use different methods and equipment to reduce emissions from their engines, but an ATD is used on all of them. The ATD is ally builds up, and the DPF must be removed and physically cleaned.

IMPORTANT: To minimize soot buildup on the DPF, low-ash oil is necessary for maximum service between physical cleanings. Only low-ash oil should be used in EPA07 engines.

NOTE: Freightliner documentation deals only with removal and installation of the components of the ATS. Refer to the engine manufacturer's

service literature for all testing, disassembly, cleaning, and repair of the ATD and other components.

IMPORTANT: The ATS is part of an integrated engine and emissions management system, controlled by the ECM. Follow the engine manufacturer's procedures, and use the correct equipment when diagnosing or working on any part of the ATS.

Regeneration

There are two types of regeneration; passive and active.

Passive regeneration happens whenever the ATD internal temperature is 572°F (300°C) or higher. This happens during normal loaded vehicle operation, and exhaust gas temperature is no higher than normal. Under load and at highway speeds, passive regeneration may be all that is necessary to keep the DPF clear. But running light loads, or at low speeds, does not generate enough heat in the ATD for passive regeneration, and soot builds up in the DPF.

As soot builds up in the DPF, it creates back pressure and decreases engine efficiency. So at intervals determined by the ECM, which keeps track of measurements such as engine hours, fuel consumed, and mileage, the ATS raises the temperature inside the ATD to burn the built-up soot to ash. This reduces the back pressure and allows the DPF to continue operating efficiently for tens of thousands of miles.

During active regeneration, engine rpm rise to fast-idle speed and extra fuel is injected into the ATD to raise its interior temperature very high, over 1112°F (600°C), and turn the trapped soot to harmless ash. There are two types of active regeneration; at-speed and parked.

- When conditions permit, the ECM automatically initiates at-speed regeneration. The exact conditions for regeneration vary, according to the engine manufacturer's design. Generally, it can happen only when the vehicle speed is above 7.5 mph, and active regeneration stops when the vehicle slows to 5 mph or below.
- Parked regeneration is initiated by a driver or technician when the vehicle is safely parked with the exhaust outlet well away from any flammable substance, a specific sequence of procedures is followed, and the driver pushes the regeneration button on the dashboard. The parked regeneration sequence varies according to engine and vehicle configuration, but it must be exactly followed or regeneration cannot happen. Follow the exact sequence prescribed for the vehicle, according to the engine manufacturer's literature.

EPA07 Aftertreatment Device Removal and Installation

Removal

These instructions are generalized, because vehicle configurations vary widely. The basic procedures apply to all aftertreatment systems. For service and repair beyond removal and installation, refer to the engine manufacturer's service literature.

NOTE: For test or service procedures on components of the ATS, consult the engine manufacturer's service literature.

NOTICE

The ATD assembly weighs from 125 to 150 pounds (57 to 68 kg) and must be protected from impact or sharp jolts. Dropping the ATD, or subjecting it to jarring impact can crack the diesel particulate filter (DPF) inside, which is built on a ceramic substrate. If that happens, the DPF is ruined and must be replaced.

A secure support is necessary to remove and install the ATD safely. The ATD must be held securely to protect it from falling, or hitting hard against something else.

The horizontal ATD lifting device (TLZ00785) is designed to handle a horizontal ATD. Vertical ATDs require a shop hoist secured to the lifting ears on top.

The aftertreatment device (ATD) is constructed so that its exterior operating temperature is comparable to that of a standard muffler, but during active regeneration, when a fuel mist is injected to raise its temperature and destroy soot deposits, its interior (see **Fig. 1**) and the outlet become hot enough to melt or ignite many common materials.

⚠ WARNING

Aftertreatment Device (ATD) internal temperatures can remain hot enough to cause personal injury, or ignite combustible materials, for hours after the engine is shut down.

To avoid potentially serious burns or material damage:

- Let the ATD cool before handling it; be especially careful when opening it to expose the DPF.
- Wear appropriate protective gear.
- Be careful not to place the ATD where flammable gases or other combustible materials may come into contact with hot interior parts.

1. Set the parking brake and chock the tires.

NOTE: Never attempt to start the vehicle with the ATD removed or with the ATD sensors disconnected, unless the engine manufacturer's documentation allows it for a diagnostic procedure.

2. Disconnect the connections at the sensor housing and the diesel oxidation catalyst (DOC) inlet temperature sensor. See **Fig. 1**.
3. Mark the Marmon fitting joints and mounting bracket orientation to the ATD, so that it can be installed exactly as it was removed. See **Fig. 2**.

NOTE: There are guide pins (see **Fig. 3**) to position the ATD during vehicle manufacture, but they are designed to break off if they are stressed. The most important thing about ATD mounting is that the other ATS components, particularly the bellows, must align correctly.

4. If the ATD is horizontally mounted, raise the ATD-handling device into place against it, so that the ATD is supported securely. If the ATD is vertically mounted, attach a shop crane or similar device to the lifting ears and take up the slack so that the lifting device is beginning to take the weight of the ATD.
5. The exhaust pipe may require support, such as a rope sling, to support it when the ATD is removed. If such support is required, install it now.

NOTICE

Be careful not to stress or twist the bellows as the ATD is manipulated. The bellows is not designed to support weight or withstand undue stress and can easily be damaged, requiring expensive replacement.

6. Remove the clamps from the Marmon fittings at the ATD inlet and outlet.
7. Remove the two mounting bands that hold the ATD to its mounting brackets, so that the ATD is held by the ATD handling device.

EPA07 Aftertreatment Device Removal and Installation

9. DPF Outlet Temperature Sensor (connection to sensor housing not shown)
10. Exhaust Outlet Marmon Fitting
11. DPF Outlet Pressure Sensor
12. DPF Ceramic Substrate

Fig. 1, Typical ATD

NOTE: It may be necessary to raise the vehicle, or remove heat shields or body panels, to remove the ATD.

8. Move the ATD handling device slightly, so that the ATD positioning pin (see **Fig. 4**) clears its hole in the mounting bracket. Carefully remove the ATD from the vehicle.

NOTE: ATD component service procedures, such as cleaning the DPF or servicing the sensors, are documented in the engine manufacturers' service literature.

Installation

1. Use the ATD handling device to move the ATD into position, so the inlet and exhaust align with the inlet and exhaust piping. Be sure the ATD positioning pin engages its hole in the ATD mounting bracket, or that the positioning marks align.
2. Install the ATD mounting bands, but do not tighten them yet.
3. Position the V-band clamps on the Marmon fittings and tighten them to the value shown in **Table 1**.
4. Tighten the ATD mounting bands to the value shown in **Table 1**.
5. Connect the harness to the sensor housing and the front temperature sensor.
6. Remove the ATD handling device.
7. If a support was fastened around the exhaust pipe, remove it.
8. Operate the vehicle and check for leaks.

EPA07 Aftertreatment System Bellows Replacement

Replacement

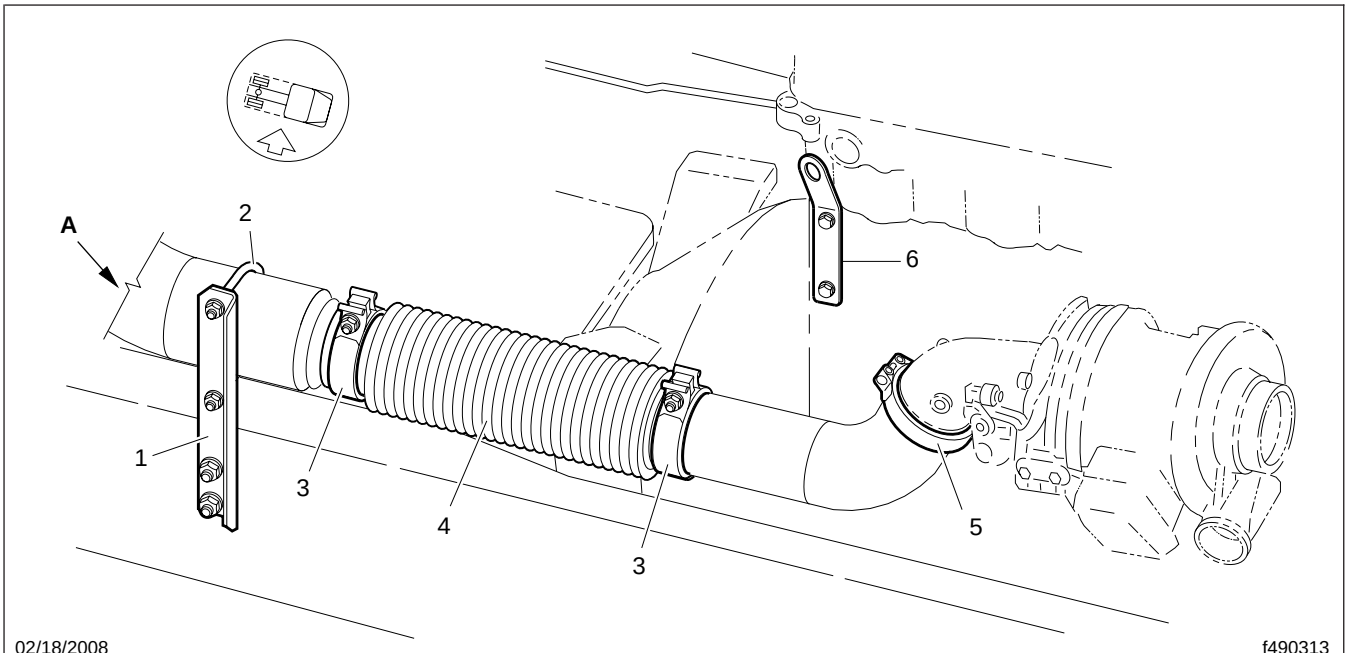
1. Open the hood.
2. Open the tool box under the passenger-side door, and remove the cover.
3. Remove the right quarter fender and mud flap. For instructions, see **Group 88**.
4. Remove the V-clamp (**Fig. 1**, Item 5) that holds the turbo outlet pipe to the turbocharger.
5. Remove the U-clamp that holds the aftertreatment device (ATD) inlet pipe to the support bracket on the frame rail (**Fig. 1**, Item 2).
6. Remove the clamp that holds the exhaust pipe to the front of the ATD, then disconnect the exhaust pipe from the ATD.
7. Remove the bellows and exhaust pipes as a unit from under the vehicle. If the vehicle is equipped with side fairings, remove the parts from the rear of the vehicle.
8. Place the assembly on a work bench. Loosen and spread the seal clamps on the ends of the bellows. Pry the ends of the bellows off the exhaust pipes, being careful not to damage the exhaust pipe ends. If it is not possible to remove the bellows this way, proceed as follows:

WARNING

Always wear a face shield and other appropriate protection when using a cutting wheel.

The cut edges of the bellows are extremely sharp, and can cause serious injury. Wear appropriate protective gear, including heavy gloves and a face shield, when removing the bellows from the exhaust pipes.

9. If you cannot remove the bellows by prying, use a cutoff wheel to cut through each end of the bellows between the exhaust pipe ends. Be careful not to cut the exhaust pipes. Discard the center section of the bellows when it is cut loose.



A. To the Aftertreatment Device (ATD)

2. U-Clamp
3. Seal Clamp
4. Bellows
5. V-Clamp
6. Bellows Support Bracket

Fig. 1, Bellows Installation

EPA07 Aftertreatment System Bellows Replacement

10. Carefully remove the bellows ends and clamps from the exhaust pipes, either by prying them off, or by driving them off with a soft drift. Be careful not to damage the exhaust pipes.

IMPORTANT: Take the following measurements *before* installing the bellows.

The main section of the ATD inlet pipe is a larger diameter than the turbo outlet pipe. Make sure you measure at the **end** of the pipe, where it inserts into the bellows. The two measurements should be identical. If they are not, loosen the U-clamp nuts that hold the ATD inlet pipe to the frame-rail support bracket, and move the pipe up or down as needed.

NOTICE

The ends of the ATD inlet pipe and the turbo outlet pipe must be in exact vertical and horizontal alignment before installing the new bellows. If they are not aligned the bellows will be twisted, and will fail after a short time.

11. Attach the turbo outlet pipe to the turbocharger, then to the bellows support bracket. Tighten the clamps enough to hold the pipe in place.
12. Attach the ATD inlet pipe to the ATD and the frame-rail support bracket. Tighten the clamps enough to hold the pipes in place.
13. Using a ruler or tape measure, measure the vertical distance between the end of the ATD inlet pipe and the frame rail. See **Fig. 2**. Do the same for the end of the turbo outlet pipe. The two measurements must be the same. If the measurements are different, loosen the U-clamp nuts on the frame-rail support bracket, and raise or lower the ATD inlet pipe as needed. Tighten the U-clamp nuts enough to hold the pipe in place.
14. Using a ruler (or a T-square) and a tape measure, measure the distance between each pipe end and the frame rail. See **Fig. 3**. If these two measurements are different, do one or more of the following adjustments (see **Fig. 4**):
    - Check that the U-clamp on the bellows support bracket is installed correctly, and is not crooked.
    - Rotate the turbo outlet pipe at the turbocharger.
    - Support the ATD with a suitable jack, then loosen the ATD straps and rotate the ATD.
    - Rotate the ATD inlet pipe at the Marmon flange on the ATD.
15. With the two pipe ends in horizontal and vertical alignment and the bellows not installed, measure the distance between them. See **Fig. 5**.

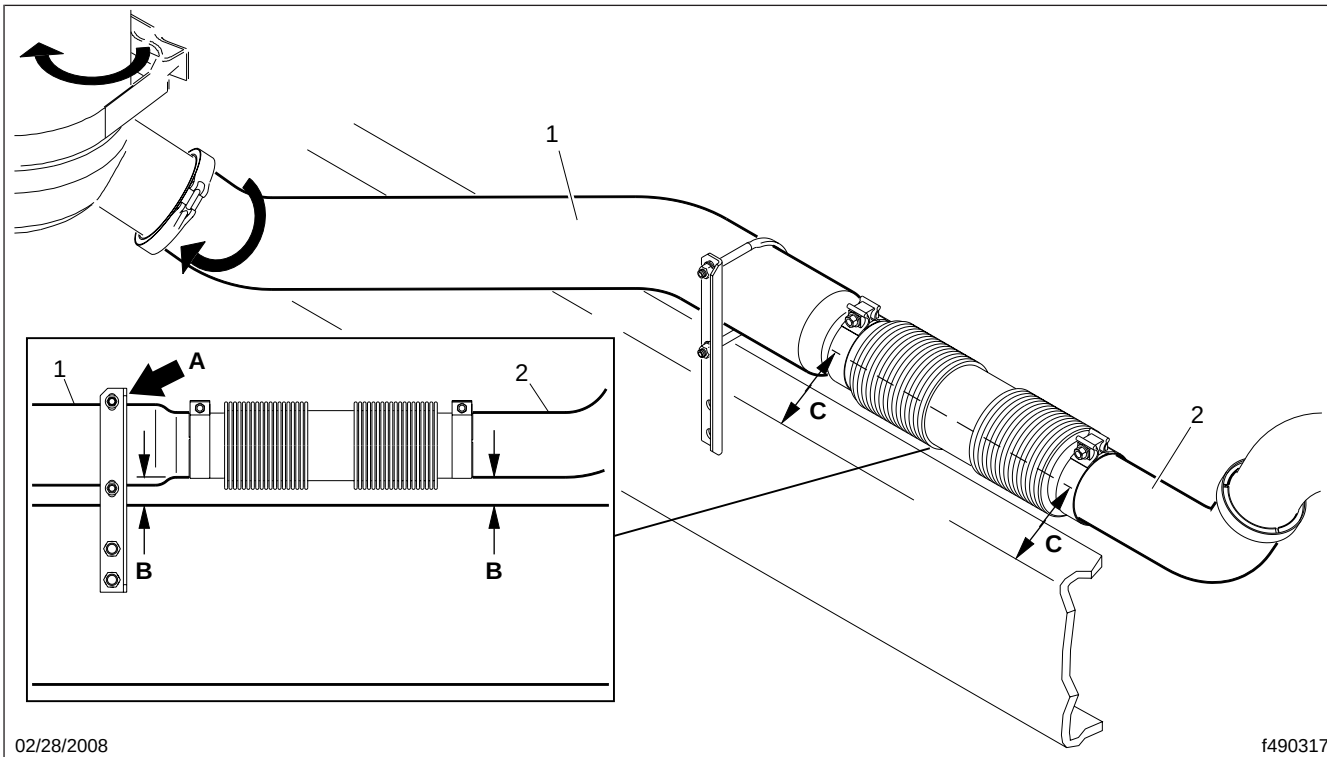
    The distance between the pipe ends is to be at least 14 inches (35.5 cm), but not more than 14-3/8 inches (36.5 cm).

    If the distance is less than the above, remove the turbo outlet pipe and the ATD inlet pipe, and cut off an equal amount from each pipe end, as needed; otherwise, go to the next step. Make sure you remove all burrs from the cut ends of the pipes.

IMPORTANT: If they were loosened, do not tighten the ATD mounting straps until the U-clamp nuts on the frame-rail support bracket are tightened to their final torque. To do otherwise will affect the alignment of the exhaust pipes.

16. When the horizontal and vertical alignment is the same for both exhaust pipes and the distances between the pipe ends is correct, tighten the U-clamp nuts on the frame-rail support bracket that holds the ATD inlet pipe in place. See **Subject 100** for torque values.
17. Tighten the V-clamp that holds the inlet pipe to the ATD. See **Subject 100** for torque values.
18. If applicable, tighten the mounting straps on the ATD, then remove the jack.
19. Remove the turbo outlet pipe from the turbocharger.
20. Remove any dirt or soot from the outer surface of the exhaust pipe ends to ease the installation of the new bellows.
21. Install the new bellows on the ATD inlet pipe, with the clamp nuts on top and facing outboard (**Fig. 2**).
22. Insert the end of the turbo outlet pipe into the bellows, then connect the pipe to the turbocharger and to the new bellows support bracket. See **Subject 100** for torque values.
23. Tighten the bellows seal clamps; see **Subject 100** for torque values.

24. Start the engine and check for leaks. Shut down the engine, and tighten any clamps as needed.

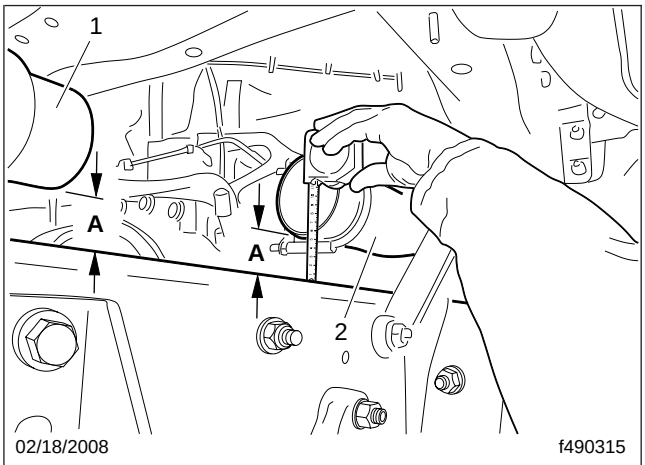


A. Up-and-down adjustment to be done at this bracket.
B. Vertical measurements to be the same.
C. Horizontal (in-and-out) measurements to be the same.

1. ATD Inlet Pipe
2. Turbo Outlet Pipe (support bracket not shown)

Fig. 2, Rotation and Adjustment Areas for Exhaust Pipe alignment (vertical ATD installation shown)

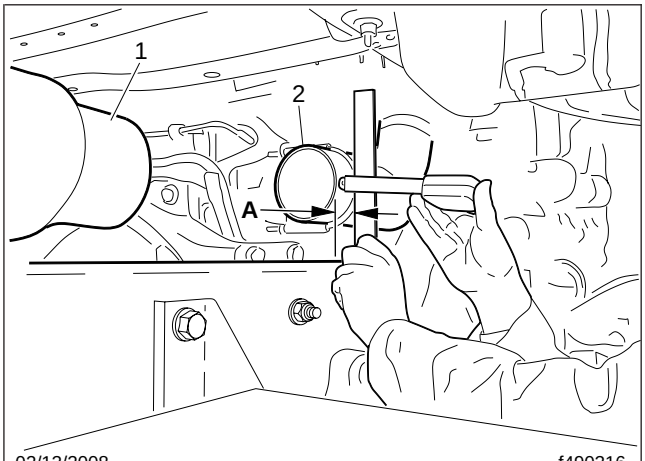
EPA07 Aftertreatment System Bellows Replacement



A. This distance must be the same at both exhaust-pipe ends.

1. ATD Inlet Pipe 2. Turbo Outlet Pipe

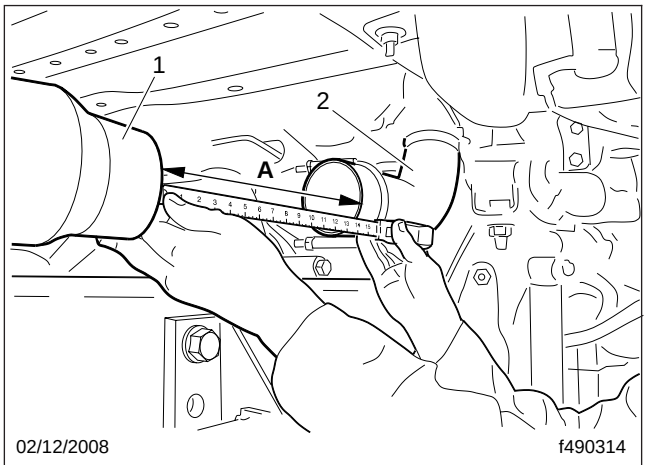
Fig. 3, Measuring the Vertical Distance



A. This distance must be the same at both exhaust-pipe ends.

1. ATD Inlet Pipe 2. Turbo Outlet Pipe

Fig. 4, Measuring the Horizontal Distance



A. This distance should be a minimum of 14 inches (35.5 cm) and a maximum of 14-3/8 inches (36.5 cm).

1. ATD Inlet Pipe 2. Turbo Outlet Pipe

Fig. 5, Measuring the Distance Between Pipe Ends

General Information

The on-highway environment places severe demands on a vehicles electrical system. The following material describes the methods for repairing and sealing electrical connections that will provide the durability necessary for the automotive environment.

There are four distinct components for making a wire repair that will withstand:

- the mechanical demands of vibration, strain, and thermal cycling
- the electrical requirement of oxidation free conductivity
- the insulating properties to resist shorting to adjacent objects
- the ability to seal for corrosion protection

When troubleshooting electrical systems, consider body height and suspension travel. Interference and strain may be caused by normal frame flexing and body accessories that are not apparent when a vehicle is stationary.

Wire Repair and Splicing

Disconnect the batteries at the negative terminals before performing any repairs to the electrical system.

IMPORTANT: Before repairing or replacing any damaged electrical system components, locate and correct the cause of the damage before continuing with the repair.

Wire that is discolored or melted due to an external heat source may need to be re-routed or installation of a heat shield may be necessary. If wire length permits, a splice may be made with a single connector. Often a length of wire will need to be added and two splices are made. Carefully check damaged wire for signs of corrosion that has wicked up into the insulation and through the wire. If the wire conductor has become green or black, cut off the discolored wire and replace it with a new section.

Corrosion on battery cable terminals may be cleaned with a mild solution of baking soda and water, and scrubbed with a wire brush.

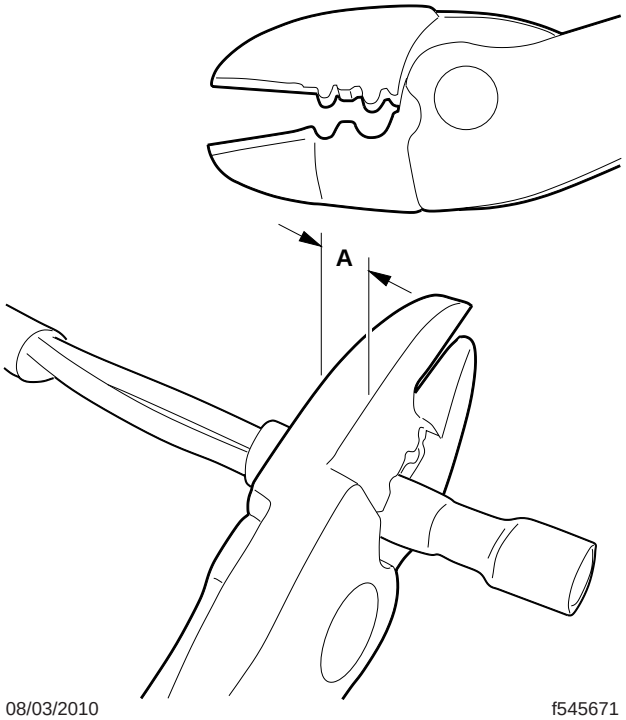
Wiring Repair Using Phillips STA-DRY® Solderless Connectors

Parts and Tools

Parts are available through the Parts Distribution Centers (PDCs) in packages of 25 connectors. Use the connectors and adhesive lined shrinkable tubing shown in **Table 1** when making a wiring splice.

Tools needed for wiring repair using solderless connectors include the following.

- A dimple-type crimp tool with a minimum 3/16 inch width. See **Fig. 1** for an example of a proper crimp tool. A typical manufacturer for this tool is Thomas & Betts.
- A heat gun rated at 1000°F (538°C).



A. Minimum 3/16 inch width.

Fig. 1, Dimple-Type Crimp Tool

Procedure

1. Dress the wires to be spliced by stripping the insulation to expose 1/4 inch of copper. Slide a 3-inch section of adhesive coated shrink tubing onto one of the wires.
2. Crimp the splice connector onto the wires. Use the type of crimp tool that makes a dimple in the connector. The dimple must be at least 3/16 inch wide or there will be too much space inside the connector and the solder will not flow into the wire. This crimp provides the mechanical retention needed. See **Fig. 2**.

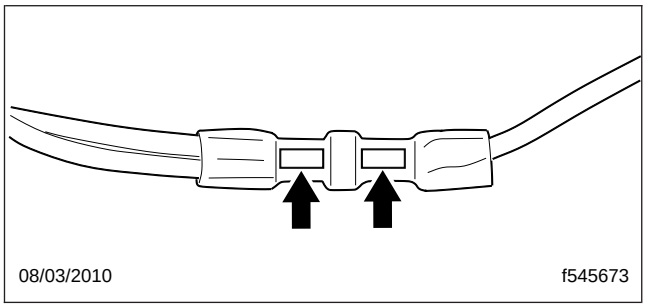


Fig. 2, Properly Crimped Splice

3. Pull test the wires by hand to ensure the crimp is mechanically solid.
4. A crimp tool that is too narrow will leave excessive air gaps in the crimp. The connection will not have the required amount of mechanical strength and the solder will not bond the wire to the connector. **Figure 3** shows an example of a bad crimp when the wrong tool is used.
5. Heat the properly crimped splice connector with the heat gun while slowly rotating the wire. The solder will take longer to flow than it will for the shrinkable insulation to contract. Heat until the solder band has completely melted into the connector. If the shrinkable insulation ruptures and a small amount of solder bubbles out, gently shake the splice to remove the solder. See **Fig. 4**.
6. When the connector has cooled, center the shrinkable tubing over the splice and heat the tubing until it has completely sealed the splice and a small fillet of adhesive is visible at the ends of the shrink tube. See **Fig. 4**.
7. A three-wire tap splice can be made following the same procedure. Use a connector that is large enough to fit all the strands of the wires. See **Fig. 5** for an example of the completed splice.

Wiring Repair Using Phillips STA-DRY® Solderless Connectors

Solderless Connector Parts		
Wire Size: gauge (mm)	**Connector Part Number***	**Shrinkable Tubing (Daimler Part Number)**
20 to 18 (0.5 to 0.8)	PHM 1 1863	1/4 inch with internal adhesive coating (48-02461-025)
16 10 14 (1 to 2)	PHM 1 1862	1/4 inch with internal adhesive coating (48-02461-025)
12 to 10 (3 to 5)	PHM 1 1861	3/8 inch with internal adhesive coating–4 foot length (48-02461-038)
8 or larger (5 or larger)	Replace the terminal or the entire cable	Use adhesive lined red for positive cables and black for negative cables.

* Twenty-five connectors per pack.

Table 1, Solderless Connector Parts

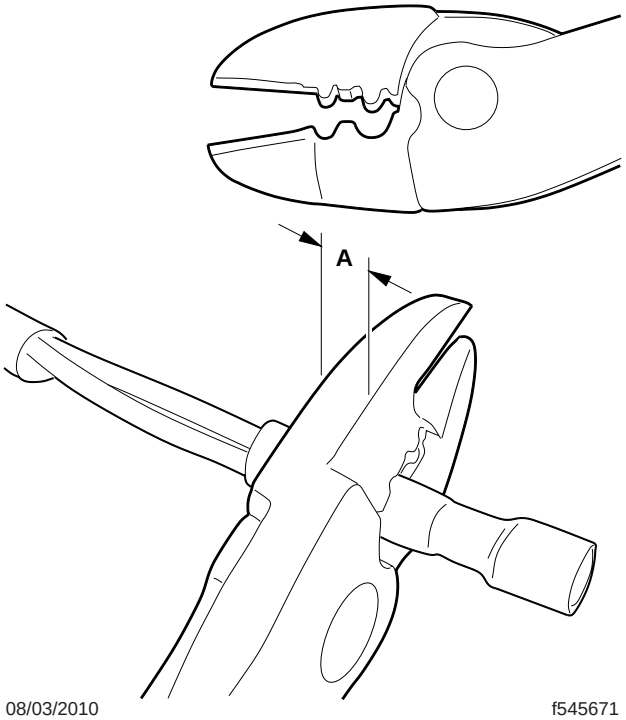
Wiring Repair Using Daimler Trucks North America (DTNA) Kit ESY ES66 404

Parts and Tools

Parts are available through the Parts Distribution Centers (PDCs) in kits with material for 50 splices. This kit may be used on 16 to 14 gauge (1 to 2 mm) wire.

Tools needed for wiring repair using solderless connectors include the following.

- A dimple-type crimp tool with a minimum 3/16 inch width. See **Fig. 1** for an example of a proper crimp tool. A typical manufacturer for this tool is Thomas & Betts.
- A heat gun rated at 250°F (121°C).



A. Minimum 3/16 inch width.

Fig. 1, Dimple-Type Crimp Tool

Procedure

1. Dress the wires to be spliced by stripping the insulation to expose 1/4 inch of copper. Slide a piece of the shrink tubing from the kit onto one of the wires.
2. Slide a shrinkable solder sleeve from the kit onto one of the wires.
3. Place the wires that will be spliced into each end of the barrel connector. See **Fig. 2** for an example of the splice.
4. Crimp each end of the barrel using a dimple-type crimp tool to secure the wires. See **Fig. 1** for an example of a proper crimp tool.
5. Pull test the wires by hand to ensure the crimp is mechanically solid.
6. Slide the shrinkable solder sleeve onto the barrel connector so the solder band is at the center of the barrel connector.
7. Heat the splice using a heat gun rated at 250°F (121°C) until the sleeve has completely shrunk against the wire and the solder flows into the barrel connector. A small fillet of adhesive may be visible at the ends of the connector. See **Fig. 3**.
8. Slide the shrinkable tubing over the splice and apply heat with a heat gun rated at 250°F (121°C) until it has completely shrunk against the wire insulation. A small fillet of adhesive should be visible at the ends of the shrinkable tubing.

Parts

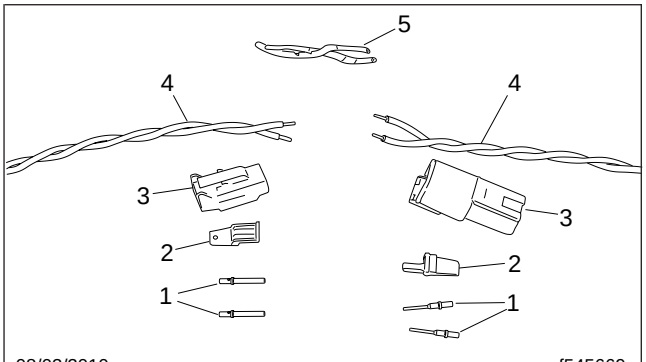
Twisted-pair datalink wires may be spliced using a mating connector set. See **Table 1** for a typical set of datalink connector parts.

Datalink Connector Parts		
Description	**Part Number**	**Quantity**
Connector Body Plug	23-13148-204	1
Terminal Lock	23-13303-015	1
Terminals	23-13210-020	2
Connector Body Receptacle	23-13148-206	1
Terminal Lock	23-13303-013	1
Terminals	23-13210-030	2

Table 1, Datalink Connector Parts

Procedure

1. Cut out any damaged section of datalink wire, keeping the lengths of the two wires equal. See **Fig. 1** for an example of a damaged section of datalink wire that has been removed and the datalink prepared for repair.



1. Terminals
2. Terminal Lock
3. Connector
4. Twisted-Pair Datalink Wires
5. Damaged Section of Datalink Wires

Fig. 1, Datalink Splice Parts

2. Crimp the terminals onto the wires using the proper crimp tool.
3. Pull test the terminals by hand to ensure the crimp is mechanically solid.
4. Insert the terminated wires into the connector body and install the terminal lock. The protocol for J1939 is for the yellow wire to be in cavity 1 and the green wire to be in cavity 2. Note that the lock is installed while holding the wires in position. Test the installation. If the wires slipped back during the lock installation, they will pull out of the connector.
5. Make certain the wires are twisted as close to the entry point of the connector as possible. Plug the two connector halves together. See **Fig. 2**.

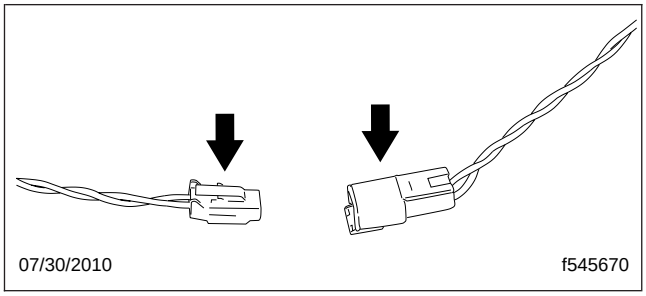


Fig. 2, Datalink Connectors

Connection Protection

Use the dielectric protectants and procedures provided here to protect electrical connections from corrosion. A list of approved dielectric protectants is shown in **Table 1**.

The components listed in **Table 2** have electrical connections that need to be protected.

When disconnecting any of these circuits, clean the connection and remove the old dielectric material. Completely cover the exposed area after assembly using the product and procedure in this bulletin. Always follow the product manufacturers recommendations for work area ventilation.

Approved Dielectric Protectants			
Material	**Type**	**Manufacturer**	**Product**
Dielectric Red Enamel	Spray On	3M®	1602 IVI
		Glyptal	1201A
	Brush On	Glyptal	1201E 2100
Dielectric Grease	Lithium Base	Fiske Brothers Lubriplate® (FLP)	DS-ES
	Synthetic	Nye	Nyogel 760G

Table 1, Approved Dielectric Protectants

Electrical Component Protection and Procedure		
Protection	**Component**	**Procedure**
Dielectric Red Enamel	Starter - All Exposed Connections	Protect connections and cable terminals.
	Magnetic Switch	Protect connections and cable terminals.
	Alternator	Protect all connections. Do not allow dielectric material to enter the alternator.
	Bolt and Stud Ground Connections (outside cab)	Cover all terminals, studs, and nuts with dielectric enamel.
	Battery Cut-Off Switch Connections	Protect connections and cable terminals.
	Exposed Battery Cable Connections (located outside of the battery box)	Protect connections and cable terminals.
	Power Distribution Modules	Protect battery power studs on chassis mounted PDMs.
	Mega Fuses (when located outside of the battery box)	Place tape across the part of the fuse with the labeling, then apply the dielectric material. Remove the tape.

Electrical Connection Protection

Electrical Component Protection and Procedure		
Protection	**Component**	**Procedure**
Dielectric Grease, Lithium Base	Tail Lamp Bulb Sockets (non LED)	Remove the bulb, apply grease to the inside of socket. Replace the bulb.
	Battery Terminals	Apply grease to battery terminals before connecting interconnect cables.
	Battery Interconnect Cable Connections	Apply grease to connection studs and pads before connecting battery cables.
	Parked HVAC Power Connections	Disconnect the two power and one ground cable where they enter the basket on the underside of the cab. Apply grease, then connect.
	Inverter Power Connections	Disconnect the power and ground feeds at the cab pass through. Apply grease, then connect.
	Mega Fuses (if located in the battery box)	Apply grease to protect exposed terminals and connections.
Dielectric Grease, Synthetic	Connections with serial data circuits or with very low voltage signals.	Apply synthetic grease to the terminals inside the connector.

Table 2, Electrical Component Protection and Procedure

General Specifications

Table 2, Circuit Numbers

Basic Wiring Diagrams

To see a specific wiring diagram, refer to the figure or section listed in **Table 3**.

NOTE: Seven air pressure switches are installed in the air manifold assembly. See **Fig. 19**. The manifold is located in the cab under the dash. For air manifold plumbing information, refer to **Group 42**.

Wiring List

Circuits 1 through 21L

Circuits 1 through 21L			
Circuit	**Gauge**	**From**	**To**
1	000	Battery (– terminal)	Main Battery Cable Ground
1A	00	Battery (– terminal)	Cab Side of Ground Shut-Off Switch
6	000	Battery (+ terminal)	Starter Battery Terminal (3-Battery System)
6	00	Battery (+ terminal)	Starter Battery Terminal (4-Battery System)
6A	00	Battery (+ terminal)	Cab Side of Power Shut-Off Switch
14	10	Starter	PDM BAT Bus
14A	10	Circuit 14C Splice	IGN Relay (terminal 87)
14B	10	Cab/Frontwall Stud	PDM ISO Bus
14C	10	Cab/Frontwall Stud	ACC Relay (terminal 87)
14E	10	40-Amp Circuit Breaker	Auxiliary PDM Circuit 14E Bus Connector
14S	8	60-Amp Circuit Breaker	Auxiliary PDM Circuit 14S Bus Connector
15	16	Ignition Keyswitch	Splice Connector
15A	16	Magnetic Switch (coil terminal)	Data Logging Unit

Circuits 1 through 21L			
Circuit	**Gauge**	**From**	**To**
15B	16	Starter (BAT terminal)	Magnetic Switch (switch terminal)
15C	16	Magnetic Switch (switch terminal)	Starter (S terminal)
15D	16	Starter	Starter Lockout Coil
15K	16	Splice Connector	Circuit 15A Splice
15T	16	Starter Temperature Switch	Magnetic Switch (coil terminal)
16	6	Alternator (output terminal)	Starter (battery terminal)
18	16	ICU Pin RH-B3 (blue connector)	Low Air Pressure Switch (secondary)
18A	16	Low Air Pressure Switch (secondary)	Low Air Pressure Switch (primary)
20	14	15-Amp Circuit Breaker (LH)	Headlight Switch
20A	14	Headlight Switch	LH Headlight Micro Relay (terminal 3)
20D	14	LH Headlight Micro Relay (terminal 2)	Headlight Dimmer Switch
20D	14	RH Headlight Micro Relay (terminal 2)	Headlight Dimmer Switch
20H	14	LH Headlight Micro Relay (terminal 5)	LH Headlight High Beams
20H	14	LH Headlight Micro Relay (terminal 5)	High Beam Indicator Light (ICU pin RH-B2)
20L	14	LH Headlight Micro Relay (terminal 4)	LH Headlight Low Beams
21	14	15-Amp Circuit Breaker (RH)	Headlight Switch
21A	14	Headlight Switch	RH Headlight Micro Relay (terminal 3)
21H	14	RH Headlight Micro Relay (terminal 5)	RH Headlight High Beams
21L	14	RH Headlight Micro Relay (terminal 4)	RH Headlight Low Beams

Circuits 23 through 29F

Circuits 23 through 29F			
Circuit	**Gauge**	**From**	**To**
23	10	Tractor Marker/Taillight Micro Relay (terminal 3)	Tractor Taillight Feed (chassis connector pin B1)
23A	14	Trailer Taillight Mini Relay (terminal 87)	Trailer Taillight Feed (7-way connector pin K1)
23D	16	Tractor Marker/Taillight Micro Relay (terminal 1)	Marker Light Interrupt Switch
23F	14	Tractor Marker/Taillight Relay (terminal 4)	Headlight Switch
24	14	15-Amp Circuit Breaker	Horn
24A	14	Horn	Horn Button
27	16	Road Light Switch	Road Light Micro Relay
27A	14	RH Headlight Micro Relay (terminal 4)	Road Light Switch
27B	14	Tractor Marker/Taillight Micro Relay (terminal 5)	Road Light Switch
27L	14	Road Light Switch	Left-Hand Road Light
27R	14	Road Light Switch	Right-Hand Road Light
29A	16	Panel Light Dimmer	ICU Pin LH-A1 (pink connector)
29A	16	Panel Light Dimmer	ICU Pin RH-A6 (blue connector)

Specifications

Circuits 23 through 29F			
Circuit	**Gauge**	**From**	**To**
29A	16	ICU Pin LH-B1 (pink connector)	ICU Keypad
29A	16	Panel Light Dimmer	Utility Light Switch
29A	16	Panel Light Dimmer	Footwell Lights
29A	16	Panel Light Dimmer	Road Light Switch
29A	16	Panel Light Dimmer	Mirror Heat Switch
29A	16	Panel Light Dimmer	Wiper/Washer Switch
29A	16	Panel Light Dimmer	Clock
29A	16	Panel Light Dimmer	Sleeper Dome Lights
29A	16	Panel Light Dimmer	Marker Light Interrupt Switch
29A	16	Panel Light Dimmer	Headlight Switch
29A	16	Panel Light Dimmer	Flipper Switch 1
29A	16	Panel Light Dimmer	Flipper Switch 2
29A	16	Panel Light Dimmer	Flipper Switch 3
29A	16	Panel Light Dimmer	Flipper Switch 4
29A	16	Panel Light Dimmer	Splice Pak
29A	16	Panel Light Dimmer	Splice
29A	16	Splice	Splice
29A	16	Splice Pak	Splice
29A	16	Panel Light Dimmer	Heater Panel Light
29A	16	Panel Light Dimmer	HVAC Panel Light
29C	14	Panel Light Relay (terminal 3)	Panel Light Dimmer
29D	14	Panel Light Relay (terminal 1)	Marker Light Interrupt Switch
29F	16	Headlight Switch	Panel Light Relay (terminal 4)

Circuits 30 through 41S

Circuits 30 through 41S			
Circuit	**Gauge**	**From**	**To**
30	18	Transmission Fluid Temperature Gauge (+)	ICU Pin RH-D7 (blue connector)
30G	18	ICU Pin RH-D6 (blue connector)	Transmission Fluid Temperature Gauge (–)
36	12	25-Amp Circuit Breaker	Brake Light Switch
36A	14	Circuit 36B Splice	Turn Signal Switch Pin TS-7
36B	10	Brake Light Switch	Circuit 36B Splice
36B	20	Circuit 36B Splice	Trailer Brake Lights
38A	12	Turn Signal Flasher	Turn Signal Switch Pin TS-1
38L	12	Turn Signal Switch Pin TS-6	Circuit 38L Splice
38L	14	Circuit 38L Splice	Front Left Turn Signals

Circuits 30 through 41S			
Circuit	**Gauge**	**From**	**To**
38L	14	Circuit 38L Splice	Trailer Left Turn Signals
38L	16	Circuit 38L Splice	ICU Pin LH-C8 (pink connector)
38L	14	Circuit 38L Splice	Side Fairing Clearance Light Turn Signals
38L	14	Circuit 38L Splice	Daytime Running Light (DRL) Module
38R	12	Turn Signal Switch Pin TS-12	Circuit 38R Splice
38R	14	Circuit 38R Splice	Front Right Turn Signals
38R	14	Circuit 38R Splice	Trailer Right Turn Signals
38R	14	Circuit 38R Splice	ICU Pin RH-B1 (blue connector)
38R	14	Circuit 38R Splice	Side Fairing Clearance Light Turn Signals
38R	14	Circuit 38R Splice	Daytime Running Light (DRL) Module
39L	14	Turn Signal Switch Pin TS-3	Rear Left Turn Signals/Brake Lights
39R	14	Turn Signal Switch Pin TS-9	Rear Right Turn Signals/Brake Lights
41	16	15-Amp Circuit Breaker	Cab Dome Light
41A+	14	Circuit 41 Splice	SleeperCab Dome Light #1
41A–	14	SleeperCab Dome Light #1	SleeperCab Dome Light Switch
41B+	14	Circuit 41 Splice	SleeperCab Dome Light #2
41B–	14	SleeperCab Dome Light #2	SleeperCab Dome Light Switch
41C+	14	Circuit 41 Splice	SleeperCab Dome Light #3
41C–	14	SleeperCab Dome Light #3	SleeperCab Dome Light Switch
41R	14	15-Amp Circuit Breaker (aux. PDM–Plug B2-2A)	Reading Lamp Switch
41RA	14	Reading Lamp Switch	Reading Lamp A
41RB	14	Reading Lamp Switch	Reading Lamp B
41S	14	15-Amp Circuit Breaker (aux. PDM–Plug B2-2C)	SleeperCab Dome Light

Circuits 42 through 78A

Circuits 42 through 78A			
Circuit	**Gauge**	**From**	**To**
42	18	Forward-Rear-Axle Oil Temperature Sensor (+)	ICU Pin RH-D5 (blue connector)
42G	18	ICU Pin RH-C5 (blue connector)	Forward-Rear-Axle Oil Temperature Sensor (–)
43	18	Rearmost-Axle Oil Temperature Sensor (+)	ICU Pin RH-D4 (blue connector)
43G	18	ICU Pin RH-C4 (blue connector)	Rearmost-Axle Oil Temperature Sensor (–)
46	16	Tractor Marker/Taillight Relay (terminal 3)	Cab Marker Lights
46	16	Tractor Marker/Taillight Relay (terminal 3)	Side Marker Lights
46A	10	Trailer Marker Light Relay (terminal 87)	7-Way Connector
46E	14	Tractor Marker/Taillight Relay (terminal 3)	Left-Hand Cab Door Marker Light
46F	14	Tractor Marker/Taillight Relay (terminal 3)	Right-Hand Cab Door Marker Light

Specifications

Circuits 42 through 78A			
Circuit	**Gauge**	**From**	**To**
47	18	Fuel Level Sensor (+)	ICU Pin RH-B5 (blue connector)
47G	18	ICU Pin RH-B6 (blue connector)	Fuel Level Sensor (–)
52	16	10-Amp Circuit Breaker	IGN Switch (BAT+ terminal)
52A	16	ACC Relay (terminal 30)	PDM (ACC bus)
52B	16	Ignition Switch (ACC terminal)	ACC Relay (terminal 85)
52C	16	IGN Relay (terminal 30)	PDM (IGN bus)
52D	16	Ignition Switch (IGN terminal)	IGN Relay (terminal 85)
52K	14	Sleeper HVAC IGN Power Relay–Plug B1-1C	Sleeper HVAC
52K	14	15-Amp Circuit Breaker (aux. PDM–plug B2-5D)	SleeperCab Lighting ACC Feed
52R	14	15-Amp Circuit Breaker (main PDM–pin DE)	10-Amp Circuit Breaker (aux. PDM–plug B3-6D)
57	14	15-Amp Circuit Breaker	Dash Cigar Lighter
57A	14	15-Amp Circuit Breaker	SleeperCab Cigar Lighter #1
57B	14	15-Amp Circuit Breaker	SleeperCab Cigar Lighter #2
57C	14	15-Amp Circuit Breaker	SleeperCab Cigar Lighter #3
73	14	10-Amp Circuit Breaker	Utility Light Switch
73A	14	Utility Light Switch	Utility Lights
76	14	Mirror Heat Switch	Right Mirror Heat (high)
76A	14	Mirror Heat Switch	Left Mirror Heat (low)
76A	14	Mirror Heat Switch	Mirror Heat Indicator Light
78	14	10-Amp Circuit Breaker	Spotlight Switch
78A	—	Spotlight Switch	Spotlight

Circuits 81C through 97T

Circuits 81C through 97T			
Circuit	**Gauge**	**From**	**To**
81C	16	10-Amp Circuit Breaker	Circuit 81C Splice
81C	16	Circuit 81C Splice	Flipper Valve 1
81C	16	Circuit 81C Splice	Flipper Valve 2
81C	16	Circuit 81C Splice	Flipper Valve 3
81C	16	Circuit 81C Splice	Flipper Valve 4
81C	16	10-Amp Circuit Breaker	Circuit 81C1 Splice
81C	16	Circuit 81C1 Splice	Engine Brake Switch
81C	16	Circuit 81C1 Splice	Cruise Control Switch
81C	16	Circuit 81C1 Splice	Engine Fan Override Switch
81C	16	Circuit 81C1 Splice	Optional Constant IGN Power
81C	16	Circuit 81C1 Splice	Optional Constant IGN Power

Circuits 81C through 97T			
Circuit	**Gauge**	**From**	**To**
93	16	10-Amp Circuit Breaker	Radio ACC Power
94	14	10-Amp Circuit Breaker	Air Dryer Heater Element
95FL+	16	Radio Left Front Speaker Power	Left Front Speaker (+ terminal)
95FR+	16	Radio Right Front Speaker Power	Right Front Speaker (+ terminal)
95ML+	16	Radio or Fader Left Rear Speaker Power	Left Mid-Cab Speaker (+ terminal)
95MR+	16	Radio or Fader Right Rear Speaker Power	Right Mid-Cab Speaker (+ terminal)
95AL+	16	Radio or Fader Left Rear Speaker Power	Left Rear Speaker (+ terminal)
95AR+	16	Radio or Fader Right Rear Speaker Power	Right Rear Speaker (+ terminal)
97A	16	A/C Switch	Sleeper HVAC Low-Speed Relay (terminal 1)
97B	14	10-Amp Circuit Breaker	A/C Protection Unit
97C	14	A/C Protection Unit	A/C Compressor Clutch
97H	14	A/C Protection Unit	A/C High Pressure Switch
97J	14	A/C High Pressure Switch	A/C Protection Unit
97L	14	A/C Protection Unit	A/C Low Pressure Switch
97M	14	A/C Low Pressure Switch	A/C Protection Unit
97T	14	A/C Thermostat	A/C Protection Unit

Circuits 98 through 98Z

Circuits 98 through 98Z			
Circuit	**Gauge**	**From**	**To**
98	12	HVAC Regular-Speed Relay (terminal 87)	HVAC Fan Switch
98A	12	HVAC Fan Switch, Speed 1	Blower Resistor
98B	12	HVAC Fan Switch, Speed 2	Blower Resistor
98C	12	HVAC Fan Switch, Speed 3	Blower Resistor
98D	12	HVAC Fan Switch, Speed 4	HVAC High-Speed Relay (terminal 85)
98E	12	HVAC Fan Switch "On" Signal	A/C Switch
98F	12	Blower Resistor	Blower Motor
98G	–	Sleeper HVAC Blower Resistor	Sleeper HVAC Blower Motor
98H	–	Sleeper HVAC High-Speed Relay (terminal 87)	Sleeper HVAC Switch Speed 4
98H	–	Sleeper HVAC High-Speed Relay (terminal 87)	Blower Resistor
98K	16	Recirculation Pressure Switch	ICU Pin LH-C10 (pink connector)
98L	–	Sleeper HVAC Low-Speed Relay (terminal 85)	Resistor Block
98M	–	Blower Switch	Resistor Block
98P	–	30-Amp Circuit Breaker	Sleeper HVAC Relays
98R	–	Blower Switch	Low-Speed HVAC Relay (terminal 87)
98S	–	Sleeper HVAC Power Relay (terminal 87)	Sleeper HVAC Fan Switch

Specifications

Circuits 98 through 98Z			
Circuit	**Gauge**	**From**	**To**
98S	–	Sleeper HVAC Power Relay (terminal 87)	Sleeper HVAC Constant Temperature Control
98T	–	Sleeper HVAC Constant Temperature Control	Sleeper HVAC Thermistor
98U	–	Sleeper HVAC Thermistor	Sleeper HVAC Constant Temperature Control
98W	–	Sleeper HVAC Constant Temperature Control	Sleeper HVAC Coolant Control Valve
98X	–	Sleeper HVAC Coolant Control Valve	Sleeper HVAC Constant Temperature Control
98Y	14	Sleeper Fan	Sleeper HVAC Power Relay (terminal 87)
98Z	14	Sleeper Fan	Sleeper HVAC High-Speed Relay (terminal 87)

Circuits 108 Through 196

Circuits 108 through 196			
Circuit	**Gauge**	**From**	**To**
108	14	15-Amp Circuit Breaker (main PDM–pin AC5)	Left Door Switch
108	14	15-Amp Circuit Breaker (main PDM–pin NB3)	Right Door Switch
108	14	15-Amp Circuit Breaker (main PDM–pin AC6)	Footwell Light Switch
108A	14	Footwell Light Switch	Left Footwell Light
108A	14	Circuit 108A Splice	Right Footwell Light
108D	14	Left Door Switch	Dome Light
108D	14	Right Door Switch	Dome Light
113	14	—	Baggage Compartment Light Switch
113A	14	Baggage Compartment Light Switch	Baggage Compartment Light
120	14	10-Amp Circuit Breaker	Back-Up Light Switch
120B	14	Back-Up Light Switch	Back-Up Lights
125	16	Parking Brake Indicator Light	Parking Brake Sensor
137	16	Alternator "I" Terminal	Alternator Warning Light
157	16	15-Amp Circuit Breaker	Power Mirror Switch
157A	16	Power Mirror Switch	LH Power Mirror Vertical Feed
157B	16	Power Mirror Switch	LH Power Mirror Horizontal Feed
157C	16	Power Mirror Switch	Power Mirror Motor Common Feed
157D	16	Power Mirror Switch	RH Power Mirror Vertical Feed
157E	16	Power Mirror Switch	RH Power Mirror Horizontal Feed
166	16	Starter Switch	Ether Solenoid
166A	16	Engine Temperature Switch (ground)	Ether Solenoid Temperature Switch
172	16	Circuit Breaker	Electric Clock
173	18	Low Coolant Level Sensor	Low Coolant Level Indicator Light
173A	18	10-Amp Circuit Breaker	Low Coolant Level Sensor
185	—	—	Vehicle Anti-Theft Alarm

Circuits 108 through 196			
Circuit	**Gauge**	**From**	**To**
196	—	—	Fuel/Water Separator Heater

Circuits 218 Through 299A

Circuits 218 through 299A			
Circuit	**Gauge**	**From**	**To**
218	—	10-Amp Circuit Breaker	Pyrometer
221	—	—	Suspension Dump Warning
234	16	Frontwall Connector Pin G2	Engine Fan Solenoid
234+	16	10-Amp Circuit Breaker	Frontwall Connector Pin G2 (DDC engines only)
234+	16	Ground (in cab)	Frontwall Connector Pin G2 (CAT & CUM engines)
234*	16	Engine Fan Override Switch	Engine Fan Solenoid
234A	—	Engine Fan Override Switch	Engine ECU
234F	—	Engine Fan Solenoid	Engine ECU
242	—	30-Amp Circuit Breaker	Power Seat Control
295A	16	10-Amp Circuit Breaker (pin ED0)	Radio (IGN power)
295B	16	10-Amp Circuit Breaker (pin BB)	Radio (BAT power)
295C	16	10-Amp Circuit Breaker (pin DF)	CB Radio (overhead panel)
299	16	Outside Cab Air Temperature Sensor (+)	ICU Pin LH-C7 (pink connector)
299A	16	ICU Pin LH-D7 (pink connector)	Outside Cab Air Temperature Sensor (–)

Circuits 315 Through 363E

Circuits 315 through 363E			
Circuit	**Gauge**	**From**	**To**
315	14	15-Amp Circuit Breaker	Wiper Switch
315A	16	Wiper Switch	Wiper Low-Speed Micro Relay (terminal 2)
315B	16	Wiper Switch	Wiper High-Speed Micro Relay (terminal 2)
315C	14	Circuit 315 Splice	Wiper Motor
315H	14	Wiper High-Speed Micro Relay (terminal 5)	Wiper Motor
315L	14	Wiper Low-Speed Micro Relay (terminal 3)	Wiper Motor
315P	14	Wiper Low-Speed Micro Relay (terminal 4)	Wiper Motor
320	14	Wiper Switch	Washer Motor
320A	16	Washer Level Sensor	ICU Pin LH-A9 (pink connector)
331	—	10-Amp Circuit Breaker (aux. PDM)	Datalink Diagnostic Connector
359	16	Main PDM Pin AD1 (headlight sensing circuit)	ICU Pin LH-D16 (pink connector)
363	—	15-Amp Circuit Breaker	Power Window Motor

Specifications

Circuits 315 through 363E			
Circuit	**Gauge**	**From**	**To**
363A	—	Power Window Motor	Left-Hand Window, Up
363B	—	Power Window Motor	Left-Hand Window, Down (express mode)
363C	—	Power Window Motor	Right-Hand Window, Up
363D	—	Power Window Motor	Right-Hand Window, Down
363E	—	Left-Hand Window, Down	Power Window Motor

Circuits 376A Through 378T

Circuits 376A through 378T			
Circuit	**Gauge**	**From**	**To**
376A	16	15-Amp Circuit Breaker (aux. PDM)	ABS Controller
376B	16	15-Amp Circuit Breaker (aux. PDM)	ABS Controller
376C	16	10-Amp Circuit Breaker (aux. PDM)	ABS Controller
376D	16	ABS Controller	7-Way Connector Pin B2
376E	10	30-Amp C/B (main PDM pin LC)	7-Way Connector Pin A1
376F	18	7-Way Connector Pin B1	TRL ABS Light (ICU pin LH-A6)
376L	16	ABS Controller	TRAC ABS Light (ICU pin RH-A3)
376S	16	ABS Controller	WHL SPN Light (ICU pin RH-B4)
377LF+	16	ABS Controller	ABS Wheel Sensor, LH Forward
377LF–	16	ABS Wheel Sensor, LH Forward	ABS Controller
377LR+	16	ABS Controller	ABS Wheel Sensor, LH Rear
377LR–	16	ABS Wheel Sensor, LH Rear	ABS Controller
377LT+	16	ABS Controller	ABS Wheel Sensor, LH Tag (rearmost axle)
377LT–	16	ABS Wheel Sensor, LH Tag (rearmost axle)	ABS Controller
377RF+	16	ABS Controller	ABS Wheel Sensor, RH Forward
377RF–	16	ABS Wheel Sensor, RH Forward	ABS Controller
377RR+	16	ABS Controller	ABS Wheel Sensor, RH Rear
377RR–	16	ABS Wheel Sensor, RH Rear	ABS Controller
377RT+	16	ABS Controller	ABS Wheel Sensor, RH Tag (rearmost axle)
377RT–	16	ABS Wheel Sensor, RH Tag (rearmost axle)	ABS Controller
378LFI	16	ABS Controller	ABS Valve, LH Forward In
378LFO	16	ABS Controller	ABS Valve, LH Forward Out
378LF–	16	ABS Controller	ABS Valve, LH Rear Ground
378LRI	16	ABS Controller	ABS Valve, LH Rear In
378LRO	16	ABS Controller	ABS Valve, LH Rear Out
378LR–	16	ABS Controller	ABS Valve, LH Forward Ground
378RFI	16	ABS Controller	ABS Valve, RH Forward In

Circuits 376A through 378T			
Circuit	**Gauge**	**From**	**To**
378RFO	16	ABS Controller	ABS Valve, RH Forward Out
378RF–	16	ABS Controller	ABS Valve, RH Rear Ground
378RRI	16	ABS Controller	ABS Valve, RH Rear In
378RRO	16	ABS Controller	ABS Valve, RH Rear Out
378RR–	16	ABS Controller	ABS Valve, RH Forward Ground
378T+	16	ABS Controller	ABS Traction Control Valve (+)
378T–	16	ABS Controller	ABS Traction Control Valve (–)

Circuits 379 Through 1587S

Circuits 379 through 1587S			
Circuit	**Gauge**	**From**	**To**
379	14	10-Amp Circuit Breaker	Daytime Running Light Module
379A	14	15-Amp Circuit Breaker	Daytime Running Light Module
379B	14	Daytime Running Light Module	Parking Brake Switch
379C	14	Daytime Running Light Module	Left Headlight Micro Relay (terminal 3)
379L	14	Daytime Running Light Module	LH Daytime Running Light
379R	14	Daytime Running Light Module	RH Daytime Running Light
437	16	10-Amp Circuit Breaker	Circuit 437 Splice
437	16	Circuit 437 Splice	ICU Pin LH-D14 (pink connector)
437	16	Circuit 437 Splice	ICU Pin RH-D11 (blue connector)
437A	16	10-Amp Circuit Breaker	ICU Pin LH-D15 (pink connector)
437A	16	10-Amp Circuit Breaker	ICU Pin RH-C15 (blue connector)
437B	16	ICU Pin LH-B8 (pink connector)	Keypad Pin 1
437C	16	ICU Pin LH-B6 (pink connector)	Keypad Pin 2
437D	16	ICU Pin LH-B5 (pink connector)	Keypad Pin 3
437E	16	ICU Pin LH-B9 (pink connector)	Keypad Pin 4
437F	16	ICU Pin LH-B7 (pink connector)	Keypad Pin 5
437W	16	LH Door Switch	ICU Pin LH-C4 (pink connector)
437Z	18	ICU Pin LH-B12 (buzzer enable circuit)	ICU Pin RH-A7 (blue connector)
442	18	10-Amp BAT Circuit Breaker (aux. PDM)	Data Logging Unit
442A	18	10-Amp IGN Circuit Breaker (aux. PDM)	Data Logging Unit
442B	18	ICU Pin LH-A2 (pink connector)	Data Logging Unit
1587+	18	J1587 Databus	Data Logging Unit
1587–	18	Data Logging Unit	J1587 Databus
1587A+	18	J1587 Databus	ABS Controller
1587A–	18	ABS Controller	J1587 Databus

Specifications

Circuits 379 through 1587S			
Circuit	**Gauge**	**From**	**To**
1587C+	18	J1587 Databus	ICU Pin LH-B10 (pink connector)
1587C–	18	ICU Pin LH-B3 (pink connector)	J1587 Databus
1587D+	18	J1587 Databus	Diagnostic Connector
1587D–	18	Diagnostic Connector	J1587 Databus
1587E+	18	J1587 Databus	Engine ECU
1587E–	18	Engine ECU	J1587 Databus
1587L+	18	J1587 Databus	Data Logging Unit
1587L–	18	Data Logging Unit	J1587 Databus
1587P+	18	ICU Pin LH-B11 (pink connector)	A/C Protection Unit
1587P–	18	A/C Protection Unit	ICU Pin LH-B4 (pink connector)
1587S+	18	J1587 Databus	ECAS ECU
1587S–	18	ECAS ECU	J1587 Databus

Fig. 19, Air Manifold and Pressure Switch Assembly

General Information

The exterior lighting system includes the following lighting circuit functions:

- Headlights
- Daytime Running Lights
- Turn Signals (front, side, side fairing, and rear; can also be activated as 4-way flashers)
- Parking Lights
- Road Lights
- Marker Lights (front, side, and side fairing clearance)
- Taillights and Stoplights
- Back-Up Lights

Each of these lighting functions illuminates one or more bulbs on the vehicle. For example, the parking light circuit illuminates the front turn signal, side marker, and taillight bulbs.

A lighting fixture may have more than one functional circuit. For example, the dual-filament bulb in the front turn signal is connected to the turn signal, daytime running light, and parking light circuits.

In the front of the vehicle there are headlights, front turn signals, road lights, and front marker lights. See **Fig. 1** and **Fig. 2**. The front turn signal light with the amber dual-filament bulb doubles as a daytime running light and turn signal.

The parking lights operate a second filament in the dual-filament bulbs located in the front turn signals, side marker lights, and taillights (red utility lights).

Optional road lights are installed on the front bumper.

The front marker lights are installed on the sun visor. On vehicles with no sun visor installed, they are located on the cab roof.

On each side of the vehicle, there is a side marker light with a dual-filament bulb. The first filament doubles as a turn signal, and the second filament is for the parking lights. In addition, there is a clearance light on the cab side, which also doubles as a turn signal.

On the rear of the Century Class Conventional vehicle, there are three utility lights. The utility lights with the red lenses have dual-filament bulbs, with one filament being a combination taillight, brake light, and rear turn signal, while the other filament is for the parking lights. The utility light with the white lens is a back-up light.

There are two utility lights on the rear of the Argosy COE vehicle, each of which controls all rear exterior lighting functions for that side: taillight, brake light, rear turn signal, parking light and back-up light.

For vehicles equipped with daytime running lights, switching on the ignition and releasing the parking brakes automatically activates the daytime running light at reduced voltage. The daytime running lights share with the turn signals the smaller (amber) light next to the headlight. This light will operate as a daytime running light until the parking brakes are applied, the headlight switch is turned on, or the turn signals are activated.

⚠ CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables and the electrical connector at the bottom of the daytime running lights (DRL) module. See Troubleshooting 300 in this section for instructions. Electric currents produced during electric welding can damage various electronic components on the vehicle.

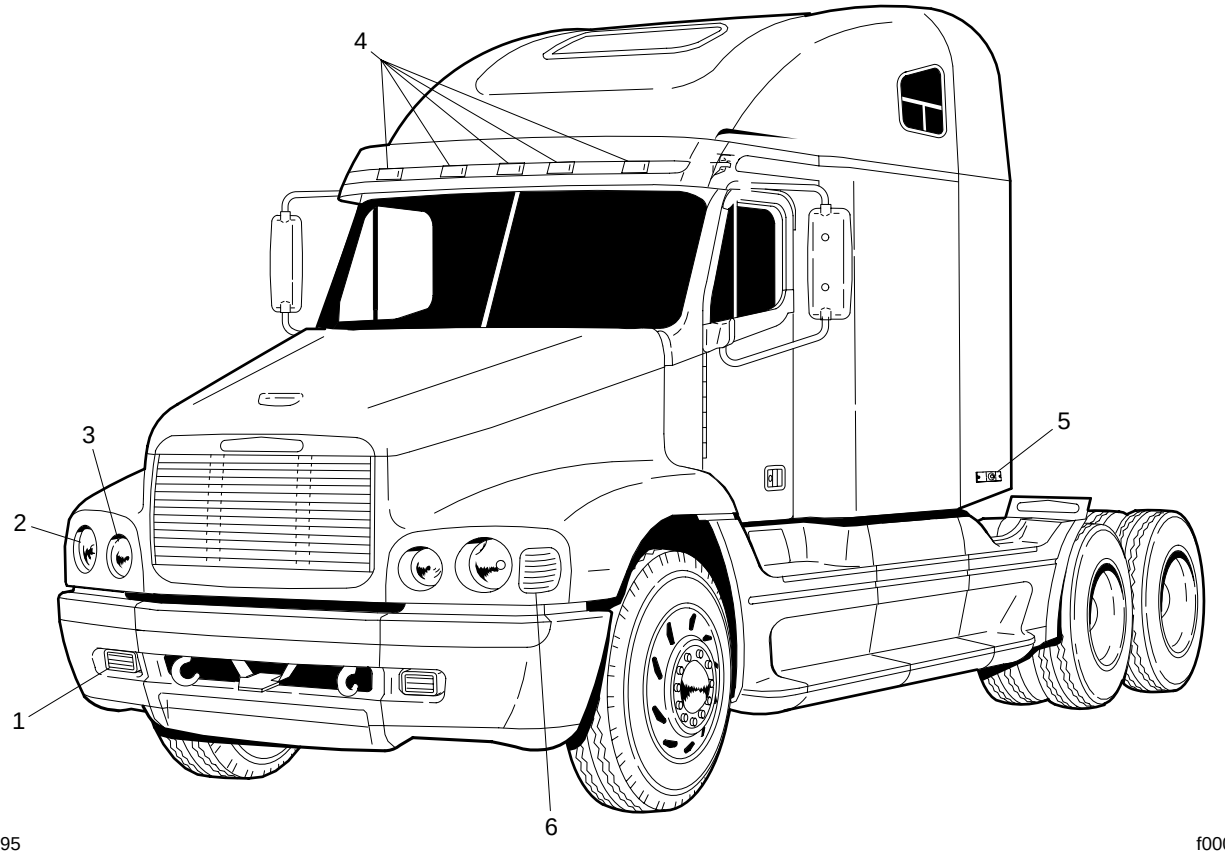
NOTE: For vehicles built to operate in the United States, the low-beam headlights must be turned on before the road lights can be turned on. The road lights will not go on if the high-beam headlights are already on, and switching from low beams to high beams will switch off the road lights.

For vehicles built to operate in Canada, the taillights and clearance lights must be on before the road lights can be turned on. Unless the headlight switch is all the way up (headlights, taillights, clearance lights, marker lights, and panel lights on) or down (taillights, clearance lights, marker lights, and panel lights on), the road light switch will not turn on the road lights.

Inside the cab are the following lights:

- Dome lights (with map and reading lights)
- Courtesy lights in both driver's and passenger's footwells

General Information



1. Road Light
2. Headlight
3. Front Turn Signal/Daytime Running Light
4. Front Marker Lights
5. Side Fairing Clearance Light
6. Side Marker Light

Fig. 1, Cab Exterior Lighting, Front, Century Class Conventional

- An instrument panel that features fully lighted gauges and panels

The steering column-mounted turn-signal switch has the headlight dimmer switch built into it.

In the bunk or sleeper are dome lights, under-bunk storage compartment lights, and reading lights. Baggage compartments may be equipped with accessory lights.

Headlight aim can be checked and adjusted most easily, using the Hopkins mechanical aimer. The aimer attaches to the headlight with a vacuum cup activated by pushing the piston handle located on the base of the aimer. See **Fig. 3**.

To adjust the horizontal aim, turn the horizontal adjusting screw on the headlight until the split image aligns in the split image view port. To adjust the vertical aim, turn the vertical adjusting screw on the headlight until the bubble is centered in the level vial.

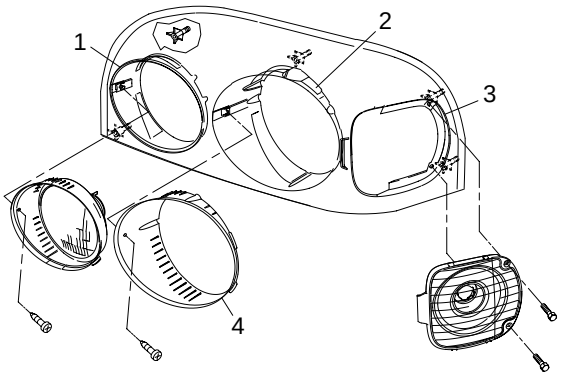
Headlight Replacement

Century Class and Argosy COE

NOTE: The Century Class headlight bezel contains the headlight, front turn signal/daytime running light, and the side marker light. See **Fig. 1**. The side marker light also functions as a turn signal.

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the headlight trim cone from the headlight bezel or the headlight housing. See **Fig. 2**.



09/28/95 f541128

NOTE: The front turn signal doubles as a daytime running light (DRL), when DRLs are installed.

1. Front Turn Signal Bucket
2. Headlight Bucket
3. Side Marker Light Bucket
4. Headlight Trim Cone

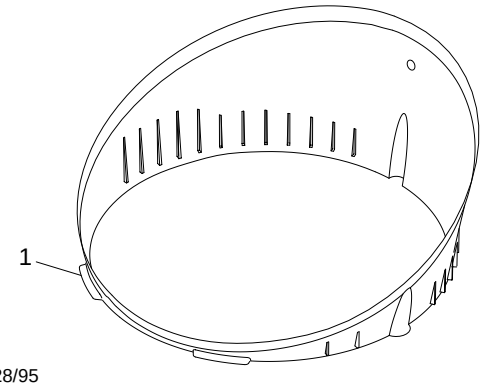
Fig. 1, Headlight Bezel, Century Class Conventional

2.1 Remove the Torx®-head mounting screw on the side of the headlight trim cone.

2.2 Rotate the free side of trim cone out until the two mounting tabs on the other side of the trim cone come loose.

2.3 Remove the trim cone.

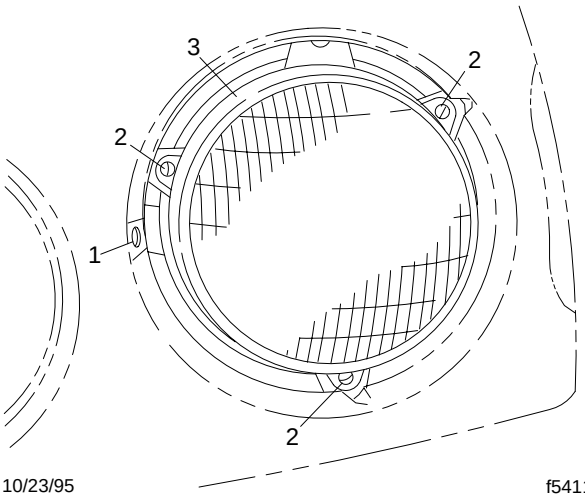
3. Remove the retaining ring screws. See. **Fig. 3**.
4. Remove the retaining ring.



09/28/95 f541130

1. Mounting Tab

Fig. 2, Headlight Trim Cone



10/23/95 f541159

1. Trim Cone Screw Hole
2. Retaining Ring Screws
3. Headlight Bucket

Fig. 3, Headlight Retaining Ring Screws

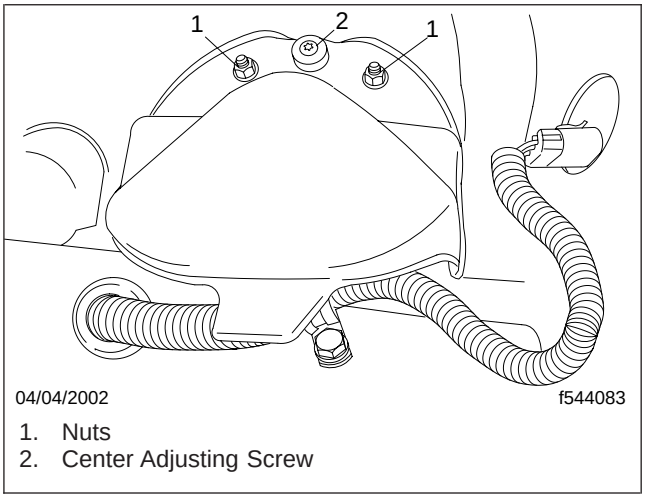
5. Remove the sealed-beam headlight from the housing; disconnect the wiring connector from the back of the light.
6. To provide corrosion protection, coat the prongs and base of the new light with dielectric grease. Refer to the approved electrical lubricants table in **Specifications, 400**.
7. Push the wiring connector onto the prongs at the rear of the new light.

Exterior Light Replacement

8. Place the new light in the headlight housing.
9. Place the retaining ring over the light and install the retaining ring screws; tighten them securely.
10. Check and, if necessary, adjust the headlight aim.
11. Install the headlight trim cone.
    - 11.1 Work the two mounting tabs on the trim cone under the edge of the headlight bezel.
    - 11.2 Rotate the opposite side of the trim cone into the bezel.
    - 11.3 Secure the trim cone to the bezel with the mounting screw.
12. Remove the chocks from the tires.

Coronado

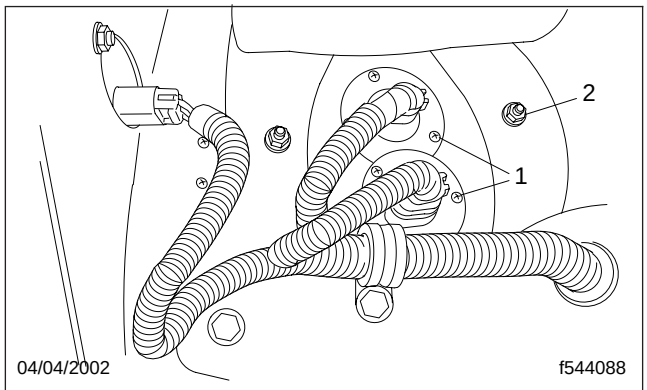
1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Tilt the hood.
3. Lift the interior mudflap to access the headlight assembly. See **Fig. 4**.



1. Nuts
2. Center Adjusting Screw

Fig. 4, Interior Mud Flap

4. Disconnect the wiring connectors.
5. Remove the retainer nuts from the headlight assembly, located on the inside of the hood. See **Fig. 5**



1. Headlight Retainer Nuts
2. Capscrews

Fig. 5, Inner Cab Headlight Assembly

6. Remove the headlight assembly by pulling the assembly from the front of the hood.
7. To provide corrosion protection, coat the prongs and base of the new light with dielectric grease. Refer to the approved electrical lubricants table in **Specifications, 400**.
8. Push the wiring connectors onto the prongs at the rear of the new light.
9. Install the retaining nuts and tighten securely.
10. Check and, if necessary, adjust the headlight aim.
11. Return the hood to the operating position.
12. Remove the chocks from the tires.

Turn Signal/Daytime Running Light Replacement

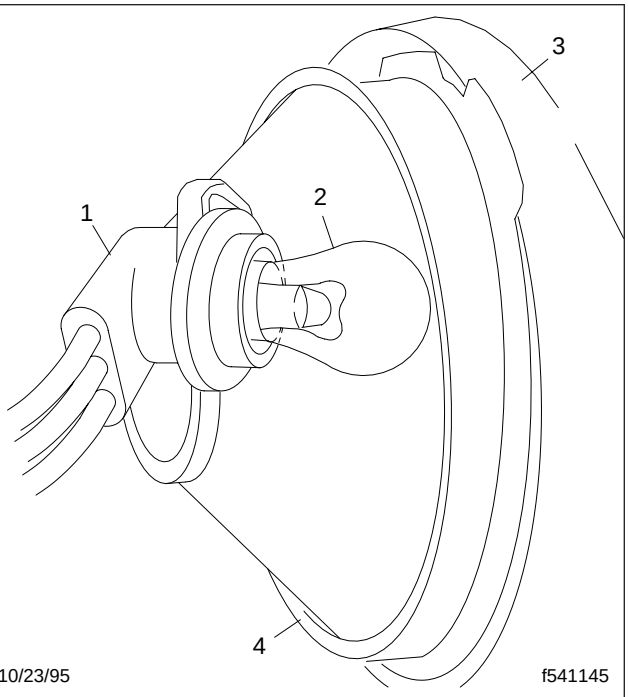
Front Turn Signal/Daytime Running Light

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.

NOTE: The front turn signal light has an amber dual-filament bulb and a clear lens. In vehicles so equipped, the turn signal filament doubles as a daytime running light. The other filament functions as a parking light through a separate circuit.

2. On the Century Class Conventional vehicle, tilt the hood. It is easier and more efficient to remove the bulb through the bottom of the bezel. See **Fig. 6**.

   On the Argosy COE vehicle, remove the Torx-head screw from the turn signal/DRL bezel, then remove the light assembly from the housing.



1. Bulb Socket
2. Amber Bulb
3. Back of Headlight Bezel
4. Turn Signal Trim Cone

Fig. 6, Front Turn Signal

3. Twist the socket counterclockwise one-quarter turn to unlock.
4. Replace the bulb. To provide corrosion protection, coat the prongs and base of the new bulb with dielectric grease. Refer to the approved electrical lubricants table in **Specifications, 400**.
5. Check the bulb for proper operation.
6. Twist the socket clockwise and press in on the locking tab to install it. Tug gently on the socket to make sure it is locked in place.
7. Lower the hood of the Century Class Conventional vehicle, or, on the Argosy COE vehicle, install the light assembly into the housing, and secure it with the Torx-head screw.
8. Remove the chocks from the tires.

Side Turn Signal

See "Side Marker Light" for instructions on replacing the side turn signal light bulbs.

Side Fairing Turn Signal

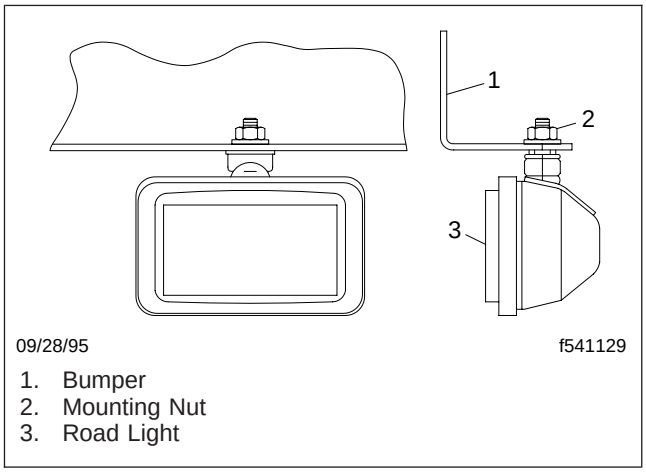
See "Clearance Light" for instructions on replacing the side turn signal light bulbs.

Rear Turn Signal

See "Utility Light Replacement" for instructions on replacing the rear turn signals.

Road Light Replacement

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the nut attaching the road light to the bumper. See **Fig. 7**.



1. Bumper
2. Mounting Nut
3. Road Light

Fig. 7, Road Light

3. Unplug the electrical connector.
4. Install a new road light. Attach the mounting nut to the bumper.
5. To provide corrosion protection, coat the pins and base of the connector with dielectric grease.

Exterior Light Replacement

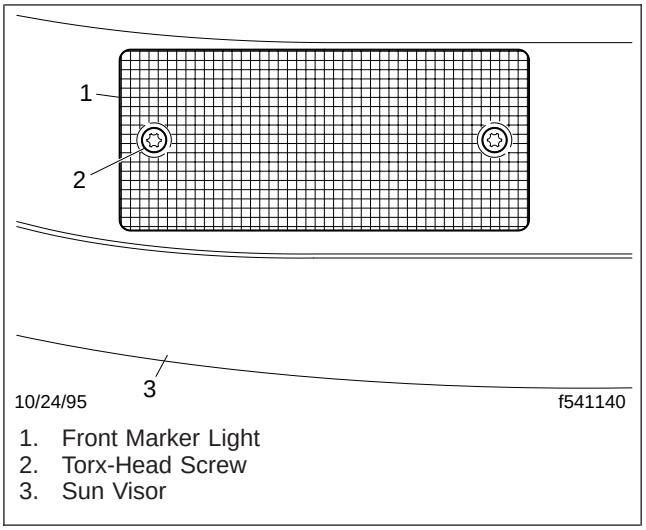
Refer to the approved electrical lubricants table in **Specifications, 400**.

6. Plug in the electrical connector.
7. Wipe the lens with a clean cloth to remove any dirt or skin oil.
8. Test the light for proper operation.
9. Check the alignment of the light. Make sure the light is pointing forward and slightly toward the shoulder side of the road.
10. Remove the chocks from the tires.

Marker Light Replacement

Front Marker Light

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the two Torx-head screws on the amber front marker light lens. Remove the lens. See **Fig. 8**.



1. Front Marker Light
2. Torx-Head Screw
3. Sun Visor

Fig. 8, Front Marker Light

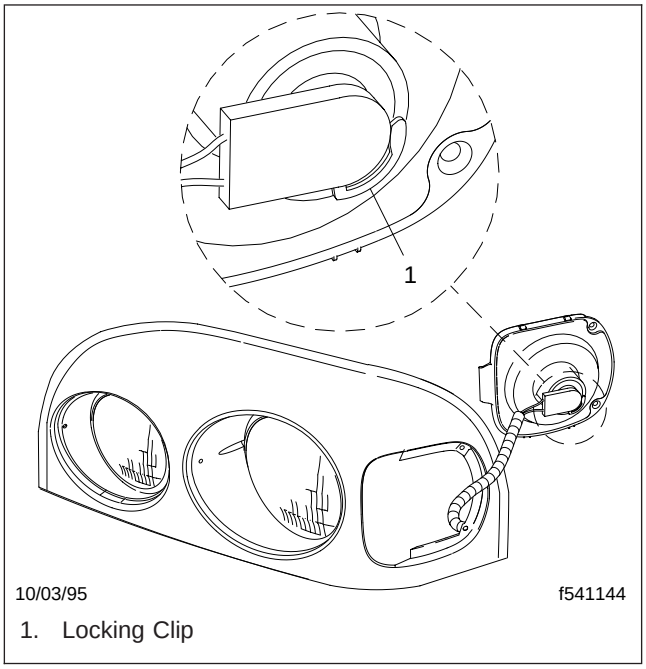
3. Twist the bulb socket counterclockwise one-quarter turn to remove.
4. Replace the bulb. To provide corrosion protection, coat the prongs and base of the new bulb with dielectric grease. Refer to the approved electrical lubricants table in **Specifications, 400**.
5. Twist the socket clockwise and press in on the locking tab to install it. Tug gently on the socket to make sure it is locked in place.
6. Check the bulb for proper operation.
7. Install the amber marker light lens. Tighten the two Torx-head screws firmly.
8. Remove the chocks from the tires.

Side Marker Light

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.

NOTE: The side marker light has a dual-filament bulb. The side marker light filament doubles as a side turn signal. The other filament is for the parking lights through a separate circuit.

2. Remove the two Torx-head screws on the amber side marker light lens.
3. Twist the socket counterclockwise one-quarter turn to remove. See **Fig. 9**.



1. Locking Clip

Fig. 9, Side Marker Light, Century Class Conventional

4. Replace the bulb. To provide corrosion protection, coat the prongs and base of the new bulb

with dielectric grease. Refer to the approved electrical lubricants table in **Specifications, 400**.

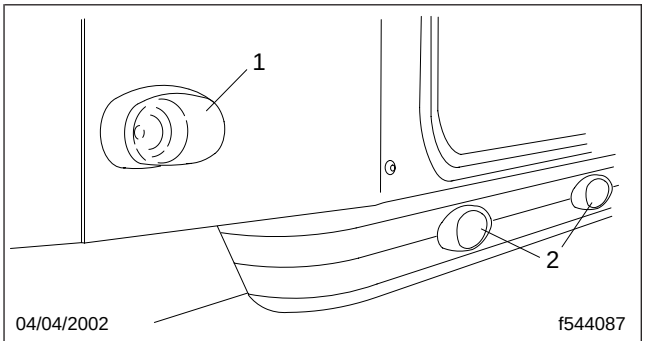
5. Check the bulb for proper operation.
6. Twist the socket clockwise and press in on the locking tab to install it. Tug gently on the socket to make sure it is locked in place.
7. Install the two Torx-head screws on the amber lens.
8. Remove the chocks from the tires.

Accent Lights, Coronado

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.

NOTE: These steps apply to the accent lights and the marker light on the side of the cab. See **Fig. 10**.

2. If replacing accent lights on the hood, tilt the hood.
3. If replacing the accent lights on the cab door, first remove the door lower interior trim panel. See **Fig. 11**.



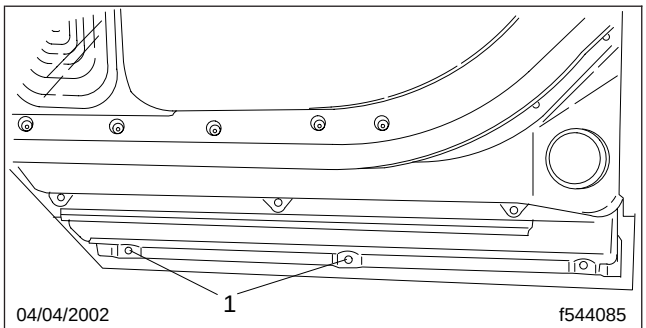
1. Marker Light
2. Accent Lights

Fig. 10, Coronado Accent and Marker Lights

3.1 Remove the six capscrews that attach the inner door trim panel to the cab door.

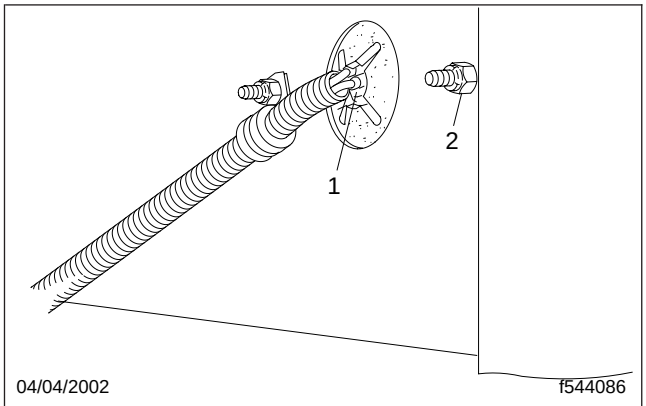
3.2 Remove the trim panel.

4. Disconnect the wiring connector from the light. See **Fig. 12**.
5. Remove the retaining nuts.
6. Remove the accent light from the cab.



1. Trim Panel Capscrews

Fig. 11, Lower Interior Door Trim Panel



1. Wiring Connector
2. Retaining Nuts

Fig. 12, Accent Light Screws

7. Push the wiring connector onto the prongs at the rear of the new light.
8. Position the new accent light on the cab.
9. Install the retaining nuts onto the accent light and tighten securely.
10. If necessary, install the door lower interior trim panel.

10.1 Position the trim panel on the cab door interior.

10.2 Install the six screws and tighten securely.

11. If necessary, lower the hood.
12. Remove the chocks from the tires.

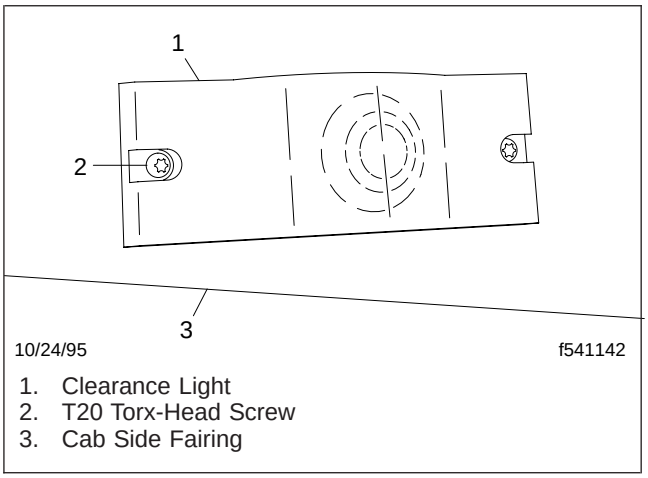
Exterior Light Replacement

Clearance Light, Century Class Conventional

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.

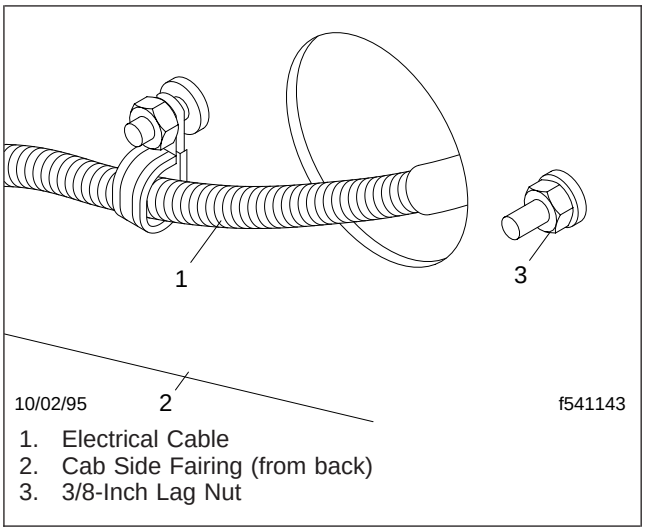
NOTE: The clearance light doubles as a side fairing turn signal. See **Fig. 13**.

2. Remove the two 3/8-inch lag nuts on the rear of the cab side fairing. See **Fig. 14**.



1. Clearance Light
2. T20 Torx-Head Screw
3. Cab Side Fairing

Fig. 13, Clearance Light Installation



1. Electrical Cable
2. Cab Side Fairing (from back)
3. 3/8-Inch Lag Nut

Fig. 14, Clearance Light Installation (rear view)

3. Remove the lens housing, bulb and electrical cable. It is a sealed unit.
4. Disconnect the electrical connector.
5. Connect a new sealed unit to the electrical connector.
6. Test the light for correct operation.
7. Install the new unit on the front of the fairing; make sure that it is fully seated. Tighten the 3/8-inch nuts firmly.
8. Remove the chocks from the tires.

Clearance Light, Argosy COE

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.

NOTE: The clearance light doubles as a side turn signal.

2. Remove the two Torx-head screws on the cab side. See **Fig. 13**.
3. Remove the lens housing, bulb and electrical cable.
4. Remove the amber lens cover.
5. Remove the bulb and install a new one.
6. Test the light for correct operation.
7. Replace the amber lens cover.
8. Install the assembly on the cab side; make sure that it is fully seated. Tighten the Torx-head screws firmly.
9. Remove the chocks from the tires.

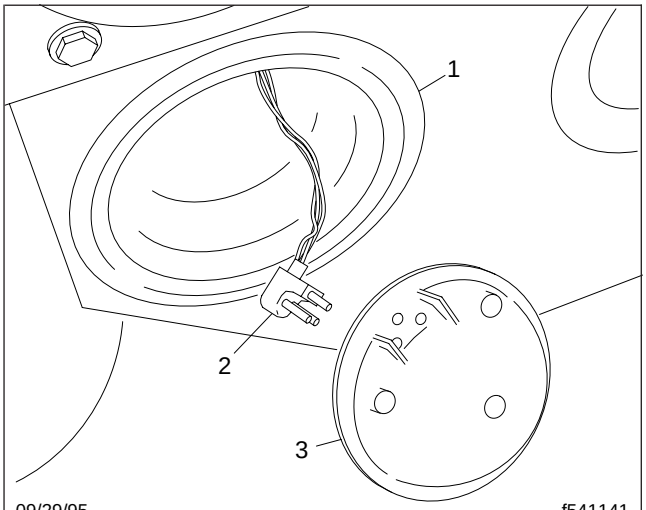
Utility Light Replacement

Century Class Conventional

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.

NOTE: The utility light with the red lens has a dual-filament bulb. One filament serves as a taillight, stoplight, and rear turn signal. The other filament is for the parking lights. The utility light with the white lens serves as a back-up light.

2. Press outward on the rear of the utility light until it comes out of the gasket. See **Fig. 15**.



09/29/95 f541141

NOTE: The utility light with the red lens has a dual-filament bulb. One filament serves as a taillight, stop-light, and rear turn signal. The other filament is for the parking lights. The utility light with the white lens serves as a back-up light.

1. Gasket
2. Electrical Connector
3. Utility Light

Fig. 15, Utility Light Replacement, Century Class Conventional

3. Pull the tab on the electrical connector and remove it from the back of the utility light.
4. Press a new sealed utility light unit into the gasket until it is firmly seated.
5. Attach the electrical connector and tug gently on it to make sure the tab on the connector is seated. Test the bulb for proper operation.
6. Remove the chocks from the tires.

Argosy COE

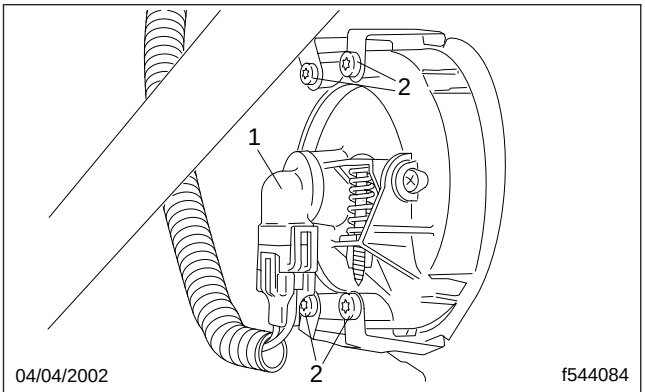
1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the four Phillips-head screws.
3. Pry the lens cover off the housing.

NOTE: The upper bulb is the back-up light; the bottom combination bulb is the taillight, parking light, brake light, and turn signal.

4. Twist the bulb counterclockwise one-quarter turn to remove it.
5. To provide corrosion protection, coat the prongs and base of the new bulb with dielectric grease. Install the new bulb. Refer to the approved electrical lubricants table in **Specifications, 400**.
6. Test the bulb for proper operation.
7. Place the lens cover on the housing and tighten the four Phillips-head screws securely.
8. Remove the chocks from the tires.

Fog Light Replacement, Coronado

1. Park the vehicle, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Open the hood.
3. Disconnect the wiring connector. See **Fig. 16**.



04/04/2002 f544084

1. Light Bulb
2. Capscrews

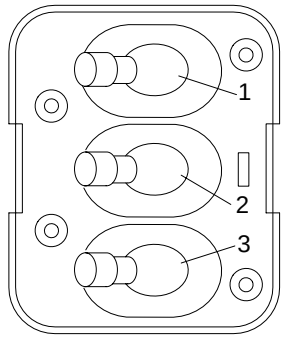
Fig. 16, Fog Light Assembly

4. Remove the four capscrews securing the fog light to the bumper.
5. Remove the fog light.
6. Position the new fog light on the bumper.
7. Install the four capscrews, and tighten securely.
8. Connect the wiring.
9. Lower the hood.
10. Remove the chocks from the tires.

Dome/Map Light Replacement

NOTE: On vehicles with an overhead console, the dome/map light has three lights: a diffuse dome light, a clear spotlight (reading light), and a red map light. See **Fig. 1**. On vehicles without an overhead console, the dome light has a single white light.

1. Remove the dome light lens, which snaps on to the lens holder. See **Fig. 2**.



06/11/98 f542582

1. Red Dome Light
2. Clear Spotlight
3. Diffuse Dome Light

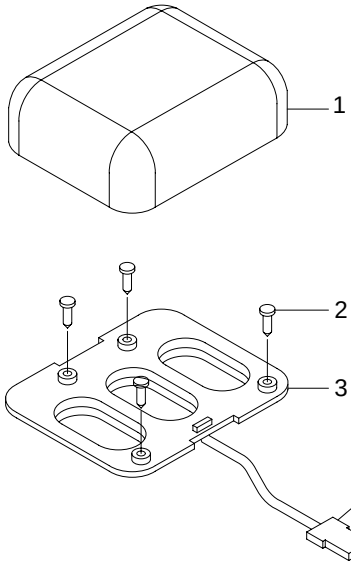
Fig. 1, Dome/Map Light Bulbs

2. Twist the bulb holder one-quarter turn clockwise to remove the bulb that needs changing.
3. Press the new bulb into its socket and check that it is firmly in place.
4. Test the light for correct operation.
5. Snap the dome light lens into place.

Courtesy Lights

DRIVER'S FLOOR COURTESY LIGHT

1. Reach in under the dash and snap the lens off the lamp base. See **Fig. 3**.
2. Replace the light bulb.
3. Snap the lens back in place on the lamp base.



09/28/95 f541132

1. Dome Light Lens
2. 10–14 Thread-Rolling Screw
3. Dome Light Lens Holder
4. Electrical Connector

Fig. 2, Lens Removal

PASSENGER'S FOOTWELL COURTESY LIGHT

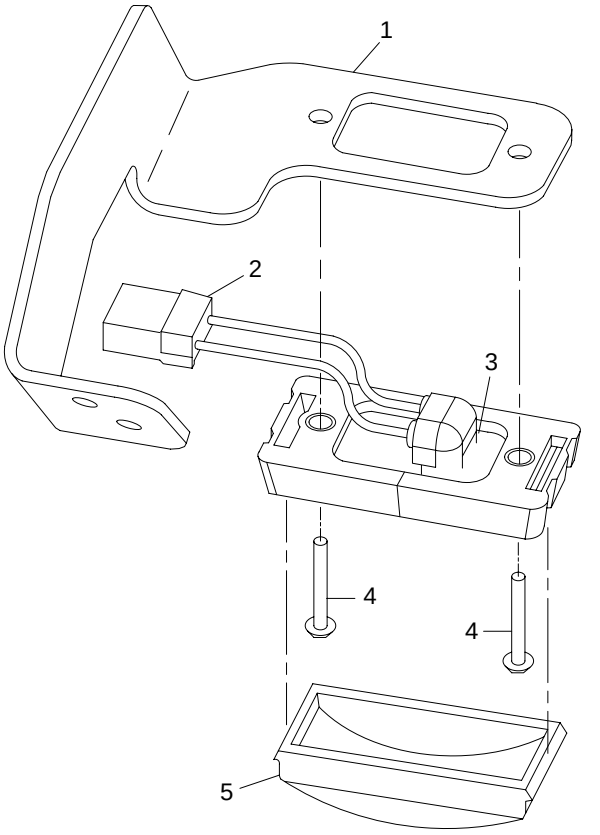
1. Reach into the recess in the HVAC cover and snap the lens off the lamp base. See **Fig. 4**.
2. Replace the bulb.
3. Snap the lens back into place on the lamp base.
4. Install the HVAC cover. For instructions, see **Section 60.08**.

Dash Panel Lights

INSTRUMENT PANEL GAUGE LIGHTS

To replace instrument panel gauge lights, see Section 54.03, **Subject 120**.

Interior Light Replacement



09/28/95 f541131

1. Steering Column Light Bracket
2. Electrical Connector
3. Lamp Base
4. 3/16-Inch Monobolt
5. Lens

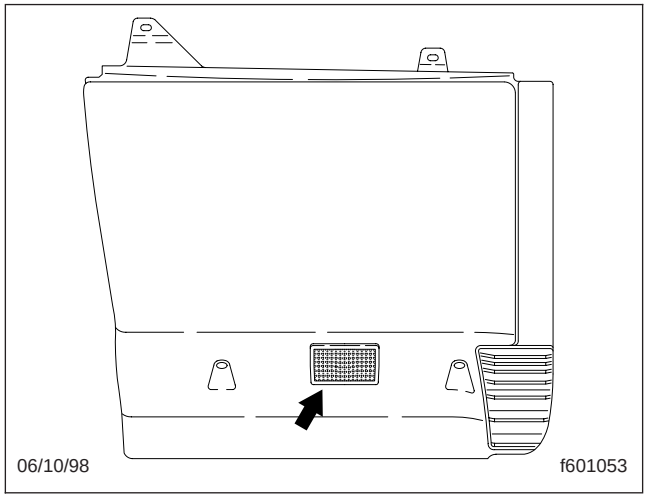
Fig. 3, Driver's Floor Courtesy Light

INSTRUMENT PANEL SWITCH LIGHTS

Wiper/Washer Switch

NOTE: The wiper/washer switch is the only double-paddle switch installed on the dash.

1. Remove the auxiliary instrument panel from the dash. For procedures, see Section 54.03, **Subject 100**.

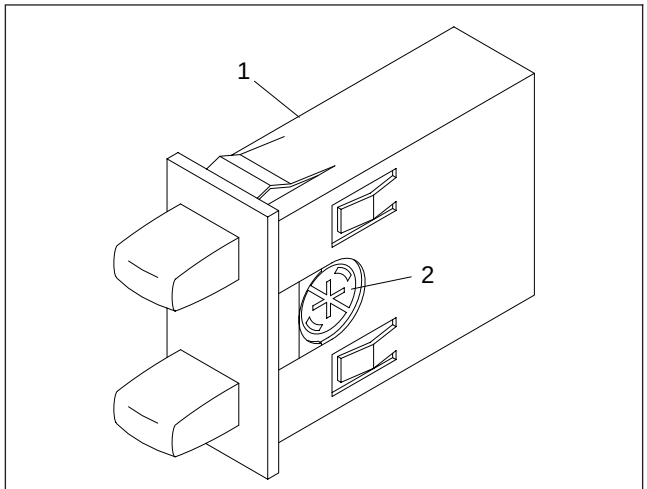


06/10/98 f601053

Fig. 4, Passenger's Footwell Courtesy Light

NOTE: In some installations, the bulb is on the side of the switch. On these switches, it is not necessary to remove the switch from the panel.

2. Remove the switch from the auxiliary instrument panel (if necessary). For procedures, see Section 54.03, **Subject 110**.
3. Locate the bulb base on the side of the switch. Using a small screwdriver, turn the bulb base one-quarter turn to remove it. See **Fig. 5**.



04/02/98 f610277

1. Switch Body
2. Bulb Base

Fig. 5, Wiper/Washer Switch Light

NOTE: The base is part of the bulb assembly and must be replaced with the bulb.

4. Install a new bulb and base assembly on the back of the valve. See **Fig. 6**.

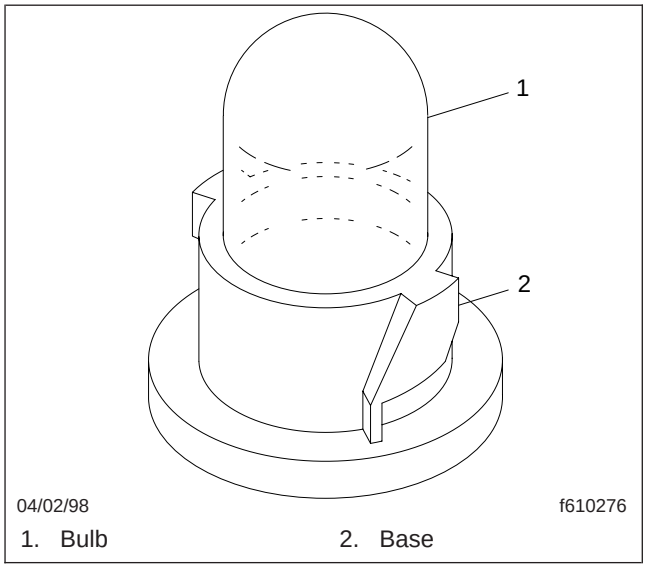


Fig. 6, Bulb Base

5. Install the switch (if removed) in the auxiliary instrument panel. For procedures, see Section 54.03, **Subject 110**.

6. Install the auxiliary instrument panel. For procedures, see Section 54.03, **Subject 100**.

Rocker Switches

1. Turn the switch on.

2. With the switch on, slip a small screwdriver under the top end of the rocker panel and pop it off of the switch body, exposing the bulb. See **Fig. 7**.

3. Using needle-nose pliers (or a small plastic tube or straw), remove the burned-out bulb.

NOTE: If using a tube or straw, rock the bulb and pull on it gently to remove it.

4. Install the new bulb in the socket.

   4.1 Push the new bulb onto the end of the small plastic tube or straw.

   NOTE: If using the bulb replacement tool located underneath the dash message center bezel, use care because the rocker switch bulbs are slightly smaller than the warning and indicator light bulbs in the dash message center.

   4.2 Holding the bulb on the end of the tube, insert it into the socket.

   4.3 Rotate the straw until the bulb is seated; then pull on the straw to remove it from the bulb.

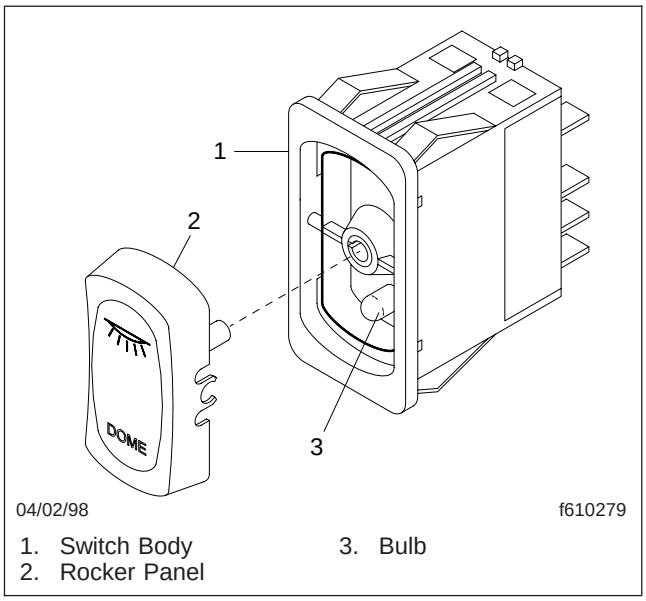

Fig. 7, Rocker Switch Light Bulb

5. Check that the rocker panel is right side up. Snap it back onto the switch body.

Single-Paddle Switches

1. With the switch on, slip a small screwdriver under the side of the lens and pry it off of the switch body, exposing the bulb. See **Fig. 8**.

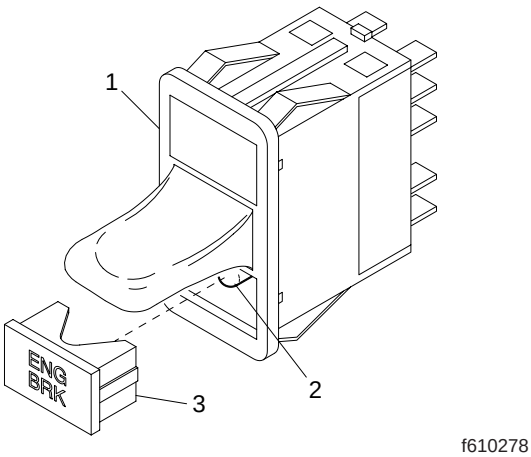
IMPORTANT: Be careful not to scratch the switch body.

2. Using needle-nose pliers (or a small plastic tube or straw), remove the burned-out bulb.

NOTE: If using a tube or straw, rock the bulb and pull on it gently to remove it.

3. Install the new bulb in the socket.

Interior Light Replacement



1. Switch Body
2. Bulb
3. Lens

Fig. 8, Single-Paddle Switch Light Bulb

3.1 Push the new bulb onto the end of the small plastic tube or straw.

NOTE: If using the bulb replacement tool located underneath the dash message center bezel, use care because the rocker switch bulbs are slightly smaller than the warning and indicator light bulbs in the dash message center.

3.2 Holding the bulb on the end of the tube, insert it into the socket.

3.3 Rotate the straw until the bulb is seated; then pull on the straw to remove it from the bulb.

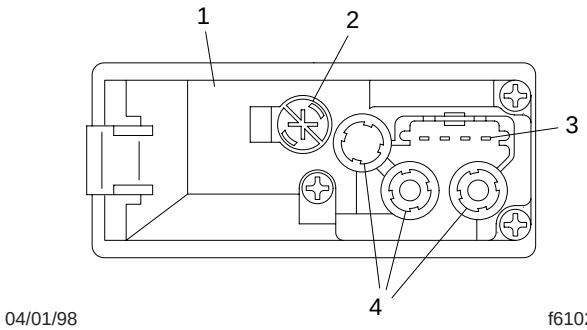
4. Check that the lens is right side up. Insert it back into the switch body.

INSTRUMENT PANEL FLIPPER VALVE LIGHTS

1. Remove the auxiliary instrument panel from the dash. For procedures, see Section 54.03, **Subject 100**.
2. Locate the bulb base on the back of the flipper valve. Using a small screwdriver, turn the bulb base one-quarter turn to remove it. See **Fig. 9**.

NOTE: The base is part of the bulb assembly and must be replaced with the bulb.

3. Install a new bulb and base assembly on the back of the valve. See **Fig. 6**.
4. Install the auxiliary instrument panel. For procedures, see Section 54.03, **Subject 100**.



Flipper valve shown in rear view.

1. Valve Body
2. Bulb Base
3. Electrical Connector
4. Air Line Connectors

Fig. 9, Flipper Valve Light

WARNING AND INDICATOR LIGHTS

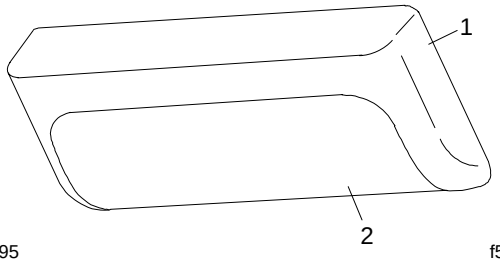
To replace warning and indicator lights, see Section 54.03, **Subject 120**.

Sleeper Cab Light Replacement

MID-ROOF DOME LIGHT

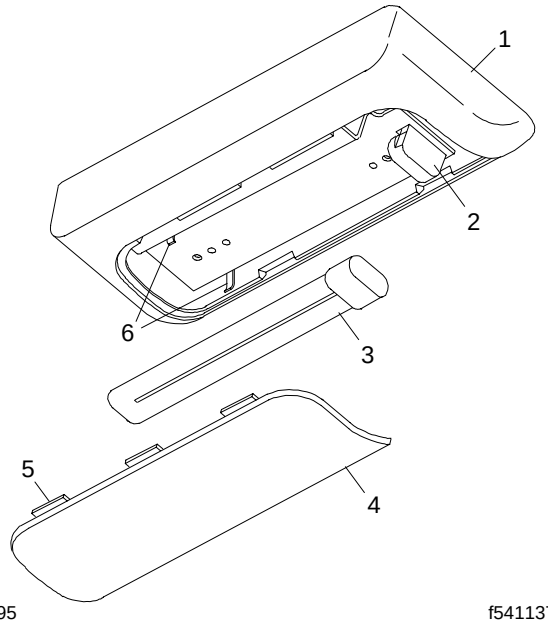
NOTE: This light is installed on sleeper cabs only. See **Fig. 10**. The front overhead dome/map light is installed on all cabs.

1. Press in on each side of the mid-roof dome light lens to release the mounting tabs (see **Fig. 11**). Remove the lens from the light receptacle.
2. Remove the fluorescent bulb from the socket.
3. Install a new fluorescent bulb. Make sure it is secure under the retaining clip. See **Fig. 11**.
4. Test the dome light for correct operation.
5. Press the lens onto the lens housing. Make sure the mounting tabs snap into place.



1. Dome Light
2. Dome Light Lens

Fig. 10, Mid-Roof Dome Light Installed



1. Dome Light
2. Socket
3. Fluorescent Bulb
4. Lens
5. Mounting Tab
6. Retaining Clip

Fig. 11, Mid-Roof Dome Light Bulb

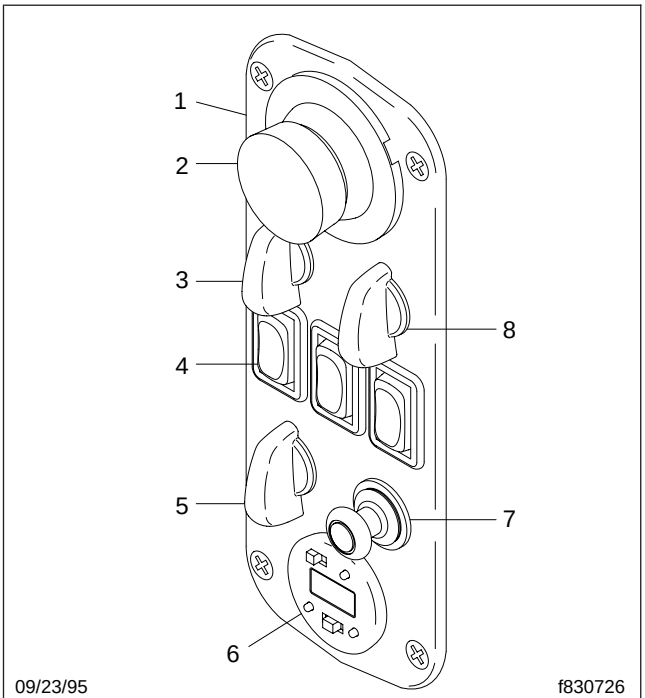
BUNK READING LIGHT

NOTE: This light is installed on sleeper cabs only.

The reading light is installed on the bunk control panel.

Lights Without Removable Bulbs

1. Twist the light counterclockwise and press in to free it from the panel. See **Fig. 12**.



NOTE: Number and placement of switches may vary.

1. Control Panel
2. Reading Light
3. Fan Control Knob
4. Dome and Reading Light Switches
5. Volume Control Knob
6. Clock
7. Cigarette Lighter
8. A.T.C. Control Knob

Fig. 12, Bunk Reading Light

2. Install a new reading light. Align the light with the three notches in the panel and snap into position.
3. Test the reading light for correct operation.

Lights With Removable Bulbs

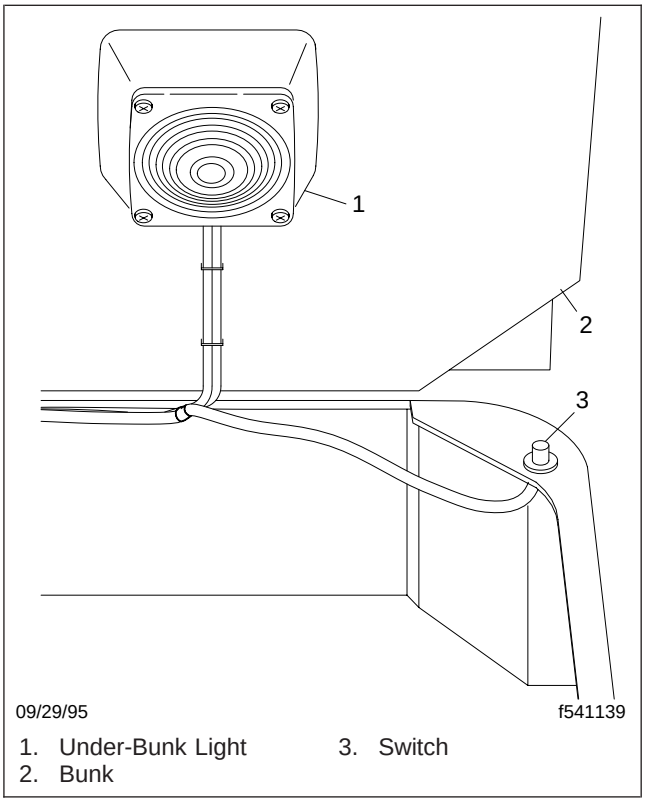
1. Remove the lens and rubber guard assembly from the lamp swivel.
2. Remove the blown light bulb.
3. Install a new light bulb.
4. Snap the lens and rubber guard assembly onto the lamp swivel.

Interior Light Replacement

UNDER-BUNK STORAGE COMPARTMENT LIGHT

NOTE: This light is installed on sleeper cabs only.

1. Open up the bunk to gain access to the storage compartment light and switch. See **Fig. 13**.



1. Under-Bunk Light
2. Bunk
3. Switch

Fig. 13, Under-Bunk Light

2. Remove the four screws from the light receptacle to expose the bulb.
3. Remove the bulb from the socket.
4. Install a new bulb.
5. Test the under-bunk light for correct operation.

Headlight Dimmer and Turn-Signal Switch Replacement

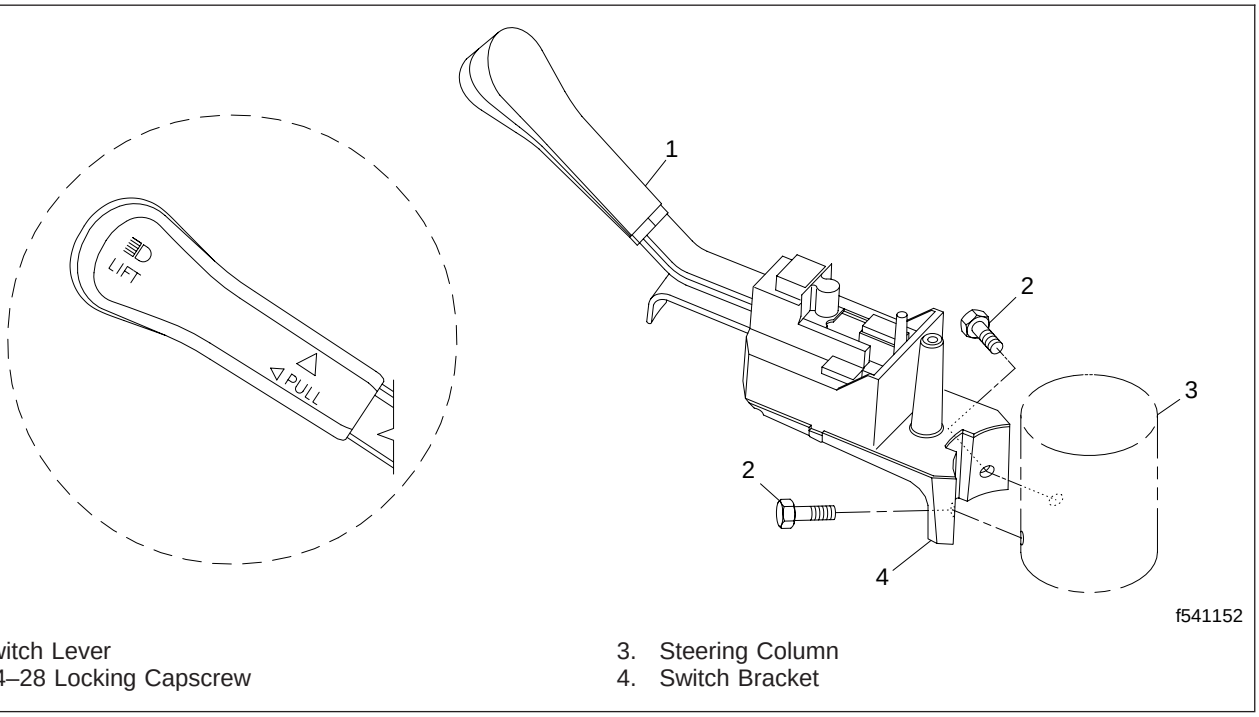
Replacement

NOTE: Before replacing the dimmer and turn-signal switch, make sure that the trouble is in the switch and not elsewhere in the circuit. Check that the circuit breaker and fuse are working, and inspect the signal light bulbs for broken filaments. Also, check the flasher relay, and replace it if necessary.

1. Remove the steering column cover (clamshell cover). For instructions, see **Section 46.07**.

NOTE: Some headlight dimmer and turn signal switches also have a horn button installed on the end of the switch.

2. Using a 7/16-inch wrench, loosen the two 1/4–28 locking capscrews attaching the headlight dimmer and turn signal switch to the steering column. Remove the turn signal switch mounting assembly from the steering column. See **Fig. 1**.
3. Unsnap the wiring connector from the turn-signal switch.
4. Connect the wiring connector to the new switch.
5. Install the turn signal switch.
   - 5.1 Position the switch on the steering column. Align the switch so that it is pointing directly to the left, toward the driver's door.
   - 5.2 Install the two locking capscrews and tighten them firmly.
6. Check the turn signals, headlight dimmer, horn (if installed), and 4-way flashers for correct operation.



1. Switch Lever
2. 1/4–28 Locking Capscrew
3. Steering Column
4. Switch Bracket

Fig. 1, Headlight Dimmer/Turn Signal Switch

Headlight Aim Checking and Adjusting

IMPORTANT: Before checking or adjusting the headlight aim, do the following:

- Remove large amounts of mud or ice from the underside of the fenders.
- Check the springs for sagging or broken leaves.
- Check the suspension for proper functioning of the leveling mechanism. Verify that the cab and suspension air systems are fully inflated and that the cab height is properly adjusted.
- Check for damage to the hood and hinge assembly. Repair as necessary.
- Clean the headlight lenses.
- With the vehicle unloaded, check that the tires are inflated to the recommended air pressure.
- Make sure the hood is properly closed and latched.

NOTE: Century Class S/T vehicles built before June 2004 have vertical and horizontal headlight adjustment screws located on the front of the headlight assembly. Century Class S/T vehicles built after June 2004 have a single vertical headlight adjustment screw located under the hood, above the headlight assembly.

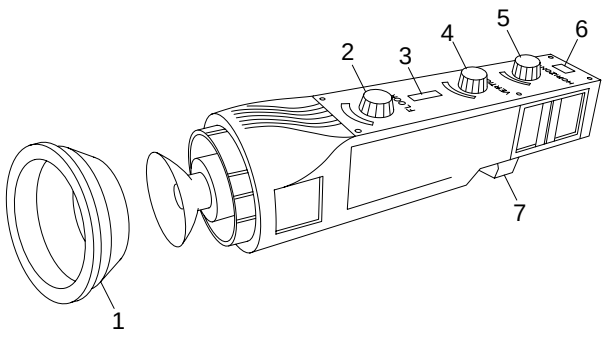
Century Class S/T Vehicles Built Before June 2004, and Argosy

Checking

For a quick check to see if the headlights need aiming, do the following procedure.

1. Move the vehicle onto a flat surface that has been calibrated for slope. Shut down the engine, set the parking brake, and chock the tires.
2. Attach a headlight aimer to each headlight, as follows.

    2.1 Attach the seven-inch circular adaptor to the aimer. See **Fig. 1**.



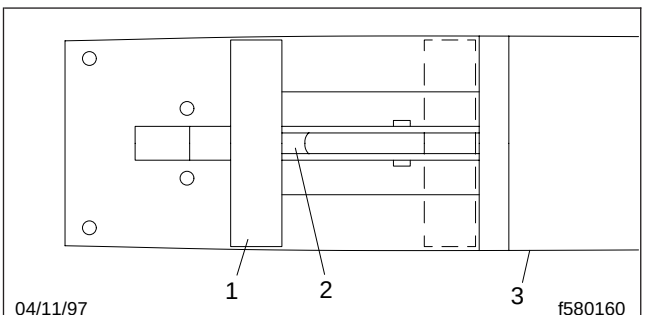
07/02/97 f580175

1. Seven-Inch Circular Adaptor
2. Floor Slope Dial
3. Level Vial
4. Vertical Dial
5. Horizontal Dial
6. Split Image View Port
7. Piston Handle

Fig. 1, Seven-Inch Circular Adaptor and Aimer

    2.2 Align the adaptor with the aiming pads on the headlight lens.

    2.3 Push the piston handle on the base of the aimer forward to engage the vacuum cup. Immediately pull the handle backward until it locks. See **Fig. 2**.



04/11/97 f580160

To attach, push the piston handle forward to engage the vacuum cup. Immediately pull the handle backward until it locks.
To remove, press the vacuum release button.

1. Piston Handle
2. Vacuum Release Button
3. Base of Aimer

Fig. 2, Aimer Attachment and Removal

    2.4 Do the same procedure with the other aimer.

Headlight Aim Checking and Adjusting

3. Check the floor slope dial for the correct setting. See **Fig. 3**.
4. Check the horizontal aim, as follows. See **Fig. 4**.
   - 4.1 Turn the horizontal dial until the split image is in alignment.
   - 4.2 If the horizontal dial scale on either aimer reads more than "4," re-aim the headlight.

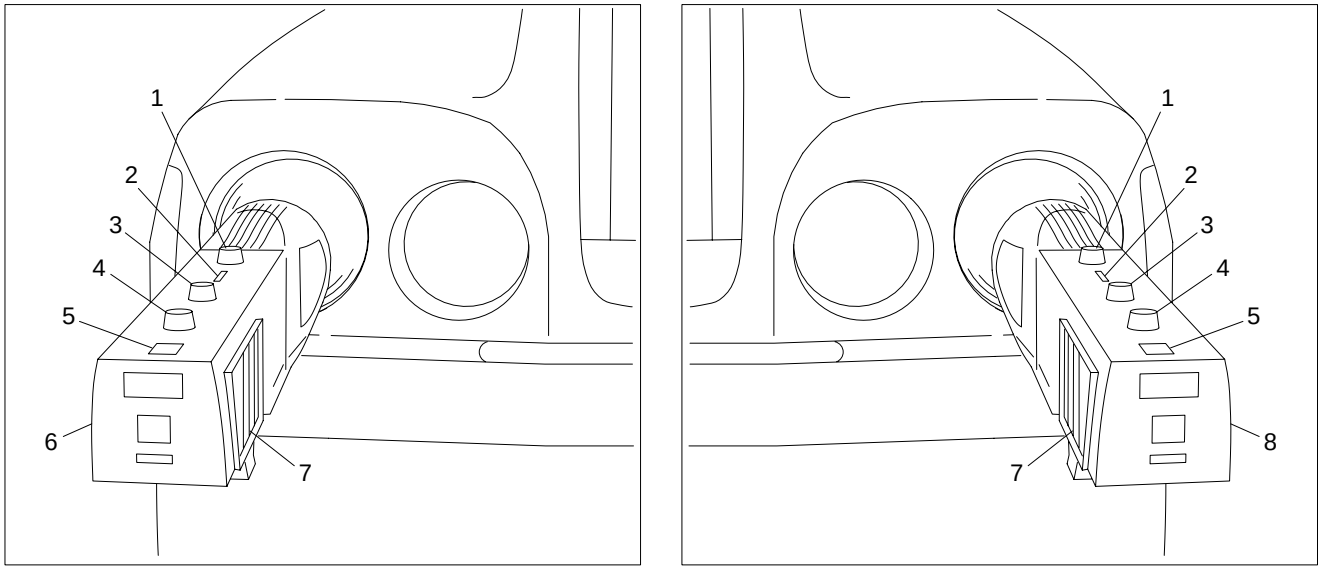
   NOTE: If adjustment is required, see the procedures under "Adjusting" below.
5. Check the vertical aim, as follows. See **Fig. 5**.
   - 5.1 Turn the vertical dial until the level vial is centered.
   - 5.2 If the vertical dial scale on either aimer reads more than "4," re-aim the headlight.

   NOTE: If adjustment is required, see the procedures under "Adjusting" below.
6. Remove the two headlight aimers. Hold each aimer securely, then press the vacuum release button.
7. Remove the chocks from the tires.

Adjusting

If the headlights need adjusting, do this procedure.

1. If not already there, move the vehicle onto a flat surface that has been calibrated for slope. Shut down the engine, set the parking brake, and chock the tires.
2. On vehicles built before June, 2004, attach a headlight aimer to each headlight. See the procedures above under "Checking" for detailed instructions.
3. Check the floor slope dial for the correct setting. See **Fig. 3**.
4. Adjust the horizontal aim, as follows. See **Fig. 4**.
   - 4.1 Set the horizontal dial to "0" (zero).
   - 4.2 Look in the viewing port for the split image target lines. If necessary, rotate either or both aimers until the lines are visible.



07/15/97 f580159

The sight openings must face each other.

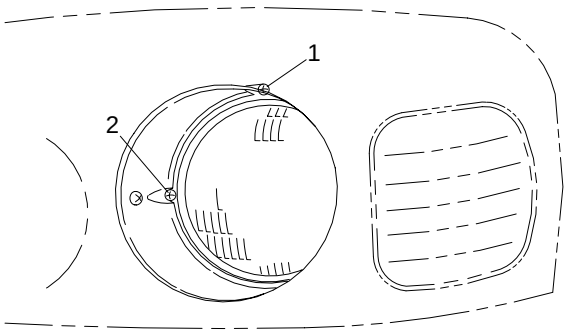
Set the vertical dial to "0" (zero).
A. Bubble Not Centered
B. Bubble Centered
1. Level Vial
2. Vertical Dial

Fig. 5, Vertical Aim Level Vial

4.3 Turn the horizontal adjustment screw as needed to make the split image appear as one solid line. See **Fig. 6**.

IMPORTANT: To avoid backlash, make the final adjustment by turning the screw clockwise.



02/12/97 f541566

1. Vertical Adjustment
2. Horizontal Adjustment

Fig. 6, Headlight Adjustment Screws (Century Class S/T built before June 2004 shown)

4.4 Do the same procedure for the other headlight.

5. Adjust the vertical aim, as follows. See **Fig. 5**.

5.1 Set the vertical dial to "0" (zero).

5.2 Turn the vertical adjustment screw as needed to center the bubble in the level vial between the lines. See **Fig. 6**.

IMPORTANT: To avoid backlash, make the final adjustment by turning the screw clockwise.

5.3 Do the same procedure for the other headlight.

6. Recheck the horizontal alignment on both aimers. Readjust if necessary.
7. Remove both headlight aimers. While holding the aimer securely, press the vacuum release button. See **Fig. 2**.
8. Remove the chocks from the tires.

Century Class S/T Vehicles Built From June 2004, and Coronado

Checking

1. Park the vehicle on a level surface 25 ft (7.6 m) from a screen or wall that can be used for aiming

Headlight Aim Checking and Adjusting

the headlights. Shut down the engine, apply the parking brake, and chock the front tires. See **Fig. 7**.

NOTE: The low-beam headlight is the top bulb in the dual-beam assembly.

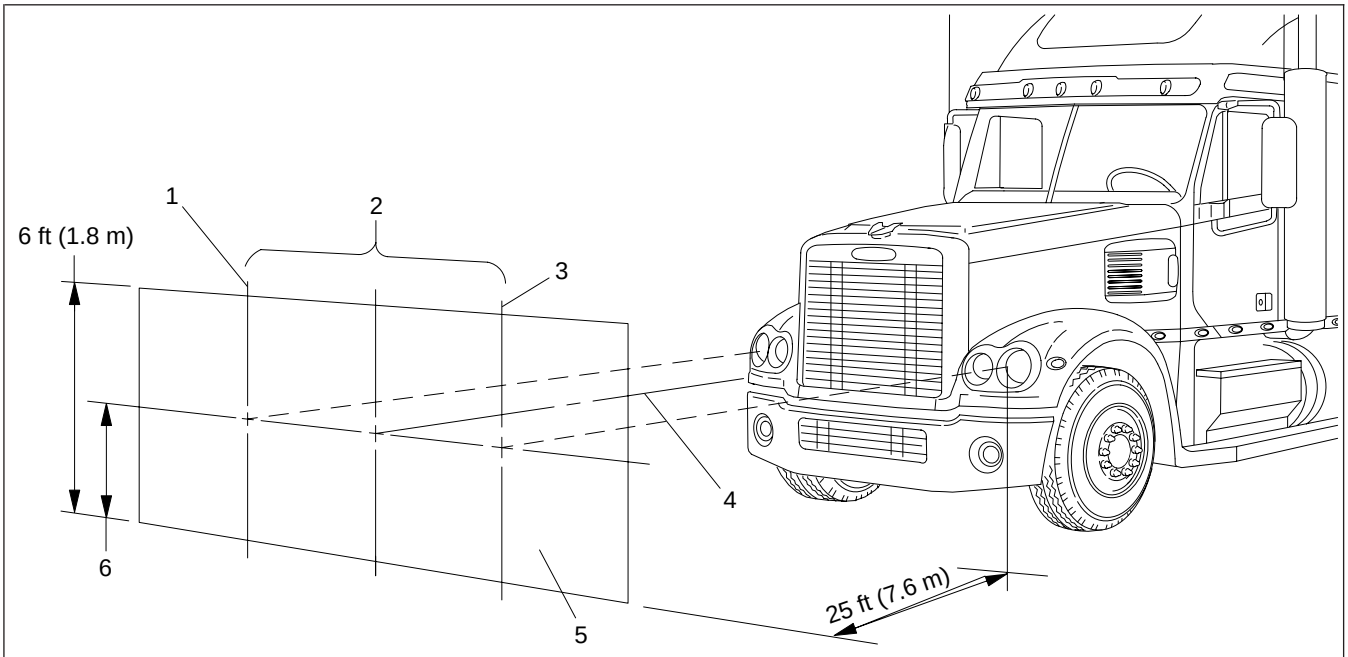
2. On each headlight, find the bulb center. See **Fig. 8**.
3. Measure the distance from the ground to the center of each low-beam bulb. Note those distances.
4. On the screen or wall 25 ft (7.6 m) away, make the appropriate markings directly across from each headlight and at the same height as measured for the low-beam headlight.
5. Turn on the headlights to the low-beam setting. See **Fig. 9** for the acceptable pattern for both headlights.
   - If either or both headlights do not aim into the inner edges of the centerline, follow the adjusting procedure below.
   - If both headlights come close to the inside of each headlight centerline (as shown), no further work is needed. Turn off the headlights and remove the chocks from the front tires.

Adjusting

1. On Century Class S/T vehicles, use a T25 Torx® screwdriver to adjust the headlight. See **Fig. 10**.

   On Coronado vehicles, lift the flap over the rear end of the headlight bucket to expose the plastic adjusting knob on each headlight. See **Fig. 11**.

NOTE: Horizontal aim is not adjustable in the field.



1. Vertical Centerline of Right Headlight
2. Distance Between Headlights
3. Vertical Centerline of Left Headlight

Troubleshooting

Daytime Running Light Test

Before troubleshooting the daytime running lights (DRLs), do the following test of DRL operation.

1. Be sure the ignition keyswitch, headlights and turn signals are off. Set the parking brake and be sure that the DRLs are off.
2. Turn on the ignition keyswitch. Make sure that the DRLs stay off.
3. With the air system fully charged, release the parking brake. Make sure that both DRLs turn on.

NOTE: The bulb for the DRLs is a dual-filament bulb. When the DRLs are on, the brighter filament is operating. When the marker lights are on, the other, less bright filament is operating.

4. Turn the headlight switch on. Make sure that the headlights and marker lights come on and the DRLs turn off.
5. Turn on the left, and then the right, turn signals and check them for proper operation. Make sure that front turn signals, side turn signals, and rear tractor and trailer turn signals (if equipped) all flash on and off at the same time.
6. Turn the headlight switch off. Check the turn signal operation again. Make sure that the front turn signals (DRLs) now flash alternately with the side turn signals, not at the same time.

   When the left turn signal is flashing, make sure that the right DRL is on.

   When the right turn signal is flashing, make sure that the left DRL is on.
7. Set the parking brake and shut down the engine. Be sure that the DRLs turn off.

Daytime Running Light Troubleshooting

If the DRLs are not operating properly, do the following steps.

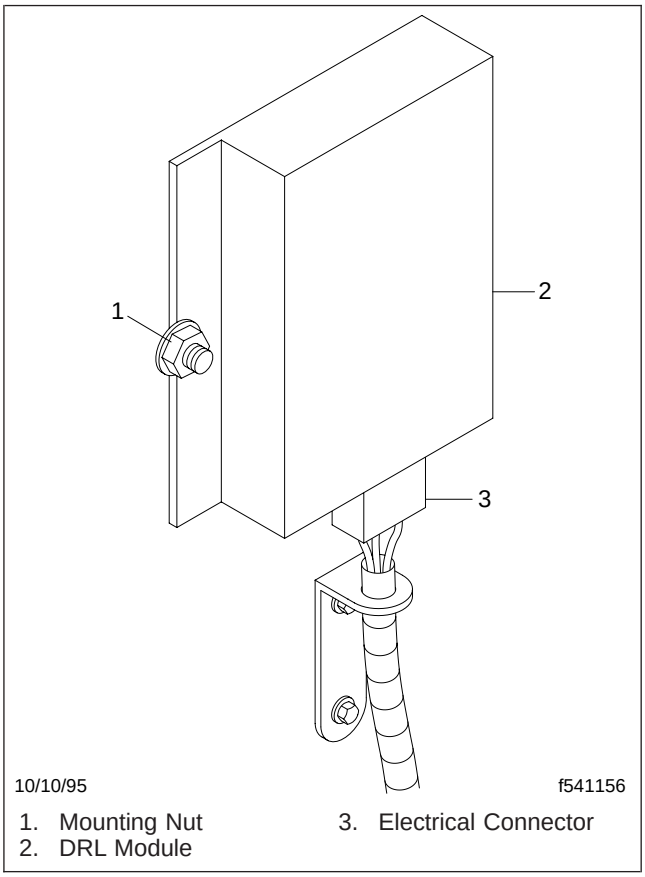
1. Check the bulbs in the DRLs. Replace any bulb that is burned out.
2. Disconnect the electrical connector to the DRL module (**see Fig. 1**) and check the pins for proper contact with the plug. Reconnect the DRL module and test again.
3. If the DRLs are still not operating, disconnect the electrical connector again and use a volt/ohmmeter (VOM) to do a voltage test on each pin (use the harness side). For the correct voltages, **see Table 1**.

DRL Module Pin Voltages			
No.	**Name**	**Instructions**	**Voltage**
A	Left Output	None	0
B	Ground	None	0
C	Park Brake	Set Park Brake and connect a VOM between pins C and D	0
		Release Park Brake and connect a VOM between pins C and D	12
D	Battery	None	12
E	Right Output	None	0
F	Right Turn Signal	Right Turn Signal Off	0
		Right Turn Signal On	0/12 (alternating)
G	Ignition	Ignition Off	0
		Ignition On	12
H	Right Headlight	Headlights Off	0
		Headlights On	12
J	Left Headlight	Headlights Off	0
		Headlights On	12
K	Left Turn Signal	Left Turn Signal Off	0
		Left Turn Signal On	0/12 (alternating)

Table 1, Daytime Running Light Module Pin Voltages

4. If any voltage tested does not match the value given **in Table 1**, correct the fault and do the test again.
5. If one or both of the DRLs still do not function at this point, check the wiring to the DRLs for open circuits or circuits shorted to ground. When only

Troubleshooting



1. Mounting Nut
2. DRL Module
3. Electrical Connector

Fig. 1, Daytime Running Light (DRL) Module

one DRL is not working, the typical cause is a failure in one of these wires.

6. If the DRLs are still not working, replace the DRL module.

General Information

Lead-Acid Batteries

Batteries are electrochemical devices that store chemical energy. When the battery is connected to an external load, such as a starter, the chemical energy is converted into electrical energy and current flows through the circuit.

The battery has three functions:

- To supply power to start the engine.
- To stabilize the voltage in the electrical system. The battery filters high voltage transients and protects electronic components in the vehicle.
- To supply power when the vehicle's electrical load requirements go beyond what the charging system can supply or when the engine is not running.

All lead-acid batteries use plates made of two unlike metals held apart by separators. One of the metals becomes the positive plate, the other the negative plate. These plates are then grouped in pairs, alternating negative and positive. The groups are connected in series, and each plate group (cell) produces about two volts. Thus, a battery with six cells is a 12-volt battery.

In conventional liquid-electrolyte batteries (wet cells), each battery contains a group of plates immersed in a solution of electrolyte (dilute sulfuric acid).

Batteries may produce hydrogen gas when being charged. The vents allow the escape of gases produced in the battery.

NOTE: Liquid-electrolyte batteries must be kept in an upright position to prevent electrolyte leakage. Tipping a wet cell beyond a 45-degree angle in any direction can allow a small amount of electrolyte to leak out the vent holes.

Proper testing will indicate the battery condition. For more information, see **Troubleshooting 300**.

Absorbed Glass Mat (AGM) Batteries

Absorbed Glass Mat (AGM) batteries are lead-acid batteries in which the electrolyte is contained in a fiberglass mat. AGM batteries are physically similar to standard batteries. Carefully check the label on every battery to be certain it is AGM, and **never install AGM batteries in the same circuit with other types of batteries.**

AGM batteries are designed for high cranking amps and repeated cycle service to accommodate many of the auxiliary loads on vehicle electrical systems. They offer good protection against damage due to vibration, and are leak- and spill-proof, even if cracked or broken. Also, they self-discharge more slowly, and generate less heat when charging or discharging.

IMPORTANT: AGM batteries may be damaged or ruined by equipment designed for other types of batteries. AGM battery chargers must be regulated to a charge voltage less than 15.4 DCV; many chargers provide excessive voltage. To get full service from AGM batteries, carefully follow the battery manufacturer's instructions regarding charging rates and procedures.

Parasitic Battery Drain

Batteries are replenished each time the vehicle is driven with normal vehicle use. In long-term parking situations, however, parasitic drains may discharge the batteries enough that the starter will not be able to crank the engine.

A parasitic drain is an electrical load that draws current from the batteries when the ignition remains off.

A typical parasitic drain falls into the 25 to 325 mA (0.025 to 0.325 amps) range. Multiply the drain (in amps) by the time (in hours) the batteries sit without being recharged. The result is the amount of ampere-hours consumed by the parasitic drain. The actual drain may be small, but over time the batteries grow steadily weaker.

At warm temperature of 77°F (25°C), using approximately 40 percent of the total available ampere-hours will bring fully charged batteries to a no-start condition. In colder temperatures, the batteries will reach a no-start condition sooner.

General Safety Precautions

⚠ WARNING

Keep sparks, flames, burning cigarettes, etc. away from batteries. Batteries generate explosive gases, which could cause a battery to explode, causing serious personal injury, including blindness.

When charging the batteries, gas forms in each cell and escapes through the vent holes. In poorly ventilated areas, the gas lingers around the battery several hours after it has been charged. The gas is explosive around sparks, flame, or other intense heat; if ignited, it could cause the battery to explode. Follow these precautions when charging the batteries.

- Wear safety glasses or a face shield when working with batteries. When many batteries are handled, wear rubber gloves and an apron to protect clothing.
- Make sure that the area is well ventilated.
- Do not install any lead-acid battery in a sealed container or enclosure. Allow hydrogen gas caused by overcharging to escape. Exploding hydrogen gas can cause blindness or other bodily injury.
- Make sure that the charger cable leads are clean and making good connections. A poor connection could cause an electrical arc which could ignite the gas mixture and explode the battery.
- Do not break live circuits at the terminals because a spark usually occurs at the point where a live circuit is broken. Use care when connecting or disconnecting booster leads or cable clamps on chargers.
- Do not smoke near batteries that are being charged or have recently been charged. Keep the batteries away from open flames or sparks.
- If the battery is frozen, let it reach room temperature and completely thaw before trying to charge it. Check for leaks and cracks before charging the battery. Replace the battery if leaks or cracks are seen.
- Take care that tools or metal objects do not fall across the battery terminals.

⚠ WARNING

Do not install any lead-acid battery in a sealed container or enclosure. Allow hydrogen gas caused by overcharging to escape. Exploding hydrogen gas can cause blindness or other bodily injury.

⚠ CAUTION

If a metal object connects an ungrounded battery terminal to a nearby metal part of the vehicle which is grounded, it could short out the batteries, causing sparks and possible property damage.

Battery Electrolyte Safety Precautions

⚠ WARNING

Protect skin and eyes from battery electrolyte (acid). Electrolyte is corrosive and could result in serious personal injury if splashed on your skin or in your eyes.

If electrolyte is splashed on your skin or in your eye, force the eye open, rinse it with cool, clean water for about five minutes and call a doctor immediately. Do not add eye drops or other medication unless advised by the doctor.

If electrolyte is swallowed, drink several large glasses of milk or water. Follow with milk of magnesia, a beaten raw egg, or vegetable oil. Call a doctor immediately.

Use extreme care to avoid spilling or splashing electrolyte. Electrolyte spilled or splashed on your body or clothing should be neutralized with baking soda or household ammonia, then rinsed with clean water.

Electrolyte can also damage painted or unpainted metal vehicle parts. If electrolyte is spilled or splashed on any metal surface, neutralize and rinse it with clean water.

To prevent possible skin burns, do not wear watches, rings, or other jewelry while performing maintenance work on the batteries.

Battery Safety Precautions

⚠ WARNING

Do not apply pressure to the end walls of a plastic-case battery. This could cause electrolyte to squirt from the vents, possibly resulting in serious injury to skin or eyes.

When handling plastic-case batteries, use a battery carrier. If one is not available, lift these batteries with your hands placed at opposite corners of the battery.

Emergency Starting Using Booster Cables

WARNING

Before jump-starting a vehicle, read the instructions in Subject 100. Failure to follow the safety precautions could result in personal injury.

WARNING

Batteries release explosive gas. Do not smoke when working around batteries. Put out all flames and remove all sources of sparks or intense heat in the vicinity of the battery. Do not allow the vehicles to touch each other. Do not lean over the batteries when making connections, and keep all other persons away from the batteries. Failure to follow these precautions could lead to severe personal injury as a result of an explosion or acid burns.

NOTICE

Make sure both electrical systems are the same voltage. Electronic devices on both vehicles can be damaged when connected to a vehicle with a different operating voltage.

1. Apply the parking brakes and turn off all lights and other electrical devices. Ensure that the vehicles are not touching and both ignition switches are turned to the OFF position.

IMPORTANT: Do not attempt to jump start a damaged battery.

2. Remove the battery box cover. See **Fig. 1** for the standard battery compartment location.

NOTICE

Always connect the batteries and jumper cables correctly (positive-to-positive and negative-to-negative). Connecting a charging device backwards (positive-to-negative) can severely damage the vehicle electrical content and cause non-warrantable failures.

IMPORTANT: On vehicles equipped with optional jump start posts, connect to these posts instead of the battery terminals. Jump start

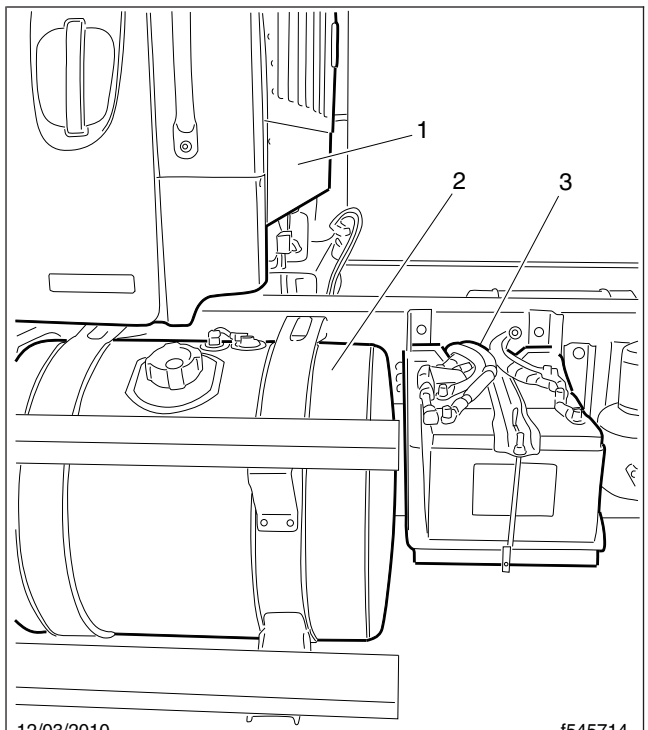

Fig. 1, Standard Battery Compartment Location

posts may be installed in various locations on the vehicle. See **Fig. 2**.

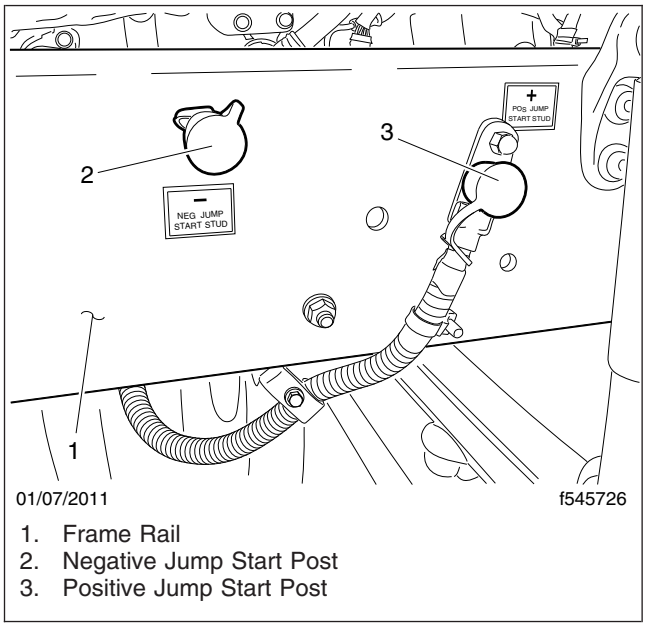
3. Connect the positive (+) jumper cable to the positive terminal or jump start post on the discharged battery. See **Fig. 3**.
4. Connect the other end of the positive jumper cable to the positive terminal or jump start post on the booster battery providing the charge.

WARNING

Do the next step exactly as instructed and do not allow the clamps of one cable to touch the clamps of the other cable. Otherwise, a spark could occur near a battery, possibly resulting in severe personal injury from explosion and acid burns.

5. Connect the negative (-) jumper cable to the negative terminal or jump start post on the booster battery.

Emergency Starting Using Booster Cables



1. Frame Rail
2. Negative Jump Start Post
3. Positive Jump Start Post

Fig. 2, Possible Jump Start Post Location (passenger-side engine compartment)

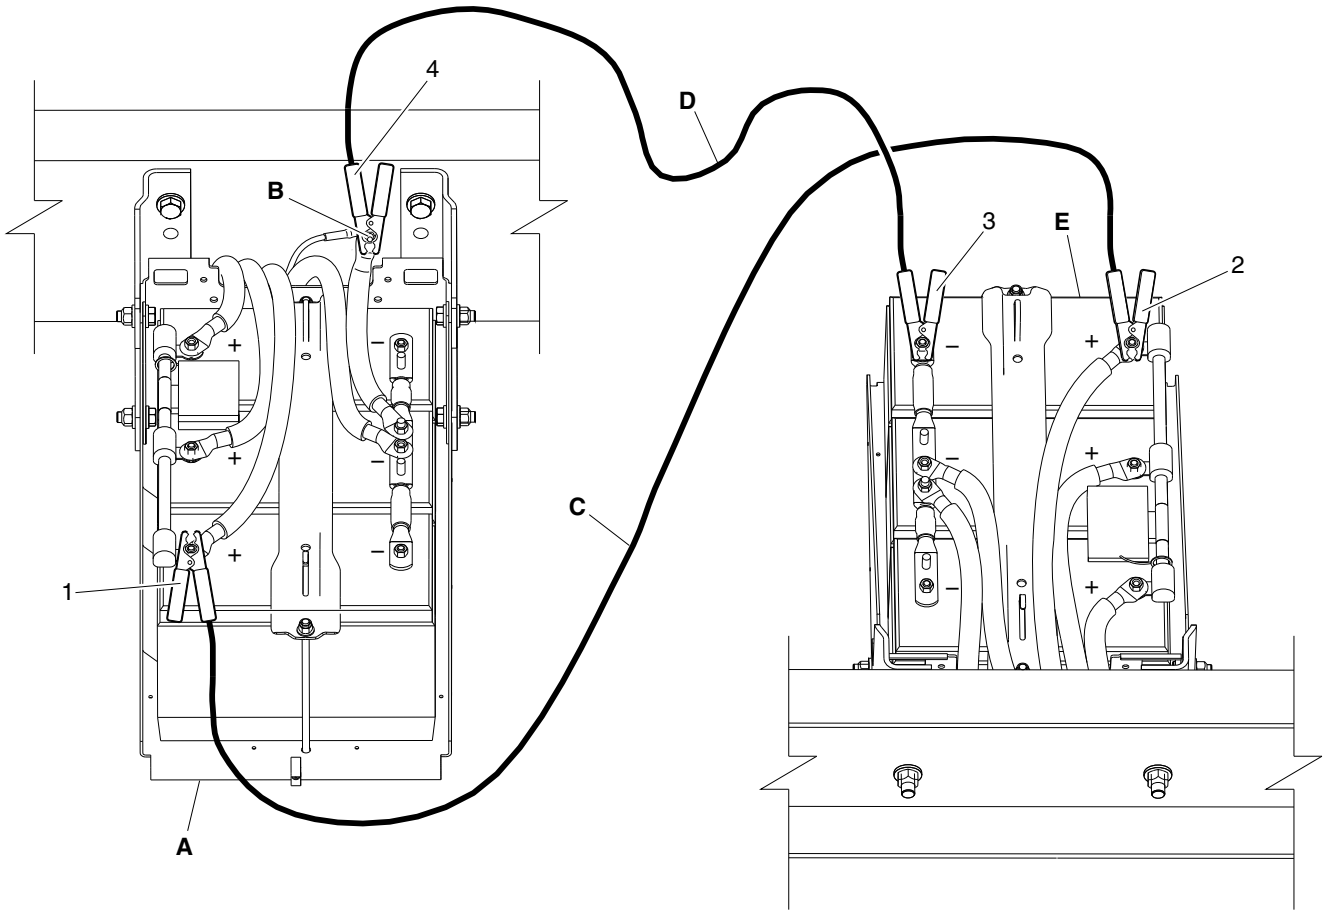
6. Connect the other end of the negative jumper cable to the negative ground stud on the vehicle requiring the jump start.
7. Start the engine of the vehicle providing the jump start and let the engine run a few minutes to charge the batteries of the other vehicle.
8. Attempt to start the engine of the vehicle receiving the jump. Do not operate the starter longer than 30 seconds, and wait at least two minutes between starting attempts to allow the starter to cool.
9. When the engine starts, let it idle a few minutes.

⚠ WARNING

Do the next step exactly as instructed and do not allow the clamps of one cable to touch the clamps of the other cable. Otherwise, a spark could occur near a battery, possibly resulting in severe personal injury from explosion and acid burns.

10. Disconnect the negative jumper cable from the negative cable stud on the jump-started vehicle.
11. Disconnect the negative jumper cable from the booster battery.
12. Disconnect the positive cable from the booster battery.
13. Disconnect the other end of the positive jumper cable from the jump-started vehicle.
14. Install the battery box cover; be sure it is positioned properly before fastening the latch.

Emergency Starting Using Booster Cables



01/07/2011 f545725

2. 2nd Connection: Positive Jumper Cable to Booster Battery
3. 3rd Connection: Negative Jumper Cable to Booster Battery
4. 4th Connection: Negative Jumper Cable to Negative Ground Stud (discharged battery)

Fig. 3, Jumper Connections

⚠ WARNING

Before charging a battery, read the instructions in Subject 100. Failure to follow the safety precautions could result in personal injury.

When charging batteries, always wear eye protection. During charging, batteries give off explosive hydrogen gas. Exploding gas can cause blindness or other bodily injury.

Battery Charging

AGM batteries may be charged only with a charger that is specified for AGM batteries. Many older chargers operate at a voltage that is too high for AGM batteries and will cause permanent damage. Never combine AGM and flooded batteries together for charging or for use in a vehicle.

See **Table 1** for voltage to approximate battery state of charge for flooded batteries.

Voltage to Approximate Battery State of Charge for Flooded batteries		
Voltage		State of Charge
Flooded	AGM	
12.6	12.8	100%
12.4	12.6	75%
12.2	12.3	50%
12.0	12.0	25%
11.8	11.8	0%

Table 1, Voltage to Approximate Battery State of Charge for Flooded batteries

1. If the batteries are not installed in the vehicle, install the lead adapters on the battery positive and negative posts.
2. Connect the charger to the battery following the manufacturer's instructions. Slightly rock the charger's clamps to insure a complete connection.

IMPORTANT: If the battery feels hotter than 125°F (52°C) or if rapid gassing or spewing of electrolyte occurs, lower the charging rate or stop charging the battery and allow it to cool.

3. When finished, turn the charger off.

⚠ WARNING

Always turn the charger off before disconnecting it. Touching a charger lead when the circuit is live could create a spark and cause an explosion, resulting in personal injury.

Battery Removal, Cleaning and Inspection, and Installation

⚠ WARNING

Before doing any of the following procedures, read the instructions in Subject 120. Failure to follow the safety precautions could result in personal injury.

Removal

Before working on any battery box, make sure all electrical loads (lights, ignition, accessories) are turned off.

Note what type of battery box is installed. Removal procedures for the side-rail battery boxes are similar; those for the between-rail and the above-rail boxes are completely different.

Three basic battery box installations are available for Century Class Conventionals. First, the standard box, long side to rail with a step and diamond plate side cover (for vehicles with one fuel tank and standard cab entry with no side fairings). See Fig. 1.

Second, an optional box, long side to rail with no step. See Fig. 2.

Third, a between-rail plastic box for vehicles with dual fuel tanks. See Fig. 3.

The standard Argosy COE battery box is mounted above the frame rails in back of the engine (see Fig. 4), though battery boxes mounted on either frame rail are also available. All Argosy COE battery boxes are aluminum.

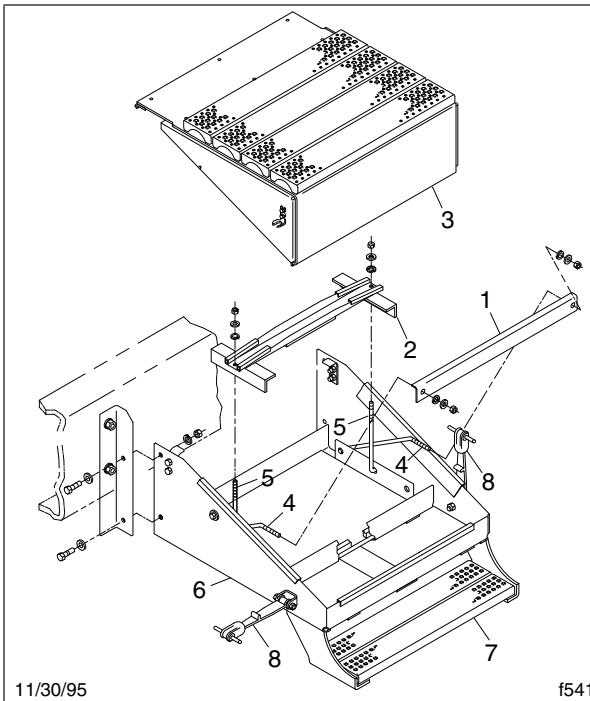
SIDE-RAIL BATTERY BOX

1. Remove the threaded fasteners that attach the air fairing panel (if equipped) in front of the battery box. Remove the air fairing panel. For instructions, see Section 60.05.

   If no air fairing panel is installed, remove the step plate.

2. Pull on the end of each hold-down latch until the end clears the cover-mounted catch. Pivot the latches out of the way, then lift off the battery box cover.

3. For assembly reference, note the locations of the battery positive and negative terminals in relation to surrounding components. Remove the battery cables.



1. Hold-Down Angle
2. Retainer Assembly

4. Hold-Down Bolt
5. Retainer Bolt
6. Battery Box
7. Step
8. Latch

Fig. 1, Side-Rail Battery Box, Long Side to Rail, with Step and Diamond Plate Side Cover

4. Remove the battery retainer assembly. Remove the batteries from the carrier.

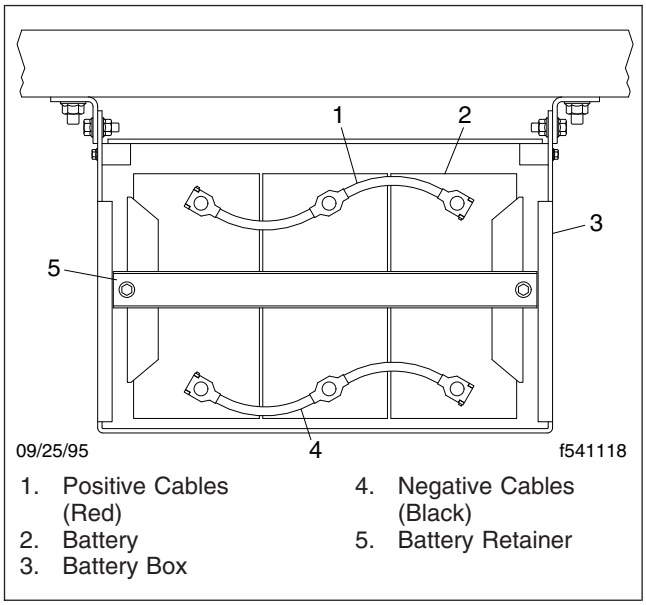
BETWEEN-RAIL BATTERY BOX, CENTURY CLASS CONVENTIONAL

1. Remove the battery box lid. If equipped, remove the spring pin.
2. Disconnect the battery cables from the battery terminals and move the cables out of the way.
3. Remove the battery hold-downs. See Fig. 5.

   3.1 Remove the 5/16–18 hold-down locknut and washer.

   3.2 Slip the hold-down off the 5/16-inch rib-neck bolt.

Battery Removal, Cleaning and Inspection, and Installation



1. Positive Cables (Red)
2. Battery
3. Battery Box
4. Negative Cables (Black)
5. Battery Retainer

Fig. 2, Side-Rail Battery Box, Long Side to Rail, with Cover Removed

3.3 Remove the rib-neck bolt and set all hold-down hardware aside.

4. Remove the batteries from the vehicle. For assembly reference, note the locations of the battery positive and negative terminals in relation to surrounding components.
5. Remove the battery box. See **Fig. 6**.
   - 5.1 From underneath the battery box, remove the 3/8–16 hexnut and flatwasher from the keeper assembly. Retain the keeper and spring.
   - 5.2 Remove the battery box from the vehicle.
6. Remove the battery box bracket from the frame rail. See **Fig. 7**.
   - 6.1 Remove the lock pin and collar from each huckspin. For instructions, see **Group 31**.
   - 6.2 Remove the bracket from the frame rail. The plastic washers are attached to the bracket with pressure-sensitive adhesive and come off with the bracket.

OVER-THE-RAIL BATTERY BOX, ARGOSY COE

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Tilt the cab. For detailed instructions, see **Group 60**.
3. Remove the air intake cleaner assembly.
   - 3.1 Loosen the screw on the hose clamp that attaches the flexible duct to the air intake cleaner assembly, and separate the flexible duct from the air cleaner assembly.
   - 3.2 Remove the four nuts from the air cleaner mounting bracket studs.
   - 3.3 Remove the air cleaner assembly from the mounting bracket, and set the assembly aside.
4. Remove the battery box cover. See **Fig. 8**.
5. For assembly reference, label the locations of the battery positive and negative terminals in relation to surrounding components. Disconnect the battery cables from the battery terminals and move the cables out of the way.
6. Remove the battery hold-down, and lift the batteries from the vehicle.
7. Detach the battery cable clamp.

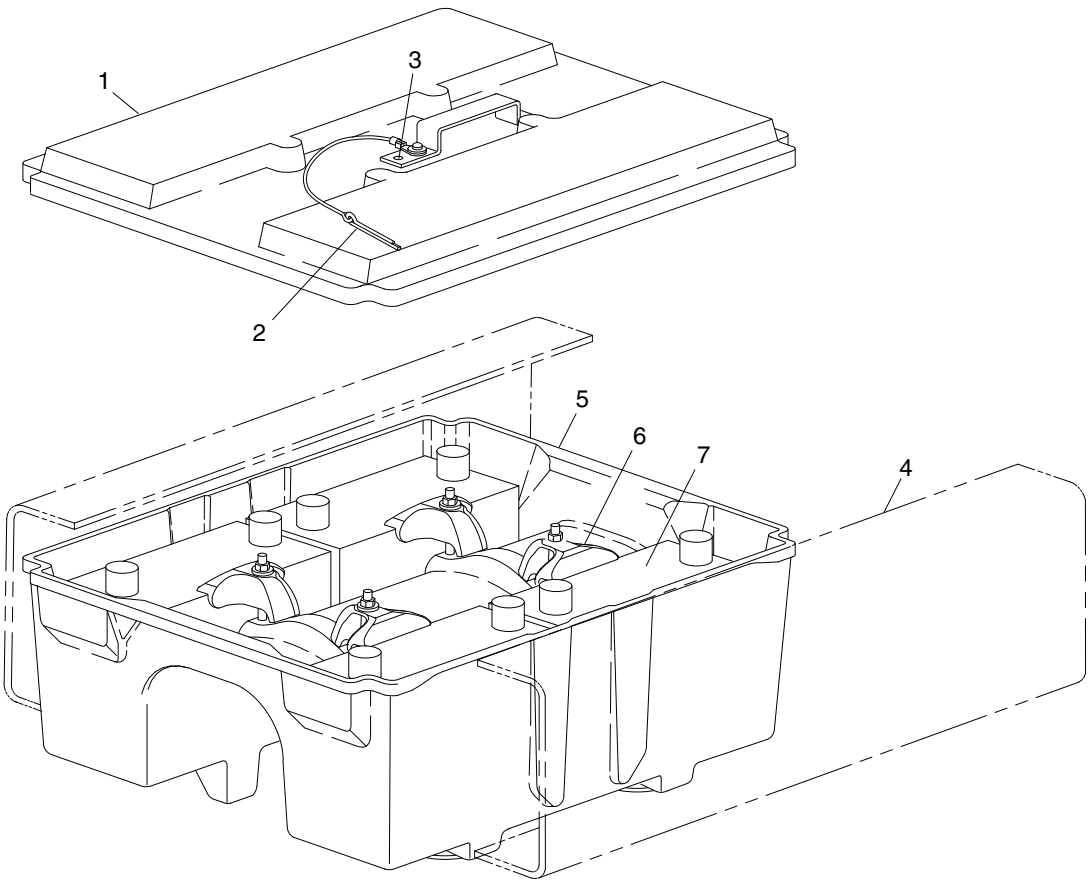
NOTE: Label all electrical connections before disconnecting them.

8. Remove the battery ON/OFF switch and the fuse box/mag switch cover panel.
9. Remove the fuse box and the mag switch.
10. Remove the battery box. Take care to retain the spacers on the upper front of the air filter assembly mounting bracket.

Cleaning and Inspection

1. Inspect all battery cables and interconnectors for wear, and replace them if necessary. Remove corrosion from cables, terminals, and battery posts with a wire brush and a solution of baking soda and water. Rinse thoroughly with clean water, and dry.

Battery Removal, Cleaning and Inspection, and Installation



1. Battery Box Lid
2. Spring Pin (if installed)
3. Spring Pin Insert Hole
4. Frame Rail
5. Battery Box
6. Battery Hold-Downs
7. Battery

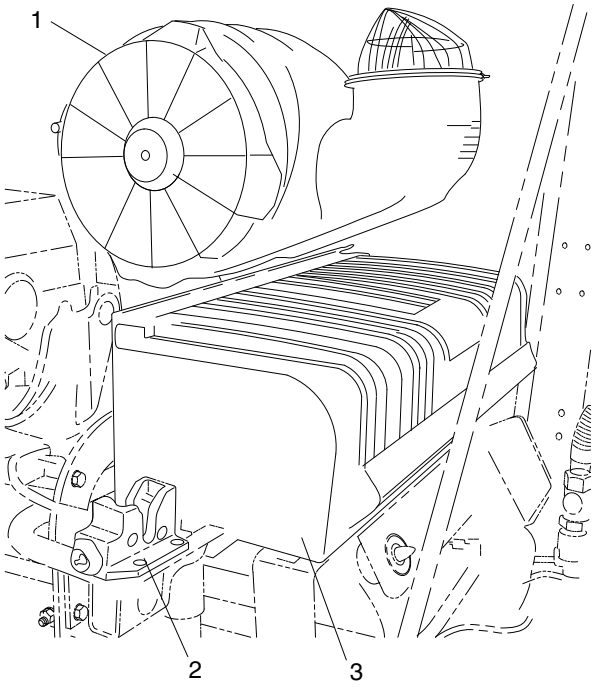
Fig. 3, Between-Rail Battery Box

2. Clean and tighten the battery ground cable at the weld stud on the frame rail. Inspect and ensure that the nut is self-locking and that a flat washer is used. Do not use a split-lock washer or star washer. Torque the nut 15 to 18 lbf·ft (20 to 24 N·m). Seal the area with red dielectric enamel.
3. Inspect the retainer assembly and battery box. Replace worn or damaged parts. Remove any corrosion with a wire brush and wash with a weak solution of baking soda and water. Rinse with clean water and dry. To prevent rusting, paint the retainer assembly if needed.
4. Be sure foreign objects, such as stones, bolts, and nuts, are removed from the battery box.

Installation

1. Be sure that the battery to be installed has a sufficient capacity to cover the electrical needs of the vehicle.

Battery Removal, Cleaning and Inspection, and Installation



07/01/98 f542607

1. Air Intake Filter Assembly
2. Rear Cab Latch
3. Battery Box

Fig. 4, Over-the-Rail Battery Box, Argosy COE

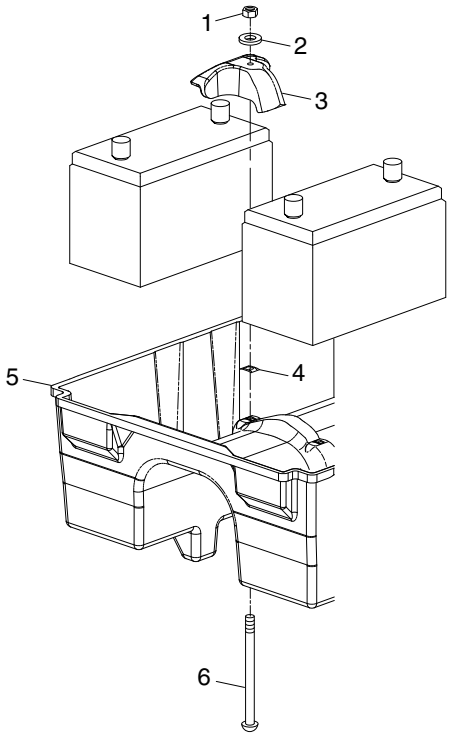
CAUTION

Using an under-capacity battery will result in poor performance and premature battery failure, resulting in damage or reduced life of the starter.

2. Be sure the battery is at full charge when installed. If the battery has been in storage for some time, or if the installation is being made in subfreezing temperatures, give the battery a boost-charge before installing it. For instructions, see **Subject 120**.

SIDE-RAIL BATTERY BOX

1. Place the batteries in the carrier with the terminals in the proper position, as referenced earlier. The batteries should rest level in the carrier.
2. Install the battery retainer assembly, and tighten it until the batteries are secure. See **Fig. 1**.



08/16/95 f541073

1. 5/16–18 Hold-Down Nut
2. Flatwasher
3. Hold-Down
4. Push-On Retainer
5. Battery Box
6. 5/16-Inch Rib-Neck Bolt

Fig. 5, Battery Hold-Downs

CAUTION

Do not overtighten the battery retainer assembly. Overtightening could damage the batteries.

3. Connect the battery cables to the batteries.
   - 3.1 To provide corrosion protection, apply pumpable dielectric grease, part no. 48–02349–000, liberally to the terminal pads. For a list of approved suppliers, see **Specifications, 400**.
   - 3.2 Install the battery cable interconnectors.
   - 3.3 Tighten the battery cables to the torque specifications listed on the battery, gener-

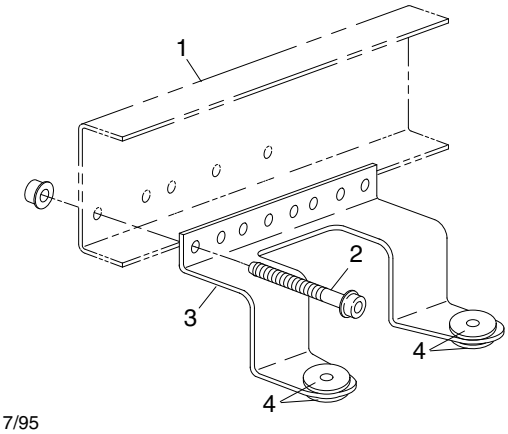
ally 10 to 15 lbf·ft (14 to 20 N·m). Connect the ground cable last.

CAUTION

Make sure the polarity is correct. Reversed polarity may cause serious damage to the electrical system.

3.4 Check for correct polarity with respect to the vehicle.

4. Start the engine, and check the operation of the charging system. If needed, adjust or repair the charging system to obtain the correct charging output. For instructions, see the appropriate section in **Group 15**.



08/17/95 f541077

1. Frame Rail
2. Huckspin Lock Pin
3. Bracket
4. Plastic Washers

Fig. 7, Battery Box Bracket Removal

CAUTION

Make sure all battery posts are covered with protective caps. Failure to do so could cause the battery box cover to short across the posts.

5. Install the battery box cover. Install the threaded fasteners that attach the air fairing panel (if equipped). For instructions, see **Section 60.05**.

   If removed, install the step plate.

BETWEEN-RAIL BATTERY BOX, CENTURY CLASS CONVENTIONAL

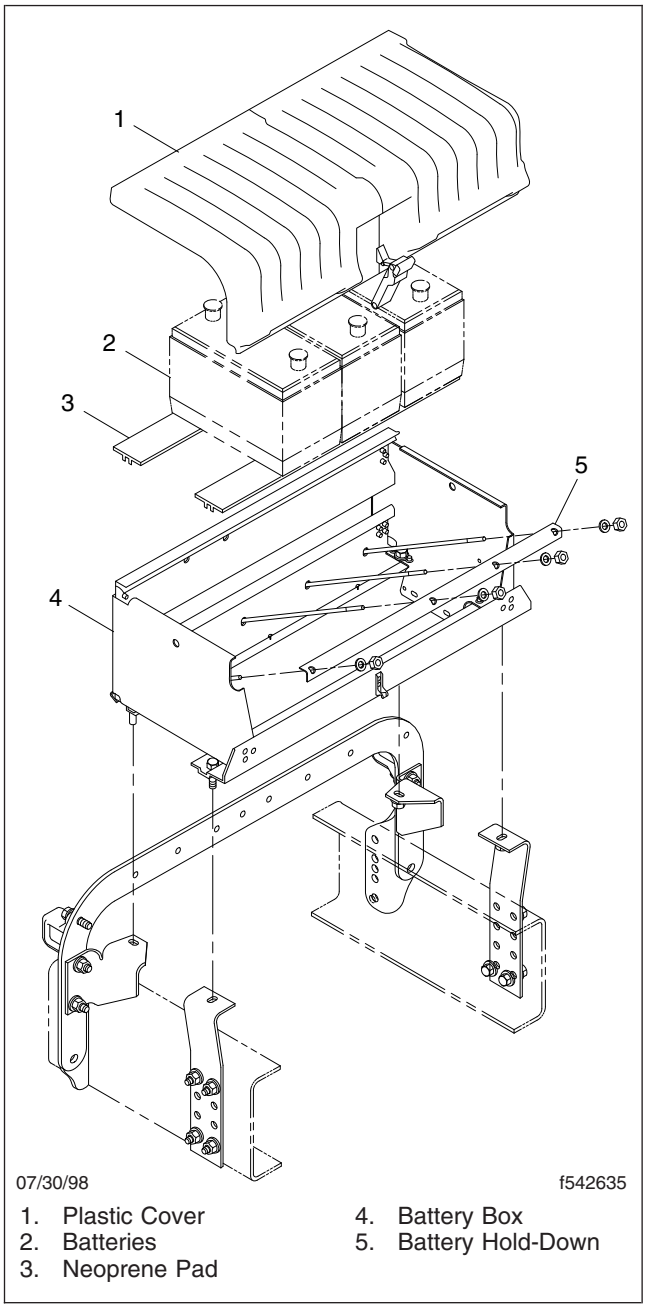
1. Install the battery box brackets on the frame rail. See **Fig. 7**. Install four new 5/8D huckspin lock pins and 5/8-inch collars on each bracket. For instructions, see **Group 31**.
2. Install the battery box. See **Fig. 6**.

   2.1 Line up the holes in the bottom of the battery box with the holes in each bracket.

   2.2 Install four keeper assemblies and springs through the holes in the battery box and brackets.

   2.3 From underneath the battery box, install a 3/8–16 hexnut and flatwasher on each keeper assembly. Tighten to 18 lbf·ft (24 N·m).

Battery Removal, Cleaning and Inspection, and Installation



1. Plastic Cover
2. Batteries
3. Neoprene Pad
4. Battery Box
5. Battery Hold-Down

Fig. 8, Over-the-Rail Battery Box, Argosy COE

3. Place the batteries in the battery box with the terminals in the proper position, as referenced earlier. Make sure the batteries rest level in the box.
4. Install the battery hold-downs. See **Fig. 5**.
   - 4.1 Install a hold-down on each battery.
   - 4.2 Insert a rib-neck bolt up through each hold-down and thread onto it a 5/16–18 hold-down locknut and washer.

⚠ CAUTION

Do not overtighten the battery hold-downs. Overtightening could damage the batteries.

   - 4.3 Tighten each locknut 10 lbf·ft (14 N·m).
5. Connect the battery cables to the batteries.
   - 5.1 To provide corrosion protection, apply pumpable dielectric grease, part no. 48–02349–000, liberally to the terminal pads. For a list of approved suppliers, see **Specifications 400**.
   - 5.2 Install the battery cable interconnectors.
   - 5.3 Tighten the battery cables to the torque specifications listed on the battery, generally 10 to 15 lbf·ft (14 to 20 N·m). Connect the ground cable last.
   - 5.4 Check for correct polarity with respect to the vehicle.

⚠ CAUTION

Make sure the polarity is correct. Reversed polarity may cause serious damage to the electrical system.

6. Start the engine, and check the operation of the charging system. If needed, adjust or repair the charging system to obtain the correct charging output. For instructions, see the appropriate section in **Group 15**.

⚠ CAUTION

Make sure all battery posts are covered with protective caps. Failure to do so could cause the battery box cover to short across the posts.

7. Install the battery box cover. If equipped, install the spring clip.

OVER-THE-RAIL BATTERY BOX, ARGOSY COE

1. Install the battery box. See **Fig. 8**.

Battery Removal, Cleaning and Inspection, and Installation

2. Install the mag switch and fuse box.
3. Install the battery ON/OFF switch.
4. Install the fuse box/mag switch cover.
5. Attach the battery cable clamp.
6. Place the two neoprene pads in the bottom of the battery box, snug against the front and back of the box.
7. Place the batteries in the battery box with the terminals in the proper position, as referenced earlier. Make sure the batteries rest level in the box.
8. Install the battery hold-down, and tighten it until the batteries are secure.

CAUTION

Do not overtighten the battery hold-down retainer. Overtightening could damage the batteries.

9. Connect the battery cables to the batteries.
   - 9.1 To provide corrosion protection, apply pumpable dielectric grease (part no. 48–02349–000) liberally to the terminal pads. For a list of approved suppliers, see **Specifications 400**.
   - 9.2 Install the battery cable interconnectors.
   - 9.3 Tighten the battery cables to the torque specifications listed on the battery, generally 10 to 15 lbf·ft (14 to 20 N·m). Connect the ground cable last.

CAUTION

Make sure the polarity is correct. Reversed polarity may cause serious damage to the electrical system.

   - 9.4 Check for correct polarity with respect to the vehicle.

CAUTION

Make sure all battery posts are covered with protective caps.

10. Install the battery box cover.
11. Install the air intake filter assembly.
    - 11.1 Place the air filter assembly on the mounting bracket studs.
    - 11.2 Install the four sets of locknuts and washers on the mounting bracket studs, and tighten the nuts 26 lbf·ft (35 N·m).
    - 11.3 Attach the air inlet duct to the filter assembly port, and secure the connection with the hose clamp. Tighten the screw on the hose clamp 35 to 40 lbf·in (400 to 450 N·cm).
12. Lower the cab. For detailed instructions, see **Group 60**.
13. Start the engine, and check the operation of the charging system. If needed, adjust or repair the charging system to obtain the correct charging output. For instructions, see the appropriate section in **Group 15**.
14. Remove the tire chocks.

General Information

WARNING

Before testing a battery, see "Battery Safety Precautions" in this section. Failure to follow the safety precautions could result in personal injury.

Test any maintenance-free battery that does not hold a charge to see if it needs to be replaced, or if the problem lies elsewhere in the electrical system. Accuracy of the test depends on variables such as temperature and age of the battery. Follow the recommended testing instructions listed below.

IMPORTANT: Two types of battery tests are discussed in this subject. The first test uses the Midtronics Micro740 battery tester, and must be used by all U.S. and Canadian dealers for battery warranty claims. The second test is a load test using a carbon pile type tester and should **not** be used by U.S. or Canadian dealers for battery warranty claims.

Visual Inspection

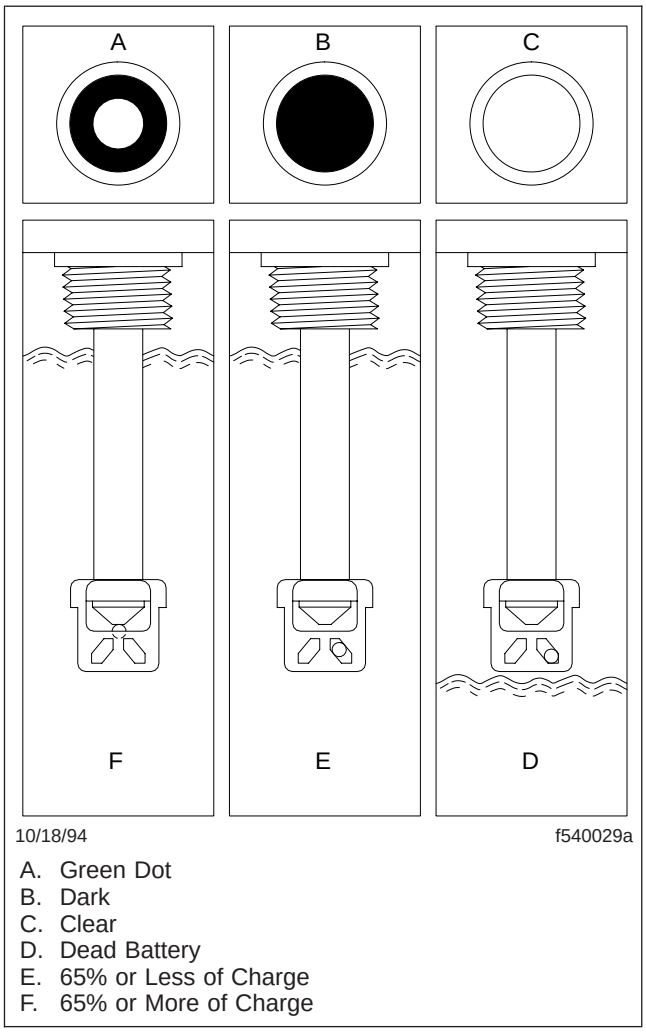
Check for obvious damage such as a cracked or broken case that could permit loss of electrolyte. If there is physical damage replace the battery. Find the cause of the damage and correct it as needed.

On maintenance-free batteries without a built-in hydrometer, perform the Midtronics PowerSensor Micro740 test or the load test.

On maintenance-free batteries with a built-in hydrometer, check the sight glass. If a green dot shows in the sight glass, test the battery. If the sight glass is dark, recharge the battery, then test it. See **Subject 150**. If the sight glass is clear, replace the battery. See **Fig. 1**.

Prior to Testing

1. Clean the battery terminals with a soft wire brush before testing.
2. At the start of the test, make sure all vehicle accessory loads are off and the ignition is in the off position.



A. Green Dot
B. Dark
C. Clear
D. Dead Battery
E. 65% or Less of Charge
F. 65% or More of Charge

Fig. 1, Built-In Hydrometer or Charge Indicator (on optional batteries only)

Midtronics PowerSensor Micro740 Test

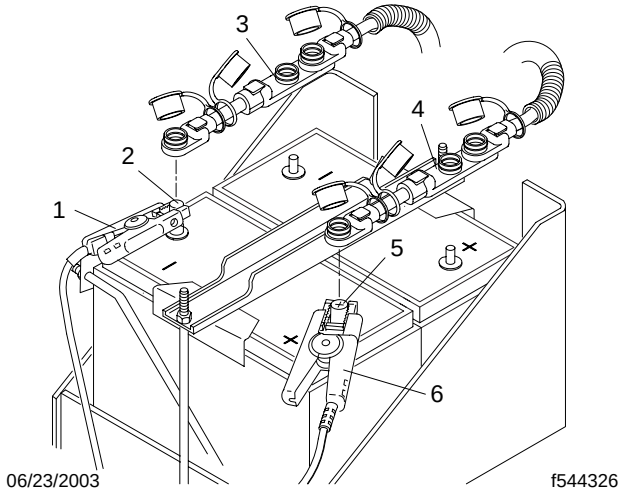
NOTE: This test must be used by all U.S and Canadian dealers for battery warranty claims.

Every battery in a pack of two or more must be disconnected before testing. If more than one battery is selected to be tested, the analyzer will test the first battery, then prompt you to connect to the next battery after the test has been completed. If the analyzer detects that the batteries are connected, it will remind you to disconnect the pack before starting the test.

Battery Testing

Connecting the Midtronics Tester

1. Screw an adapter onto the negative-terminal stud and one onto the positive-terminal stud. See **Fig. 2**.



1. Negative-Terminal Clamp
2. Negative-Terminal Stud Adaptor
3. Negative-Terminal Battery Jumper
4. Positive-Terminal Battery Jumper
5. Positive-Terminal Stud Adaptor
6. Positive-Terminal Clamp

Fig. 2, Battery Connection

IMPORTANT: For accurate test results, connect the clamps to the lead adaptors or to the lead bases of threaded studs. Lead stud adaptors are included with the Micro740. Do not connect the clamps directly onto the threaded studs or an inaccurate test result may occur.

2. Connect the red clamp to the positive-terminal stud adaptor.
3. Connect the black clamp to the negative-terminal stud adaptor.
4. Rock the clamps back and forth to ensure a secure connection. Both sides of the clamp must be firmly connected to the adaptors before testing. If the test message CHECK CONNECTION appears, clean the terminals and/or reconnect the clamps.

Battery Test

NOTE: If the analyzer displays a test message after you start the test, see *Test Messages* to determine the cause and remedy.

1. Use the arrow buttons at the top of the keypad to scroll to menu choices. Select BATTERY TEST. Press ENTER to select.
2. Enter the number of batteries being tested (1 to 6) and press ENTER to select.
3. Select the rating system; CCA, SAE, EN, IEC, DIN, or JIS then press ENTER.
4. Select the appropriate rating value (see **Table 1**) then press ENTER.
5. If the analyzer detects that the temperature of the battery may make a difference in the results it will ask you to select whether the battery temperature is above or below 32°F (0°C). It will resume the test after you make the selection and press ENTER.
6. At the end of the test, the Micro740 will display one of the following results from **Table 2** and the measured voltage and CCA, if applicable.

   If the result is REPLACE BATTERY or BAD CELL—REPLACE the analyzer will prompt you to press ENTER to generate a battery code.

   When the prompt BAT.SERIAL # appears enter the battery serial number. Use the ARROW buttons to scroll to the correct digit, then press ENTER to select it and move to the next digit. Pressing the BACK button will move the cursor back one space. When finished, press ENTER.
7. Turn on the printer and align the analyzer transmitter with the printer receiver. Press and hold the MENU button. Select PRINT RESULTS from the option menu by using the arrow buttons and pressing ENTER. It will take about 30 seconds to print all test results, which are displayed simultaneously on the screen.

Battery Rating Systems		
Rating System	**Description**	**Value Range**
CCA	Cold Cranking Amps, as specified by SAE. The most common rating for cranking batteries at 0°F (-18°C)	100 to 1700 A
SAE	European labeling of CCA	100 to 1700 A
EN	Europa-Norm	100 to 1700 A
IEC	International Electrotechnical Commission	100 to 1000 A
DIN	Deutsche Industrie-Norm	100 to 1000 A
JIS	Japanese Industrial Standard: (shown on a battery as a combination of numbers and letters, for example: 80D26)	43 values from 26A17 to 245H52

Table 1, Battery Rating Systems

Battery Test Results	
Result	**Recommendation**
Good Battery	Return to service.
Good—Recharge	The battery is good, but has an insufficient state of charge. Fully charge the battery and return to service.
Charge and Retest	The battery has a very low state of charge. Fully charge the battery and retest. Failure to fully charge the battery before retesting may cause false readings.
Replace Battery	Replace the battery and generate a test code.
Bad Cell—Replace	Replace the battery and generate a test code.

Table 2, Battery Test Results

Test Messages

Test Message—SYSTEM NOISE	
Possible Cause	**Remedy**
The analyzer has detected computer or ignition noise and will attempt to retest.	Make sure all vehicle loads are off and the ignition is in the off position. The analyzer will automatically retest when it no longer detects system noise
You may be testing too close to a noise source.	Move away from any high-current device and retest.
Battery charge is too low to test properly.	Recharge the battery and retest. If the message reappears, replace the battery.
Poor connection at battery terminal.	Connect the battery cables and retest.

Test Message—NON 12-VOLT BATTERY DETECTED	
Possible Cause	**Remedy**
You are attempting to test both batteries in a 24-volt system at the same time.	Disconnect the batteries and test each one individually.

Battery Testing

Test Message—INTERNAL ERROR, SERVICE REQUIRED	
Possible Cause	**Remedy**
The analyzer has detected a hardware or software problem.	See the Midtronics Micro740 *Instruction Manual*.

Test Message—REVERSE CONNECTION	
Possible Cause	**Remedy**
The clamps are connected in reverse polarity. i.e., Red to negative (–), and black to positive (+).	Disconnect the clamps and reclamp to proper polarity. i.e., Red to positive (+), and black to negative (–).

Test Message—UNSTABLE BATTERY	
Possible Cause	**Remedy**
Batteries that are very weak or that have just been charged may have sufficient electrical activity to alter test results. The analyzer will automatically retest when the battery has stabilized. Fully charged batteries should stabilize quickly.	Charge weak batteries and then retest.

Test Message—CHECK CONNECTION	
Possible Cause	**Remedy**
Poor connection. Both sides of the clamps must be firmly connected before testing.	Clean the battery terminals using a wire brush and a mixture of baking soda and water. Inspect and clean the clamps. Liberally apply baking soda and water with a clean cloth and thoroughly rub the jaw and spring. Use a soft wire brush to remove corrosion buildup. Rinse with water and let dry.

Load Test

NOTE: This test must **not** be used by U.S and Canadian dealers for battery warranty claims.

1. Test each battery separately, either installed or removed. Disconnect the battery cables from the battery, ground cable first.

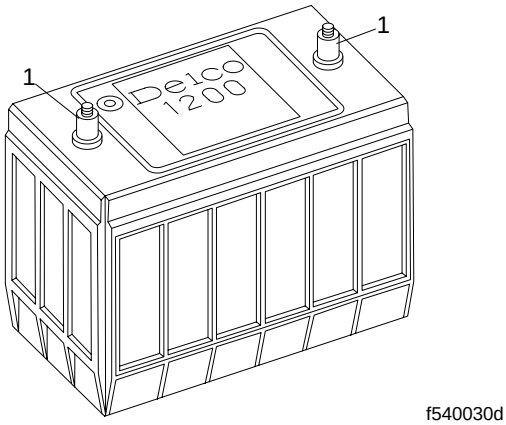
⚠ WARNING

Before charging a battery, see "Battery Safety Precautions" in this section. Failure to follow the safety precautions could result in personal injury.

When charging batteries, always wear eye protection. During charging, batteries give off explosive hydrogen gas. Exploding gas can cause blindness or other bodily injury.

2. Before beginning the load test, check the open circuit voltage (OCV) of each battery. If the voltage is below 12.4 volts, charge the battery on a shop charger for at least 2 hours. If the voltage is above 12.4 volts, proceed to the next step. See **Subject 150** for battery charging instructions.
3. Connect the tester leads to the battery terminals following the tester manufacturer's instructions. Batteries with sealed terminals require adaptors

to provide a place for attaching the tester's leads. See **Fig. 3**.



1. Terminal Adaptor

Fig. 3, Sealed Battery

4. Check the rated CCA of the battery. Apply a load equal to one-half the rated CCA across the terminals for 15 seconds to remove the surface charge from the battery. Remove the load and wait 15 seconds for the battery to recover.

   Example: For a battery rated at 620 CCA, apply a load of 310 amperes across the terminals.

5. Estimate the battery temperature by touch and by the ambient temperature the battery was exposed to before this test, then find the voltage in **Specifications 400** that must be maintained while the battery supplies a specified electrical load.

   Example: At 70°F (21°C) the battery must supply 9.6V minimum.

6. Apply the specified test load to the battery for 15 seconds. The test load (amperes) is equal to one-half of the cold-cranking amperes of the 0°F (–18°C) rating of the battery.

7. Read the terminal voltage at the end of 15 seconds with the load still connected. Do not keep the load attached for a longer period of time before reading the voltage, as this would alter the test results.

8. Remove the load after 15 seconds and note the tester reading.

If the voltage drops below the minimum listed in the table replace the battery.

If the voltage is the same or greater than the minimum listed in the table the battery is capable of further service.

⚠ WARNING

Before charging a battery, read the instructions in Subject 120. Failure to follow the safety precautions could result in personal injury.

When charging batteries, always wear eye protection. During charging, batteries give off explosive hydrogen gas. Exploding gas can cause blindness or other bodily injury.

Charging a Conventional Battery

To ensure the general well being of the electrical system, the starting battery(s) should be kept at a high state of charge. In particular, if operating a vehicle with undercharged battery(s), the alternator can be overworked and may cause premature failure.

To charge a conventional liquid-electrolyte battery (wet cell), apply a charge rate in amperes for several hours. For example, a 10-ampere charge rate for five hours would produce a 50 ampere-hour charge to the battery.

General Guidelines for Charging Batteries

When charging multiple batteries on one charger, group batteries that have similar voltages and are of similar age. If not, the group will only charge as fast as the battery with the lowest state of charge. Batteries below 5 volts should be charged individually.

IMPORTANT: Do not overcharge maintenance-free batteries. Overcharging causes excessive loss of water from the electrolyte and eventual battery damage.

Refer to **Table 1**, **Table 2**, **Table 3**, and **Table 4** for determining how long to charge the batteries.

Recharge Time Using Shop Charger for a Single Battery					
Voltage	State of Charge	Charger Maximum Rate			
		50 Amps	30 Amps	20 Amps	10 Amps
12.6	100%	Ready to Use			
12.4	75%	0.6 hrs	0.9 hrs	1.3 hrs	2.5 hrs
12.2	50%	1.2 hrs	1.9 hrs	2.7 hrs	5.1 hrs
12.0	25%	1.8 hrs	2.9 hrs	4.3 hrs	7.8 hrs
11.8	0%	2.5 hrs	4.0 hrs	5.7 hrs	10.7 hrs

Table 1, Recharge Time Using Shop Charger for a Single Battery

Recharge Time Using Shop Charger for a Two Battery System					
Voltage	State of Charge	Charger Maximum Rate			
		50 Amps	30 Amps	20 Amps	10 Amps
12.6	100%	Ready to Use			
12.4	75%	1.2 hrs	1.8 hrs	2.6 hrs	5.0 hrs
12.2	50%	2.4 hrs	3.8 hrs	5.4 hrs	10.2 hrs
12.0	25%	3.6 hrs	5.8 hrs	8.6 hrs	15.4 hrs
11.8	0%	5.0 hrs	8.0 hrs	11.4 hrs	21.4 hrs

Table 2, Recharge Time Using Shop Charger for a Two Battery System

Battery Charging

Recharge Time Using Shop Charger for a Three Battery System					
Voltage	State of Charge	Charger Maximum Rate			
		50 Amps	30 Amps	20 Amps	10 Amps
12.6	100%	Ready to Use			
12.4	75%	1.8 hrs	2.7 hrs	3.9 hrs	7.5 hrs
12.2	50%	3.6 hrs	5.7 hrs	8.1 hrs	15.3 hrs
12.0	25%	5.4 hrs	8.7 hrs	12.9 hrs	23.1 hrs
11.8	0%	7.5 hrs	12.0 hrs	17.1 hrs	32.1 hrs

Table 3, Recharge Time Using Shop Charger for a Three Battery System

Recharge Time Using Shop Charger for a Four Battery System					
Voltage	State of Charge	Charger Maximum Rate			
		50 Amps	30 Amps	20 Amps	10 Amps
12.6	100%	Ready to Use			
12.4	75%	2.4 hrs	3.6 hrs	5.2 hrs	10.0 hrs
12.2	50%	4.8 hrs	7.6 hrs	10.8 hrs	20.4 hrs
12.0	25%	7.2 hrs	11.6 hrs	17.2 hrs	31.2 hrs
11.8	0%	10.0 hrs	16.0 hrs	22.8 hrs	42.8 hrs

Table 4, Recharge Time Using Shop Charger for a Four Battery System

Batteries below 11.8 volts should be charged at no more than 10 amps for a minimum of 24 hours per battery. Check after the first hour and ensure that the battery is not getting hot.

If after using the above charging method you receive a Charge and Retest result from a Midtronics battery tester and the voltage is above 11.8 volts, continue to charge normally. If the battery voltage is below 11.8 volts, condemn the battery.

On optional batteries with built-in hydrometer (charge indicator), the battery is sufficiently charged when the green dot in the hydrometer is visible. Gently shake or tilt the battery at hourly intervals during charging to mix the electrolyte and check to see if the green dot appears. Do not tilt the battery beyond a 45-degree angle.

If the green dot does not appear after a 75 ampere-hour charge, continue charging for another 50 to 75 ampere-hours. If the green dot still does not appear, replace the battery.

NOTE: Batteries with built-in hydrometers (charge indicators) cannot be charged if the indicator color is clear or light yellow; this indicates low electrolyte level. Replace these batteries.

Refer to the following steps to charge a wet cell battery.

1. Clean the battery terminals.

NOTE: If the battery is cold, let it warm up. This will allow a normal charging rate.

2. Make sure that the charger is turned off.
3. Connect the charger to the battery following the manufacturer's instructions. Rock the charger lead clamps to make sure there is a good connection.
4. Turn on the charger and slowly increase the charging rate until the recommended ampere value is reached.

IMPORTANT: If the battery feels hotter than 125°F (52°C), or if rapid gassing or spewing of electrolyte occurs, lower the charging rate or stop charging the battery and allow it to cool.

5. After the battery(s) has charged for the recommended time, turn the charger off.

⚠ WARNING

Always turn the charger off before disconnecting it. Touching a charger lead when the circuit is live could create a spark and cause an explosion, resulting in personal injury.

6. Disconnect the charger cables from the battery.

NOTE: If the vehicle is equipped with an isolated battery system, be sure that both battery systems are charged.

7. If the engine does not crank satisfactorily when a charged battery is installed, test the battery using a Midtronics™ battery tester.

   If the battery passes the Midtronics test, check the fuel, ignition, cranking, and charging systems to find and correct the problem.

   If the battery does not pass the Midtronics test, replace it.

Gel Cell Charging

⚠ CAUTION

To avoid shortening the life of a gel cell, carefully regulate the charging voltage—between 13.8 and 14.1 volts.

It is hard to determine how long to charge a gel cell. Recharging time depends on the following factors:

- Depth of discharge
- Temperature
- Size and efficiency of the charger
- Age and condition of the battery

Because the chemical charging reaction slows down as it nears completion, about 60% of the total charging time will be spent bringing the battery from 10.5 volts under load (11.8 volts with no load) to 90% of full charge (12.92 volts, including surface charge). The other 40% of the time is required to charge the remaining 10% (full charge = 13.0 volts, including surface charge).

Example: If it takes 3-1/2 hours to charge a battery to 90%, it will take another 2-1/2 hours to bring it to full (100%) charge.

See **Table 5** for a list of estimated charging times to 90% of full charge. See **Table 6** for a list of estimated charging times to 100% of full charge. All charging times are based on the initial charge current accepted by the battery, using an automatic, temperature-sensing, voltage regulating charger set at 13.8 volts (2.30 to 2.35 volts per cell) on a totally discharged battery (at 11.80 to 12.00 volts, with no load).

Charging Time to 90% of Full Charge			
Battery	Initial Amps Needed to Recharge In		
	13 Hours	6 Hours	3-1/2 Hours
G27	8	21	41
G31*	9	24	45

* Freightliner uses the G31 (Group 31) gel cell.

Table 5, Gel Cell Charging Guide (90% charge)

HOW TO USE THESE CHARTS: Read amps about one minute after the charger is first turned on. Use this initial reading to estimate the approximate charging time.

Example: If a G31 battery reads about 24 amps charge current when first turned on, the battery will be at 90% charge in about six hours, and will be fully charged (100%) in about ten hours.

Charging Time to 100% of Full Charge			
Battery	Initial Amps Needed to Recharge In		
	22 Hours	10 Hours	6 Hours
G27	8	21	41
G31*	9	24	45

* Freightliner uses the G31 (Group 31) gel cell.

Table 6, Gel Cell Charging Guide (100% charge)

To charge a gel cell, do the following steps:

1. Remove the gel cell from the vehicle.
2. Clean the battery terminals.

Battery Charging

NOTE: If the gel cell is cold, let it warm up to 68°F (20°C). This will allow a normal charging rate.

3. Make sure that the charger is turned off.

CAUTION

Use a reliable, automatic, temperature-sensing, voltage-regulated charger to charge gel cells. Any other type of charger will damage the gel cell.

4. Connect the charger leads directly to the battery following the charger manufacturer's instructions. Rock the charger lead clamps to make sure there is a good connection.
5. Turn on the charger and set the charging rate between 13.8 and 14.1 volts (2.30 to 2.35 volts per cell).

CAUTION

To prevent damage, do not open a sealed gel cell or charge it in excess of 14.1 volts (2.35 volts per cell).

6. After about one minute, check the initial charge current. To charge to 90% of full charge, see **Table 5** to determine the approximate time of completion. To charge to 100% of full charge, see **Table 6** to determine the approximate time of completion.

IMPORTANT: If the battery feels hotter than 125°F (52°C), or if rapid gassing occurs, stop charging the battery and allow it to cool.

7. When finished, turn the charger off.

WARNING

Always turn the charger off before disconnecting it. Touching a charger lead when the circuit is live could create a spark and cause an explosion, resulting in personal injury.

8. Disconnect the charger cables from the battery.

Battery Removal, Cleaning and Inspection, and Installation

WARNING

Before doing any of the following procedures, read the instructions in Subject 120. Failure to follow the safety precautions could result in personal injury.

Removal

Before working on any battery box, make sure all electrical loads (lights, ignition, accessories) are turned off.

Note what type of battery box is installed. Removal procedures for the side-rail battery boxes are similar; those for the between-rail and the above-rail boxes are completely different.

Three basic battery box installations are available for Century Class Conventionals. First, the standard box, long side to rail with a step and diamond plate side cover (for vehicles with one fuel tank and standard cab entry with no side fairings). See **Fig. 1**.

Second, an optional box, long side to rail with no step. See **Fig. 2**.

Third, a between-rail plastic box for vehicles with dual fuel tanks. See **Fig. 3**.

The standard Argosy COE battery box is mounted above the frame rails in back of the engine (see **Fig. 4**), though battery boxes mounted on either frame rail are also available. All Argosy COE battery boxes are aluminum.

SIDE-RAIL BATTERY BOX

1. Remove the threaded fasteners that attach the air fairing panel (if equipped) in front of the battery box. Remove the air fairing panel. For instructions, see **Section 60.05**.

   If no air fairing panel is installed, remove the step plate.

2. Pull on the end of each hold-down latch until the end clears the cover-mounted catch. Pivot the latches out of the way, then lift off the battery box cover.

3. For assembly reference, note the locations of the battery positive and negative terminals in relation to surrounding components. Remove the battery cables.

1. Hold-Down Angle
2. Retainer Assembly
3. Cover
4. Hold-Down Bolt
5. Retainer Bolt
6. Battery Box
7. Step
8. Latch

Fig. 1, Side-Rail Battery Box, Long Side to Rail, with Step and Diamond Plate Side Cover

4. Remove the battery retainer assembly. Remove the batteries from the carrier.

BETWEEN-RAIL BATTERY BOX, CENTURY CLASS CONVENTIONAL

1. Remove the battery box lid. If equipped, remove the spring pin.

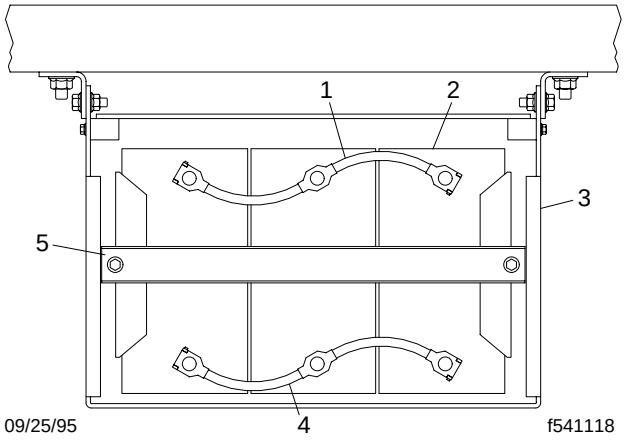
2. Disconnect the battery cables from the battery terminals and move the cables out of the way.

3. Remove the battery hold-downs. See **Fig. 5**.

   3.1 Remove the 5/16–18 hold-down locknut and washer.

   3.2 Slip the hold-down off the 5/16-inch rib-neck bolt.

Battery Removal, Cleaning and Inspection, and Installation



1. Positive Cables (Red)
2. Battery
3. Battery Box
4. Negative Cables (Black)
5. Battery Retainer

Fig. 2, Side-Rail Battery Box, Long Side to Rail, with Cover Removed

3.3 Remove the rib-neck bolt and set all hold-down hardware aside.

4. Remove the batteries from the vehicle. For assembly reference, note the locations of the battery positive and negative terminals in relation to surrounding components.
5. Remove the battery box. See **Fig. 6**.
   - 5.1 From underneath the battery box, remove the 3/8–16 hexnut and flatwasher from the keeper assembly. Retain the keeper and spring.
   - 5.2 Remove the battery box from the vehicle.
6. Remove the battery box bracket from the frame rail. See **Fig. 7**.
   - 6.1 Remove the lock pin and collar from each huckspin. For instructions, see **Group 31**.
   - 6.2 Remove the bracket from the frame rail. The plastic washers are attached to the bracket with pressure-sensitive adhesive and come off with the bracket.

OVER-THE-RAIL BATTERY BOX, ARGOSY COE

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Tilt the cab. For detailed instructions, see **Group 60**.
3. Remove the air intake cleaner assembly.
   - 3.1 Loosen the screw on the hose clamp that attaches the flexible duct to the air intake cleaner assembly, and separate the flexible duct from the air cleaner assembly.
   - 3.2 Remove the four nuts from the air cleaner mounting bracket studs.
   - 3.3 Remove the air cleaner assembly from the mounting bracket, and set the assembly aside.
4. Remove the battery box cover. See **Fig. 8**.
5. For assembly reference, label the locations of the battery positive and negative terminals in relation to surrounding components. Disconnect the battery cables from the battery terminals and move the cables out of the way.
6. Remove the battery hold-down, and lift the batteries from the vehicle.
7. Detach the battery cable clamp.

NOTE: Label all electrical connections before disconnecting them.

8. Remove the battery ON/OFF switch and the fuse box/mag switch cover panel.
9. Remove the fuse box and the mag switch.
10. Remove the battery box. Take care to retain the spacers on the upper front of the air filter assembly mounting bracket.

Cleaning and Inspection

1. Inspect the battery cables for wear, and replace them if necessary. Clean the cable connector terminals with a wire brush.
2. Clean and tighten the battery ground cable, terminals, and clamps.

Battery Removal, Cleaning and Inspection, and Installation

2. Spring Pin (if installed)
3. Spring Pin Insert Hole
4. Frame Rail
5. Battery Box
6. Battery Hold-Downs
7. Battery

Fig. 3, Between-Rail Battery Box

3. Inspect the retainer assembly (or battery hold-downs) and battery box. Replace worn or damaged parts. Remove any corrosion with a wire brush, and wash with a weak solution of baking soda and water. Rinse with clean water, and dry. Paint the retainer assembly, if needed, to prevent rusting.
4. Be sure foreign objects, such as stones, bolts, and nuts, are removed from the battery box.

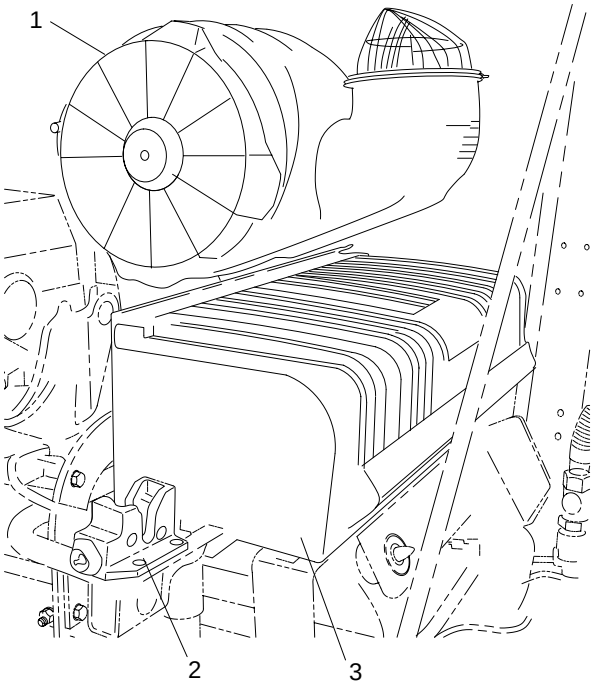
Installation

1. Be sure that the battery to be installed has a sufficient capacity to cover the electrical needs of the vehicle. For more information, see **Subject 100**.

⚠ CAUTION

Using an under-capacity battery will result in poor performance and premature battery failure, resulting in damage or reduced life of the starter.

Battery Removal, Cleaning and Inspection, and Installation



1. Air Intake Filter Assembly
2. Rear Cab Latch
3. Battery Box

Fig. 4, Over-the-Rail Battery Box, Argosy COE

2. Be sure the battery is at full charge when installed. If the battery has been in storage for some time, or if the installation is being made in subfreezing temperatures, give the battery a boost-charge before installing it. For instructions, see **Subject 150**.

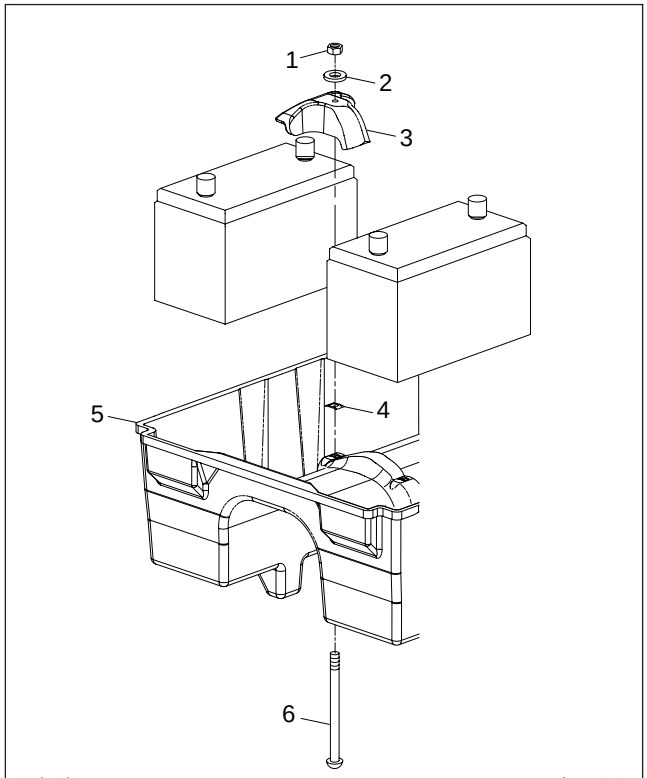
SIDE-RAIL BATTERY BOX

1. Place the batteries in the carrier with the terminals in the proper position, as referenced earlier. The batteries should rest level in the carrier.
2. Install the battery retainer assembly, and tighten it until the batteries are secure. See **Fig. 1**.

⚠ CAUTION

Do not overtighten the battery retainer assembly. Overtightening could damage the batteries.

3. Connect the battery cables to the batteries.



1. 5/16–18 Hold-Down Nut
2. Flatwasher
3. Hold-Down
4. Push-On Retainer
5. Battery Box
6. 5/16-Inch Rib-Neck Bolt

Fig. 5, Battery Hold-Downs

3.1 To provide corrosion protection, apply pumpable dielectric grease, part no. 48–02349–000, liberally to the terminal pads. For a list of approved suppliers, see **Specifications, 400**.

3.2 Install the battery cable interconnectors.

3.3 Tighten the battery cables to the torque specifications listed on the battery, generally 10 to 15 lbf·ft (14 to 20 N·m). Connect the ground cable last.

⚠ CAUTION

Make sure the polarity is correct. Reversed polarity may cause serious damage to the electrical system.

1. Frame Rail
2. Huckspin Lock Pin
3. Bracket
4. Plastic Washers

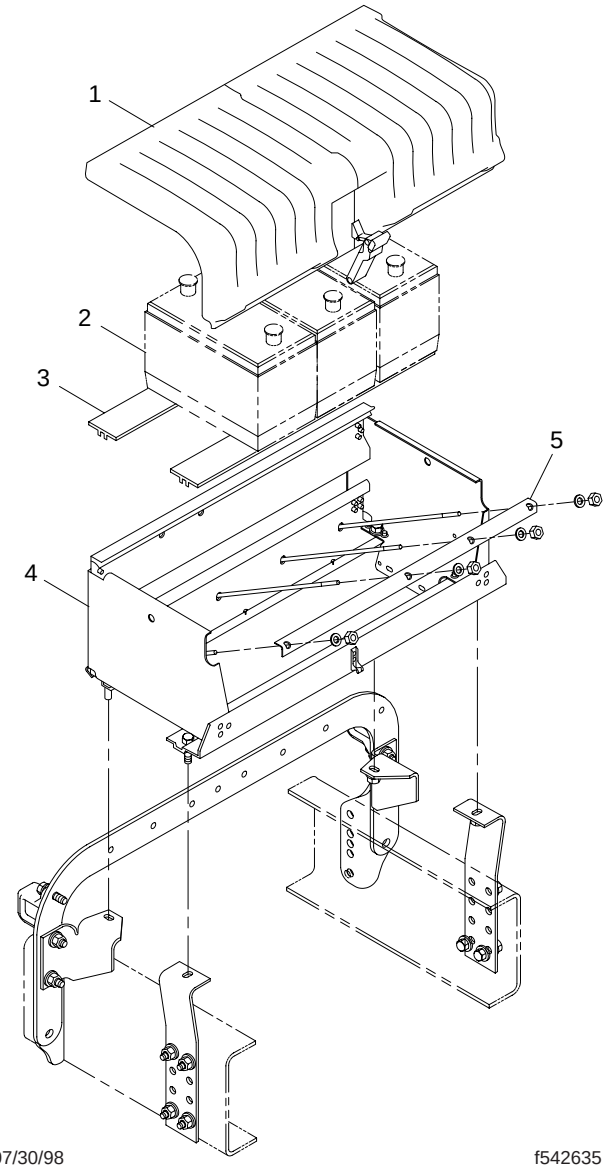
Fig. 7, Battery Box Bracket Removal

If removed, install the step plate.

BETWEEN-RAIL BATTERY BOX, CENTURY CLASS CONVENTIONAL

1. Install the battery box brackets on the frame rail. See **Fig. 7**. Install four new 5/8D huckspin lock pins and 5/8-inch collars on each bracket. For instructions, see **Group 31**.
2. Install the battery box. See **Fig. 6**.
   - 2.1 Line up the holes in the bottom of the battery box with the holes in each bracket.
   - 2.2 Install four keeper assemblies and springs through the holes in the battery box and brackets.
   - 2.3 From underneath the battery box, install a 3/8–16 hexnut and flatwasher on each keeper assembly. Tighten to 18 lbf·ft (24 N·m).
3. Place the batteries in the battery box with the terminals in the proper position, as referenced earlier. Make sure the batteries rest level in the box.
4. Install the battery hold-downs. See **Fig. 5**.
   - 4.1 Install a hold-down on each battery.

Battery Removal, Cleaning and Inspection, and Installation



1. Plastic Cover
2. Batteries
3. Neoprene Pad
4. Battery Box
5. Battery Hold-Down

Fig. 8, Over-the-Rail Battery Box, Argosy COE

4.2 Insert a rib-neck bolt up through each hold-down and thread onto it a 5/16–18 hold-down locknut and washer.

CAUTION

Do not overtighten the battery hold-downs. Overtightening could damage the batteries.

4.3 Tighten each locknut 10 lbf·ft (14 N·m).

5. Connect the battery cables to the batteries.

5.1 To provide corrosion protection, apply pumpable dielectric grease, part no. 48–02349–000, liberally to the terminal pads. For a list of approved suppliers, see **Specifications, 400**.

5.2 Install the battery cable interconnectors.

5.3 Tighten the battery cables to the torque specifications listed on the battery, generally 10 to 15 lbf·ft (14 to 20 N·m). Connect the ground cable last.

5.4 Check for correct polarity with respect to the vehicle.

CAUTION

Make sure the polarity is correct. Reversed polarity may cause serious damage to the electrical system.

6. Start the engine, and check the operation of the charging system. If needed, adjust or repair the charging system to obtain the correct charging output. For instructions, see the appropriate section in **Group 15**.

CAUTION

Make sure all battery posts are covered with protective caps. Failure to do so could cause the battery box cover to short across the posts.

7. Install the battery box cover. If equipped, install the spring clip.

OVER-THE-RAIL BATTERY BOX, ARGOSY COE

1. Install the battery box. See **Fig. 8**.
2. Install the mag switch and fuse box.
3. Install the battery ON/OFF switch.
4. Install the fuse box/mag switch cover.

Battery Removal, Cleaning and Inspection, and Installation

5. Attach the battery cable clamp.
6. Place the two neoprene pads in the bottom of the battery box, snug against the front and back of the box.
7. Place the batteries in the battery box with the terminals in the proper position, as referenced earlier. Make sure the batteries rest level in the box.
8. Install the battery hold-down, and tighten it until the batteries are secure.

CAUTION

Do not overtighten the battery hold-down retainer. Overtightening could damage the batteries.

9. Connect the battery cables to the batteries.
   - 9.1 To provide corrosion protection, apply pumpable dielectric grease (part no. 48–02349–000) liberally to the terminal pads. For a list of approved suppliers, see **Specifications 400**.
   - 9.2 Install the battery cable interconnectors.
   - 9.3 Tighten the battery cables to the torque specifications listed on the battery, generally 10 to 15 lbf·ft (14 to 20 N·m). Connect the ground cable last.

CAUTION

Make sure the polarity is correct. Reversed polarity may cause serious damage to the electrical system.

   - 9.4 Check for correct polarity with respect to the vehicle.

CAUTION

Make sure all battery posts are covered with protective caps.

10. Install the battery box cover.
11. Install the air intake filter assembly.
    - 11.1 Place the air filter assembly on the mounting bracket studs.
    - 11.2 Install the four sets of locknuts and washers on the mounting bracket studs, and tighten the nuts 26 lbf·ft (35 N·m).
    - 11.3 Attach the air inlet duct to the filter assembly port, and secure the connection with the hose clamp. Tighten the screw on the hose clamp 35 to 40 lbf·in (400 to 450 N·cm).
12. Lower the cab. For detailed instructions, see **Group 60**.
13. Start the engine, and check the operation of the charging system. If needed, adjust or repair the charging system to obtain the correct charging output. For instructions, see the appropriate section in **Group 15**.
14. Remove the tire chocks.

Troubleshooting

If the batteries pass testing, check for the following causes:

1. Accessories were left on overnight.
2. A slipping alternator belt, high resistance in the wiring, or a defective alternator is causing the batteries to discharge.
3. The electrical loads are exceeding the charging system capacity.
4. Wires in the electrical system are shorted or pinched.
5. There are loose or damaged battery cable-to-terminal connections.
6. The batteries are still connected in a vehicle that has been out of service. Small current drains of accessories that are connected all the time can discharge the batteries in a few days. Batteries left in a discharged condition are subject to freezing.

Electrical Drain and Parasitic Load

Batteries are replenished each time the vehicle is driven with normal vehicle use. In long-term parking situations, however, parasitic drains may discharge the batteries enough to cause a no-start condition.

A parasitic drain is an electrical load that draws current from the batteries when the ignition remains off. Some devices, such as the electronic control unit (ECU), the bulkhead module (BHM), the chassis module (CHM), the antilock braking system (ABS), and radio memory are intended to draw a very small current continuously. These draws are measured in milliamps (mA). Current draw should be less than 325 milliamps with no circuits active and the ECU, BHM, CHM, and ABS turned off.

Problem—The Batteries Are Undercharged

Problem—The Batteries Are Undercharged	
Possible Cause	**Remedy**
The drive belt is loose.	Check the drive belt and tensioner. Refer to the drive belt subject in the appropriate engine section in **Group 01** for instructions. If necessary, tighten to the manufacturer's specifications. Start the engine and check the alternator voltage and output. Refer to the troubleshooting subject in the alternator section in **Group 15** for instructions.
The drive belt is damaged or missing.	Check the drive pulleys for locked bearings. Repair or replace any damaged components. Replace the drive belt and start the engine. Check the alternator voltage and output. Refer to the troubleshooting subject in the alternator section in **Group 15** for instructions.
The batteries are undercharged.	Perform a battery test. Charge or replace batteries as needed. If the batteries were discharged, start the engine and check the alternator voltage and output. Refer to the troubleshooting subject in the appropriate alternator section in **Group 15** for instructions.
The alternator or battery cables are undersized.	Perform a cable load drop test.
The alternator is malfunctioning.	Refer to the troubleshooting subject in the appropriate alternator section in **Group 15** for instructions.
The isolator relay is not operating correctly (optional battery isolator system only).	Refer to **Group 82, Subject 300** in this manual for instructions.

Battery Troubleshooting

1. **Check battery pack voltage to determine state of charge**.

   If equipped, set Load Disconnect Switch to "Off." With the DMM probes on the positive and negative posts of the battery pack, record the voltage. Due to differences in their design and operation, flooded cell and AGM batteries have different voltages at the same state of charge.

   Batteries should be fully charged before further testing. If batteries are not fully charged, they will draw current to recharge during testing, invalidating the troubleshooting test results. Fully charged batteries ensure reliable diagnosis.

   See **Table 1** for voltage as an approximate indicator of state of charge for AGM and flooded batteries.

   If the battery pack will not charge to 100% state of charge, there may be a shorted cell. Break the pack into individual batteries and test individually using an approved tester. Go to **Check 3, Individual Battery Testing**. After batteries have been tested individually, verify pack voltage once again.

Flooded	AGM	SoC
12.6	12.8	100%
12.4	12.6	80%
12.3	12.4	60%
12.1	12.2	40%
12	12	20%
11.8	11.8	0%

Table 1, Voltage to Approximate State of Charge (SoC)

2. **Remove surface charge: HVAC blower, lights on, 5 min.**

   Surface charge refers to a higher initial charge (volts), when discharging, in recently-charged batteries. This charge is a "shallow" charge, meaning that the charging-induced chemical reaction has mostly occurred at the surface of the lead plates, and has not equalized throughout the lead. Drawing current from the batteries before testing removes the surface charge, allowing for a better assessment of the "deep charge" state of the lead plates.

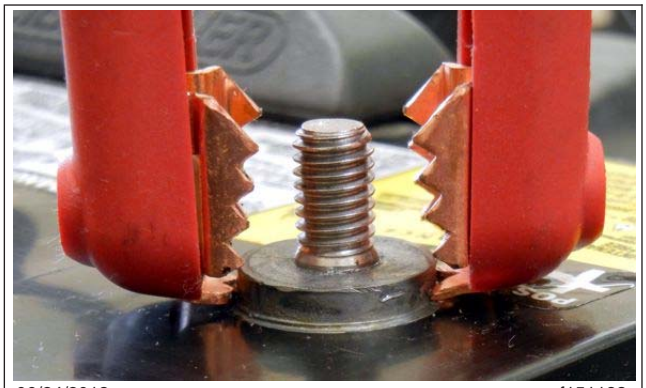
   After the surface charge is removed, the batteries need to be at least 80% SoC for further testing. See **Table 1** for voltage as an approximate indicator of state of charge.

3. **Test Individual Batteries**.

   IMPORTANT: Batteries should only be tested individually.

   3.1 Remove the negative cables of the batteries first, and secure the leads out of the way before touching the positive cables. Remove the battery cables and clean the terminal pads with a wire brush. The adapters will not make sufficient contact with dirty or corroded contact pads.

   3.2 Connect the battery tester's positive and negative clamps to the lead base terminal pads at the positive and negative studs. See **Fig. 1**.



06/24/2013 f151183

Fig. 1, Tester Clamps Attached to the Post

The threaded portion of the battery posts are *not* the right place to clip: the steel threads won't make a good connection. The base of the post, on the lead, is the best place to clip. Taking a few extra seconds to make sure the tester, DMM, and carbon pile clips are well-connected can be the difference between a useful and a useless test.

NOTE: If the lead base is too small to clamp to, only lead stud adapters should be used, never nuts. The lead stud adapters must be screwed down tight against the cleaned lead base using a

hand tool. Lead adapters are available at most tool vendors.

Refer to the battery tester instruction manual for complete testing instructions.

If the battery tester requires the CCA rating of the battery, it should be on the battery label. See **Fig. 2**.

3.3 If the battery fails, enter the battery serial number and print out the result. The sensor windows on the tester and printer must be aligned to transmit the test results to the printer.

Fig. 2, Battery Label

See **Table 1** for recharge times. Refer to the commercial batteries page at **www.dekabatteries.com** for more information.

Recharge Time Using a Typical Charger (hours)						
Open Circuit Voltage		State of Charge	Charger Maximum Rate			
Flooded	AGM		50 Amps	30 Amps	20 Amps	10 Amps
12.6V	12.8V	100%	Ready to Use			
12.4V	12.6V	75%	0.6	0.9	1.3	2.5
12.2V	12.3V	50%	1.2	1.9	2.7	5.1
12.0V	12.0V	25%	1.8	2.9	4.3	10.7
11.8V	11.8V	0%	2.5	4.0	5.7	10.7

Table 1, Recharge Time Using a Typical Charger

General Description

The instrumentation control unit (ICU) is an integrated electronic dashboard that accepts input from electrical/magnetic vehicle sensors and converts it into digital output that can be fed to an electronic gauge. Only air gauges operate mechanically.

There can be up to 14 gauges on the driver's instrument panel, and, if needed, the ICU can be set up to drive additional gauges located on the auxiliary instrument panel.

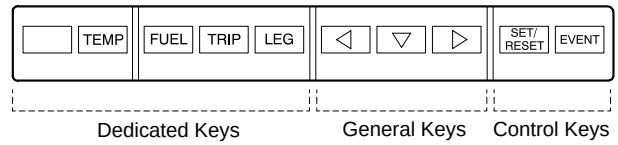
The heart of the ICU is the Driver Message Center. It has two parts, a set of 18 warning and indicator lights similar to those found on a conventional lightbar, and a dash driver display screen. The dash driver display screen is a 2-line by 20-character vacuum fluorescent display that provides a wide range of information to the driver.

Some of the information that can be provided by the message center includes:

- odometer readings
- outside air temperature
- messages from remote locations such as company docks and offices, shipper's terminals, etc. (if equipped with a communications system, such as Qualcomm)
- trip information, such as trip miles and hours, idle hours, average mph, and leg miles and hours
- fuel information, such as fuel used and miles per gallon, fuel used idling, and PTO fuel used
- engine information, such as miles, hours, gallons of fuel used, and PTO fuel used
- diagnostic information, such as listings of active faults and troubleshooting information
- vehicle information, such as datalink operation and use data, dash part number, and software number

The ICU is controlled by a keypad located on the auxiliary dash panel. See **Fig. 1**. This keypad, which has 10 keys, can be used to do the following things:

- Call up information onto direct access screens by pressing the appropriate key.
- Move about from screen to screen while the vehicle is stationary.



To reset a screen, press the SET/RESET key twice.

Fig. 1, Keypad

- Set up the display.
- Record significant data using the EVENT key.

NOTE: One key is blank and is not usable at this time.

To set, press the SET/RESET key once. To reset, press the SET/RESET key once. The confirmation screen appears: PUSH RESET AGAIN/TO CONFIRM CLEAR. Now press the SET/RESET key for a second time.

⚠ CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables and the four color-coded electrical connectors from behind the instrumentation control unit (ICU) housing. See Subject 100 in this section for instructions. Electric currents produced during electric welding can damage various electronic components on the vehicle.

Principles of Operation

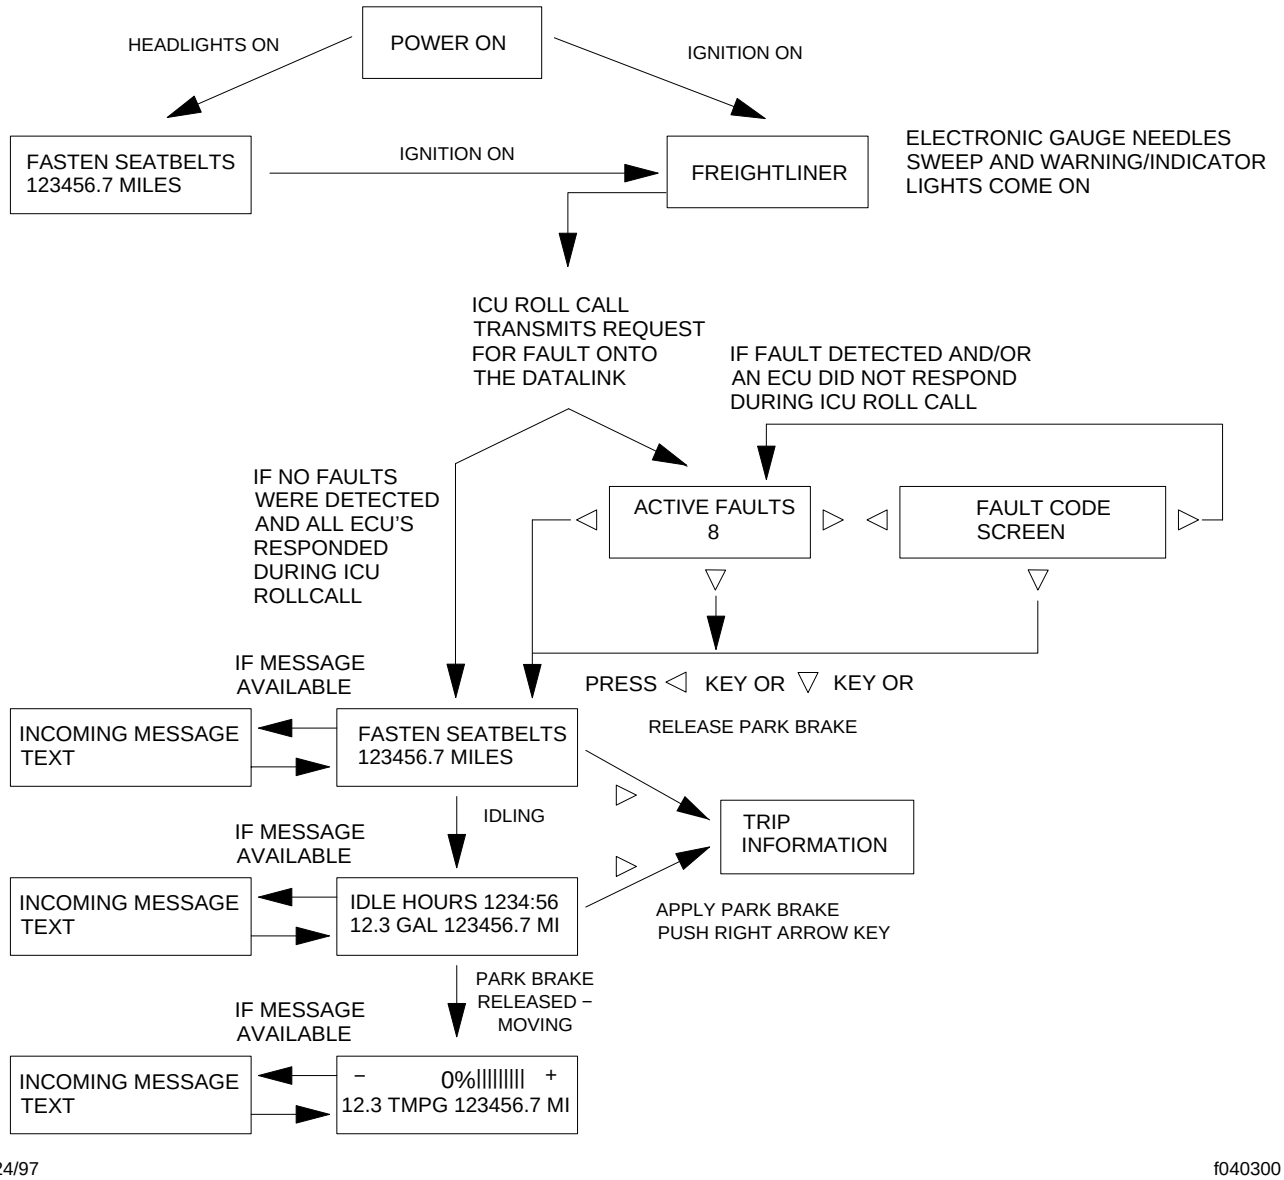
IGNITION SEQUENCE

When the ignition is turned on, the ICU runs through the ignition sequence. See **Fig. 2**. If the headlights are turned on, the screen displays the odometer and waits for the ignition to be turned on.

IMPORTANT: When the ignition is first turned on, all the electronic gauges complete a full sweep of their dials, the warning and indicator lights light up for five seconds, and the buzzer sounds for two seconds.

Once the ignition has been turned on, the screen displays the "Freightliner" message. At the same time, the ICU conducts a roll call of all the electronic

General Information



NOTE: The roll call and incoming message features appear only on ICUs installed with software version 8.4.0 or later (vehicles built on or after March 7, 1997).

Fig. 2, Ignition Sequence

control units (ECUs) installed on the vehicle, looking for active faults.

NOTE: The roll call function is found only on ICUs installed with software version 8.4.0 or later (vehicles built on or after March 7, 1997).

If there are no active faults, the screen displays the "Fasten Seat Belts/Odometer" screen.

If, however, the ICU has received active fault codes, or an electronic control unit (ECU) fails to respond to the roll call, it shows the "Active Faults" screen and displays the number of active faults, up to a total of

eight. If desired, press RIGHT ARROW to see the active fault codes. Otherwise, press LEFT ARROW, or, if the engine is on, release the parking brake to go on to the "Fasten Seat Belts/Odometer" screen.

Unless the engine is running, the ignition sequence ends with the "Fasten Seat Belts/Odometer" screen.

NOTE: At this point, if the vehicle has a communications system and an incoming message is available, it will be displayed. To dismiss the incoming message, press any key on the keypad.

With the engine idling (the vehicle not moving), the ignition sequence cycles on, and displays the "Idle Hours/Idle Gallons..Odometer" screen.

NOTE: To understand the information displayed on the message screen, here is an example of screen layout. On the "Idle Hours/Idle Gallons..Odometer" screen (see **Fig. 2**), idle hours are displayed on the top line with the words "Idle Hours" on the left side of the screen and the number of hours on the right. On the bottom line, the number of idle gallons is on the left and the odometer miles are on the right, with a space in between.

Once the parking brake is released (whether the vehicle is moving or not), the regular message screen display is the "MPG Graph/MPG Value..Odometer" screen. The MPG graph is a dynamic display graph demonstrating how the actions of the driver affect fuel economy. The graph moves to the right as fuel economy improves.

ICU ROLL CALL

NOTE: The roll call function is found only on ICUs installed with software version 8.4.0 or later (vehicles built on or after March 7, 1997).

Each time the ignition keyswitch is turned on, the ICU roll call function requests data from each ECU on the databus. If the ECU does respond to this request, the databus is communicating with that ECU and no fault code is displayed.

NOTE: Each ICU is configured to receive responses from a list of selected ECUs, as installed on that particular vehicle.

If the ECU does not respond to this request, the ICU displays an active fault code that indicates the databus is not communicating with that ECU. For sample fault codes of this type, see **Table 1**.

The roll call is initiated by the ICU, and so it is the ICU that actually reports these fault codes. Logically, a unit can not report that it is not reporting. However, for convenience in troubleshooting and to better identify the non-reporting unit, each fault code reports the MID of the non-responding ECU.

ICU Roll Call Fault Codes

Fault Code	Description
ENG Controller NoRESPONSE128s254 07	The engine ECM did not respond
Trans Controller NoRESPONSE130s254 07	The electronic transmission ECU did not respond
Brake Controller NoRESPONSE136s254 07	The antilock brake system (ABS) ECU did not respond
CMPTR Controller NoRESPONSE179s254 07	The data logging unit (DLU) did not respond
Sat1 Controller NoRESPONSE181s254 07	The Qualcomm® communications system did not respond
A/C Controller NoRESPONSE190s254 07	The air conditioning protection unit (ACPU) did not respond

General Information

ICU Roll Call Fault Codes	
Fault Code	**Description**
Radar Controller NoRESPONSE219s254 07	The VORAD collision warning system did not respond
Sat1 Controller NoRESPONSE231s254 07	The HighwayMaster® communications system did not respond

Table 1, ICU Roll Call Fault Codes

ODOMETER

The odometer is a seven-digit display with one decimal point after the sixth digit, allowing it to display tenths of miles (or kilometers). To make it more similar to mechanical odometers, the odometer always displays seven digits, including leading zeros.

Example: 000456.7

NOTE: Other features that display numbers, such as trip miles (kilometers), or miles per gallon (kilometers per liter), only display meaningful digits, and do not show the leading zeros.

When first installed, the odometer starts at 000000.0 miles (or kilometers). When replaced, the odometer does not start with the engine miles, but starts again from 000000.0 and cannot be changed, either up or down.

IMPORTANT: Although the odometer uses data supplied by the engine ECM to update its count, it keeps its own mileage starting from the zero point, which marks where it was first installed.

ALERT SCREENS

Alert screens appear when the vehicle is moving; they override the regular screen display. They are warnings, cautions, or other messages that require the driver's attention, but not all of them are critical to the operation of the vehicle.

Alert screens appear whenever the condition occurs. All priority 1 and 2 messages, plus "Turn Signal On" (priority 5) show the word "WARNING," blinking on and off, on the first line of the display.

NOTE: Warning messages always display at full brightness.

There are currently eleven alert screens arranged in seven priority levels. See **Table 2**.

Alert Screen Priority Levels	
Priority	**Alert Screen Description**
1	Park Brake On
2	Low Oil Pressure
	High Coolant Temp
	Low Coolant Level
	Low Voltage
3	Faulty Speedo Gauge
4	HVAC Recirculation Messages *
5	Turn Signal On
6	Incoming Message *
7	No Datalink Activity

* Found only on ICUs installed with software version 8.4.0 or later (vehicles built on or after March 7, 1997).

Table 2, Alert Screen Priority Levels

Priority 1 Screen

The "Park Brake On" screen overrides any other screen message. See **Fig. 3**. It comes on, with the buzzer sounding, only when the vehicle is moving at a speed greater than 2.5 miles per hour. It can be dismissed, and the buzzer turned off, only by releasing the parking brake.

NOTE: If the "Park Brake On" screen remains on after the brake is physically released, check the parking brake switch for proper function.

Priority 2 Screens

The "Low Oil Pressure" screen comes on whether the vehicle is idling or in motion. See **Fig. 4**.

The "High Coolant Temp" screen has the same priority as "Low Oil Pressure." See **Fig. 5**. The same is true of "Low Coolant Level" (see **Fig. 6**) and "Low Voltage" (see **Fig. 7**).

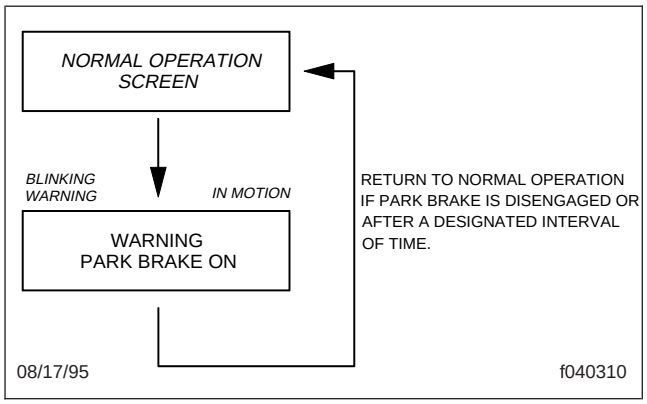


Fig. 3, Park Brake On

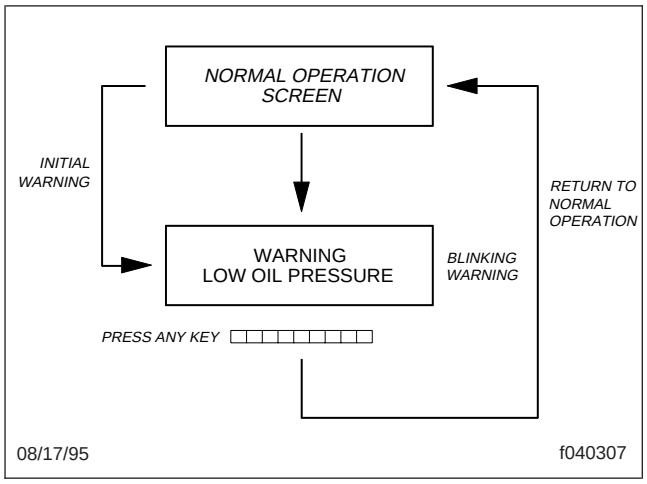

Fig. 4, Low Oil Pressure

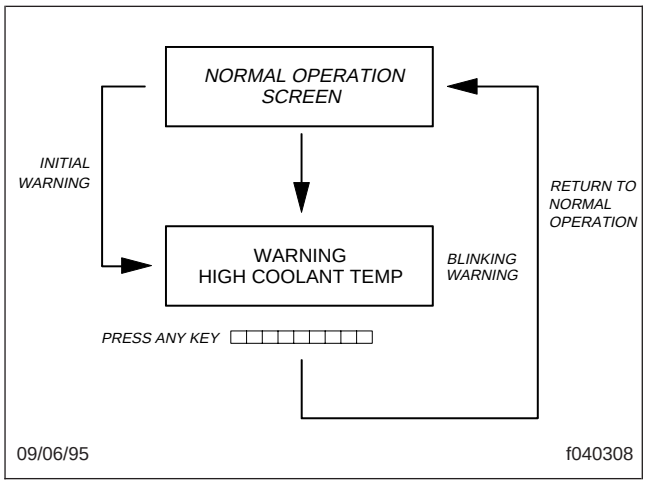

Fig. 5, High Coolant Temperature

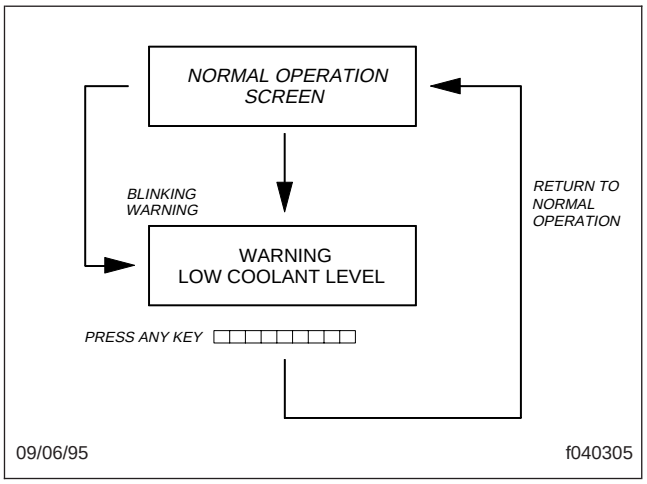

Fig. 6, Low Coolant Level

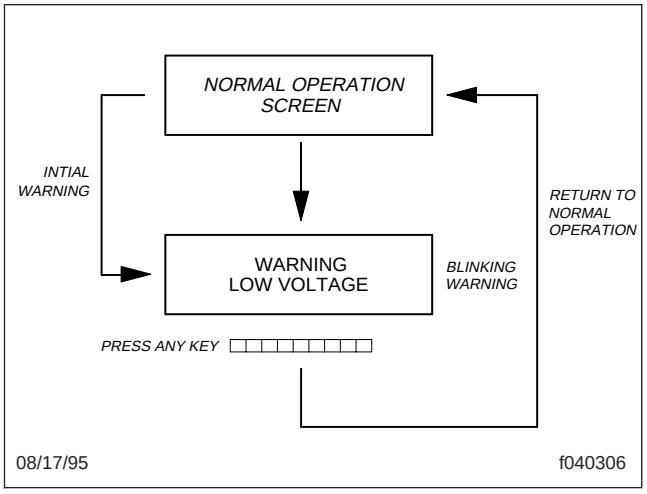

Fig. 7, Low Voltage

Priority 2 screens appear on the dash display as soon as the message is received on the datalink and remain on until any key is pressed. After a key is pressed, the message is dismissed and the dash display returns to the previous screen.

If more than one alert screen message is received, pressing any key dismisses the first message and displays the next, and so on until all the messages have been received.

After 30 seconds, the message is displayed again, and can be dismissed, as before, by pressing any key.

NOTE: Priority 2 screens do not override the ignition sequence (the sequence that runs when

the ignition keyswitch is first turned on). Instead, they are displayed as active faults. Press RIGHT ARROW to see the active faults. For more information on the ignition sequence, see "Ignition Sequence" in this subject.

Priority 3 Screen

The "Faulty Speedo Gauge" screen turns on the alternate speedometer when the ICU detects a faulty speedometer gauge. See **Fig. 8**. Once the alternate speedometer has been turned on, it replaces the "MPG Bar Graph" as the regular screen until the speedometer gauge is replaced.

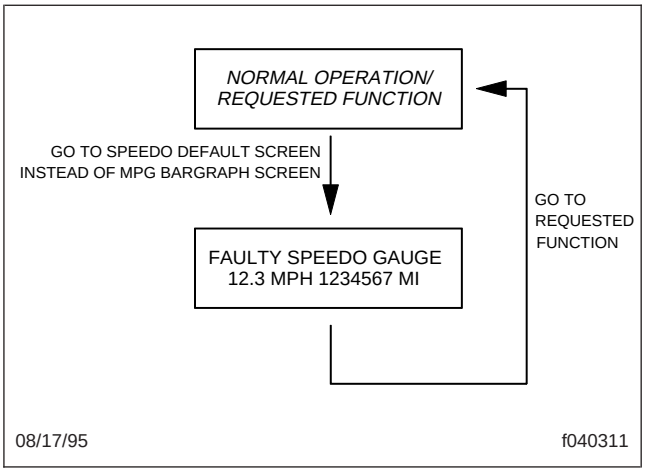

Fig. 8, Faulty Speedo Gauge, or Alternate Speedometer Screen

Priority 4 Screens

There are two HVAC (heating, ventilation, and air conditioning) recirculation screens: "Recirc Mode Engaged" and "Provide Fresh Air."

NOTE: HVAC recirculation screens appear only on ICUs installed with software version 8.4.0 or later (vehicles built on or after March 7, 1997).

The "Recirc Mode Engaged" screen comes on whenever recirculated air is selected on the fresh/air recirculation switch, or the air circulation switch is rotated to the maximum air conditioning position. See **Fig. 9**. It displays one time only for seven seconds and notifies the driver that recirculated air is being used and that fresh air needs to be provided within at least 20 minutes.

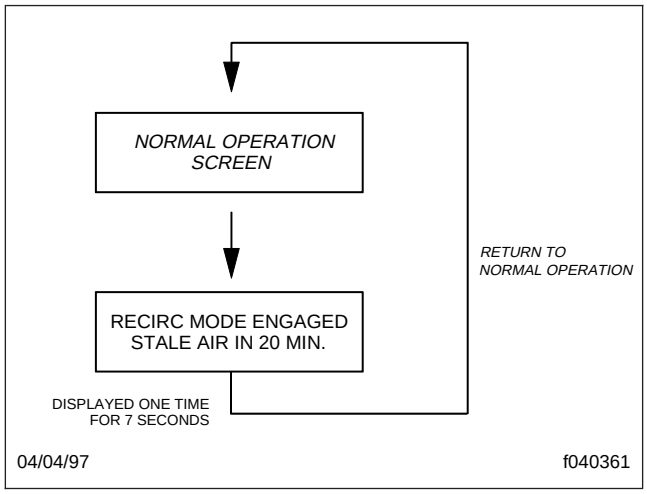

Fig. 9, Recirc Mode Engaged

If fresh air is not provided within that time span, the "Provide Fresh Air Message" is displayed. See **Fig. 10**. It displays for seven seconds every 254 seconds until the driver switches to fresh air, either by selecting fresh air on the fresh/air recirculation switch, or by rotating the air circulation switch away from maximum air conditioning and to one of the other positions.

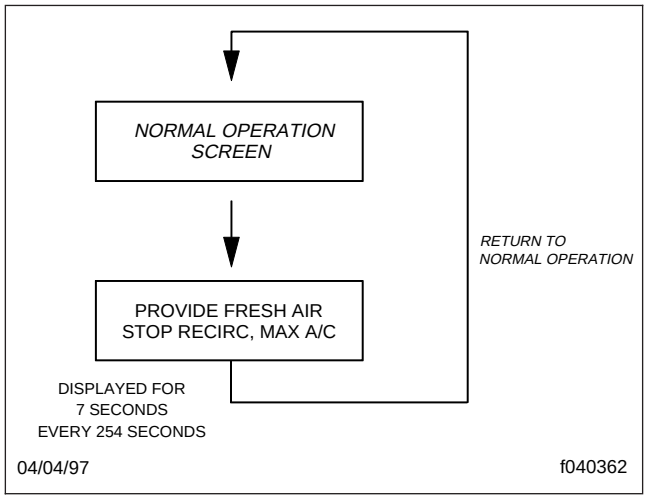

Fig. 10, Provide Fresh Air

Priority 5 Screen

The "Turn Signal On" screen is also connected to the buzzer (the buzzer connection can be disabled, if desired). See **Fig. 11**. It notifies the driver that the turn signal is on. On vehicles equipped with daytime

running lights, the daytime running light is not on when the turn signal is flashing.

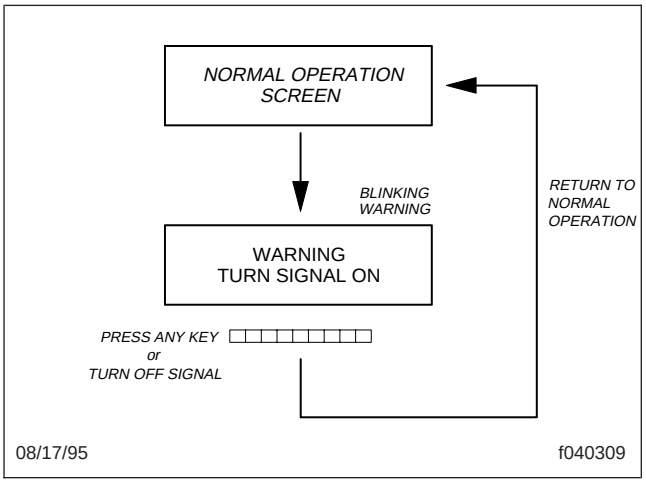

Fig. 11, Turn Signal On

To dismiss this screen, either turn off the turn signal, or press any key.

Priority 6 Screen

The "Incoming Message" screen comes on whenever the communications system receives a message. See **Fig. 12**. It displays one time only and can be dismissed by pressing any key.

NOTE: The incoming message screen appears only on ICUs installed with software version 8.4.0 or later (vehicles built on or after March 7, 1997).

NOTE: The "Incoming Message" screen also displays during the ignition sequence, in case a message came in while the vehicle was not operating.

Priority 7 Screen

The "No Datalink Activity" screen comes on whenever the datalink is not receiving data. See **Fig. 13**.

This screen is a diagnostic tool. For information on how to use this screen to check the datalink wiring, see **Troubleshooting 300**.

DIRECT ACCESS SCREENS

The driver can also override the regular screen display at any time by pressing the keypad to display

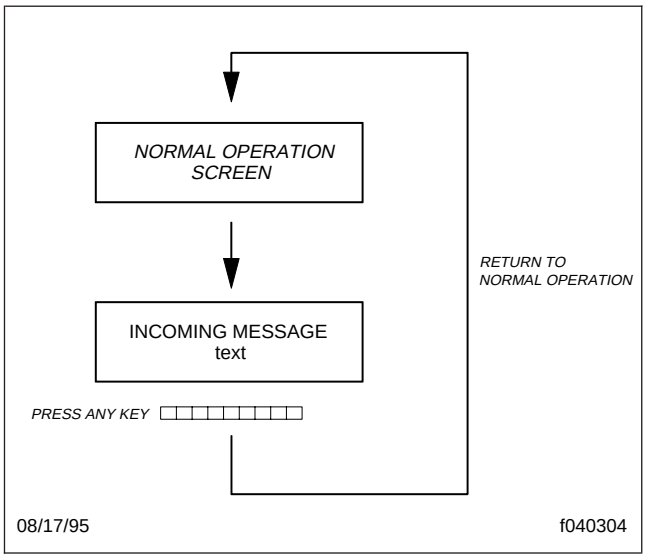

Fig. 12, Incoming Message

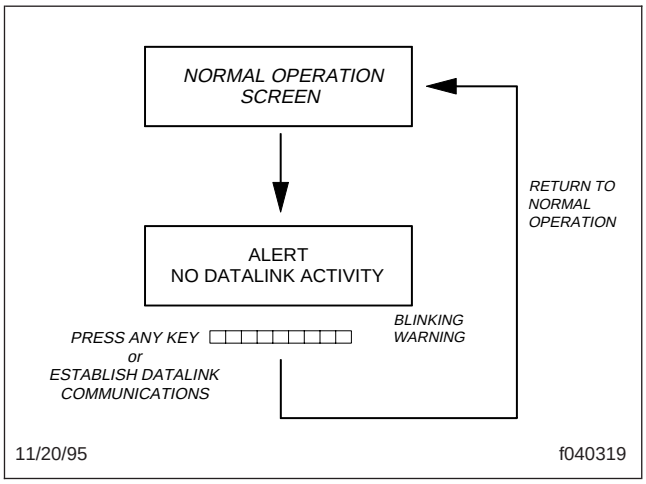

Fig. 13, No Datalink Activity

one of the direct access screens. For a list of the direct access screens, see **Table 3**.

Direct Access Screens		
Key	**Screen Contents**	**Reset?**
TRIP	TRIP MILES 123456.7 TRIP HOURS 1234:56	Yes
FUEL	FUEL USED 12345.6 AVERAGE MPG 12.34	Yes

Direct Access Screens		
Key	**Screen Contents**	**Reset?**
LEG	LEG MILES 123456.7 LEG HOURS 1234:56	Yes
EVENT	DATA BEING RECORDED	No
TEMP	OUTSIDE AIR TEMPERATURE -12F	No

Table 3, Direct Access Screens

To reset the data displayed on TRIP, FUEL or LEG screens back to zero, press the SET/RESET key twice with the screen displayed.

NOTE: Resetting "Leg Miles and Hours" also resets "Trip Miles and Hours."

Use the EVENT key to record data about a significant driving event (engine problem, driving problem, unusual vehicle operation, etc.). The other keys are used for informational purposes.

NOTE: Normally, the screen displays DATA BEING RECORDED as shown in **Table 3**. However, if the memory in the data logger is full, the screen instead displays MEMORY FULL/DATA NOT RECORDED. If the data logger is not connected or not responding, the screen displays DATA RECORDER/NOT RESPONDING. If the EVENT key was pressed recently (within the last two minutes), the screen displays STILL RECORDING/LAST EVENT.

All keys display their data for a programmable period of time. This time period is a *resetable parameter* and can be set individually for each direct access screen.

The three screens that display trip-related data (Trip, Fuel, and Leg) can have their display time reset independently of each other, to display for from one to 254 seconds at a time. Resetting the Trip, Fuel, or Leg screen in direct access also resets the display time for the corresponding screen when the vehicle is not moving. For more information, see "Stationary Access Screens."

The time of display on the other two direct access screens (Event and Temp) cannot be reset except at the factory.

STATIONARY ACCESS SCREENS

The stationary access screens are a series of informational displays that give driver, maintenance, and service information.

For reasons of safety, stationary access screens can be seen only when the vehicle is not moving and the parking brake is applied.

There are six sets of stationary access screens:

- Trip Information (see **Fig. 14**)
- Fuel Information (see **Fig. 14**)
- Engine Information (see **Fig. 14**)
- Diagnostic Information (see **Fig. 15**)
- Setup Information (see **Fig. 16**)
- Vehicle Information (see **Fig. 16**)

Each set of stationary access screens has a title screen followed by one or more data screens. To move forward and backward through these screens, use the three arrow keys as shown in **Fig. 14**, **Fig. 15**, and **Fig. 16**.

Trip Information

Trip information provides three data screens: "Trip Miles and Hours," "Idle Hours and Average MPH," and "Leg Miles and Hours." See **Fig. 14**.

"Trip Miles and Hours" displays the number of miles and hours driven since the start of the trip. At the start of a trip, press RESET (SET/RESET twice) to set trip miles and hours back to zero.

NOTE: Resetting "Trip Miles and Hours" also resets "Idle Hours and Average MPH."

"Idle Hours and Average MPH" displays the hours spent idling and the average miles per hour.

"Leg Miles and Hours" records the number of miles and hours driven since the start of the leg. At the start of a new leg, press RESET to set leg miles and hours back to zero.

NOTE: Resetting "Leg Miles and Hours" also resets "Trip Miles and Hours."

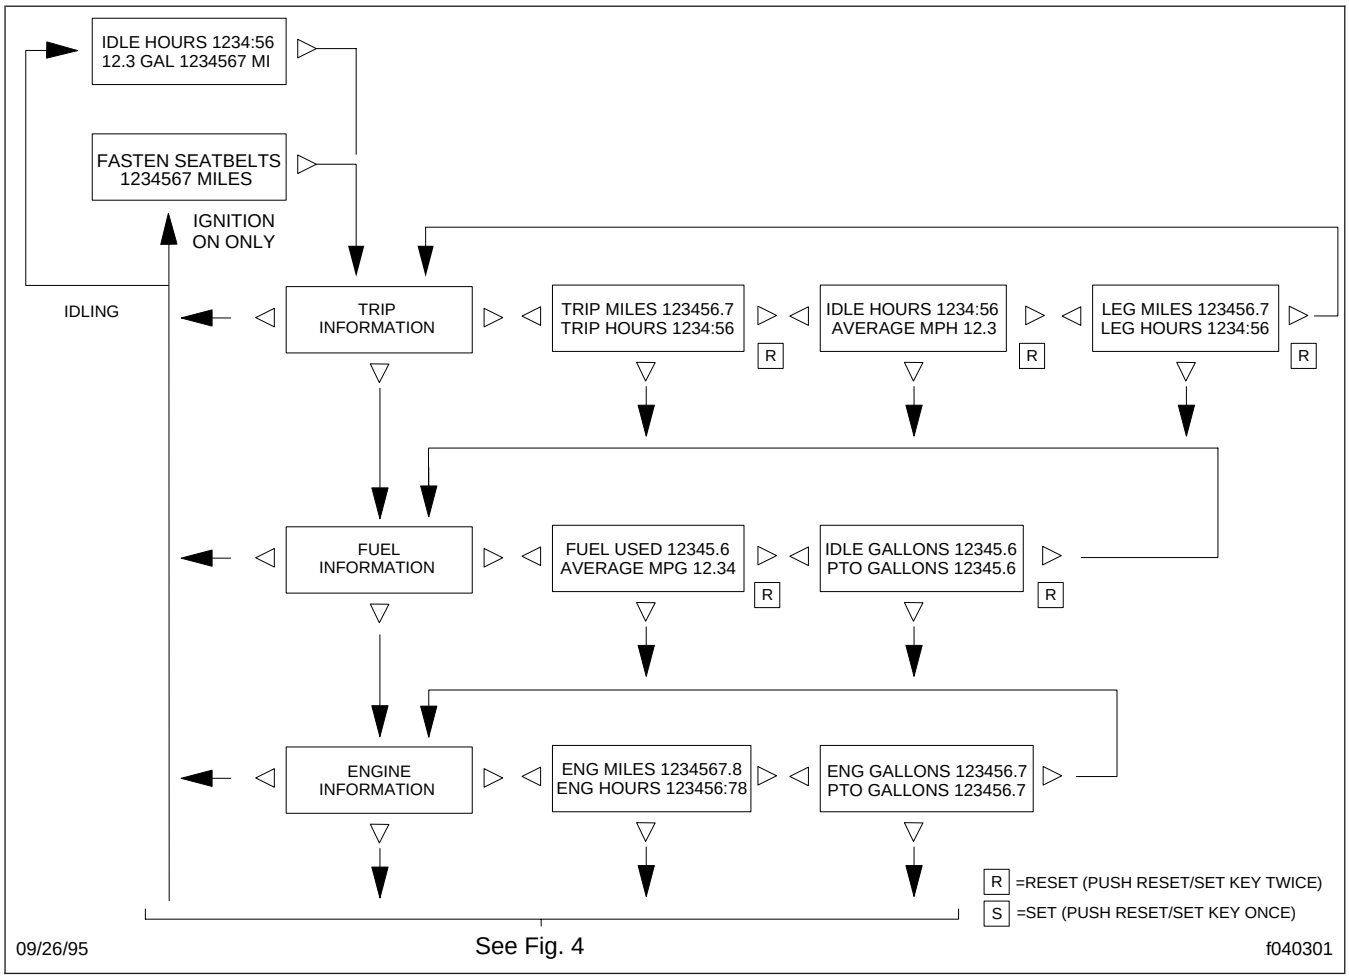

Fig. 14, Trip Information, Fuel Information, and Engine Information

Fuel Information

Fuel information provides two data screens: "Fuel Used and Average MPG," and "Idle Gallons and PTO Gallons." See **Fig. 14**.

"Fuel Used and Average MPG" displays the gallons of fuel used since the last reset. At the start of a trip, after refueling, or whenever desired, press RESET (SET/RESET twice) to set fuel used and average miles per gallon back to zero.

NOTE: Resetting "Trip Miles and Hours" does not also reset "Fuel Used and Average MPG" or "Idle Gallons and PTO Gallons." Fuel Information must be reset separately.

"Idle Gallons and PTO Gallons" displays the gallons of fuel used idling and to operate the Power Take Off unit (if installed). At the start of a trip or whenever desired, press RESET to set idle gallons and PTO gallons back to zero.

Engine Information

Engine information provides two data screens: "Engine Miles and Hours," and "Engine Gallons and PTO Gallons." See **Fig. 14**.

"Engine Miles and Hours" displays the total miles and hours logged by the engine since installation.

General Information

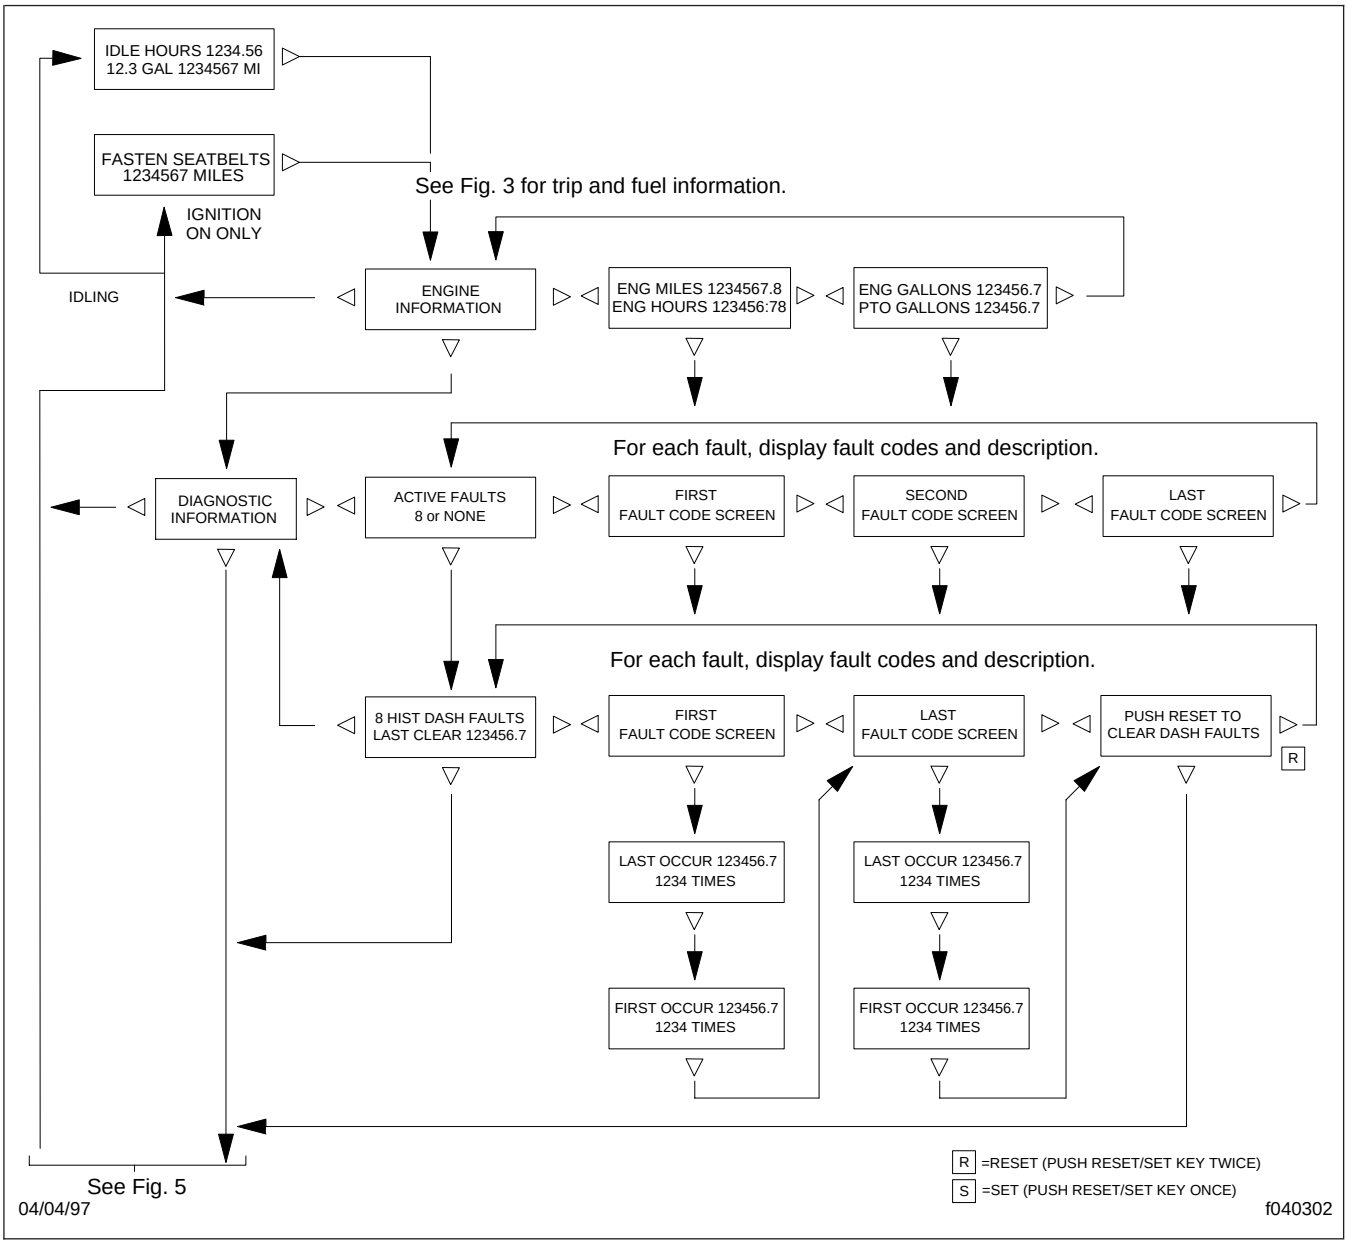

Fig. 15, Engine Information and Diagnostic Information

NOTE: Engine information is supplied by the engine Electronic Control Module (ECM). It cannot be reset except when installing a new engine.

"Engine Gallons and PTO Gallons" displays the gallons of fuel used by the engine and PTO since installation.

Diagnostic Information

Diagnostic information provides two sets of data screens: "Active Faults," followed by a separate screen for each fault until all have been shown; and "Historical Dash Faults," also followed by a separate screen for each fault until all have been shown. See **Fig. 15**.

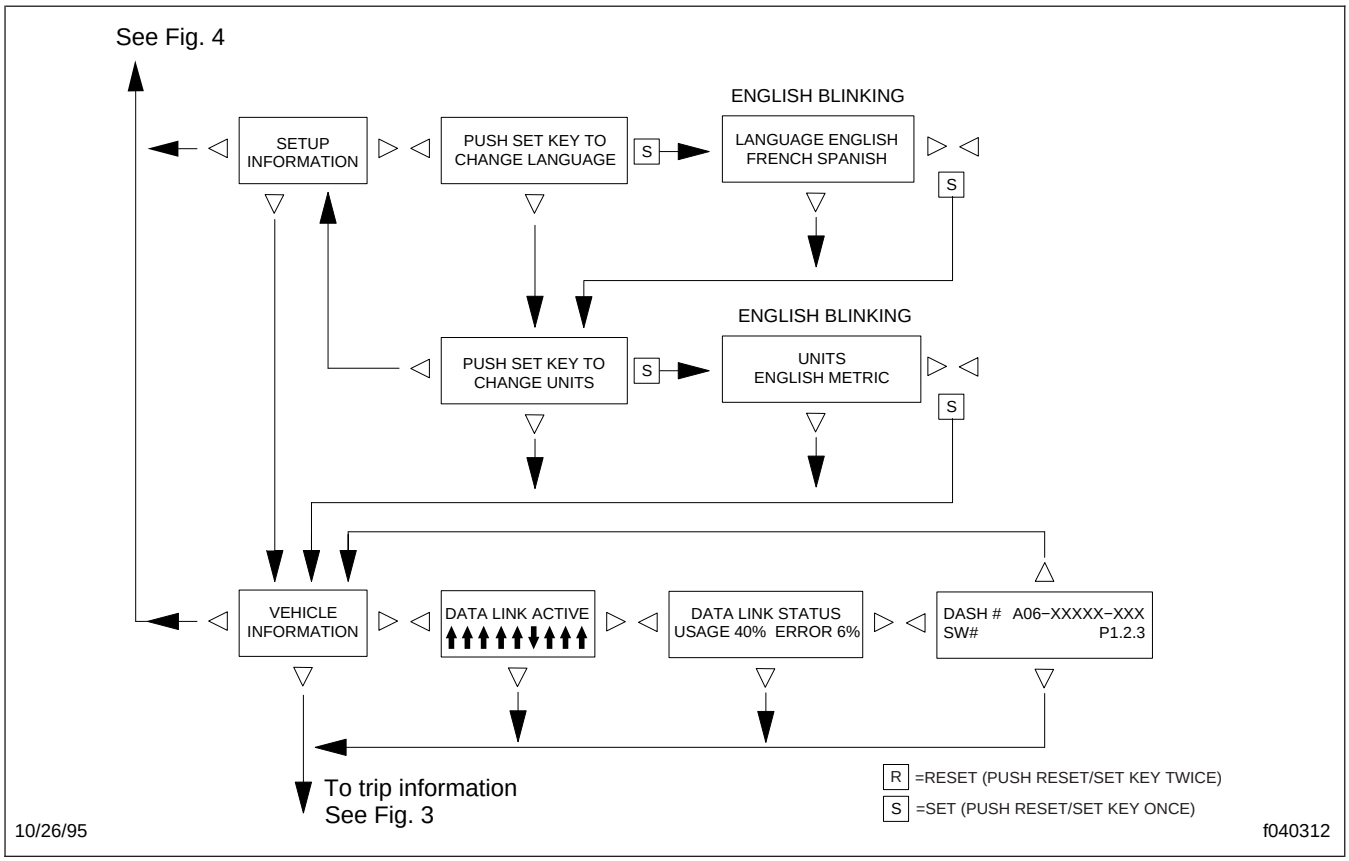

Fig. 16, Setup Information and Vehicle Information

"Active Faults" cannot be reset. Active faults can be cleared only by correcting the fault.

"Historical Dash Faults" displays all dash faults since the last reset. The second line of the display shows the mileage the last time faults were cleared.

Setup Information

Setup information allows the user to change the language of the display (English, French, or Spanish), and the units of measurement (English/US conventional or metric).

When prompted by the screen, press SET (push the SET/RESET key once). The units that are settable will be blinking. Use the arrow keys (LEFT, RIGHT, and DOWN) until the display shows the desired setup. See **Fig. 16**.

Vehicle Information

Vehicle information displays important vehicle information, including datalink activity and status, ICU part number, and software identification number.

The "Datalink Active" screen is a dynamic display that shows if the datalink unit is active at the given time. If all the arrows are pointing down, the ICU has not received any information on the datalink since the last time the ignition keyswitch was turned on.

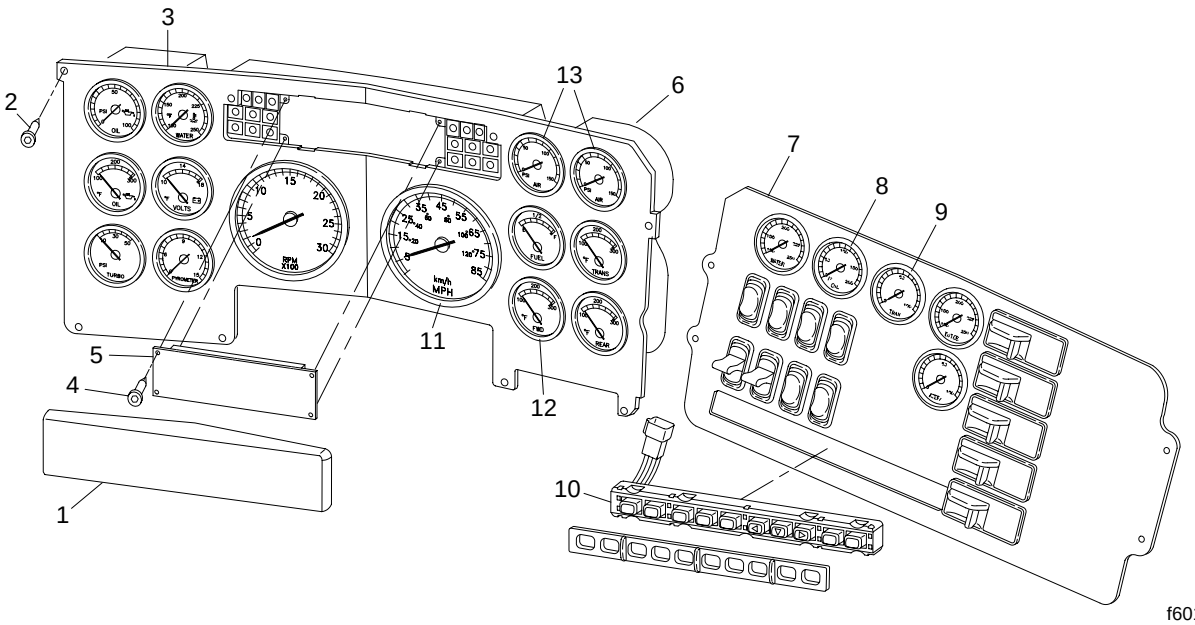
The "Datalink Status" screen is also dynamic, showing current datalink use and error rate. The other screen, which shows the ICU part number and the software identification number, is informational only. See **Fig. 16**.

After vehicle information, pressing the DOWN ARROW takes you back to trip information, and so on.

Instrumentation Control Unit and Auxiliary Instrument Panel Replacement

Instrumentation Control Unit Replacement

The ICU includes the driver's instrument panel, the ICU housing, and the Driver Message Center (all installed as one unit). Input to the ICU comes from the keypad and the electronic gauges. See **Fig. 1**.



11/06/98 f601737

1. Message Center Bezel
2. Dog-Point Screw
3. Driver's Instrument Panel (A-panel)
4. Display Screen Screw
5. Dash Driver Display Screen
6. ICU Housing
7. Auxiliary Instrument Panel
8. Electrical or Electronic Gauge (B-panel mounted)
9. Mechanical Gauge (B-panel mounted)
10. Keypad
11. Electronic Gauge (large face)
12. Electronic Gauge (small face)
13. Mechanical Gauge (A-panel mounted)

Fig. 1, Instrumentation Control Unit

To replace a complete ICU with a new set of gauges, see "ICU (With Gauges)." To replace an ICU and reinstall the old set of gauges, see "ICU (Without Gauges)."

To replace individual gauges, switches, or flipper valves, see **Subject 110**. To replace light bulbs (gauge light, or warning and indicator light), see **Subject 120**. To replace the warning buzzer, see **Subject 130**. To replace the dash driver display screen, see **Subject 140**. To replace the keypad, see **Subject 150**.

ICU (With Gauges)

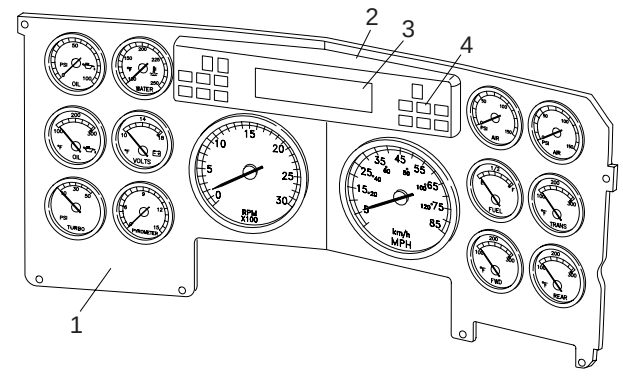
1. Remove the left-hand dash panels. Be sure the screws attaching the dash panel trimtop to the upper dash assembly have been removed. For instructions, see **Section 60.08**.
2. Remove the screw attaching the dash panel trimtop to the lower dash panel. This screw is located on the far left of the trimtop.

CAUTION

Electronic components of the ICU are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU circuitry.

Instrumentation Control Unit and Auxiliary Instrument Panel Replacement

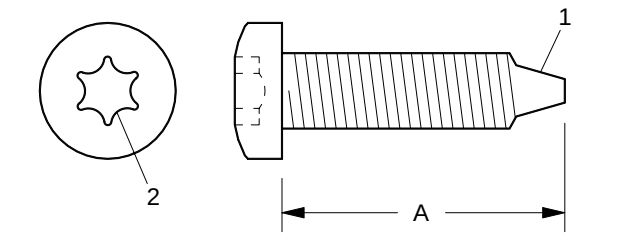
3. Remove the fasteners from the driver's instrument panel. See **Fig. 2**. Fasteners used on the ICU are T25 Torx-head dog-point screws. See **Fig. 3**.



09/27/95 f600991

1. Driver's Instrument Panel (A-panel)
2. Driver Message Center
3. Dash Driver Display Screen
4. Warning and Indicator Lights

Fig. 2, Driver's Instrument Panel



08/31/95 f230045

A. 3/4 Inch (19 mm)
1. Dog Point
2. Torx Head

Fig. 3, Dog-Point Screw

3.1 Remove the bezel from the Driver Message Center, exposing the two screws underneath it. For more information, see **Subject 140**.

3.2 Remove the two screws underneath the Driver Message Center bezel.

3.3 Remove the four screws on the bottom of the driver's panel.

3.4 Remove the two screws on the sides of the driver's panel.

CAUTION

When removing the ICU, the wiring harness may have to be loosened before the driver's panel can be pulled free of the dash. Do not forcibly pull the driver's panel from the dash. This may disconnect wires from the harness electrical connectors on the back of the ICU housing and damage them.

4. Pull the ICU away from the dash.

4.1 From behind the ICU housing, disconnect the four color-coded electrical connectors.

4.2 Disconnect all air hoses. Using a paint pen, mark the hoses for ease of installation.

4.3 Remove the ICU from the dash.

5. Remove the ICU from the dash. See **Fig. 4**.

5.1 Remove the three screws and speed nuts attaching the dash panel trimtop to the ICU.

5.2 Install the dash panel trimtop on the new ICU.

6. Install the ICU on the dash.

6.1 Connect the air hoses to the air gauges as marked on removal.

6.2 Connect the four color-coded electrical connectors, as removed.

6.3 Place the new ICU in the dash and install the fasteners. Be sure to install the fasteners that attach the dash panel trimtop to the upper dash assembly and lower dash panel.

IMPORTANT: A typical warning and indicator light layout is shown in **Fig. 5**.

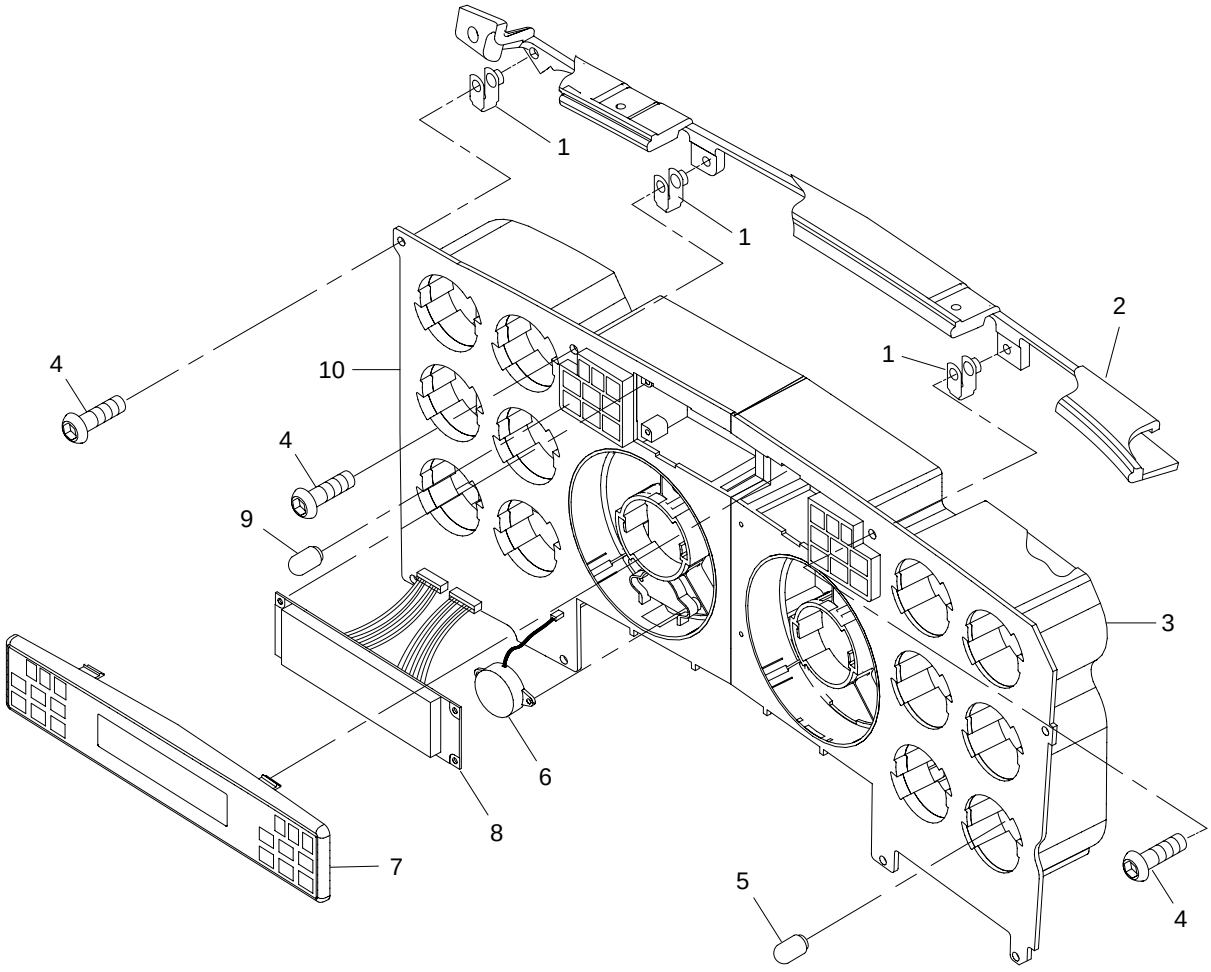
7. Install the Driver Message Center. See **Fig. 5**.

7.1 Remove the bezel from the Driver Message Center on the old ICU.

CAUTION

Be careful not to scratch the bezel. Scratches on the inside of the bezel are visible from the front.

Instrumentation Control Unit and Auxiliary Instrument Panel Replacement



04/18/97 f601357

NOTE: Gauges have been removed.

1. Speed Nut
2. Dash Panel Trimtop
3. ICU Housing, RH
4. T25 Dog-Point Screw
5. Gauge Light Bulb
6. Buzzer
7. Message Center Bezel
8. Dash Display Screen
9. Warning and Indicator Light Bulb
10. ICU Housing, LH

Fig. 4, ICU Housing

7.2 Snap the old message center bezel into place on the new ICU.

8. Check the gauge layout of the new unit and compare it to the old unit.

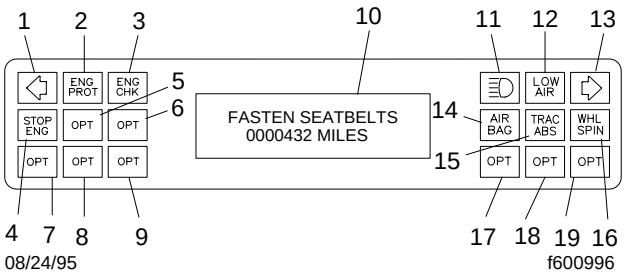
8.1 If any positions are different, replace the gauge for that position with the correct gauge from the old unit. For gauge replacement procedures, see **Subject 110**.

8.2 Reconfigure the ICU to its original factory settings. For instructions, see **Subject 160**.

NOTE: Mechanical (air) gauges do not make a sweep.

9. Turn on the ignition and test the operation of the new ICU. All the electronic gauges (except the voltmeter) should make one complete sweep and

Instrumentation Control Unit and Auxiliary Instrument Panel Replacement



Typical installation shown. Location and function of optional lights may vary.

1. Left Turn Indicator
2. Engine Protection Warning & Indicator
3. Check Engine Indicator
4. Stop Engine Warning (Cummins engine only)
5. ECAS Failure Warning (optional)
6. ECAS Transfer Indicator (optional)
7. Trailer ABS Warning (optional)
8. Alternator No Charge Warning (optional)
9. Automatic Transmission Warning (optional)
10. Dash Driver Display Screen
11. High Beam Indicator
12. Low Air Warning
13. Right Turn Indicator
14. Air Bag Warning (optional)
15. Tractor ABS Warning
16. Wheel Spin Warning
17. Optional Indicator 6
18. Low Voltage Warning (optional)
19. Optional Indicator 8

Fig. 5, Driver Message Center

return to their normal indicating positions; the warning and indicator lights should turn on, then off.

If any gauges are not working properly, they will need to be serviced or replaced.

ICU (Without Gauges)

1. Remove the left-hand dash panels. For instructions, see **Section 60.08**.
2. Remove the fasteners from the driver's instrument panel and dash panel trimtop. See **Fig. 2**. Fasteners used on the ICU are 10-16 Torx-head dog-point screws. See **Fig. 3**.

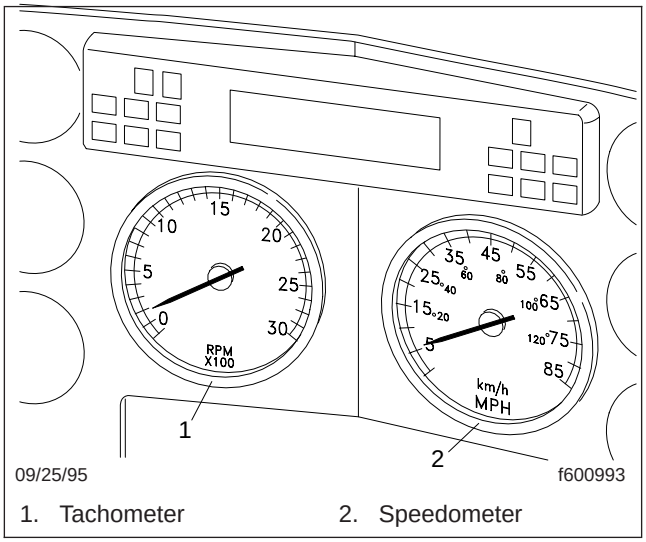
   2.1 Remove the bezel from the Driver Message Center, to expose the two screws underneath it. Remove these two screws.

   2.2 Remove the four screws on the bottom of the driver's panel.

   2.3 Remove the two screws on the sides of the driver's panel.

3. Note the gauge layout for later installation. Any gauge pigtails that have been rerouted on the disconnected ICU will have to be changed on the new ICU. Remove all the gauges. For instructions, see **Subject 110**. Set aside the gauges for later installation in the new panel.

   3.1 Remove the two large-face gauges from the center of the driver's panel. See **Fig. 6**.



1. Tachometer 2. Speedometer

Fig. 6, Driver's Panel Gauge Layout -- Typical (large-face gauges)

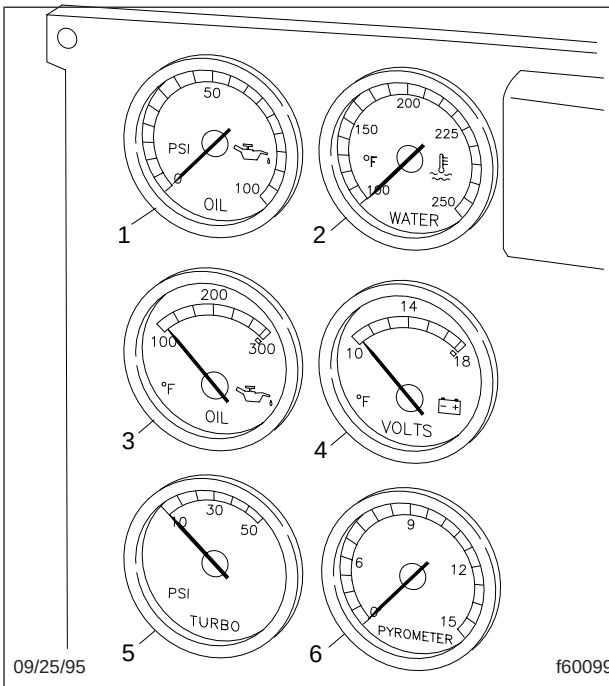
   3.2 Remove the small-face gauges (six maximum) from the left-hand side of the driver's panel. See **Fig. 7**.

   3.3 Remove the small-face gauges (six maximum) from the right-hand side of the driver's panel. See **Fig. 8**.

⚠ CAUTION

Do not lay gauges face down for long periods of time. The electronic gauges use an oil-dampening fluid that leaks out when the gauge is face down, causing dial movement to become erratic.

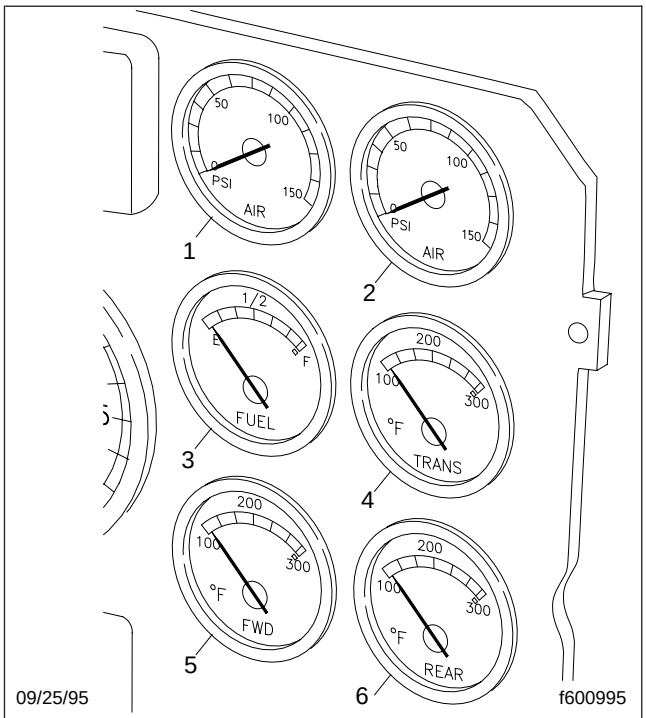
Instrumentation Control Unit and Auxiliary Instrument Panel Replacement



Gauge layouts may vary. To work properly, gauges must be installed in their correct locations or the pigtails must be rerouted.

1. Oil Pressure Gauge
2. Water Temperature Gauge
3. Oil Temperature Gauge (optional)
4. Voltmeter
5. Turbo Air Pressure Gauge (optional)
6. Pyrometer (optional)

Fig. 7, Driver's Panel Gauge Layout -- Typical (left-hand side)



Gauge layouts may vary. To work properly, gauges must be installed in their correct locations.

1. Primary Air Pressure Gauge
2. Secondary Air Pressure Gauge
3. Fuel Gauge
4. Transmission Fluid Temperature Gauge (optional)
5. Forward Axle Temperature Gauge (optional)
6. Rear Axle Temperature Gauge (optional)

Fig. 8, Driver's Panel Gauge Layout (right-hand side)

4. Remove the ICU from the dash. See **Fig. 4**.
   - 4.1 Remove the three screws and speed nuts attaching the dash panel trimtop to the ICU.
   - 4.2 Install the dash panel trimtop on the new ICU.
5. Install a new ICU in the dash.
   - 5.1 Install all the fasteners as removed, including the fasteners attaching the dash panel trimtop to the upper dashassembly and lower dash panel.
   - 5.2 Install all gauges in the positions from which they were removed. Insert each gauge into its correct hole and twist clockwise about 1/8 turn, until seated.
6. Snap the Driver Message Center bezel into place, using the four small tabs on the sides of the bezel.

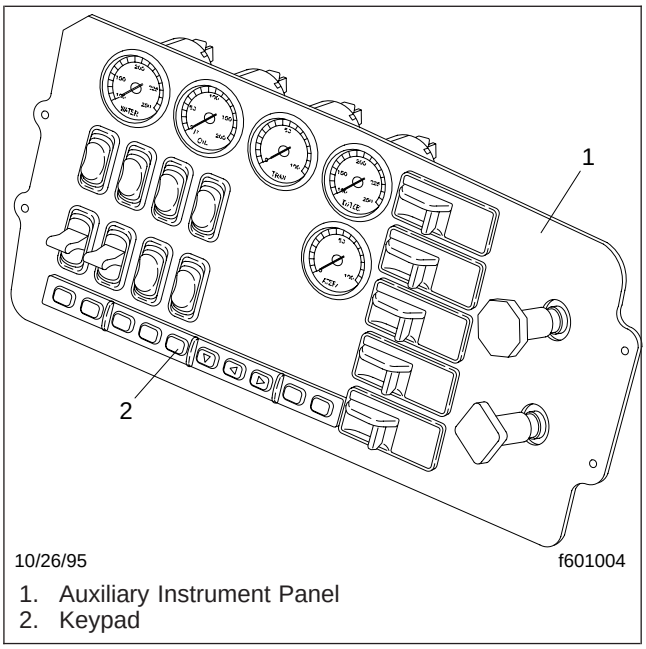
NOTE: Mechanical (air) gauges do not make a sweep.

7. Turn on the ignition and test the operation of the gauges. All the electronic gauges (except the voltmeter) should make one complete sweep and return to their normal indicating positions; the warning and indicator lights should turn on, then off.
8. Reconfigure the ICU to its original factory settings. For instructions, see **Subject 160**.

Instrumentation Control Unit and Auxiliary Instrument Panel Replacement

Auxiliary Instrument Panel Replacement

1. Remove the dash panel. For instructions, see the applicable subject in **Section 60.08**.
2. Remove the fasteners from the auxiliary instrument panel. See **Fig. 9**.



1. Auxiliary Instrument Panel
2. Keypad

Fig. 9, Auxiliary Instrument Panel

2.1 Remove the two screws from the left-hand side of the auxiliary panel.

2.2 Remove the two screws from the right-hand side of the auxiliary panel.

CAUTION

When removing the auxiliary panel, the wiring harness may have to be loosened before the panel can be pulled free of the dash. Do not forcibly pull the auxiliary panel from the dash. This may disconnect wires from the harness electrical connectors on the back of the auxiliary panel and damage them.

3. Pull the auxiliary panel away from the dash. See **Fig. 9**.

3.1 From behind the auxiliary panel, disconnect the electrical connectors from the keypad and each flipper valve. Using a paint pen, mark the connectors for ease of installation.

3.2 From behind the auxiliary panel, disconnect the electrical connectors from each rocker or paddle switch. Using a paint pen, mark the connectors and switches for ease of installation.

3.3 Disconnect all air hoses from the flipper valves and mechanical gauges. If not color-coded, use a paint pen to mark the hoses, valves and gauges for ease of installation.

3.4 Remove the keypad bezel. For instructions, see **Subject 150**.

4. Remove the auxiliary panel from the vehicle. Note the gauge, switch and flipper valve layout for later installation and remove all the panel components (gauges, gauge housings, switches and valves). For instructions, see **Subject 110**. Set aside the panel components for later installation in the new panel.
5. Install a new auxiliary panel. Install all gauges, switches and valves in the positions from which they were removed. For instructions on gauge, switch, and valve installation, see **Subject 110**.

5.1 Connect the air hoses to the air gauges, as marked on removal.

5.2 Connect the electrical connectors, as marked on removal.

5.3 Place the new auxiliary panel on the dash and install the fasteners.

5.4 Install the keypad bezel. For instructions, see **Subject 150**. Tug gently on the bezel to make sure the retainer hooks have snapped into position.

6. Turn on the ignition and the air system and test the operation of the gauges.

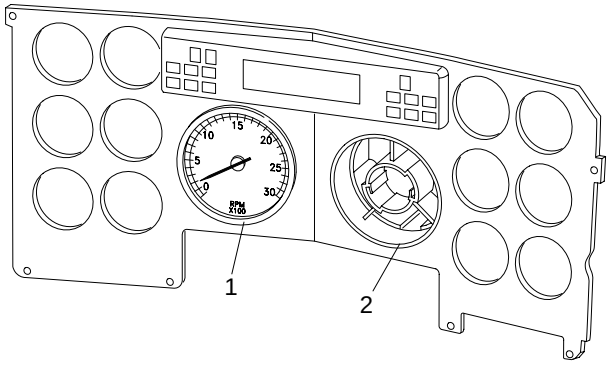
   Test each switch and flipper valve for correct operation.

Gauge Replacement

First, determine if the gauge to be replaced is an electronic or mechanical gauge. There are different procedures for electronic and mechanical gauges.

ELECTRONIC GAUGES

For large-face gauges, such as the speedometer or tachometer, and for small-face gauges located in the A-panel, see **Fig. 1**. For small-face electronic gauges located in the auxiliary panel, such as the voltmeter or fuel gauge, see **Fig. 2**.



10/26/95 f601008

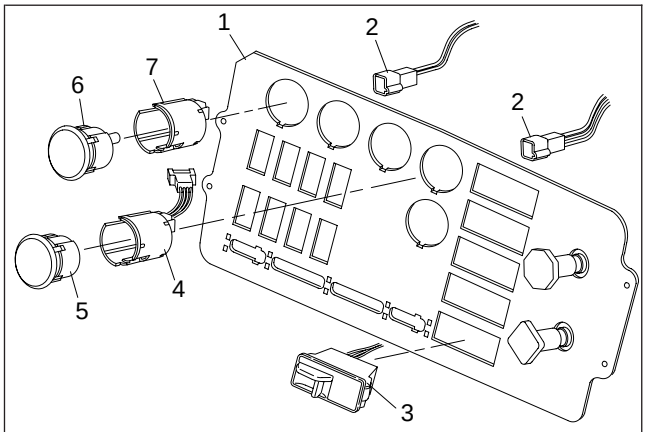
Be sure to note gauge location and gauge pigtail location before removal. Gauges will not function correctly if moved to a new location unless the gauge pigtail can be routed to the new location.

1. Large-Face Gauge
2. Large-Face Gauge Removed

Fig. 1, Large-Face Gauge Replacement

IMPORTANT: Be sure to note gauge location before removal. A-panel gauges will not function correctly if moved to a new location, unless the gauge pigtail connection can be moved to the new position. B-panel gauge locations can be changed only if the gauge housing is also moved.

1. Grasp the gauge bezel with the fingertips and twist it counterclockwise until it comes free of the panel. Pull the gauge straight out of its housing.



11/06/98 f601738

Be sure to note gauge and flipper valve location before removal. Gauges and flipper valves will not function correctly if moved to a new location with changing the wire routing.

1. Auxiliary Instrument Panel
2. Main Cab Harness Connector
3. Flipper Valve
4. Electronic Gauge Housing (auxiliary panel only)
5. Electronic Front-Removable Gauge
6. Mechanical Front-Removable Gauge
7. Mechanical Gauge Housing (auxiliary panel only)

Fig. 2, Small-Face Gauge, Gauge Housing, and Flipper Valve Replacement

CAUTION

Be careful not to pinch the wires of the electrical harness. Pinched wires can cause the gauge to malfunction.

2. Disconnect the 4-wire pigtail harness from the gauge. Be careful not to pinch or kink any wires.

CAUTION

Do not lay gauges face down for long periods of time. The electronic gauges use an oil-dampening fluid that leaks out when the gauge is face down, causing dial movement to become erratic.

3. Insert the new gauge carefully into the opening in the panel. When fully inserted, grasp the bezel with fingertips and twist clockwise until the gauge clicks into position. Tug gently at the gauge to be sure it is properly seated.

4. When finished, turn on the ignition and test the operation of the new gauge(s). All the electronic gauges (except the voltmeter) should make one complete sweep and return to their normal indicating positions; the warning and indicator lights should turn on, then off.

MECHANICAL GAUGES (see Fig. 2)

IMPORTANT: Be sure to note gauge location before removal. Air gauges will not function correctly if moved to a new location unless the air hose for the gauge is also moved to the new location.

1. Grasp the gauge bezel with the fingertips and twist it counterclockwise until it comes free of the panel. Pull the gauge straight out of its housing.

⚠ WARNING

Remove the compressed air from the air tanks before disconnecting the hoses to the air gauges. Failure to do so could cause the hoses to move uncontrollably and cause personal injury or damage to the equipment.

2. Remove the air hose from the gauge.
   - 2.1 Carefully pull the hose out through the panel housing.
   - 2.2 While holding the gauge in the palm of one hand, press on the colored collar around the hose. Remove the hose with the free hand.
3. Install the air hose in the new gauge.
   - 3.1 Insert the hose into the colored collar. Push on it gently to seat it, being careful not to kink the hose.
   - 3.2 Tug firmly on the hose to be sure it is well gripped by the collar.
   - 3.3 Lead the hose carefully back into the panel housing, being careful not to kink it.
4. Insert the new gauge carefully into the opening in the panel. When fully inserted, grasp the bezel with fingertips and twist until the gauge clicks into position. Tug gently at the gauge to be sure it is properly seated.
5. When finished, turn on the ignition (for air gauges, turn on the air system) and test the operation of the new gauge(s).

B-PANEL GAUGE HOUSINGS

(see Fig. 2)

1. Remove the gauge. For procedures, see either "Electronic Gauge Replacement" or "Mechanical Gauge Replacement."
2. Remove the old front-removable gauge housing. From the back of the panel, unplug the main cab harness electrical connector from the gauge housing.
3. Install a new front-removable gauge housing.
   - 3.1 Install the electrical connector to the gauge housing.
   - 3.2 Place the tab on the back of the housing at 6 o'clock.
   - 3.3 Slide the housing into the panel from the front.
   - 3.4 Press in firmly until the housing snaps into position.
4. Install the gauge. For procedures, see either "Electronic Gauge Replacement" or "Mechanical Gauge Replacement."
5. When finished, turn on the ignition and test the operation of the new gauge(s). All the electronic gauges (except the voltmeter) should make one complete sweep and return to their normal indicating positions; the warning and indicator lights should turn on, then off.

Flipper Valve Replacement

(see Fig. 2)

IMPORTANT: Be sure to note flipper valve location before removal. If moved to a new location, flipper valves will not function correctly without also relocating the associated hoses.

1. From the back of the valve, unplug the electrical connector. Hold on to the connector and avoid pulling on the wires.
2. Disconnect the air supply and distribution hoses.

⚠ WARNING

Relieve pressure in the compressed air tanks before attempting to remove any air hoses. A sudden release of air pressure can cause injury to eyes and ears. The disconnected ends of pressurized air hoses can move uncontrollably and cause personal injury or equipment damage.

2.1 If not color-coded, use a paint pen to mark the air supply and distribution ports and hoses for ease of installation.

2.2 Disconnect the air supply and distribution hoses.

2.3 Label and remove any jumper hoses.

3. To remove the old valve, press the retainer tab on the right side of the valve. While holding the retainer tab, gently roll the valve towards the left and out the front of the panel.

4. To install the new valve, align the groove on the left side of the valve with the cutout on the instrument panel and slip into place. Then roll the right side into the cutout until the valve snaps into place. Tug on the valve firmly to make sure it is properly seated.

5. Connect the air hoses and electrical connectors.

5.1 Support the valve on the front of the panel with one hand.

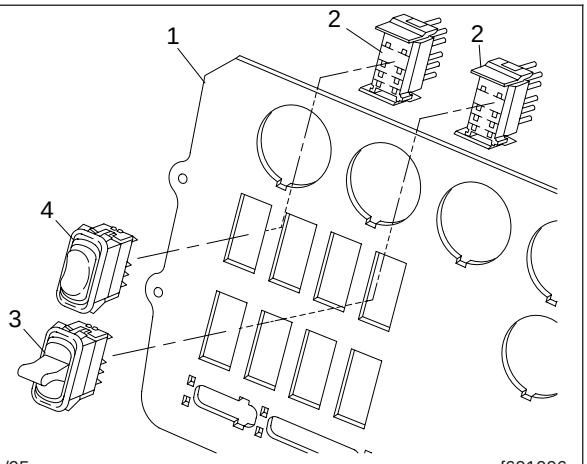
5.2 With the other hand, connect the air supply and distribution hoses as marked on removal. Connect any jumper hoses as marked.

5.3 While still supporting the valve with one hand, connect the electrical connector.

6. When finished, turn on the ignition and test the new flipper valve(s) for correct operation.

Rocker and Paddle Switch Replacement (see Fig. 3)

IMPORTANT: Be sure to note switch location before removal. If moved to a new location, switches will not function correctly without also relocating the associated wiring.



1. Auxiliary Instrument Panel
2. Switch Connector
3. Paddle Switch
4. Rocker Switch

Fig. 3, Rocker and Paddle Switch Replacement

1. From the back of the panel, unplug the electrical connector. Hold on to the connector and avoid pulling on the wires.

2. Remove the old switch(es) from the panel.

2.1 If more than one switch is to be replaced, use a paint pen to mark the switch location and connector, for ease of installation.

2.2 From the back of the panel, depress the two locking clips and pull the switch out the front of the panel.

3. Install the new switch(es) in the panel.

3.1 Make sure the top of the switch is up when installed.

3.2 Press the switch into the panel from the front until it clicks into place. Tug firmly on the switch to make sure it is properly seated.

3.3 While supporting the switch with one hand, connect the electrical connector with the other. Be sure the locking tabs on the switch mesh with those on the connector.

4. When finished, turn on the ignition and test the new switch(es) for correct operation.

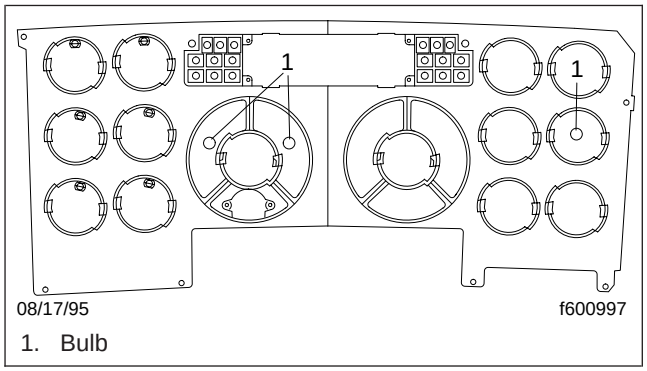
This subject covers bulb replacement for gauges and for the warning and indicator lights.

Gauge Light Bulb Replacement

1. Remove the gauge. For instructions, see **Subject 110**.

NOTE: Small gauge bulbs are the same size as warning and indicator light bulbs. Large gauges have larger light bulbs.

2. Remove the old bulb by grasping it with the fingers and pulling until it comes out. There are two bulbs in large-face gauges, and one bulb in small-face gauges. See **Fig. 1**.



1. Bulb

Fig. 1, Gauge Light Bulb Replacement

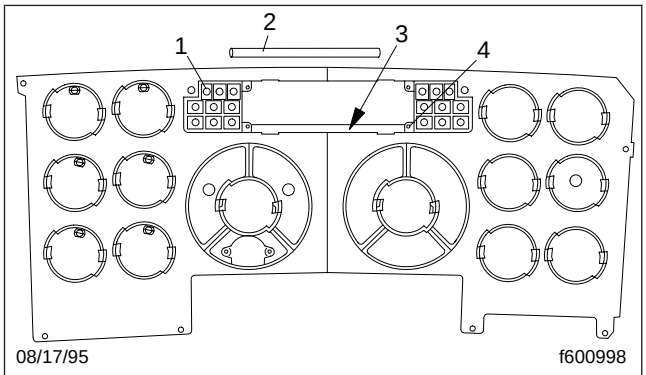
NOTE: If broken, the bulbs in the large-face gauges may be removed by twisting the bulb socket on the back of the ICU and removing the socket through the hole in back shield of the housing.

3. Install the new bulb by inserting it into the correct bulb socket and pushing it until it seats. Gently tug on the bulb to make sure it is properly seated.
4. Install the gauge. For instructions, see **Subject 110**.
5. Turn on the dash lights and check the new bulb(s) for proper operation.

Warning and Indicator Light Bulb Replacement

NOTE: Small gauge bulbs are the same size as warning and indicator light bulbs.

1. Remove the Driver Message Center bezel. For instructions, see **Subject 140**.
2. Retrieve the bulb replacement tool from its housing underneath the bezel. See **Fig. 2**.



1. Bulb
2. Bulb Replacement Tool
3. Replacement Tool Housing
4. Screw

Fig. 2, Warning and Indicator Light Bulb Replacement

3. Remove the old bulb from its socket.
   - 3.1 Gently press the tool onto the bulb until it fits snugly.
   - 3.2 Pull the tool outward to free the bulb from its socket.
   - 3.3 Remove the bulb from the tool when it is free of the socket. Hold the bulb with one hand and twist the tool with the other hand.
4. Insert the new bulb in the socket.
   - 4.1 Insert the new bulb into the end of the replacement tool.
   - 4.2 Gently push the new bulb into the socket until it seats. Gently twist while pulling outward on the tool to free it from the bulb.
5. Return the bulb replacement tool to its housing underneath the bezel. See **Fig. 2**.

ICU Bulb Replacement

6. Install the Driver Message Center bezel. For instructions, see **Subject 140**.
7. Turn on the dash lights and check the new bulb(s) for proper operation.

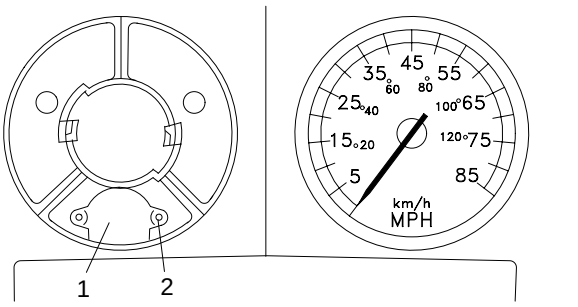
Replacement

1. Remove the tachometer from the driver's instrument panel. For procedures, see **Subject 110**.

CAUTION

Electronic components of the ICU are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU circuitry.

2. The buzzer sits in the lower portion of the tachometer housing. Remove the old buzzer by unfastening the two mounting screws. See **Fig. 1**.



09/25/95 f600999

Viewed from front of driver's panel.

1. Buzzer 2. Screw

Fig. 1, Buzzer Replacement

3. Remove the electrical connector by gently pulling on the wires. If it cannot be removed by finger pressure only, use a jeweler's screwdriver or needlenose pliers to pry it loose.
4. Insert the electrical connector into the printed circuit board.

CAUTION

Be sure that the wires are clear of the tachometer contact pins. Otherwise, the buzzer wiring may be damaged.

5. Install the new buzzer by inserting it into the tachometer housing and fastening the two screws.
6. Install the tachometer in the driver's instrument panel. For procedures, see **Subject 110**.
7. Turn on the ignition and check the new buzzer for proper operation.

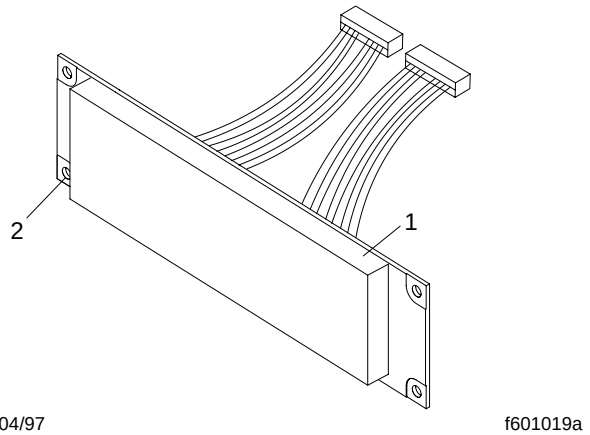
Dash Driver Display Screen Replacement

Replacement

CAUTION

Electronic components of the ICU are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU circuitry.

1. Remove the Driver Message Center bezel. Work the four small clips on the sides of the bezel out of the slots in the instrumentation control unit (ICU) housing.
   - 1.1 Grasp the bezel with both hands approximately 3 inches from each end, fingers on the top edge and thumbs below the bottom edge.
   - 1.2 Squeeze with enough pressure to disengage the retainer hooks.
   - 1.3 Roll the top edge of the bezel outward and down to remove it from the vehicle.
2. Remove the four screws attaching the dash driver display screen to the Driver Message Center. See **Fig. 1**.



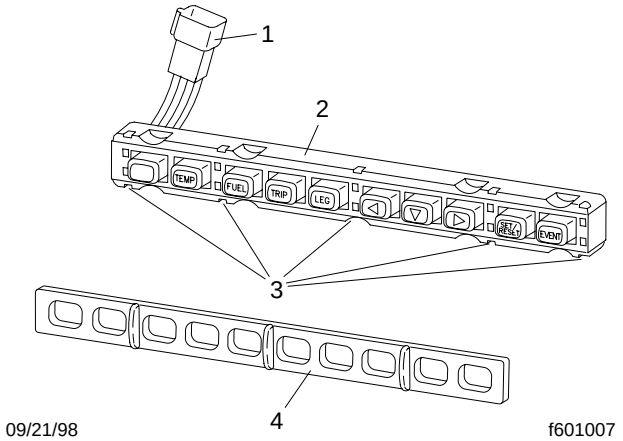
1. Dash Driver Display Screen
2. Screw Hole

Fig. 1, Dash Driver Display Screen Replacement

3. Carefully disconnect the two keyed electrical connectors. Note the orientation of the connectors, for correct installation.
4. Insert the two electrical connectors into the printed circuit board, as removed.
5. Replace the display screen. Fasten the four screws.
6. Install the Driver Message Center bezel. Press the four small clips on the bezel into the slots in the ICU housing.
7. Turn on the ignition and check the new display for proper operation.

Replacement

1. Remove the auxiliary instrument panel. For instructions, see **Subject 100**.
2. Remove the keypad bezel. See **Fig. 1**.



1. Electrical Connector
2. Keypad Housing
3. Access Holes
4. Keypad Bezel

Fig. 1, Keypad Replacement

IMPORTANT: Proceed carefully with the keypad bezel removal. The locking tabs break easily when too much force is applied.

2.1 Beginning at one end, insert a small screwdriver into one of the access holes on the bottom edge of the keypad housing to release a tab.

2.2 Roll the bottom edge of the bezel outward and upward to disengage the locking tab. Insert a small screwdriver or blade under the bezel to prevent the bezel from snapping back into place.

2.3 Continue this process until all five locking tabs are released.

2.4 Carefully lift the edge of the keypad bezel over the keys to release the bezel from the keypad.

NOTE: It may be helpful to press each of the keys to help the bezel clear the tops of the keys.

3. Remove the keypad housing.

3.1 Pull the keypad housing away from the panel.

3.2 Unplug the electrical connector.

3.3 Remove the keypad housing from the vehicle.

4. Install the keypad housing.

4.1 Snap the electrical connector into the wiring harness.

4.2 Align the four tabs on the keypad housing with the four slots on the auxiliary instrument panel.

5. Install the keypad bezel.

5.1 Insert the five lower retainer hooks into the notches in the panel.

5.2 While holding the keypad housing from the back, roll the top edge of the bezel into the housing until the upper hooks snap into place and hold the housing against the panel.

6. Install the auxiliary instrument panel. For instructions, see **Subject 100**.
7. Turn on the ignition and check the new keypad for proper operation.

IMPORTANT: The Instrumentation Control Unit (ICU) must be reconfigured after replacement to avoid incorrect operation of the gauges.

NOTE: Using ServiceLink 2.0, the ICU can be reconfigured to original factory specifications either on or off the vehicle. Different procedures are required if the ICU is not installed in the vehicle. Please take care to choose the correct procedure.

For specific instructions on operating Servicelink 2.0, see the self-paced Freightliner training materials available for this subject. If ServiceLink 2.0 is not available, the ICU cannot be reprogrammed. Contact your District Service Manager for an ICU that is already programmed.

On-Vehicle Reconfiguring

NOTE: The Freightliner help desk, 1–503–735–7877, is available 24 hours a day to assist with problems during ICU reconfiguring.

1. Connect the computer to the diagnostic connector on the vehicle.
2. Turn the keyswitch to the ON position.
3. Start ServiceLink 2.0 and connect to the vehicle's datalink.

   NOTE: Follow the procedures in the Servicelink 2.0 documentation for downloading parameter files if the Servicelink 2.0 computer is not connected to the ALLPRO server at the same time that it is connected to the vehicle.
4. Enter the last six digits of the vehicle's serial number when prompted.

   NOTE: A replacement ICU will not contain a vehicle serial number.
5. Select the icon for the ICU and then click on the PARAMETERS tab.
6. To download parameters, click the RESET PARAMETERS button and choose the parameter set to be downloaded.
7. When complete, Servicelink 2.0 will query the ICU for current parameters.

IMPORTANT: The ICU does not store parameter changes until the keyswitch is in the OFF position for AT LEAST ten seconds. If the battery is disconnected at a battery disconnect switch before the ICU stores the changes, all changes will be lost.

8. Exit ServiceLink 2.0.
9. Disconnect the diagnostic connector from the vehicle and turn off the ignition keyswitch.

Off-Vehicle Reconfiguring

Before starting, make sure of the following:

- The computer is on and running Windows.
- The computer is either connected to the Freightliner network or has been set up for RAS access, via a modem, to the Freightliner host.
- There is an appropriate vehicle interface (a cable or an external interface device) connected to the computer.
- The technician knows the vehicle serial number for the unit that needs to be reconfigured.
- Kent-Moore Tool J–42139 is available. See **Fig. 1**. To order this tool, call the Kent-Moore Tool Company at 1–800–328–6657.

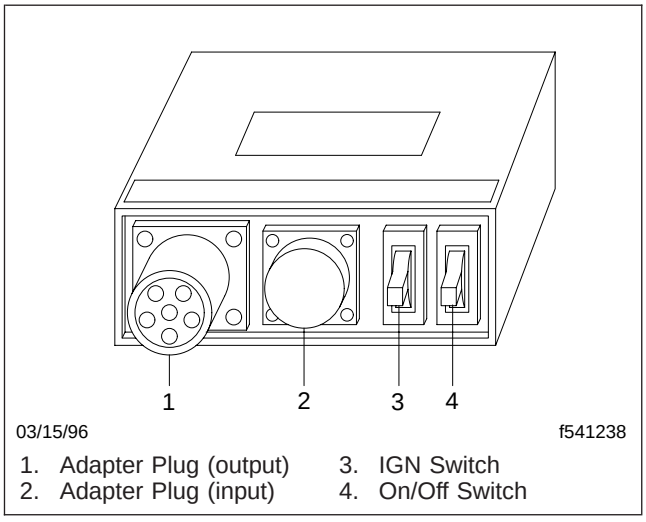


Fig. 1, Kent-Moore Tool J-42139

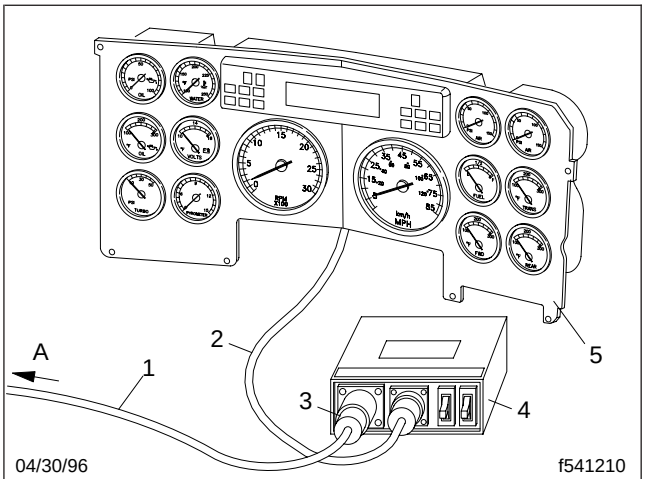
ICU Reconfiguring

NOTE: The Freightliner help desk, 1–503–735–7877, is available 24 hours a day to assist with problems during ICU reconfiguring.

1. Connect the appropriate (pink/blue for ICU1, pink for ICU2M) connectors of the adapter harness to the connectors on the back of the ICU. The gray connector is not used. Connect the adapter harness to Kent-Moore tool J–42139. See **Fig. 2**.



A. To Computer
1. Vehicle Interface Cable
2. Adapter Harness
3. Diagnostic Connector
4. Tool J–42139
5. ICU

Fig. 2, ICU Reconfiguring Set-Up

NOTE: The adapter harness is included with Kent-Moore tool J–42139.

2. Connect the diagnostic connector from the computer to Kent-Moore tool J–42139.
3. Turn on both switches on the Kent-Moore tool J–42139.
4. Start ServiceLink 2.0 and connect to the vehicle's datalink.

   NOTE: Follow the procedures in the Servicelink 2.0 documentation for downloading parameter files if the Servicelink 2.0 computer is not connected to the ALLPRO server at the same time that it is connected to the vehicle.

5. Enter the last six digits of the vehicle's serial number when prompted.

   NOTE: A replacement ICU will not contain a vehicle serial number.

6. Select the icon for the ICU and then click on the PARAMETERS tab.
7. To download parameters, click the RESET PARAMETERS button and choose the parameter set to be downloaded.
8. When complete, Servicelink 2.0 will query the ICU for current parameters.

IMPORTANT: The ICU does not store parameter changes until the keyswitch is in the OFF position for AT LEAST ten seconds. If the battery is disconnected at a battery disconnect switch before the ICU stores the changes, all changes will be lost.

9. Exit ServiceLink 2.0.
10. Disconnect the diagnostic connector from the vehicle and turn off the ignition keyswitch.

Display Parameter Changing

To change display parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

Display Parameters			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
1 *	Sec	0–15	**Freightliner Screen:** Controls the length of time that the "Freightliner" screen shows on the dash driver display during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		7–15	Enter any number between "7" and "15." The screen displays for that number of seconds.
2 *	Sec	0–15	**Monitored Systems OK Screen:** Controls the enabling of this screen and the length of time that it shows on the dash driver display during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–15	Enter any number between "1" and "15." The screen displays for that number of seconds.
3 †	Sec	0–15	**Fasten Seat Belts/Odometer Screen:** Controls the length of time that the "Fasten Seat Belts/ Odometer" screen shows on the dash driver display.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		3–15	Enter any number between "3" and "15." The screen displays for that number of seconds.
4	Sec	0–63	**Incoming Message Screen:** Controls the length of time that the "Incoming Message" screen shows on the dash driver display whenever the ICU receives a message from the data link.
		0=Off	Enter "0" (zero). The screen never displays at all.
		1–62	Enter any number between "1" and "62." The screen displays for that number of seconds.
		63	Enter "63." The screen displays until the operator dismisses it by pressing any key.
5	None	0 or 1	**Idle Hours and Gallons Screen:** Controls the enabling of this stationary access screen (accessed from the keypad).
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display when requested).
		1=On	Enter "1." The screen display is enabled (it displays when requested).
6	None	0 or 1	**MPG Display Screen:** Controls the enabling of this screen. This is the basic display screen, showing the mpg bar graph (dynamic display), current mpg value and the odometer reading.
			For programming instructions, see parm #5.
7	None	0 or 1	**Trip Information Screen:** Controls the enabling of this title screen (accessed from the keypad).
			For programming instructions, see parm #5.
8	None	0 or 1	**Trip Miles and Trip Hours Screen:** Controls the enabling of this stationary access screen (accessed from the keypad).
			For programming instructions, see parm #5. For screen display time, see parm #26.
9	None	0 or 1	**Idle Hours and Average MPG Screen:** Controls the enabling of this screen (accessed from the keypad).

Display Parameter Changing

Display Parameters			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
			For programming instructions, see parm #5.

* No access by users

† Authorization required

Table 1, Display Parameters (parms #1-9)

Display Parameters *			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
10	None	0 or 1	**Leg Miles and Leg Hours Screen:** Controls the enabling of this stationary access screen (accessed from the keypad).
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display when requested).
		1=On	Enter "1." The screen display is enabled (it does display when requested).
			NOTE: For screen display time, see parm #28.
11	None	0 or 1	**Fuel Information Screen:** Controls the enabling of this title screen (accessed from the keypad).
			For programming instructions, see parm #10.
12	None	0 or 1	**Fuel Used and Average MPG Screen:** Controls the enabling of this stationary access screen (accessed from the keypad).
			For programming instructions, see parm #10.
			NOTE: For screen display time, see parm #27.
13	None	0 or 1	**Idle Gallons and PTO Gallons Screen:** Controls the enabling of this screen (accessed from the keypad).
			For programming instructions, see parm #10.
14	None	0 or 1	**Engine Information Screen:** Controls the enabling of this title screen (accessed from the keypad).
			For programming instructions, see parm #10.
15	None	0 or 1	**Engine Miles and Engine Hours Screen:** Controls the enabling of this screen (accessed from the keypad).
			For programming instructions, see parm #10.
16	None	0 or 1	**Engine Gallons and PTO Gallons Screen:** Controls the enabling of this screen (accessed from the keypad).
			For programming instructions, see parm #10.
17 †	None	0 or 1	**Active Faults Screen:** Controls the enabling of this screen (accessed from the keypad), alerting the driver that faults are present. This screen displays all vehicle active faults in the memory of the ICU, as received on the J1587 databus.
			For programming instructions, see parm #10.
18 †	None	0 or 1	**Historical Faults Screen:** Controls the enabling of this screen (accessed from the keypad). This screen shows how many historic dash faults (both active and inactive) since the last reset, and the odometer reading at last reset.
			For programming instructions, see parm #10.
19 †	Miles	0–254	**Reset Faults Screen:** Controls the enabling of this screen, whose purpose is to delete all the accumulated historical faults.

Display Parameters *			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display when requested).
		1–254	Enter any number between "1" and "254." The screen function is enabled for from 1 to 254 odometer miles. NOTE: This function is used by the production plants only.

* All parameters in this table are accessible to users

† Authorization required

Table 2, Display Parameters (parms #10-19)

Display Parameters			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
20 *	None	0 or 1	**Set Brightness Screen:** Controls the enabling of this screen (accessed from the keypad). This screen allows the driver to adjust screen brightness to current conditions.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display when requested).
		1=On	Enter "1." The screen display is enabled (it does display when requested). NOTE: To set the basic screen brightness level, see parm #48.
21	None	0 or 1	**Set Language Screen:** Controls the enabling of this screen (accessed from the keypad). This screen allows the driver to change the language of the display (English, French, Spanish). For programming instructions, see parm #20.
22	None	0 or 1	**Set Units Screen:** Controls the enabling of this screen (accessed from the keypad). This screen allows the driver to choose between U.S. Customary (feet, pounds) and metric units of measurement. For programming instructions, see parm #20.
23 *	None	0 or 1	**Part No. and Software Screen:** Controls the enabling of this screen (accessed from the keypad). This screen displays the ICU part number (see parm #159) and software version number (see parm #130). For programming instructions, see parm #20.
24 *	Sec	0–15	**Set Screen Blinking Time:** Controls the blinking rate of screen displays.
		0=Off	Enter "0" (zero). Blinking is disabled (no screen displays blink).
		1–15	Enter any number between "1" and "15." The screen displays for one-half that number of seconds. For example, if the blinking time is set to "3," blinking displays will blink every 1.5 seconds.
25 †	None	0 or 1	**Vehicle ID Number Screen:** Controls the enabling of this screen (accessed from the keypad). This screen displays vehicle ID number (see parm #142). For programming instructions, see parm #20.
26	Sec	0–254	**Trip Miles and Trip Hours Screen Display Time:** Controls the enabling of this direct access screen and the length of time that it shows on the dash driver display after pressing the TRIP key.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–254	Enter any number between "1" and "254." The screen displays for that number of seconds.
27	Sec	0–254	**Fuel Used and Average MPG Screen Display Time:** Controls the enabling of this direct access screen and the length of time that it shows on the dash driver display after pressing the FUEL key. For programming instructions, see parm #26.

Display Parameter Changing

Display Parameters			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
28	Sec	0–254	**Leg Miles and Leg Hours Screen Display Time:** Controls the enabling of this direct access screen and the length of time that it shows on the dash driver display after pressing the LEG key. For programming instructions, see parm #26.

* No access by users

† Authorization required

Table 3, Display Parameters (parms #20-28)

Display Parameters			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
29 *	Sec	0–254	**Low Coolant Level Warning Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the engine ECU reports a low coolant level fault. NOTE: See parm #49 when the coolant level sensor reports low coolant level.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1	Enter "1." The screen displays one time only for seven seconds.
		2	Enter "2." The screen displays for seven seconds, dismisses itself, and returns every 254 seconds until the fault is corrected.
		3–253	Enter any number between "3" and "253." The screen display repeats after that number of seconds. It continues its repeat cycle until the fault is corrected. Each time, it can be dismissed by the driver pushing any key.
		254	Enter "254." The screen displays continuously until the condition returns to normal. It can not be dismissed.
30 †	Sec	0–254	**Low Voltage Warning Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. See parm #29 for programming instructions.
31 †	Sec	0–254	**Low Oil Pressure Warning Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. See parm #29 for programming instructions.
32 †	Sec	0–254	**High Coolant Temperature Warning Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. See parm #29 for programming instructions.
33 †	Mph	1–15	**Parking Brake Warning Screen (Vehicle MPH):** Controls the vehicle speed required to activate this alert screen (vehicle moving, parking brake on). Enter any number between "1" and "15." The alert screen displays when the vehicle is traveling at one-half that speed. For example, if the vehicle mph value is set to "5," the screen displays when the vehicle is traveling at a speed of 2.5 mph with the parking brake on.
34 †	Sec	60–254	**Parking Brake Warning Screen (Time On):** Controls the number of seconds this alert screen displays (vehicle moving, parking brake on). Enter any number between "60" and "254." The alert screen displays for that number of seconds, then turns itself off.

Display Parameters			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
35 *	Sec	0–15	**Reset Key Valid Time:** When the "Reset Confirmation" screen is enabled (see parm #45), controls the number of seconds allowed to confirm a reset (prevents accidental resets).
		0=Off	Enter "0" (zero). This function is disabled (resets are not confirmed).
		1-15	Enter any number between "1" and "15." The reset is confirmed if the reset key is pressed within that number of seconds. If the reset key is not pressed within the allotted time, the screen being reset continues to report its old values.

* No access by users

† Authorization required

Table 4, Display Parameters (parms #29-35)

Display Parameters			
Parm	**Units**	**Range**	**Description**
36 *	Sec	0–15	**Bulb Check Time On:** Controls the number of seconds that the bulbs illuminate during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). This function is disabled (the bulbs do not illuminate).
		1-15	Enter any number between "1" and "15." The bulbs illuminate for that number of seconds.
37 *	Min	0–254	**Dash Active After Ignition Off:** Controls the number of minutes that the dash continues to remain active after the ignition keyswitch is turned OFF.
		0	Enter "0" (zero). When the ignition keyswitch is turned off, the dash turns inactive immediately.
		1–254	Enter any number between "1" and "254." After the ignition keyswitch has been turned off, the dash continues to remain active for that number of minutes. NOTE: The dash will appear to be turned off, even though the microprocessor remains active to perform these functions: door open, parking brake off (as enabled by parm #34); buzzer (as enabled by parms #100-118).
38 *	Sec	0–7	**Buzzer Check Time On:** Controls the number of seconds that the buzzer sounds during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). The buzzer does not sound at all.
		1–7	Enter any number between "1" and "7." The buzzer sounds for that number of seconds.
39	None	None	This parameter is not used.
40	None	None	This parameter is disabled.
41 †	Volts	5–135	**Low Voltage Warning Threshold:** Controls the voltage required to trigger the display of the "Warning–Low Voltage" screen. Enter any number between "5" and "135." The low voltage warning comes on when the voltage equals one-tenth that amount. For example, if this parameter is set to "122," the warning comes on at 12.2 volts.
42 *	None	1–254	**Short Term Fuel Economy Average Coefficient:** On the mpg bar graph display (see parm #6), controls the amount of filtering done to the fuel economy data. Enter any number between "1" and "254." A lower number provides more filtering (a less responsive, slower to change graph). A higher number provides less filtering (a more responsive, faster to change graph).

Display Parameter Changing

Display Parameters			
Parm	**Units**	**Range**	**Description**
43 *	None	1–254	**Fuel Economy Rate of Change Coefficient:** On the mpg bar graph display (see parm #6), controls the amount of filtering done to the rate of change calculated by comparing current fuel usage to previous usage. Enter any number between "1" and "254." A lower number provides more filtering (a less responsive, slower moving graph). A higher number provides less filtering (a more responsive, faster moving graph).
44 *	None	1–254	**Maximum Rate of Change Value MPG Bar Graph:** On the mpg bar graph display (see parm #6), sets a maximum value to the rate of change. Enter any number between "1" and "254." A lower number provides a lower maximum value for the rate change (graph moves in smaller jumps). A higher number provides a higher maximum value for the rate change (graph moves in bigger jumps).

* No access by users

† Authorization required

Table 5, Display Parameters (parms #36-44)

Display Parameters			
Parm	**Units**	**Range**	**Description**
45 *	None	0 or 1	**Reset Confirmation Screen:** Controls the enabling of this screen, which appears when the reset button on the keypad is pressed.
		0=Off	Enter "0" (zero). The screen is disabled (it does not display when the reset button is pressed).
		1=On	Enter "1." The screen display is enabled (it displays when the reset button is pressed). NOTE: See parm #35, which sets the number of seconds required for confirmation.
46	None	0 or 1	**Turn Signal Warning Screen:** Controls the enabling of this alert screen, which appears when the turn signals have been left on. It also disables the turn signal buzzer (see parm #108).
		0=Off	Enter "0" (zero). The screen is disabled (it does not display at all).
		1=On	Enter "1." The screen display is enabled (it displays when the turn signals have been left on). NOTE: See parm #113, which controls the number of seconds the turn signals have to remain on before the alert screen activates, and parm #114, which controls the distance in miles the vehicle has to travel.
47 *	None	0–254	**Low Windshield Wiper Water Level Alert Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the water level in the washer reservoir gets low.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1	Enter "1." The screen displays one time only for seven seconds.
		2	Enter "2." The screen displays for seven seconds, dismisses itself, and returns every 254 seconds until the fault is corrected.
		3–253	Enter any number between "3" and "253." The screen display repeats after that number of seconds. It continues its repeat cycle until the fault is corrected. Each time, it can be dismissed by the driver pushing any key.
		254	Enter "254." The screen displays continuously until the condition returns to normal. It can not be dismissed.

Display Parameters			
Parm	**Units**	**Range**	**Description**
48 *	None	0 or 254, 150–180	**VFD Brightness Control:** Establishes the basic brightness level of the dash driver display.
		0=Bright	Enter "0" (zero). The screen displays at maximum brightness.
		254=Off	Enter "254" (zero). The screen is turned off.
		150–180	Enter any number between "150" and 180." A higher number reduces the brightness of the screen.

* No access by users

Table 6, Display Parameters (parms #45-48)

Display Parameters			
Parm	**Units**	**Range**	**Description**
49 *	None	0–254	**Add Engine Coolant Alert Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the coolant level in the radiator gets low, as reported by the coolant level sensor. NOTE: When the engine ECU reports low coolant level, see parm #29.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1	Enter "1." The screen displays one time only for seven seconds.
		2	Enter "2." The screen displays for seven seconds, dismisses itself, and returns every 254 seconds until the fault is corrected.
		3–253	Enter any number between "3" and "253." The screen display repeats after that number of seconds. It continues its repeat cycle until the fault is corrected. Each time, it can be dismissed by the driver pushing any key.
		254	Enter "254." The screen displays continuously until the condition returns to normal. It can not be dismissed.
50 †	None	0–254	**Recirc Mode Engaged Alert Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the HVAC unit has been switched to recirculated air. See parm #49 for programming instructions. NOTE: To change the buzzer function, see parm #110.
51 †	None	0–254	**Provide Fresh Air Alert Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the HVAC unit has been operating for 20 minutes on recirculated air. See parm #49 for programming instructions. NOTE: To change the buzzer function, see parm #110.
52 ‡	Sec	1–15	**Clock Screen Scroll Rate:** Controls rate at which the "Set Time" screen (parm #202) scrolls from one function to another (minutes, hours, day, month, year). Enter any number from "1" to "15." The screen scrolls that many times per second. NOTE: To change the blink rate on the "Set Time" screen, see parm #24.

Display Parameter Changing

Display Parameters			
Parm	**Units**	**Range**	**Description**
54 *	None	4.0.3-4.0.4	**CCP File Revision No:** Stores in memory the number of the current Cluster Configuration Parameter (CCP) file.

* No access by users

† Authorization required

‡ Found only on vehicles manufactured before March 7, 1997

Table 7, Display Parameters (parms 49-54)

Buzzer Parameter Changing

To change buzzer parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

Buzzer Parameters			
Parm	**Units**	**Range**	**Description**
100 *	None	0–3	**Door Open, Headlights On, Ignition Off Buzzer:** Controls the enabling of this buzzer, and the type of sound: continuous buzzing (type 1), steady pulsing (type 2), or programmable pulsing (type 3). This buzzer sounds when the door is open or the headlights are on, but the ignition keyswitch is turned OFF.
		0=Off	Enter "0" (zero). The buzzer function is disabled (it does not sound).
		1	Enter "1." The buzzer sounds continuously until the problem is corrected.
		2	Enter "2." The buzzer pulses steadily until the problem is corrected.
		3	Enter "3." The buzzer pulses according to a programmed pattern until the problem is corrected. NOTE: To change the programmable pulsing function, see parm #115.
101 *	None	0–3	**Door Open and Parking Brake Off Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when the door is open and the parking brake is off. For programming instructions, see parm #100.
102 †	None	0–3	**Parking Brake On and Vehicle Moving Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when the vehicle is moving and the parking brake is on. For programming instructions, see parm #100.
103 †	None	0–3	**Engine Protection Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when the engine protection light comes on. For programming instructions, see parm #100.
104 *	None	0–3	**Low Air Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when the air pressure drops below the minimum. For programming instructions, see parm #100.
105 †	None	0–3	**Low Coolant Level Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when the coolant level is too low. For programming instructions, see parm #100.
106 †	None	0–3	**Low Oil Pressure Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when the oil pressure is too low. For programming instructions, see parm #100.
107 †	None	0–3	**High Coolant Temperature Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when the coolant temperature is too high. For programming instructions, see parm #100.

Table 1, Buzzer Parameters (parms #100-107)

Buzzer Parameter Changing

Buzzer Parameters			
Parm	**Units**	**Range**	**Description**
108	None	0–3	**Turn Signal ON Buzzer:** Controls the enabling of this buzzer, and the type of sound: continuous buzzing (type 1), steady pulsing (type 2), or programmable pulsing (type 3). This buzzer sounds when the turn signals are left on too long, as defined by time (see parm #113), distance (see parm #114), or both. NOTE: This buzzer is disabled when the "Warning–Turn Signal ON" screen is disabled (see parm #46).
		0=Off	Enter "0" (zero). The buzzer function is disabled (it does not sound).
		1	Enter "1." The buzzer sounds continuously until the problem is corrected.
		2	Enter "2." The buzzer pulses steadily until the problem is corrected.
		3	Enter "3." The buzzer pulses according to a programmed pattern until the problem is corrected. NOTE: To change the programmable pulsing function, see parm #115.
109 *	None	0–3	**Axle Lock Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when the axle locks are left on. For programming instructions, see parm #108.
110 *	None	0–3	**HVAC Input Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when either the Recirc Mode Engaged (parm #50) or Provide Fresh Air (parm #51) alert screens come on. For programming instructions, see parm #108.
111	None	0–3	**Buzzer Enable II:** Controls the enabling of this buzzer, and the type of sound. This is an optional buzzer function. For programming instructions, see parm #108.
112 †	None	0–3	**Low Voltage Warning Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when the voltage goes below a preset minimum (see parm #41). For programming instructions, see parm #108.
113	Min	0–15	**Turn Signal Warning Activation Time:** Controls how long the turn signals have to remain ON before the buzzer warning activates and the dash driver display shows the "Warning–Turn Signal ON" screen.
		0=Off	Enter "0" (zero). The warning does not activate (it does not come on at all).
		1–15	Enter any number between "1" and "15." The warning activates, but only after that number of minutes has elapsed. NOTE: If both parm #113, turn signal activation time, and parm #114, turn signal activation distance, are turned on, the turn signal warning is activated by whichever condition becomes active first.

* No access by users

† Authorization required

Table 2, Buzzer Parameters (parms #108-113)

Buzzer Parameters			
Parm	**Units**	**Range**	**Description**
114	Miles	0–15	**Turn Signal Warning Activation Distance:** Controls how far the vehicle has to travel with the turn signals ON before the buzzer warning activates and the dash driver display shows the "Warning–Turn Signal ON" screen.
		0=Off	Enter "0" (zero). The warning does not activate (it does not come on at all).
		1–15	Enter any number between "1" and "15." The warning activates, but only after the vehicle has traveled one-tenth that number of miles. For example, if "5" is entered, the turn signal warning activates after the vehicle has traveled 0.5 (one-half) mile. NOTE: If both parm #113, turn signal activation time, and parm #114, turn signal activation distance, are turned on, the turn signal warning is activated by whichever condition becomes active first.
115	Sec	0–15	**Number of Seconds ON for Type 3 Buzzer Pulsed:** Controls the number of seconds each buzzer pulse lasts when the type 3 buzzer is selected.
		0=Off	Enter "0" (zero). The type 3 (programmable) buzzer function is disabled (this does not affect the other two types of buzzer function).
		1–15	Enter any number between "1" and "15." The buzzer remains ON for that number of seconds during each pulse.
116 *	None	0–3	**Buzzer Enable III:** Controls the enabling of this buzzer, and the type of sound: continuous buzzing (type 1), steady pulsing (type 2), or programmable pulsing (type 3). This is an optional buzzer function.
		0=Off	Enter "0" (zero). The buzzer function is disabled (it does not sound).
		1	Enter "1." The buzzer sounds continuously until the problem is corrected.
		2	Enter "2." The buzzer pulses steadily until the problem is corrected.
		3	Enter "3." The buzzer pulses according to a programmed pattern until the problem is corrected. NOTE: To change the programmable pulsing function, see parm #115.
117 *	None	0–3	**Buzzer Enable IV:** Controls the enabling of this buzzer, and the type of sound. This is an optional buzzer function. For programming instructions, see parm #116.
118 *	None	0–3	**Low Windshield Wiper Water Level Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer comes on when the windshield washer water level gets too low. For programming instructions, see parm #116.

* No access by users

Table 3, Buzzer Parameters (parms #114-118)

System Parameter Changing

To change system parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

System Parameters			
Parm	**Units**	**Range**	**Description**
130 *	None	12 bits	**Input Software Version Number:** Allows the input of the software version number installed in the ICU.
			This is a data input parameter. Enter the software version number.
142 †	None	17 bits	**Input Vehicle ID Number:** Allows the input of the vehicle identification number.
			This is a data input parameter. Enter the vehicle identification number.
159 *	None	21 bits	**Input Century Class ICU Part Number:** Allows the input of the ICU part number.
			This is a data input parameter. Enter the ICU part number.
189 †	None	0 or 219	**VORAD:** Enables the ICU to look for an Eaton VORAD collision avoidance system installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no collision avoidance system is installed.
		219	Enter "219" if a collision avoidance system is installed.
190	None	0 or 136	**ABS:** Enables the ICU to look for an antilock brake system installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no antilock brake system is installed.
		136	Enter "136" if an antilock brake system is installed.
191	None	0 or 150	**ECAS:** Enables the ICU to look for an electronic suspension installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no electronic suspension is installed.
		150	Enter "150" if an electronic suspension is installed.
192	None	0 or 190	**ACPU:** Enables the ICU to look for an air conditioning protection unit installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no air conditioning protection unit is installed.
		190	Enter "190" if an air conditioning protection unit is installed.
193	None	0 or 130	**Transmission:** Enables the ICU to look for an electronic transmission installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no electronic transmission is installed.
		130	Enter "130" if an electronic transmission is installed.

* No access by users

† Authorization required

Table 1, System Parameters (parms #130-193)

System Parameter Changing

System Parameters			
Parm	**Units**	**Range**	**Description**
194	None	0, 181, or 231	**Communications:** Enables the ICU to look for a satellite communications system installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no communications system is installed.
		181	Enter "181" if a Qualcomm® communications system is installed.
		231	Enter "231" if a HighwayMaster® communications system is installed.
195	None	0 or 179	**Data Logging Unit:** Enables the ICU to look for a data logging unit installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no data logging unit is installed.
		179	Enter "179" if a data logging unit is installed.

Table 2, System Parameters (parms #194-195)

Additional Display Parameter Changing

To change the additional display parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

To change parms #196 through #200, see **Table 1**.
To change parms #201 through #210, see **Table 2**.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

Additional Display Message Parameters			
Parm	**Units**	**Range**	**Description**
196 *	Miles	0–254	**Maintenance Category (miles):** Allows the setting of custom maintenance intervals by mileage on the "Next Service" screen (see parm #201).
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–254	Enter any number between "1" and "254." The ICU establishes a maintenance interval benchmark for 250 times that number of miles. For example, if "40" is entered, the ICU establishes a 10,000-mile benchmark and calculates the "miles remaining to next service" backward from 10,000.
197 *	Hours	0–254	**Maintenance Category (hours):** Allows the setting of custom maintenance intervals by engine hours on the "Next Service" screen (see parm #201).
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–254	Enter any number between "1" and "254." The ICU establishes a maintenance interval benchmark for 10 times that number of hours. For example, if "40" is entered, the ICU establishes a 400-hour benchmark and calculates the "hours remaining to next service" backward from 400.
198 †	Sec	0–15	**Data Recorded Screen:** Controls the enabling of the data recording function screens, and how long they remain on. This function is accessed by pressing the EVENT key.
		0=Off	Enter "0" (zero). The screen displays for this function are disabled (they do not display at all).
		1–14	Enter any number between "1" and "14." The screen activated by this function displays for that number of seconds before dismissing itself.
		15	Enter "15." The screen activated by this function displays until the reset key is pressed.
			NOTE: When the EVENT key is pressed, this function displays one of three different screens. Normally, it displays "Data Being/Recorded." If the memory in the data logging unit (DLU) is full, it displays "Memory Full/Data Not Recorded." If the DLU is not connected, or not responding, it displays "Data Recorder/Not Responding."
199 †	Sec	0–15	**Outside Temperature Screen:** Controls the enabling of this screen, and how long it remains on. This screen is accessed by pressing the TEMP key.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–14	Enter any number between "1" and "14." The screen displays for that number of seconds before dismissing itself.
		15	Enter "15." The screen displays until the reset key is pressed.
200 *	Sec	0–15	**Time Screen:** Controls the enabling of this direct access screen, and how long it remains on. This screen is accessed by pressing the TIME key.
			For programming instructions, see parm #199.

* No access by users

† Authorization required

Table 1, Additional Display Message Parameters (parms #196-200)

Additional Display Parameter Changing

Additional Display Message Parameters			
Parm	**Units**	**Range**	**Description**
201 *	None	0–2	**Next Service Screen:** Controls the enabling of this screen, and whether it displays the next service interval in miles or engine hours.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–2	Enter "1" to display the interval in miles. Enter "2" to display the interval in engine hours.
202 *	None	0 or 1	**Set Time Screen:** Controls the enabling of this screen.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1=On	Enter "1." The screen display is enabled (it displays when requested).
203	None	0 or 1	**Diagnostic Information Screen:** Controls the enabling of this title screen.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1=On	Enter "1." The screen display is enabled (it displays when requested).
204 *	None	0 or 1	**Service Information Screen:** Controls the enabling of this title screen.
			For programming instructions, see parm #203.
205	None	0 or 1	**Setup Information Screen:** Controls the enabling of this title screen.
			For programming instructions, see parm #203.
206	None	0 or 1	**Vehicle Information Screen:** Controls the enabling of this title screen.
			For programming instructions, see parm #203.
207	None	0 or 1	**Data Link Active Screen:** Controls the enabling of this dynamic display screen.
			For programming instructions, see parm #203.
208	None	0 or 1	**Data Link Status Screen:** Controls the enabling of this dynamic display screen.
			For programming instructions, see parm #203.
209 †	Sec	0–254	**No Data Link Activity Alert Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the ICU cannot detect any response from the J1587 databus through the data link.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1	Enter "1." The screen displays one time only for seven seconds.
		2	Enter "2." The screen displays for seven seconds, dismisses itself, and returns every 254 seconds until the fault is corrected.
		3–253	Enter any number between "3" and "253." The screen display repeats after that number of seconds. It continues its repeat cycle until the fault is corrected. Each time, it can be dismissed by the driver pushing any key.
		254	Enter "254." The screen displays continuously until the condition returns to normal. It can not be dismissed.

Table 2, Additional Display Message Parameters (parms #201-209)

Additional Display Parameter Changing

Additional Display Message Parameters			
Parm	**Units**	**Range**	**Description**
210 *	None	0 or 1	**Gauge Diagnostic Faults:** Controls the enabling of this function, which monitors the gauges connected to the ICU left microprocessor and reports any faults found.
		0=Off	Enter "0" (zero). The function is disabled (faults are not reported).
		1=On	Enter "1." The function is enabled (faults are reported).
211	None	0 or 1	**Parking Brake Off Warning Screen:** Controls the enabling of this alert screen, which comes on when the parking brake is off and the door open and/or the ignition keyswitch turned on.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1=On	Enter "1." The screen display is enabled (it displays when conditions require). NOTE: Found only on vehicles built before March 7, 1997.

* Authorization required

Table 3, Additional Display Message Parameters (parms #210-211)

Gauge/Indicator Light Parameter Changing

To change gauge and indicator light parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

Indicator light parameters control the type of input switched to a particular light, but they are not assigned specific functions.

Gauge parameters are of two types. Firstly, at each electronic gauge location, the gauge function is programmable. Each function is assigned a number based on the module number for that gauge. For a list of the gauge assignment numbers for each gauge function, see **Table 5**. When assigning gauge functions, use only the numbers in this table.

Secondly, at certain gauge locations the gauge sweep is programmable to either 90 degrees or 270 degrees.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

ICU Left Microprocessor Indicator Light Parameters			
Parm	**Units**	**Range**	**Description**
220 *	None	0–3	**Indicator Light Input WL008:** Controls the type of input switched to this indicator light, which is currently unassigned.
		0	Enter "0" (zero). The circuit receives ground-active input.
		1	Enter "1." The circuit receives ground-inactive input.
		2	Enter "2." The circuit receives power-active input.
		3	Enter "3." The circuit receives power-inactive input.
221 *	None	0–3	**Indicator Light Input WL009:** Controls the type of input switched to this indicator light, which is currently unassigned.
			For programming instructions, see parm #220.
222 *	None	0–3	**Indicator Light Input WL013:** Controls the type of input switched to this indicator light, which is currently unassigned.
			For programming instructions, see parm #220.
223 *	None	0–3	**Indicator Light Input WL014:** Controls the type of input switched to this indicator light, which is currently unassigned.
			For programming instructions, see parm #220.
224 *	None	0–3	**Indicator Light Input WL015:** Controls the type of input switched to this indicator light, which is currently unassigned.
			For programming instructions, see parm #220.

* No access by users

Table 1, ICU Left Microprocessor Indicator Light Parameters (parms #220-224)

ICU Left Microprocessor Gauge Parameters			
Parm	**Units**	**Range**	**Description**
230	None	0–866	**Gauge Function DR001:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR001.

Gauge/Indicator Light Parameter Changing

ICU Left Microprocessor Gauge Parameters			
Parm	**Units**	**Range**	**Description**
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the engine oil pressure gauge is installed here, enter "852."
232	None	0–866	**Gauge Function DR002:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR002.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the engine oil temperature gauge is installed here, enter "856."
234	None	0–866	**Gauge Function DR003:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR003.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the coolant temperature gauge is installed here, enter "854."
236	None	0–866	**Gauge Function DR005:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR005.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the turbo air pressure gauge is installed here, enter "842."
238	None	0–866	**Gauge Function DR006:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR006.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the pyrometer is installed here, enter "858." NOTE: The gauge installed here is linked to the gauge sweep parameter for this location (parm #244). If a turbo pressure gauge (parm #238=842), the gauge sweep must be set to 90 degrees (parm #244=0). If a pyrometer (parm #238=858), the gauge sweep must be set to 270 degrees (parm #244=1).
240	None	0–866	**Gauge Function DR007:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR007.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the tachometer is installed here, enter "812."
242 *	None	0 or 1	**Gauge Sweep Function DR001:** Controls the dial sweep on the gauge installed at this location.
		0	Enter "0" (zero) for a dial sweep of 90 degrees at gauge location DR001.
		1	Enter "1" for a dial sweep of 270 degrees at gauge location DR001.
243 *	None	0 or 1	**Gauge Sweep Function DR002:** Controls the dial sweep on the gauge installed at this location.
		0	Enter "0" (zero) for a dial sweep of 90 degrees at gauge location DR002.
		1	Enter "1" for a dial sweep of 270 degrees at gauge location DR002.

* No access by users

Table 2, ICU Left Microprocessor Gauge Parameters (parms #230-243)

ICU Right Microprocessor Indicator Light and Gauge Parameters			
Parm	**Units**	**Range**	**Description**
244	None	0 or 1	**Gauge Sweep Function DR006:** Controls the dial sweep on the gauge installed at this location. See note at parm #238.
		0	Enter "0" (zero) for a dial sweep of 90 degrees at gauge location DR006.
		1	Enter "1" for a dial sweep of 270 degrees at gauge location DR006.
257 *	None	0–3	**Indicator Light Input WL016:** Controls the type of input switched to this indicator light (possible application: utility lights).
		0	Enter "0" (zero). The circuit receives ground-active input.
		1	Enter "1." The circuit receives ground-inactive input.
		2	Enter "2." The circuit receives power-active input.
		3	Enter "3." The circuit receives power-inactive input.
258 *	None	0–3	**Indicator Light Input WL017:** Controls the type of input switched to this indicator light (possible application: differential lock).
			For programming instructions, see parm #257.
259 *	None	0–3	**Indicator Light Input WL018:** Controls the type of input switched to this indicator light (possible application: air suspension warning)
			For programming instructions, see parm #257.
265	None	0–866	**Gauge Function DR008:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR008.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the speedometer is installed here, enter "810."
267	None	0–866	**Gauge Function DR011:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR012.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the fuel level gauge is installed here, enter "844."
269	None	0–866	**Gauge Function DR012:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR012.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the transmission fluid temperature gauge is installed here, enter "864."
271	None	0–866	**Gauge Function DR013:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR013.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the forward (or rear) axle temperature gauge is installed here, enter "866."

* No access by users

ICU Right Microprocessor Gauge Parameters			
Parm	**Units**	**Range**	**Description**
273	None	0–866	**Gauge Function DR014:** Specifies a gauge function at this location.

Gauge/Indicator Light Parameter Changing

ICU Right Microprocessor Gauge Parameters			
Parm	**Units**	**Range**	**Description**
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR014.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the rear (or forward) axle temperature gauge is installed here, enter "866."
275 *	None	0 or 1	**Gauge Sweep Function DR011:** Controls the dial sweep on the gauge installed at this location.
		0	Enter "0" (zero) for a dial sweep of 90 degrees at gauge location DR011.
		1	Enter "1" for a dial sweep of 270 degrees at gauge location DR011.
276 *	None	0–866	**Gauge Function AU011:** Specifies a gauge function at this optional location on the auxiliary instrument panel.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location AU011.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if an axle temperature gauge is installed here, enter "866." See **Table 5**.
278 *	None	0–866	**Gauge Function AU012:** Specifies a gauge function at this optional location on the auxiliary instrument panel.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location AU012.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if a fuel pressure gauge is installed here, enter "843." See **Table 5**.
280 *	None	0–866	**Gauge Function AU013:** Specifies a gauge function at this optional location on the auxiliary instrument panel.
			For programming instructions, see parm #278.
282 *	None	0–866	**Gauge Function AU014:** Specifies a gauge function at this optional location on the auxiliary instrument panel.
			For programming instructions, see parm #278.

Parameter Changing, Right Microprocessor

Certain parameters must be repeated for use of the ICU right microprocessor. These parameters are listed below.

To change the right microprocessor parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

ICU Right Microprocessor Display Parameters			
Parm	**Units**	**Range**	**Description**
284 *	Sec	0–15	**Set Screen Blinking Time:** Controls the blinking rate of certain screen displays.
		0=Off	Enter "0" (zero). Blinking is disabled (screen displays do not blink).
		1–15	Enter any number between "1" and "15." The screen displays for one-half that number of seconds. For example, if the blinking time is set to "3," blinking displays will blink every 1.5 seconds.
			NOTE: This parameter is identical to parm #24, but repeated for use of the right microprocessor.
285 *	Sec	0–15	**Bulb Check Time On:** Controls the number of seconds that the bulbs illuminate during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). This function is disabled (the bulbs do not illuminate).
			Enter any number between "1" and "15." The bulbs illuminate for that number of seconds.
			NOTE: This parameter is identical to parm #36, but repeated for use of the right microprocessor.
286 *	Min	0–254	**Dash Active After Ignition Off:** Controls the number of minutes that the dash continues to receive power after the ignition keyswitch is turned OFF.
		0	Enter "0" (zero). When the ignition keyswitch is turned off, the dash turns inactive immediately.
		1–254	Enter any number between "1" and "254." After the ignition keyswitch has been turned off, the dash continues to receive power for that number of minutes.
			NOTE: When the dash is receiving power, it will appear to be turned off, even though the microprocessor remains active to perform these functions: door open, parking brake off (as enabled by parm #34); buzzer (as enabled by parms #100-118). This parameter is identical to parm #37, but repeated for use of the right microprocessor.
287 *	Sec	0–7	**Buzzer Check Time On:** Controls the number of seconds that the buzzer sounds during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). The buzzer does not sound at all.
		1–7	Enter any number between "1" and "7." The buzzer sounds for that number of seconds.
			NOTE: This parameter is identical to parm #38, but repeated for use of the right microprocessor.
288 *	Volts	5–135	**Low Voltage Warning Threshold:** Controls the voltage required to trigger the display of the "Warning–Low Voltage" screen.
			Enter any number between "5" and "135." The low voltage warning comes on when the voltage equals one-tenth that amount. For example, if this parameter is set to "122," the warning comes on at 12.2 volts.
			NOTE: This parameter is identical to parm #41, but repeated for use of the right microprocessor.

* No access by users

Table 1, ICU Right Microprocessor Display Parameters (parms #284-288)

Parameter Changing, Right Microprocessor

ICU Right Microprocessor Buzzer Parameters			
Parm	**Units**	**Range**	**Description**
289 *	None	0–3	**Engine Protection Buzzer:** Controls the enabling of this buzzer, and the type of sound: continuous buzzing (type 1), steady pulsing (type 2), or programmable pulsing (type 3). This buzzer sounds when the engine temperature is too high.
		0=Off	Enter "0" (zero). The buzzer function is disabled (it does not sound).
		1	Enter "1." The buzzer sounds continuously until the problem is corrected.
		2	Enter "2." The buzzer pulses steadily until the problem is corrected.
		3	Enter "3." The buzzer pulses according to a programmed pattern until the problem is corrected. NOTE: To change the programmable pulsing function, see parm #295. This parameter is identical to parm #103, but repeated for use of the right microprocessor.
290 *	None	0–3	**Low Air Buzzer:** Controls the enabling of this buzzer, and the type of sound. This buzzer sounds when the air pressure drops below the minimum. For programming instructions, see parm #289. NOTE: This parameter is identical to parm #104, but repeated for use of the right microprocessor.
291	None	0–3	**HVAC Input Buzzer:** Controls the enabling of this buzzer, and how it sounds: continuous buzzing, steady pulsing, or programmable pulsing. This buzzer sounds when either the Recirc Mode Engaged (parm #50) or Provide Fresh Air (parm #51) alert screens come on. For programming instructions, see parm #289. NOTE: This parameter is identical to parm #110, but repeated for use of the right microprocessor.
292 *	None	0–3	**Buzzer Enable II:** Controls the enabling of this buzzer, and the type of sound. This is an optional buzzer function. For programming instructions, see parm #289. NOTE: This parameter is identical to parm #111, but repeated for use of the right microprocessor.
293 *	Min	0–15	**Turn Signal Warning Activation Time:** Controls how long the turn signals have to remain ON before the buzzer warning activates and the dash driver display shows the "Warning–Turn Signal ON" screen.
		0=Off	Enter "0" (zero). The warning does not activate (it does not come on at all).
		1–15	Enter any number between "1" and "15." The warning activates, but only after that number of minutes has elapsed. NOTE: If both parm #293, turn signal activation time, and parm #294, turn signal activation distance, are turned on, the turn signal warning is activated by whichever condition becomes active first. This parameter is identical to parm #113, but repeated for use of the right microprocessor.

* No access by users

Table 2, ICU Right Microprocessor Buzzer Parameters (parms #289-293)

ICU Right Microprocessor Buzzer and System Parameters			
Parm	**Units**	**Range**	**Description**
294 *	Miles	0–15	**Turn Signal Warning Activation Distance:** Controls how far the vehicle has to travel with the turn signals ON before the buzzer warning activates and the dash driver display shows the "Warning–Turn Signal ON" screen.

ICU Right Microprocessor Buzzer and System Parameters			
Parm	**Units**	**Range**	**Description**
		0=Off	Enter "0" (zero). The warning does not activate (it does not come on at all).
		1–15	Enter any number between "1" and "15." The warning activates, but only after the vehicle has traveled one-tenth that number of miles. For example, if "5" is entered, the turn signal warning activates after the vehicle has traveled 0.5 (one-half) mile. NOTE: If both parm #293, turn signal activation time, and parm #294, turn signal activation distance, are turned on, the turn signal warning is activated by whichever condition becomes active first. This parameter is identical to parm #114, but repeated for use of the right microprocessor.
295	Sec	0–15	**Number of Seconds ON for Type 3 Buzzer Pulsed:** Controls the number of seconds each buzzer pulse lasts when the type 3 buzzer.
		0=Off	Enter "0" (zero). The type 3 (programmable) buzzer function is disabled (this does not affect the other two types of buzzer function).
		1–15	Enter any number between "1" and "15." The buzzer remains ON for that number of seconds during each pulse. NOTE: This parameter is identical to parm #115, but repeated for use of the right microprocessor.
296 *	None	0 or 136	**ABS:** Enables the ICU to look for an antilock brake system installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no antilock brake system is installed.
		136	Enter "136" if an antilock brake system is installed. NOTE: This parameter is identical to parm #190, but repeated for use of the right microprocessor.
297 *	None	0 or 150	**ECAS:** Enables the ICU to look for an electronic suspension system installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no electronic suspension is installed.
		150	Enter "150" if an electronic suspension is installed. NOTE: This parameter is identical to parm #191, but repeated for use of the right microprocessor.
298 *	None	0 or 190	**ACPU:** Enables the ICU to look for an air conditioning protection unit installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no air conditioning protection unit is installed.
		190	Enter "190" if an air conditioning protection unit is installed. NOTE: This parameter is identical to parm #192, but repeated for use of the right microprocessor.
299 *	None	0 or 130	**Transmission:** Enables the ICU to look for an electronic transmission installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no electronic transmission is installed.
		130	Enter "130" if an electronic transmission is installed. NOTE: This parameter is identical to parm #193, but repeated for use of the right microprocessor.

Table 3, ICU Right Microprocessor Buzzer and System Parameters (parms #294-299)

Parameter Changing, Right Microprocessor

ICU Right Microprocessor Miscellaneous Parameters			
Parm	**Units**	**Range**	**Description**
300 *	Sec	0–15	**Monitored Systems OK Screen:** Controls the enabling of this screen and the length of time that it shows on the dash driver display during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–15	Enter any number between "1" and "15." The screen displays for that number of seconds.
			NOTE: This parameter is identical to parm #2, but repeated for use of the right microprocessor.
301 *	None	N/A	**Input Software Version Number:** Allows the input of the software version number installed in the ICU.
			This is a data input parameter. Enter the software version number.
			NOTE: This parameter is identical to parm #130, but repeated for use of the right microprocessor.
313 *	None	N/A	**Input Century Class ICU Part Number:** Allows the input of the ICU part number.
			This is a data input parameter. Enter the ICU part number.
			NOTE: This parameter is identical to parm #159, but repeated for use of the right microprocessor.
334 *	None	0 or 1	**Gauge Diagnostic Faults:** Controls the enabling of this function, which monitors the gauges connected to the ICU and reports any faults found.
		0=Off	Enter "0" (zero). The function is disabled (faults are not reported).
		1=On	Enter "1." The function is enabled (faults are reported).
			NOTE: This parameter is identical to parm #210, but repeated for use of the right microprocessor.

* No access by users

Table 4, ICU Right Microprocessor Miscellaneous Parameters (parms #300-334)

Troubleshooting

The instrumentation control unit (ICU) receives warnings via the J1708/1587 data bus and displays them as received.

The ICU presents this information to the operator or service technician in the form of alert screens (when the vehicle is moving) or diagnostic information data screens (when the vehicle is not moving).

Ignition Sequence

When the ignition switch is turned ON, the ICU performs an ignition sequence. The electronically driven gauges sweep from zero to full scale and then back to zero. The warning/indicator lights also activate for a certain number of seconds (the number of seconds can be programmed).

NOTE: The battery voltage, primary air, and secondary air gauges are not electronically driven and do not sweep.

During the ignition sequence, the ICU monitors and records any active vehicle electronic system fault codes transmitted on the datalink by other Electronic Control Units (ECUs). The ICU stores a maximum of 16 active fault codes (eight each for the ICU and for other vehicle systems). The ICU will store these active faults in memory until one of the following happens:

- The ignition switch is turned OFF or;
- The ICU receives a "DIAGNOSTIC CLEAR" message and the ECU stops transmitting the fault code.

The ICU can store eight ICU system historic, or inactive, fault codes. Clear ICU system historic fault codes with the SET/RESET keypad key or with ServiceLink.

System Fault Analysis

When displaying fault codes, the ICU uses four kinds of code groups:

- Message Identifiers (MIDs)
- Parameter Identifiers (PIDs)
- Sub-System Identifiers (SIDs)
- Failure Mode Identifiers (FMIs)

For lists of MIDs, PIDs, SIDs, and FMIs, see **Specifications, 400**. For more information on these code groups and how to read them, see "Fault Codes" in this subject.

To correct an active fault, see the following sources:

- Engine ECM (MID 128)—use the engine manufacturer's literature.
- ABS ECU (MID 136)—see **Section 42.08** or use the antilock brake system manufacturer's literature.
- ICU (MIDs 140, 142, and 234)—see this section.
- DLU (MID 179)—see **Section 54.06**.
- ACPU (MID 190)—see **Section 83.02**.

1. To begin troubleshooting active fault codes, first turn the ignition switch OFF and then ON. This verifies that a fault is still active and allows the ICU to record any other faults currently being transmitted.

IMPORTANT: There are two central processing units (CPUs) in the ICU, each with its own MID. Left CPU faults are broadcast as MID 140. Right CPU faults were originally broadcast as MID 142, but on ICUs with software version 8.4.0, the MID has been changed to 234.

2. Correct the active fault. See below for information on specific faults. See **Table 1** for LH CPU faults (except keypad faults). See **Table 2** for RH CPU faults. See **Table 3** for keypad faults.
3. To verify that the problem is corrected and that the fault code is no longer displayed as active, turn the ignition switch OFF and then ON.

Datalink Activity

1. If the alert message "NO DATALINK ACTIVITY" is displayed, check the J1705/J1587 datalink wiring (twisted pairs).
2. Verify that all ECUs are connected.
3. Verify that the ECU J1587+ is connected to the datalink J1587+ and that ECU J1587– is connected to datalink J1587–.

Table 1, Instrumentation Control Unit (ICU) Fault Codes, Left-Hand CPU (non-keypad)

Gauges

Gauge Does Not Sweep

If a particular gauge does not sweep during the ignition sequence, then there is a problem either with the gauge or the ICU circuit board.

1. Turn the gauge counterclockwise and remove it from the ICU housing.
2. Install a gauge known to be good and repeat the ignition sequence.
3. If the test gauge sweeps full scale and back to zero, replace the original gauge with a new one. For replacement instructions, see **Subject 110**.
4. If the test gauge does not sweep, replace the ICU. For replacement instructions, see **Subject 100**.

NOTE: If one ICU circuit board has failed, replace the complete ICU housing containing both the left and right ICU circuit boards. Remove all gauges, the message center bezel, and the wood grain panel. Install these parts in the new ICU housing.

Gauge Does Sweep

If a gauge malfunctions but sweeps during the ignition sequence, the ICU is not at fault.

1. Check the circuits that supply input signals to the ICU.
2. Check the engine ECM programming.

Instr	AUX9 COIL	Short	Gauge at this position has a shorted coil	234	030	06	
Instr	EEPROM	Bad	Right-hand EEPROM failure	234	039	12	Replace the ICU

Table 2, Instrumentation Control Unit (ICU) Fault Codes, Right-Hand CPU

Warning/Indicator Lights

Light Does Not Illuminate

Most warning and indicator lights illuminate during the ignition sequence. This can be used as a diagnostic test of these lights.

IMPORTANT: The following lights do not illuminate during the ignition sequence:

A. ENG PROT indicator light input WL002

B. CHK ENG indicator light input WL003

C. STOP ENG indicator light input WL007 (used on Cummins engines only)

D. TRAC ABS indicator light input WL011

If a warning/indicator light other than those listed above does not illuminate during the ignition sequence, either the light bulb or the ICU circuit board is malfunctioning. Replace the light bulb with a test bulb known to be good and repeat the ignition sequence.

Troubleshooting

Instrumentation Control Unit (ICU) Fault Codes, Keypad Faults							
ICU Text Message			Problem	MID	Fault #	FMI	Correction
Instr	KEY 1	Bad	Key has failed or keypad connection open	140	009	12	Check keypad connection to cab harness, repair as required. Check circuit 437B from the keypad to the LH ICU pin B8 and 437G to LH ICU D11, repair as required. If circuits are OK, replace keypad.
Instr	KEY 2	Bad	Key has failed or keypad connection open	140	010	12	Check keypad connection to cab harness, repair as required. Check circuit 437C from the keypad to the LH ICU pin B6 and 437G to LH ICU D11, repair as required. If circuits are OK, replace keypad.
Instr	KEY 3	Bad	Key has failed or keypad connection open	140	011	12	Check keypad connection to cab harness, repair as required. Check circuit 437D from the keypad to the LH ICU pin B5 and 437G to LH ICU D11, repair as required. If circuits are OK, replace keypad.
Instr	KEY 4	Bad	Key has failed or keypad connection open	140	012	12	Check keypad connection to cab harness, repair as required. Check circuit 437E from the keypad to the LH ICU pin B9 and 437G to LH ICU D11, repair as required. If circuits are OK, replace keypad.
Instr	KEY 5	Bad	Key has failed or keypad connection open	140	013	12	Check keypad connection to cab harness, repair as required. Check circuit 437F from the keypad to the LH ICU pin B7 and 437G to LH ICU D11, repair as required. If circuits are OK, replace keypad.

Table 3, Instrumentation Control Unit (ICU) Fault Codes, Keypad Faults

1. Remove the message center bezel and replace the bulb with a test bulb. Use the bulb replacement tool provided.
2. If the test bulb lights, replace the original bulb with a new one. For replacement instructions, see **Subject 120**.

   If the test bulb does not light, replace the ICU. For replacement instructions, see **Subject 100**.

Light Illuminates

If a warning/indicator light malfunctions but illuminates during the ignition sequence, the ICU is not at fault.

1. Check the circuits that supply input signals to the ICU. These lights are activated by either a 12V power input or a ground input.
2. Check the ECU programming corresponding to the light.

Buzzer

Buzzer Does Not Operate

If the buzzer does not activate during the ignition sequence, either the buzzer or the ICU circuit board is malfunctioning. The buzzer is mounted behind the speedometer.

1. Install a buzzer known to be good and repeat the ignition sequence.
2. If the test buzzer functions, replace the original buzzer with a new one. For replacement instructions, see **Subject 130**.

   If the test buzzer does not function, replace the ICU. For replacement instructions, see **Subject 100**.

Buzzer Does Operate

If the buzzer operates during the ignition sequence but does not work properly for another function, then there is a problem with the ICU configuration or with ICU input circuits.

1. Check the ICU parameter (buzzer functions) configuration with ServiceLink. For more information, see **Subject 180**.
2. Check the circuits that supply input signals to the ICU.
3. Check the ECU programming corresponding to the buzzer function.

Dash Driver Display Screen

Screen Does Not Activate

If the dash driver display screen does not activate during the ignition sequence, either the display screen itself or the ICU circuit board is malfunctioning. The dash driver display screen is mounted behind the message center bezel.

1. Install a dash driver display screen known to be good and repeat the ignition sequence.
2. If the test screen functions, replace the original dash driver display screen with a new one. For replacement instructions, see **Subject 140**.

   If the test screen does not function, replace the ICU. For replacement instructions, see **Subject 100**.

Screen Does Activate

If the dash driver display screen operates during the ignition sequence, but does not work properly for another function, then there is a problem in the ICU configuration or the key pad.

1. Check the ICU parameter configuration (screen display functions) with ServiceLink.
2. Verify that the ICU parameter that controls the screen function which is having the problem is configured correctly.
3. If the parameter value is incorrect, change the parameter value and enable the screen function. For more information, see **Subject 170** or **Subject 200**. For screen functions controlled by the right-hand ICU microprocessor, see **Subject 220**.
4. Check the ICU dash driver display for the message "KEY PAD FAULT." See **Table 3**.

   If this message is displayed, check the keypad connection to the wiring harness and repair the circuit if necessary.
5. If the keypad to wiring harness connection is good, replace the keypad. For replacement instructions, see **Subject 150**.

ICU Small Gauges

The oil pressure, coolant temperature, oil temperature, and turbo air pressure gauges are driven electronically by the ICU using data inputs from the engine ECM. The ICU receives digital data from the engine ECM via the J1708/J1587 datalink.

1. First, to determine whether the fault lies in the ICU or the gauge input circuits, do the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be in the gauge input circuits, use the dash driver display, ServiceLink, or the engine manufacturer's diagnostic software tool, and determine if there is an active engine ECM fault code related to the problem.
3. If an active fault code is displayed, follow the engine manufacturer's instructions to correct the problem.

   If no active fault code is displayed, check the datalink connection from the engine ECM to the ICU.
4. Check the datalink for cross-wired connections from all ECUs.

Voltmeter

The voltmeter is driven by the voltage input to the ICU. The voltmeter should function with the ignition switch in the ON position.

1. Replace a problem gauge with a test gauge known to be good and turn the ignition ON.
2. If the test gauge indicates 11 to 14V, replace the original gauge with a new one.

   If the test gauge indicates lower than 11V or higher than 14V, then check input voltages to the left-hand ICU board (pink connector) as follows:

   2.1 Check the 12V battery circuit: pin LH-D14 and wire 437.

   2.2 Check the 12V ignition circuit: pin LH-D15 and wire 437A.

   2.3 Check the ground circuit: pin LH-D13 and wire GND1.
3. Troubleshoot and repair any of the above circuits that shows a malfunction.

   If all the circuits above are functioning, replace the ICU. For replacement instructions, see **Subject 100**.

Pyrometer

The pyrometer is electronically driven by the ICU. The pyrometer input circuit to the ICU contains a thermocouple mounted on the turbocharger exhaust port and a thermocouple amplifier module (TAM). The thermocouple senses the exhaust temperature and sends a small voltage signal to the TAM. The TAM amplifies this voltage signal by a factor of 100 (typically 0 to 8 VDC) and sends it on to the ICU. The ICU receives the analog voltage signal from the TAM and converts it to the digital signal that drives the pyrometer.

1. First, to determine whether the fault lies in the ICU or the gauge input circuits, do the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be in the gauge input circuits, check for 12 VDC of ignition power at the vehicle side connector to the TAM (circuit 218). The TAM is located just above the right-hand wheel well. Repair a malfunctioning circuit if necessary.
3. Warm up the engine fully so that the thermocouple reaches operating temperature. Then shut down the engine and turn the ignition back on.

NOTE: Do not measure voltage using chassis ground as a reference.

4. Check the voltage output signal of the TAM.

   Example: At 300°F (150°C) = 5.14 VDC (acceptable); at 480°F (250°C) = 9.16 VDC (unacceptable).

   NOTE: To measure TAM output voltage, gain access the circuits at the right-hand wheel well or at the ICU left-hand connector pin C6 (218A+) and pin D6 (218A–).

   4.1 Check between circuits 218A+ (positive lead) and 218A– (negative lead). Voltage should be 4 to 8 VDC, depending on temperature.

   4.2 If this measurement is not within the tolerances, then either the TAM or the thermocouple is malfunctioning.

NOTE: The TAM's output should be 100 times greater then the thermocouple output (TAM output = 5.14 VDC, thermocouple output = .0514 VDC).

NOTE: Do not measure voltage using chassis ground as a reference.

5. Check the voltage output signal of the thermocouple.

   Example: At 300°F (150°C) = 0.514 VDC (acceptable); at 480°F (250°C) = 0.916 VDC (unacceptable).

   NOTE: To measure thermocouple output voltage, gain access to the circuits at the right-hand wheel well.

   5.1 Check the voltage between circuits 218A+ (positive lead) and 218A– (negative lead). The voltage should be between 0.4 and 0.8 VDC.

   5.2 If this measurement is out of tolerance, the thermocouple is malfunctioning. Replace a malfunctioning thermocouple as required.

   If this measurement is within tolerance, but the measurement in the previous step was out of tolerance, the TAM is malfunctioning. Replace a malfunctioning TAM as required.
6. Check the circuits from the TAM to the ICU.

   6.1 Check for continuity between circuit 218A+ and ICU left-hand connector pin C6.

   6.2 Check for continuity between circuit 218A– and pin D6.

   6.3 Repair a malfunctioning circuit if necessary.

Transmission Temperature Gauge

The transmission temperature gauge is electronically driven by the ICU. The ICU input circuit contains a temperature sensor (thermistor) mounted in the transmission housing. The sensor sends a resistance signal corresponding to the transmission temperature. The ICU receives this signal and converts it to a

digital signal, which drives the electronic transmission temperature gauge.

NOTE: Do not measure resistance using chassis ground as a reference.

1. First, to determine whether the fault lies in the ICU or the gauge input circuits, do the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be in the gauge input circuits, check the resistance of the temperature sensor at the transmission. The resistance between the two sensor pins is typically 32 to 1 KΩ. Replace the sensor if necessary.

   Examples: At 32°F (0°C) = 32 KΩ; at 77°F (25°C) = 10 KΩ.
3. Check the continuity of the sensor-to-ICU circuits on the ICU right-hand (blue) connector. Repair a malfunctioning circuit if necessary.

   3.1 Check for continuity between wire 30 and pin RH-D7.

   3.2 Check for continuity between wire 30G and pin RH-D6.

Drive Axle Temperature Gauges

The temperature gauges for the forward-rear and rearmost drive axles are electronically driven by the ICU. The input circuits to the ICU contain temperature sensors (thermistors) mounted in the drive axle housings. The sensor sends a resistance signal corresponding to the axle temperature. The ICU receives the resistance signal and converts it to a digital signal which drives the electronic gauges.

NOTE: Do not measure resistance using chassis ground as a reference.

1. First, to determine whether the fault lies in the ICU or the gauge input circuits, do the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be in the gauge input circuits, check the resistance of the rear axle temperature sensors. The resistance between the two sensor pins is typically 32 to 1 KΩ. Replace the sensor if necessary.

   Examples: At 32°F (0°C) = 32 KΩ; at 77°F (25°C) = 10 KΩ.
3. Check the continuity of the circuits from the forward-rear drive axle sensors to the ICU right-hand (blue) connector. Repair a malfunctioning circuit if necessary.

   3.1 Check for continuity between wire 42 and pin RH-D5.

   3.2 Check for continuity between wire 42G and pin RH-C5.
4. Check the continuity of the circuits from the rearmost drive axle sensors to the ICU right-hand (blue) connector. Repair a malfunctioning circuit if necessary.

   4.1 Check for continuity between wire 43 and pin RH-D4.

   4.2 Check for continuity between wire 43G and pin RH-C4.

Outside Ambient Air Temperature Circuit

A temperature sensor (thermistor) is mounted under the front bumper step. The sensor sends a resistance value corresponding to the outside air temperature to the ICU which converts it to a digital signal. The ICU uses this digital signal to display the outside ambient air temperature on the dash driver display when the TEMP key is pressed on the keypad.

1. Turn the ignition switch to the ON position and push the TEMP key on the keypad to troubleshoot the outside ambient air temperature circuit.
2. If the temperature displayed is a large negative number, for example –34°F (–37°C), then there is an open circuit. Verify that the sensor is connected.
3. Check the continuity of circuit 299 (Air Temp+) from the front bumper step to the chassis connector, and from there to the left-hand (pink) ICU connector. Repair a malfunctioning circuit if necessary.

3.1 Check for continuity between the front bumper step and chassis connector pin D7.

3.2 Check for continuity between chassis connector pin D7 and ICU pin LH-C7.

4. Check the continuity of circuit 299A (Air Temp GND) from the front bumper step to the chassis connector, and from there to the left-hand (pink) ICU connector. Repair a malfunctioning circuit if necessary.

   4.1 Check for continuity between the front bumper step and chassis connector pin D9.

   4.2 Check for continuity between chassis connector pin D9 and ICU pin LH-D7.

NOTE: Do not measure resistance using chassis ground as a reference.

5. If the temperature displayed does not correspond to the air temperature, check the resistance of the temperature sensor. The resistance between the two sensor pins is typically 34 to 0.25 K Ω. Replace the sensor if necessary.

   Examples: At 59°F (15°C) = 1.5 to 1.6 KΩ; at 68°F (20°C) = 1.2 to 1.3 KΩ; and at 77°F (25°C) = 0.9 to 1.1 KΩ.

Fuel Level Gauge Diagnosis

The fuel level gauge is controlled by the ICU using a variable resistance input from the fuel level sending unit that is located in the fuel tank. The fuel level sending unit resistance varies linearly from 31±2Ω with a full tank to 247±3Ω when empty.

If the ICU3 is measuring a resistance greater than 284Ω between circuit 47 and ground, a fault will be set for fuel level circuit open. If the ICU3 is measuring less than 23.5Ω between circuit 47 and ground, a fault will be set for fuel level circuit shorted low. ServiceLink may be used to monitor for these faults. The gauge will read empty until the measurement from the sensor is between 284Ω and 23.5Ω. Refer to **Table 4** for the fuel level diagnostic procedure.

NOTE: If the fuel level sensor is below the minimum resistance (short to ground) or above the maximum (open), the fuel gauge will read empty. Shorting the fuel sensor wires will not drive the gauge to full scale.

Fuel Level Gauge Diagnosis

Step	Test Procedure	Test Result	Action
1	If a 100 ohm resistor is available, disconnect the fuel level sender connector and place the resistor across circuit 47 and ground in the wiring harness connector to simulate the fuel level sending unit. Turn the ignition to the ON position and observe the fuel gauge. If, after gauge initialization, the gauge points very closely to the half tank mark, then the wiring and ICU are all operating correctly. Jump to Step 4 if there is no problem with the wiring and ICU. Does the fuel level gauge stay at empty even though there is fuel in the tank or is the complaint an inaccurate and intermittent reading? Note - turn the ignition to OFF and disconnect the batteries before continuing.	Stays at Empty	Go to Step 2.
		Inaccurate or Intermittent	Go to Step 4.

Fuel Level Gauge Diagnosis			
Step	**Test Procedure**	**Test Result**	**Action**
2	Disconnect the connector at the fuel level sender and measure the resistance of the sender. What is the resistance of the sender?	Greater than 284Ω or Less than 23.5Ω	Go to Step 4.
		Between 284Ω and 23.5Ω	Go to Step 3.
3	Connect the fuel level sender and disconnect the connectors on the back of the ICU. Measure the resistance in the vehicle wiring between circuit 47 in connector pin D1 and the ground circuit in connector pin D2. What is the resistance of the circuit?	Greater than 284Ω	Troubleshoot and repair an open circuit on either circuit 47 or the ground between the ICU connector and the fuel level sender.
		Between 284Ω and 23.5Ω	This is the valid resistance range. If the fuel tank is full and the resistance is close to 31Ω, replace the ICU. Otherwise no problem is indicated.
		Less than 23.5Ω	Troubleshoot and repair a short to ground on circuit 47 between the ICU connector and the fuel level sender.
4	Remove the fuel sending unit from the fuel tank. Connect an ohm meter to the pins at the fuel level sender connector. Slowly move the level of the float arm from full to empty. See **Fig. 1**. Does the resistance vary linearly from 31±2Ω to 247±3Ω?	Yes	Troubleshoot and repair for corrosion or an intermittent connection in the circuitry between the ICU and the fuel level sender.
		No	Replace the fuel level sending unit.

Table 4, Fuel Level Gauge Diagnosis

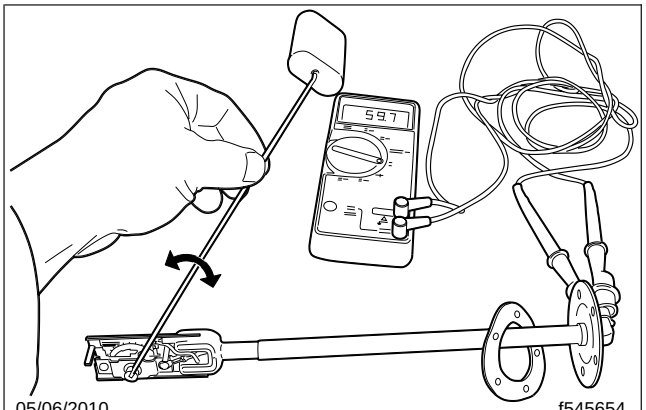

Fig. 1, Testing the Fuel Level Sending Unit

Fault Codes

The ICU displays four kinds of numerical code groups for reporting faults, accompanied by a text message which describes both the failed component and the failure mode, or cause of failure.

Each fault code displayed consists of three code groups. The first code group identifies the fault transmitter. It is referred to as the message identifier (MID). For a complete list of MIDs, see **Specifications, 400**.

The next code group consists of three digits also. This code identifies the system in which the fault was detected. It is either the parameter identifier (PID), or the sub-system identifier (SID). For lists of PIDs and SIDs, see **Specifications, 400**.

NOTE: Instrumentation control unit (ICU) faults have special fault numbers. For a list of ICU fault numbers for the LH CPU, see **Table 5**. For a list of ICU fault numbers for the RH CPU, see **Table 6**.

Since the ICU gathers information electronically, any error message or warning displayed by the ICU can indicate one of two things: a fault in the vehicle system or a fault in the data. If the fault lies in a particu-

Troubleshooting

lar vehicle system, see the troubleshooting subject in the appropriate section of the workshop manual.

To help identify faults in the data, the ICU displays a two-digit code at the end of each fault message called the Failure Mode Identifier (FMI). The FMI gives information about where the fault lies. Is the circuit shorted, or open? Is the vehicle low on coolant, or is the coolant level sensor bad? For a complete list of FMIs, see **Specifications, 400**.

ICU Fault Numbers (MID=140)

* Text messages specify the gauge location, not a particular gauge. The location of particular gauges can vary.

Table 5, ICU Fault Numbers (LH CPU)

Fault Code Screens

Fault code screens provide troubleshooting information in a brief, easy-to-read format.

In release 8.4.0, the top line of the display gives a description of the fault code. The bottom line gives a short text description of the failure mode, followed by the fault code. See the example in **Table 6**.

* Text messages specify the gauge location, not a particular gauge. The location of particular gauges can vary.

Table 6, ICU Fault Numbers (RH CPU)

In earlier releases, the top line of the display gives the fault code and the name of the reporting unit. The bottom line gives a text description of the fault code and failure mode, followed by the fault code. See the example in **Table 7**.

NOTE: The second code group in the fault code can be either a PID or a SID. To tell them apart, all SIDs are preceded by an "s" in the space between the first code group (the MID) and the second code group. If the second code group is a PID, the space is blank.

Table 7, Fault Code Screens

Schematics

See **Fig. 1** for a schematic of the ICU keypad wiring and chassis sensor wiring (chassis sensors include the fuel level, transmission temperature, and axle temperature sensors).

For a schematic of the wiring connecting the ICU to ignition and battery power, showing the interconnections to the datalink wiring and to ground, see **Fig. 2** on vehicles built before August 30, 1996. See **Fig. 3** on vehicles built on or after August 30, 1996.

See **Fig. 4** for a schematic of the ICU wiring showing the discrete signals coming in from the engine ECM, ABS module, and other discrete sources located in the engine and cab.

Connector Pin Assignment Tables

Each ICU microprocessor has two connectors. Connector #1 has 24 pins, numbered A1 through A12, and B1 through B12. Connector #2 has 32 pins, numbered C1 through C16, and D1 through D16.

Tables 1 through 4 show the connector pin assignments for the ICUs.

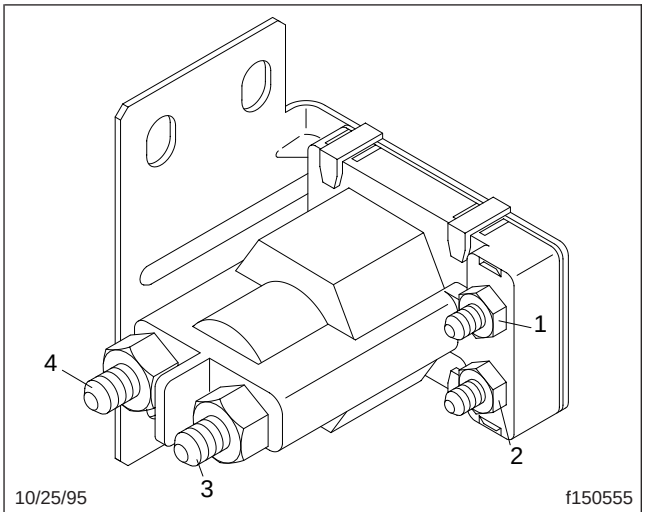
13	Out of calibration	Calibrate
14	Special instructions	RSRVD
15	Reserved for future assignment	RSRVD

Table 22, Failure Mode Identifiers (FMIs)

General Information

All 12-volt starting systems are equipped with a heavy duty starter relay, referred to as a magnetic switch (see **Fig. 1**). On the Century Class Conventional, the magnetic switch is attached to the lower left-hand frontwall. On the Argosy COE, the magnetic switch is mounted on the overslung crossmember. When the ignition switch is held in the extreme clockwise (start) position, the magnetic switch closes, connecting electrical current to the starter solenoid, which engages the starter motor pinion with the engine flywheel ring gear, and then energizes the starter motor.



1. Coil Terminal (To Ground)
2. Coil Terminal (To Ignition Switch)
3. Switch Terminal (To Solenoid)
4. Switch Terminal (To Starter BAT Terminal)

Fig. 1, Magnetic Switch

The magnetic switch consists of a winding, mounted around a hollow cylinder containing a movable core or plunger, with a contact disk that is assembled onto the plunger.

When the winding is energized, plunger movement causes the contact disk to be held tightly against the two main switch terminals; this closes the circuit between these terminals, and activates the starting motor. When the winding is de-energized, a return spring causes the plunger to return to its original position, opening the circuit to the starter motor.

Magnetic Switch Replacement

Before replacing the magnetic switch, or repairing or replacing any of the starting and charging circuits, do the preliminary checks and the magnetic switch circuit test in **Troubleshooting 300**.

Replacement

The magnetic switch cannot be disassembled. If the switch does not work, replace it.

1. Apply the parking brakes, and chock the tires.
2. Tilt the hood or cab. For cab tilting instructions, refer to **Group 60** in this workshop manual.
3. Disconnect the batteries.
4. On the Century Class Conventional, remove the inner fender splash shield to gain access to the magnetic switch.
5. Mark the wires for later reference, then disconnect the wires that are attached to the magnetic switch. See **Fig. 1**.
6. On the Century Class Conventional, remove the two mounting screws that attach the magnetic switch to the frontwall.

   On the Argosy COE, remove the two mounting screws that attach the magnetic switch to the overslung crossmember bracket. See **Fig. 2**.
7. Remove the two large terminal nuts.
8. Disconnect the two-pin pigtail connector. Remove the magnetic switch.
9. On the Century Class Conventional, install the new magnetic switch on the frontwall.

   On the Argosy COE, install the new magnetic switch on the overslung crossmember bracket.

   9.1 Tighten the mounting screws 84 lbf·in (940 N·cm).

   9.2 Connect the wires to the magnetic switch, using the marks made on removal. Tighten the terminal nuts securely.

   9.3 Connect the two-pin pigtail connector.
10. Spray any exposed terminal connectors with dielectric red enamel. See **Table 1**.

Protectant Material	Approved Brands
Spray-On Application	MMM 1602 IVI–Spray Sealer, Red Electric Grade; order from the PDC
Brush-On Application	Glyptal 1201EW– Low VOC, Red; order at www.glyptal.com or 1-800-GLP-1201

Table 1, Approved Dielectric Red Enamel

11. On the Century Class Conventional, install the inner fender splash shield.
12. Connect the batteries and lower the hood or cab. For cab lowering instructions, refer to **Group 60** in this workshop manual.
13. Remove the chocks from the tires.

Preliminary Checks

Before replacing the magnetic switch, or repairing or replacing any of the starting and charging circuits, do these preliminary checks and the "Magnetic Switch Circuit Test."

1. Apply the parking brakes, and chock the tires.
2. Check the condition of the batteries. Follow the battery testing procedure in **Section 54.02**. Be sure the batteries are fully charged.

NOTE: The wiring, switches, and starter motor cannot be checked if the batteries are damaged or discharged.

3. Check the starting motor, ignition switch, and solenoid for damage or wear. Repair or replace the component(s), as needed.

Magnetic Switch Circuit Test

Before replacing the magnetic switch, or repairing or replacing any of the starting and charging circuits, do this test.

1. Apply the parking brakes, and chock the tires.
2. Check the wiring and the magnetic switch for wear or damage. See **Fig. 1**.
3. Check the circuit between the magnetic switch and the starter "B" terminal (circuit 15B) for correct voltage.
   - 3.1 Disconnect the circuit running from the starter "S" terminal to the magnetic switch (circuit 15C).
   - 3.2 Connect a voltmeter to the magnetic switch terminal where the circuit from the starter "B" terminal is connected (circuit 15B).
   - 3.3 If the voltmeter reading is 0 volt, check for an open circuit.

     If the voltmeter reading is less than 12.0 volts, check for corroded or loose connections.

     If the voltmeter reading is 12.0 volts or more, go to the next step.
   - 3.4 Repair or replace any damaged wires.
4. Check the magnetic switch ground circuit.
   - 4.1 Connect an ohmmeter between the magnetic switch ground terminal and a known good ground.
   - 4.2 If the ohmmeter reading is more than 0.5 ohm, check for corroded or loose connections.
   - 4.3 Repair or replace any damaged wires.
5. Check the magnetic switch ignition wiring (circuit 15) for correct voltage.

   NOTE: This check requires two persons.
   - 5.1 Have one person turn on the ignition keyswitch and hold it in the "start" position.
   - 5.2 Have the other person connect a voltmeter between the magnetic switch terminal where the ignition circuit is connected (circuit 15A) and a known good ground.
   - 5.3 If the voltmeter reading is 0 volt, check for an open in circuit 15A.

     If the voltmeter reading is less than 11.0 volts, check for corroded or loose connections.

     If the voltmeter reading is 11.0 volts or more, go to the next step.
   - 5.4 Repair or replace any damaged wires, circuit breakers, or relays.
6. Check the circuit between the magnetic switch and the starter "S" terminal (circuit 15C) for correct voltage.

   NOTE: This check requires two persons.
   - 6.1 Have one person hold the ignition keyswitch in the "start" position.
   - 6.2 Have the other person connect a voltmeter between the magnetic switch terminal where the circuit from the starter "S" terminal is connected (circuit 15C) and a known good ground.
   - 6.3 If the voltmeter reading is less than 12.0 volts, replace the magnetic switch.
7. Check the voltage to the magnetic switch again. If the voltmeter reading is now eleven volts or more, disconnect the voltmeter, and remove the chocks from the tires. If the reading is still less

Fig. 1, Magnetic Switch Wiring

than eleven volts, replace the magnetic switch. For instructions, refer to **Subject 100**.

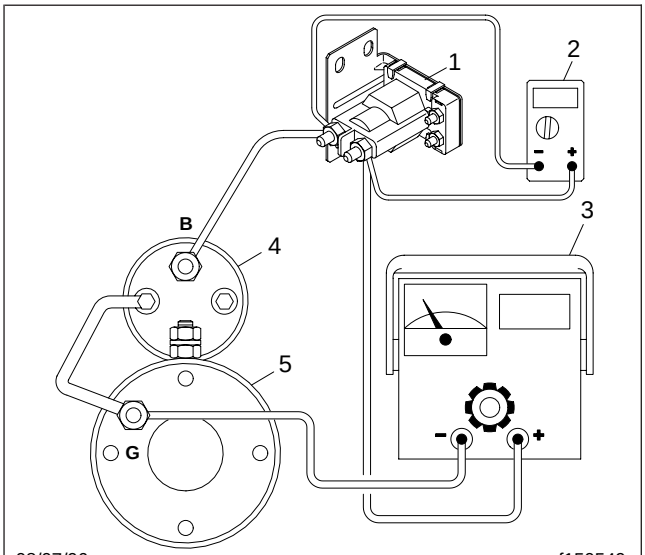
Magnetic Switch Contactor Test

The cranking circuit includes the battery, starter solenoid, cranking motor, magnetic switch, and ignition keyswitch.

If there is excessive voltage loss in the cranking circuit, the starter may not engage the flywheel at all, or it may drop out too soon when battery voltage goes down. In this case, check the cranking circuit and starter solenoid for voltage loss. For instructions, refer to **Section 15.00**.

If the magnetic switch closes during the cranking circuit test and the starter wiring test, also check the magnetic switch contactors for voltage loss.

1. Disconnect the lead from the magnetic switch to the "S" (solenoid) terminal on the starter (leave as in "Starter Wiring Test").
2. Connect this lead to the positive lead of a carbon pile tester. Connect the negative lead of the carbon pile to the starter "G" (ground) terminal (leave as in "Starter Wiring Test").
3. Set a digital voltmeter on the low scale and connect the positive lead to the magnetic switch wire lead to which the carbon pile is already connected. Connect the negative lead to the other large terminal on the magnetic switch. See **Fig. 2**.



1. Magnetic Switch
2. Digital Voltmeter
3. Carbon Pile
4. Starter Solenoid
5. Cranking Motor

Fig. 2, Magnetic Switch Contactor Test

4. Hold the key to the start position and read the voltage on the voltmeter. It should read 0 volt.
5. Turn on the carbon pile and adjust it to a 100-amp load.

    5.1 Now read and record the voltage on the voltmeter. Turn off the carbon pile.

    5.2 If the voltage reads 0.5 volts or less, the magnetic switch contactors are OK.

    If the voltage reads more than 0.5 volts, replace the magnetic switch.

For magnetic switch wiring, see **Fig. 1**.

Fig. 1, Magnetic Switch Wiring

General Information

Circuit protection is accomplished by routing all wiring through circuit breakers mounted in a power distribution module. There are two power distribution modules. The main power distribution module (see **Fig. 1**) is the electrical power center of the vehicle and is mounted underneath the electrical cover inside the upper dash assembly (right-hand panel).

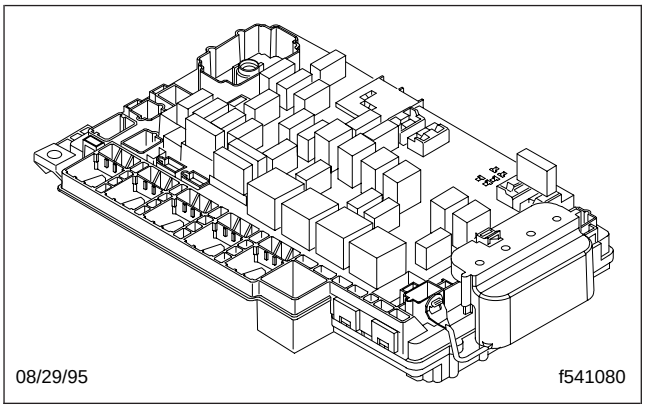

Fig. 1, Main Power Distribution Module

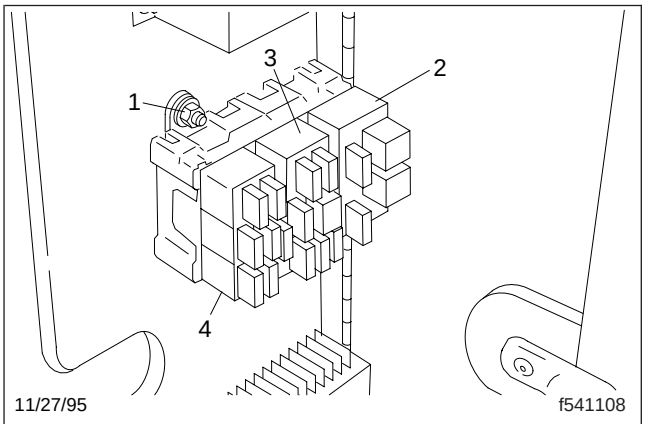
There is also an auxiliary power distribution module mounted on the inside of the electrical compartment door located on the B-pillar on the left-hand side behind the seat. See **Fig. 2** for the Century Class Conventional and **Fig. 3** for the Argosy COE.



1. Mounting Nut
2. Block B1 - Sleeper HVAC (sleepercabs only)
3. Block B2 - Sleeper Electrical (sleepercabs only)
4. Block B3 - ABS (and ECAS, if installed)

Fig. 2, Auxiliary Power Distribution Module, Century Class Conventional

6. Circuit Breaker
7. Connector P3
8. Relay
9. Cover
10. Connector P2
11. Connector P1

Fig. 3, Auxiliary Power Distribution Module, Argosy COE

On the Century Class Conventional, the auxiliary power module consists of three blocks: block B1 protects the sleeper unit of the heating, ventilation, and air conditioning system (HVAC); block B2 protects the other sleeper electrical components; block B3 protects the Anti-Lock Braking System (ABS), and, if installed, the electronic suspension (ECAS). Blocks B1 and B2 are not installed on day cabs.

On the Argosy COE, the auxiliary power module has three horizontal rows:

- The top row contains several fuses for the sleeper lighting and one sleeper HVAC circuit breaker.
- The middle row contains three relays for the sleeper HVAC.
- The bottom row contains ignition and battery power for the ABS and data logging unit (DLU).

The new auxiliary power module on the Argosy COE also has six plug-in connectors for easy disconnection of circuits during troubleshooting.

Main Power Distribution Module Removal and Installation

Removal

1. Apply the parking brakes and chock the tires. Disconnect the batteries.
2. Push the button to remove the electrical cover.
3. Remove the HVAC ducting.
   - 3.1 Remove the horizontal piece of ducting on top of the main power distribution module (PDM).
   - 3.2 Remove the two fasteners holding the vertical piece of ducting along the kick panel. Remove the ducting.
4. Remove the cover from the four PDM ring terminals on the right-hand side of the main PDM. Remove the ground connector from the right-hand aft corner of the PDM.
5. Remove the four ring connectors from their terminals. See **Fig. 1**. Mark with a paint pen for ease in installation.
6. Remove the PDM from the vehicle.
   - 6.1 Remove the two hold-down nuts and washers from the aft edge of the PDM.
   - 6.2 Remove the eight electrical connectors B through J from the top of the PDM by inserting a flat-blade screwdriver on the side of the plug to unfasten the clips. See **Fig. 2**. Remove the 7-mm capscrew attaching 46-pin connector A to the PDM.
   - 6.3 Unfasten the locking clips on the relays on the aft edge of the PDM. Push the relays through the holes in the PDM. Mark with a paint pen.
   - 6.4 Disconnect the accessory (ACC) and ignition (IGN) relays (the two relays fastened to the PDM with spade connectors). Then detach the clips from the PDM with care.

     IMPORTANT: Do not break the clip off the spade connector.
   - 6.5 Rotate the PDM to an angle of about 60° from vertical to expose the bottom of the PDM. If the PDM will not rotate that far because of binding from the electrical harness, disconnect the three main junction connectors and cut tie straps as needed to gain enough flexibility. See **Fig. 3**.

10. ISO Ring Terminal
11. BAT Ring Terminal
12. Cannon Plugs
13. ACC Relay
14. IGN Relay

Fig. 1, Main Power Distribution Module

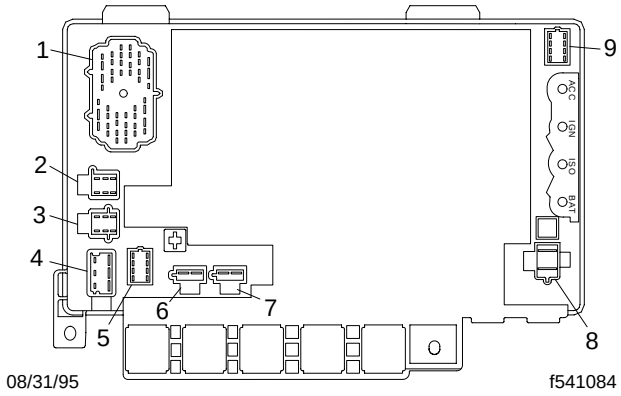
NOTE: To disconnect the junction connectors, first disconnect, from the engine side, the cannon plugs leading to the junction connectors. Both the cannon plugs and the junction connectors fasten with clips on their top edges.

- 6.6 Remove the electrical pins and connectors from the four terminals at the bottom of the PDM, including the large 46-pin connector N. See **Fig. 4**.

NOTE: There is a 7-mm capscrew attaching 46-pin connector N to the PDM.

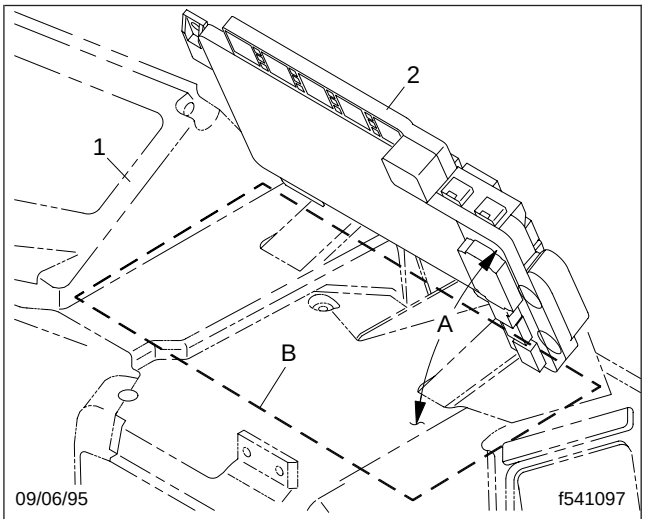
- 6.7 After all the plugs and connectors have been removed, remove the PDM from the vehicle.

Main Power Distribution Module Removal and Installation



1. 46-Pin Connector A
2. 6-Pin Connector B
3. 6-Pin Connector C
4. 6-Pin Connector D
5. 8-Pin Connector E
6. 2-Pin Connector F
7. 2-Pin Connector G
8. 2-Pin Connector H
9. 8-Pin Connector J

Fig. 2, Pin Connectors (top view)



Tilt the PDM onto its forward edge. At Angle A, it can be removed from the vehicle more easily.

1. 46-Pin Connector N
2. 2-Pin Connector M
3. 6-Pin Connector L
4. 6-Pin Connector K

Fig. 4, Pin Connectors (bottom view)

Installation

1. With the PDM tilted upwards, install the connectors to the bottom of the PDM. Attach the 7-mm capscrew to 46-pin connector N. See **Fig. 4**.
2. Place the PDM over the two attaching studs with the holes lined up. Make sure the ground wire and all ring terminals, harnesses and electrical connectors are clear. See **Fig. 1**.
3. Install the PDM on the vehicle.
   - 3.1 Install the ground connector to the lower right-hand receptacle.
   - 3.2 Install the ring connectors using the markings made on removal. Install the attaching nuts and washers.
   - 3.3 Attach the 7-mm capscrew to the 46-pin connector and install it to the top of the PDM. See **Fig. 2**.
   - 3.4 Attach all relays and electrical connectors to the top of the PDM, using the markings made on removal. Attach all locking clips and make sure the connections are firm.

IMPORTANT: Do not break the clip off the spade connector.

3.5 Fasten the PDM to the cab with the hold-down nuts and washers.

4. Install the HVAC ducting on the vehicle.

   4.1 Install the vertical piece of ducting along the right-hand kick panel, using the two fasteners removed earlier.

   4.2 Install the horizontal piece of ducting over the PDM.

5. If removed, install the junction connectors on the frontwall. Attach tie straps as needed and reroute the electrical harness to its correct position.

6. Install the electrical cover.

7. Connect the batteries. Then remove the chocks from the tires.

Auxiliary Power Distribution Module Removal and Installation

Century Class Conventional

REMOVAL

1. Apply the parking brakes and chock the tires. Disconnect the batteries.
2. Open the electrical compartment door on the left-hand B-pillar, behind the seat. See **Fig. 1**. The auxiliary power distribution module is installed on the inside of the door. Going from right to left, there are three separate blocks: B1, B2, and B3.

   The rightmost one is block B1. It protects the sleeper cab heating, ventilation, and air conditioning (HVAC) circuits. It is only installed on sleeper cabs.

   The center one is block B2. It protects the sleeper cab electrical lighting and accessory circuits. It is only installed on sleeper cabs.

   The leftmost one is block B3. It protects the anti-lock brake system (ABS) and also, if installed, the electronic suspension (ECAS) circuits.

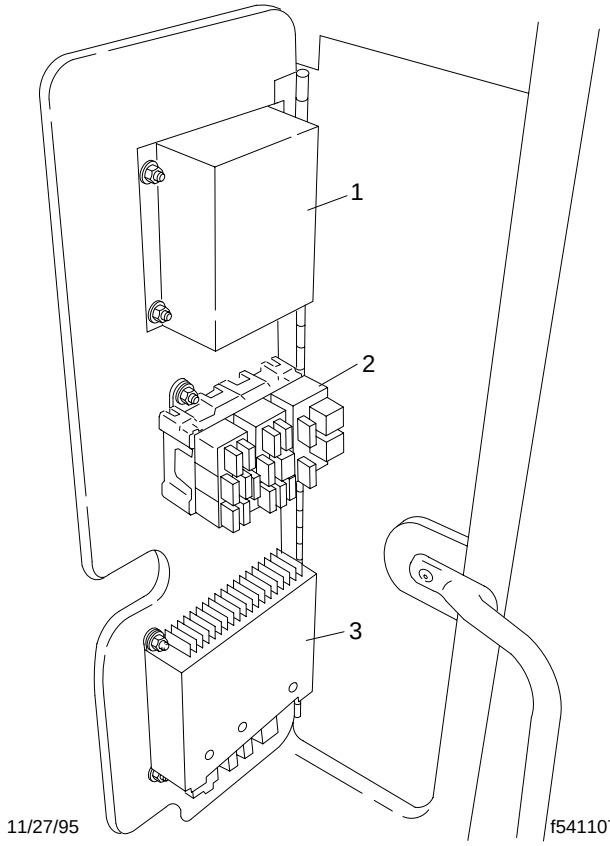
NOTE: For a list of individual relays and circuit breakers installed on the Century Class Conventional auxiliary power module and their plug-in positions, see **Troubleshooting, 300**.

3. Remove the auxiliary power distribution module. See **Fig. 2.**
   - 3.1 Remove the two mounting hexnuts attaching the auxiliary power module to the B-pillar access door.
   - 3.2 Remove the auxiliary power module from the electrical compartment door.
4. To remove an individual block from the module base, insert a screw driver into the slot in the base. Press underneath the tab and the block will release.

NOTE: There is no electrical connector on the auxiliary power module. Circuits are hard-wired into the block.

INSTALLATION

1. Install the auxiliary power distribution module onto the left-hand B-pillar electrical compartment door. See **Fig. 2**.



1. Data Logging Unit
2. Auxiliary Power Distribution Module
3. ABS Controller

Fig. 1, Left-Hand B-Pillar Electrical Compartment, Century Class Conventional

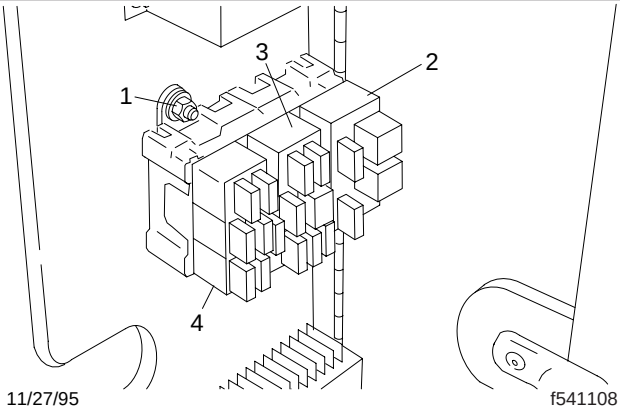
   - 1.1 Snap any removed blocks into the base.
   - 1.2 Install the two mounting hexnuts attaching the auxiliary power module to the B-pillar access door.
2. Close the electrical compartment door on the left-hand B-pillar. See **Fig. 1**.
3. Connect the batteries. Then remove the chocks from the tires.

Argosy COE

REMOVAL

1. Apply the parking brakes and chock the tires. Disconnect the batteries.

Auxiliary Power Distribution Module Removal and Installation



1. Mounting Nut
2. Block B1 - Sleeper HVAC (sleeper cabs only)
3. Block B2 - Sleeper Cab Electrical (sleeper cabs only)
4. Block B3 - ABS (and ECAS, if installed)

Fig. 2, Auxiliary Power Distribution Module, Century Class Conventional

2. Open the electrical compartment door on the left-hand B-pillar, behind the seat. See **Fig. 3**. The auxiliary power distribution module is installed on the inside of the door.

NOTE: For a list of individual relays and circuit breakers installed on the Argosy COE auxiliary power module and their plug-in positions, see **Troubleshooting, 300**.

3. Remove the auxiliary power distribution module. See **Fig. 4**.

   3.1 Unplug the six electrical connectors (top, right-hand side, and bottom) and mark them for later installation.

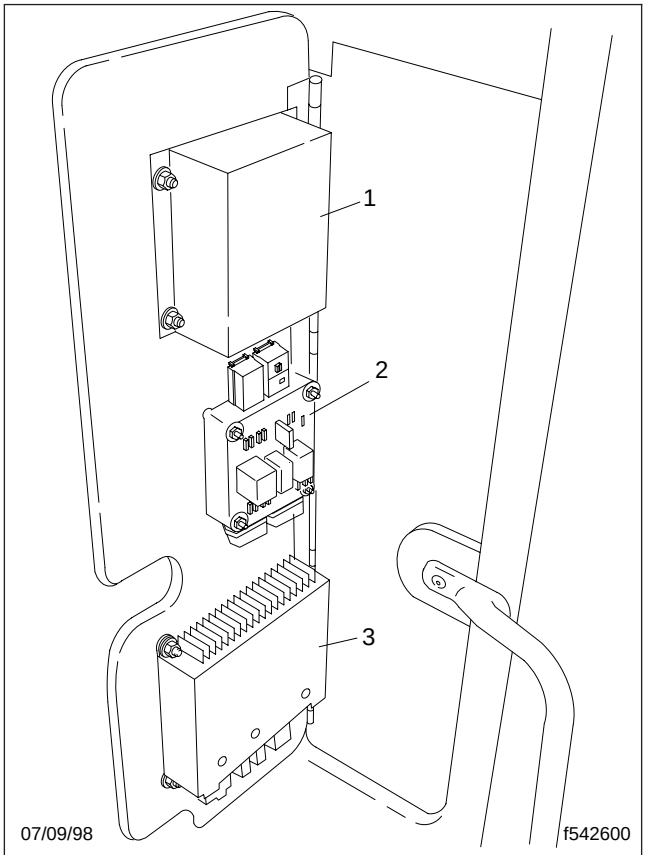
   3.2 Remove the four 10–24 locknuts and washers attaching the auxiliary power module to the B-pillar access door.

   3.3 Remove the auxiliary power module from the electrical compartment door.

INSTALLATION

1. Install the auxiliary power distribution module onto the left-hand B-pillar electrical compartment door. See **Fig. 4**.

   1.1 Install the four mounting locknuts and washers attaching the auxiliary power module to the B-pillar access door.



1. Data Logging Unit
2. Auxiliary Power Distribution Module
3. ABS Controller

Main Power Distribution Module

To troubleshoot malfunctioning circuit breakers (C/Bs) and relays, do the following:

1. Check the circuit breaker/relay location on the applicable figure.
2. Check the applicable table to find the breaker or relay size and note the pin (or plug) positions.
3. Replace the C/B or relay.
4. Find the pin-outs (or plug-ins) on the applicable figure and check the circuit again.

For circuit breaker and relay locations on the main power distribution module (PDM), see **Fig. 1**.

For a list of standard component circuit breakers and relays installed in the main PDM, see **Table 1**. For a list of optional component circuit breakers and relays installed in the main PDM, see **Table 2**.

For location of pin connectors on the top of the main PDM, see **Fig. 2**. For position of individual pin-outs on pin connectors A through G (main PDM—left-hand side), see **Fig. 3**. For position of individual pin-outs on pin connectors H and J (main PDM—right-hand side), see **Fig. 4**.

For location of pin connectors on the bottom of the main PDM, see **Fig. 5**.

Table 2, Main PDM Circuit Breaker/Relay ID (optional components)

NOTE: To locate pin-outs, use this key: The first letter indicates the connector in which the pin is located. The second letter indicates the row of the connector. The number indicates the number of the pin in the row, if there is more than one. If there is only one pin in a row, this number is missing.

Examples: Pin number AF5 means connector A, row F, pin 5. Pin number BC means connector B, pin C.

3G	7C 8C	52R 434R	10-Amp C/B	ECAS IGN or Communications System*

* Optional; not installed on all vehicles

Table 5, Circuit Breaker/Relay ID (Block B3), Century Class Conventional Auxiliary PDM

There are no pin connectors on the auxiliary power module. Circuits are hard-wired into the block. For this reason, plug-in terminal locations are given for each wire running into each block. Follow the wires to the plug-in locations on the front of the block and check for continuity.

NOTE: To locate plug-ins, use this key: Each block is numbered: B1, B2, or B3. Across all blocks, each horizontal row is assigned a number: 1 through 9. Within each block, each vertical column is assigned a letter: A, B, C, or D. *There are three "A" columns, one in each block.*

Examples: Plug number 2A means row 2, column A. Checking the table for block B2, circuit 41S is wired into plug-in 2A. Checking the table for block B3, circuit 376A is wired into plug-in 2A.

For wiring and harness diagrams of the main and auxiliary power modules, see **Specifications, 400**.

ARGOSY COE

The Argosy COE has an auxiliary power module with six plug-in connectors (two each on the top, right-hand side, and bottom of the module case).

On the auxiliary power module itself, there are three rows:

- Row A, the top row, contains 6 fuses and one 30-amp HVAC circuit breaker.
- Row D, the middle row, contains 3 HVAC relays.
- Row G, the bottom row, contains between 3 and 8 fuses, depending on options installed.

For circuit breaker and relay locations on the Argosy COE auxiliary power module, see **Fig. 7**.

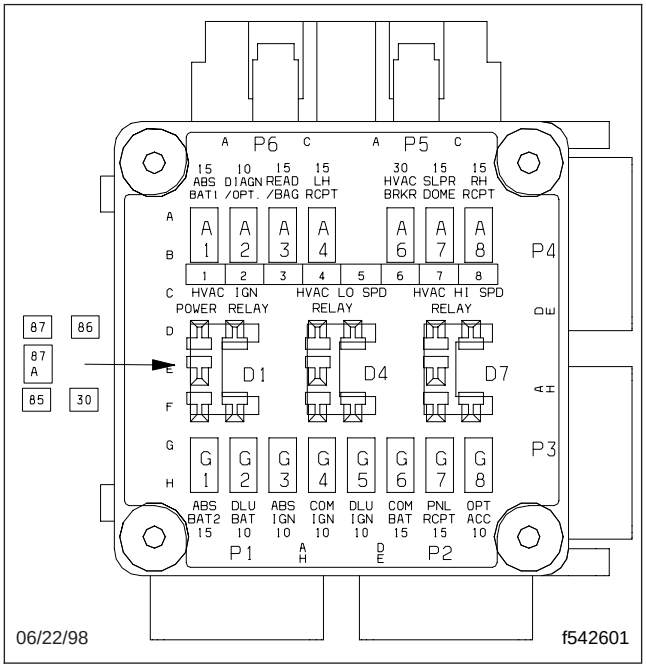

Fig. 7, Circuit Breaker/Relay Locations, Argosy COE Auxiliary PDM

For lists of all component fuses (standard and optional), circuit breakers, and relays installed in the Argosy COE auxiliary power module, together with the connector and pin number of each circuit, see **Table 6** for Row A, **Table 7** for Row D, and **Table 8** for Row G.

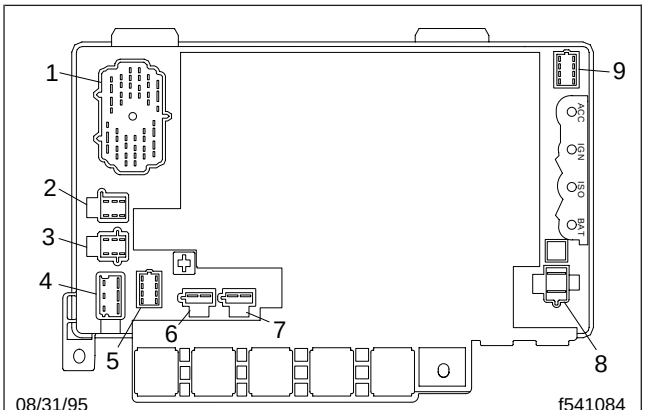
Table 8, Fuse ID (Row G), Argosy COE Auxiliary PDM

For pin connector locations on the top of the main PDM, see **Fig. 1**.



1. 46-Pin Connector A
2. 6-Pin Connector B
3. 6-Pin Connector C
4. 6-Pin Connector D
5. 8-Pin Connector E
6. 2-Pin Connector F
7. 2-Pin Connector G
8. 2-Pin Connector H
9. 8-Pin Connector J

Fig. 1, Main PDM Pin Connectors (top view)

For positions of individual pin-outs on the top of the main PDM, see **Fig. 2** for connectors A through G (left-hand side), and **Fig. 3** for connectors H and J (right-hand side).

For location of pin connectors and individual pin positions on the bottom of the PDM, see **Fig. 4**.

NOTE: To locate pin-outs, use this key: The first letter indicates the connector in which the pin is located. The second letter indicates the row of the connector. The third number, if present, indicates the number of the pin in the row, if there is more than one. If there is only one pin in a row, this number is missing.

Examples: Pin number AF5 means connector A, row F, pin 5. Pin number BC means connector B, pin C.

For a list of circuit breakers and relays installed in the main and auxiliary power distribution modules, see **Troubleshooting, 300**.

For a full schematic view of the PDM wiring, see **Fig. 5**. For a detailed (partial) view of the PDM wiring schematic, see **Fig. 6** and **Fig. 7**.

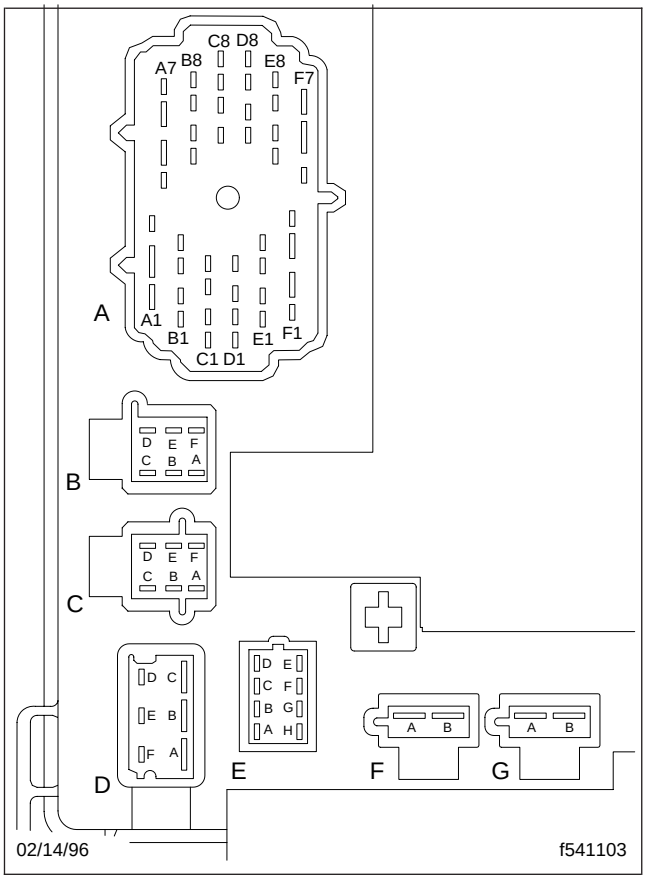


Fig. 2, Pin-Out Positions-Main PDM (left-hand side, top)

To identify relay terminals, first check the type of relay. On micro relays, the terminals are numbered 1 through 5, corresponding to the position numbers on the schematic. On all other relays, the terminals are numbered 30 through 87A, corresponding to positions 1 through 5 as shown in **Table 1**.

Mini Relay Terminal Numbers	
Position	**Terminal Number**
1	86
2	85
3	30
4	87A
5	87

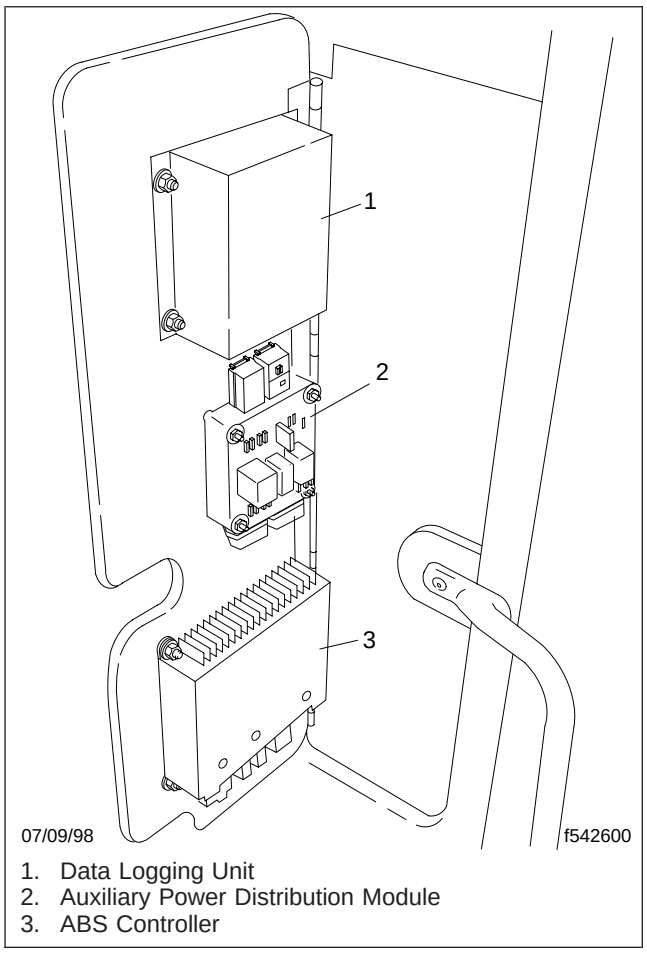
General Information

The Freightliner data logging unit (DLU) is mounted on the inside of the electrical compartment door located on the left-hand B-pillar behind the seat. See **Fig. 1**.



1. Data Logging Unit
2. Auxiliary Power Distribution Module
3. ABS Controller

Fig. 1, Left-Hand B-Pillar Electrical Compartment

The DLU (see **Fig. 2**) monitors all data transmitted on the J1587 databus by the vehicle electronic control units (ECUs). It records all data defined in the vehicle parameter file (VPF).

The VPF identifies which data shall be monitored and recorded in rolling history as an event. An event is a snapshot of data recorded whenever the DLU reports a fault, or notes an out-of-range condition, and one is generated and stored whenever a parameter matches a value defined in the VPF.

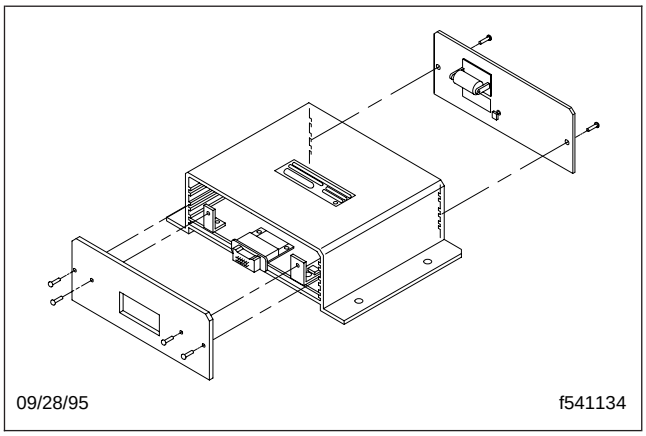


Fig. 2, Data Logging Unit

The VPF also contains information about the following:

- How long a fault condition must last for it to be recorded as an event
- How much time must pass between occurrences of a fault for it to be recorded as two separate events, rather than as a single one
- What high or low tolerance thresholds, if any, must be met to qualify as an out-of-range condition

Data parameters are stored in two history types: short term history and long term history. Any parameter associated with an event must come from either of these two history types.

- *Short Term History*—A short term history parameter is available for recording within the following time frame: from 60 seconds before the event to 60 seconds after the event. In a specific event, the sampling rate can be set from one sample per second to one sample every 60 seconds.
- *Long Term History*—A long term history parameter is available for recording 30 minutes before the event. In a specific event, the sampling rate can be set from one sample per minute to one sample every 30 minutes.

The DLU may be programmed to record events as defined by the VPF. The DLU can record the following types of events:

- Manually-triggered events
- PID 194 (ECU-triggered) events

General Information

- Out-of-range events
- Rapid deceleration events
- VIN (vehicle ID number) change events
- Parking brake ON events

For a description of these events, see **Table 1**.

CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables and the electrical connector at the bottom of the data logging unit (DLU). See Subject 100 in this section for instructions. Electric currents produced during electric welding can damage various electronic components on the vehicle.

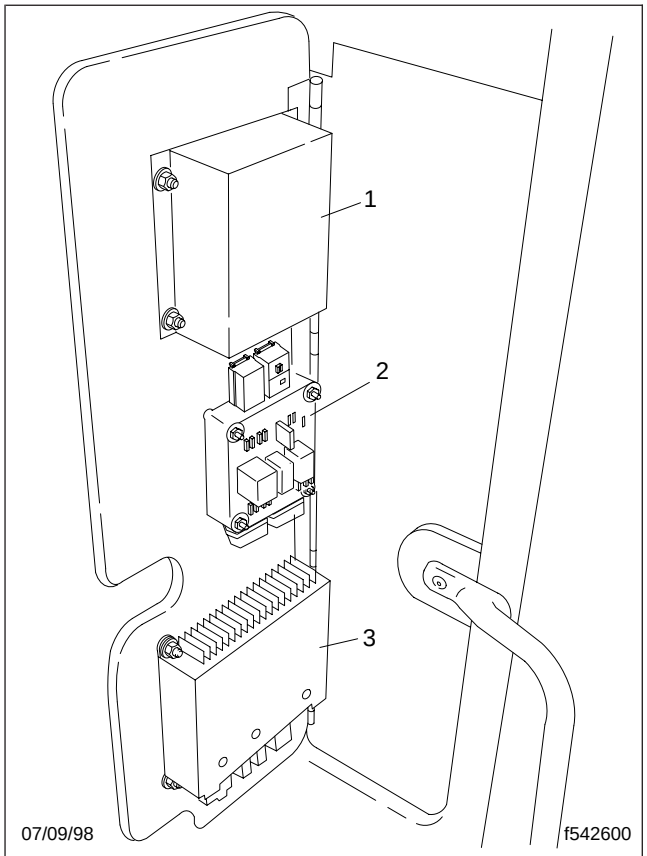
Data Logging Unit Events	
Type of Event	**Description**
Manually-triggered	Recorded when the EVENT key on the dash is pressed, or when commanded by the instrumentation control unit (ICU). All the vehicle parameters stored in short term history will be recorded.
PID 194 (ECU-triggered)	Recorded when the databus transmits a predetermined fault. Up to 30 different events can be selected (the VPF controls which events are selected), and each event may have as many as 20 parameters associated with it.
Out-of-range	Recorded when a transmitted parameter is determined to be beyond its normal range as defined in the VPF. Up to 15 different events can be selected (the VPF controls which events are selected), and each event may have as many as 12 parameters associated with it.
Rapid deceleration	Recorded when a vehicle decelerates at or above a pre-set rate. There are two types of rapid deceleration events: Customer-defined (defined in the VPF); and Freightliner (defined in the DLU).
VIN change	Generated every time the DLU receives a vehicle identification number (VIN) that is different from the number stored in the DLU.
Parking brake ON	Generated every time the parking brake is set and the vehicle is moving.

Table 1, Data Logging Unit Events

Data Logging Unit Removal and Installation

Removal

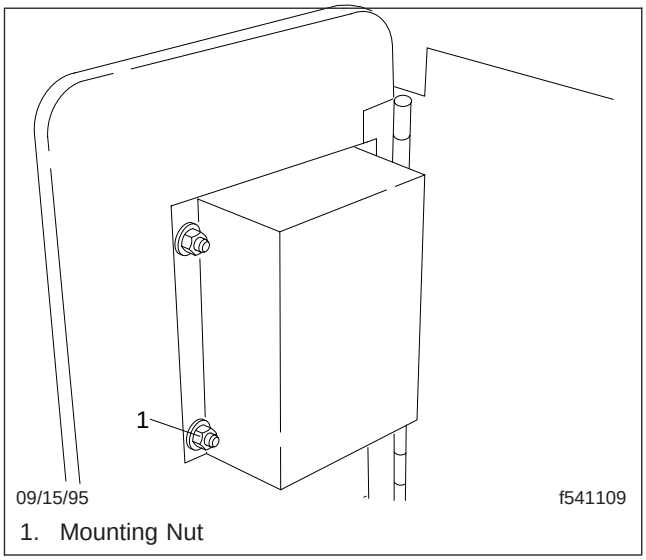
1. Apply the parking brakes and chock the tires. Disconnect the batteries.
2. Open the electrical compartment door on the left-hand B-pillar, behind the seat. The data logging unit is the top unit, above the auxiliary power distribution module. See **Fig. 1**.



1. Data Logging Unit
2. Auxiliary Power Distribution Module
3. ABS Controller

Fig. 1, Left-Hand B-Pillar Electrical Compartment

3. Remove the data logging unit. See **Fig. 2**.
   - 3.1 Remove the electrical connector from the bottom of the data logging unit.
   - 3.2 Remove the four mounting hexnuts, two on each side, from the mounting studs attached to the B-pillar access door.



1. Mounting Nut

Fig. 2, Data Logging Unit

   - 3.3 Remove the data logging unit from the electrical compartment door.

Installation

1. Install the data logging unit onto the left-hand B-pillar electrical compartment door. See **Fig. 2**.
   - 1.1 Position the data logging unit on the four mounting studs attached to the B-pillar electrical compartment door.
   - 1.2 Install the four mounting hexnuts and tighten them firmly.
   - 1.3 Plug the electrical connector into the bottom of the data logging unit.
2. Close the electrical compartment door on the left-hand B-pillar, behind the seat. See **Fig. 1**.
3. Connect the batteries and remove the chocks from the tires.

IMPORTANT: Using ServiceLink, the Data Logging Unit (DLU) can be reconfigured to original factory specifications either on or off the vehicle. Different procedures are required. Please take care to choose the correct procedure.

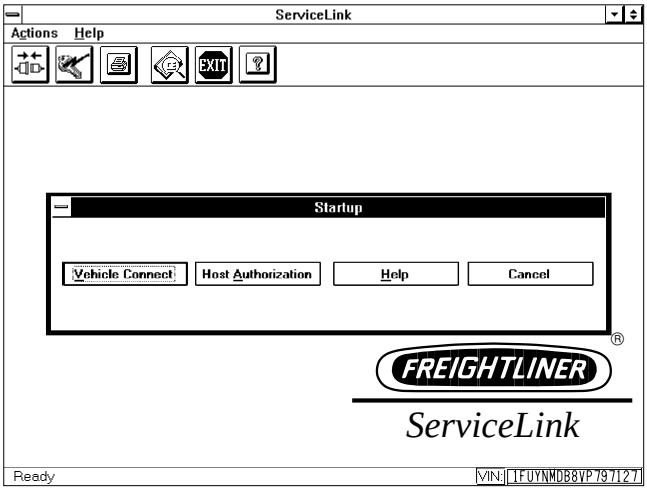
On-Vehicle Reconfiguring, ServiceLink Version 1

Before starting, make sure of the following:

- The computer is on and running Windows.
- The computer is either connected to the Freightliner network or has been set up for RAS access, via a modem, to the Freightliner host.
- There is a Flexible Vehicle Interface® (FVI) cable connected to the adapter in the computer.

NOTE: The Freightliner help desk, 1–503–735–7877, is available 24 hours a day to assist with problems during DLU reconfiguring.

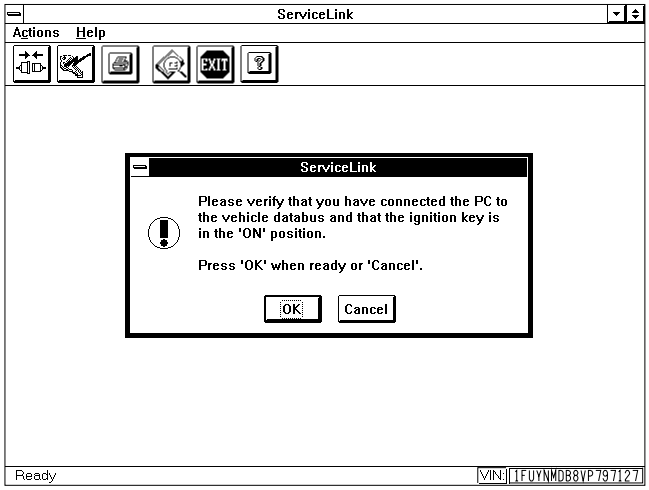
1. Connect the computer to the diagnostic connector on the vehicle.
2. Start ServiceLink.
3. When the "Startup" dialog box appears, click the "Vehicle Connect" button. See **Fig. 1**.



12/13/96 f120090

Fig. 1, Startup Dialog Box

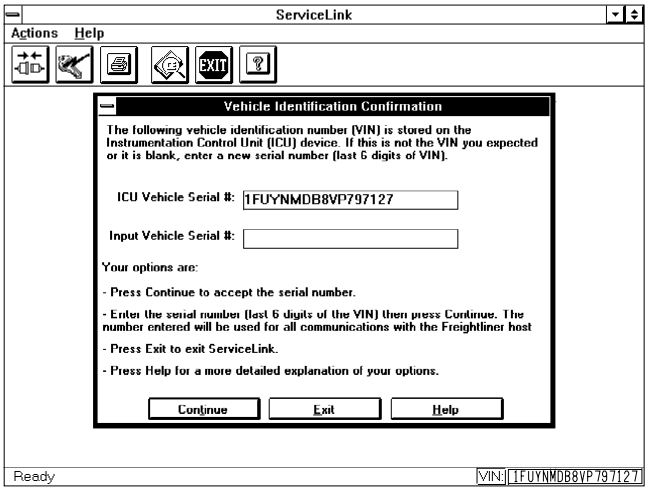
4. Then, when the "Verify Connections" dialog box appears, turn the ignition keyswitch to the correct (ON) position. See **Fig. 2**.



12/13/96 f120074a

Fig. 2, Verify Connections Dialog Box

5. The serial number of the vehicle is automatically downloaded when the "Vehicle Identification Confirmation" dialog box appears. Click the "Continue" button. See **Fig. 3**.



12/16/96 f120091

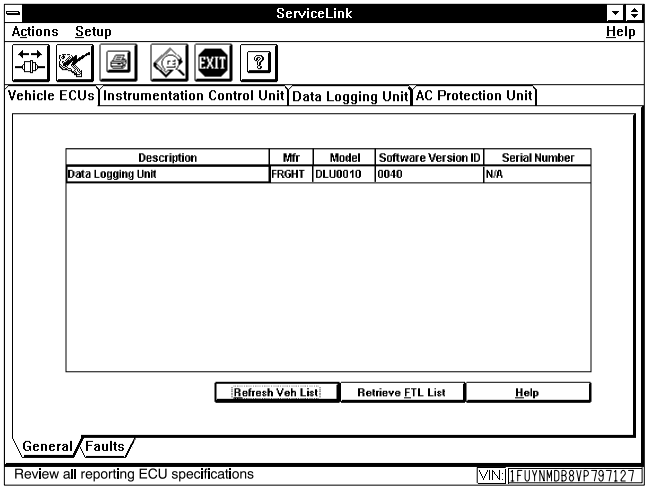
Fig. 3, Vehicle Identification Confirmation Dialog Box

6. In response, the ServiceLink software displays the "Review All Reporting ECU Specifications"

Data Logging Unit Reconfiguring

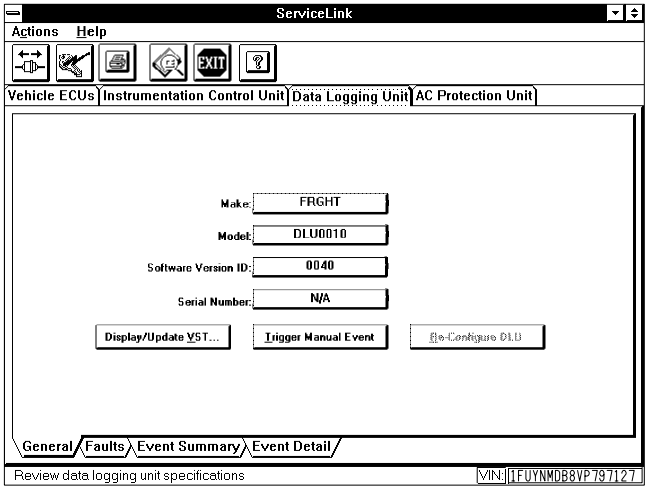
screen showing folders with tabs at both the top and bottom. See **Fig. 4**.

From this screen, click the "Data Logging Unit" top tab folder to display the "Review Data Logging Unit Specifications" screen. See **Fig. 5**.



12/13/96 f120081a

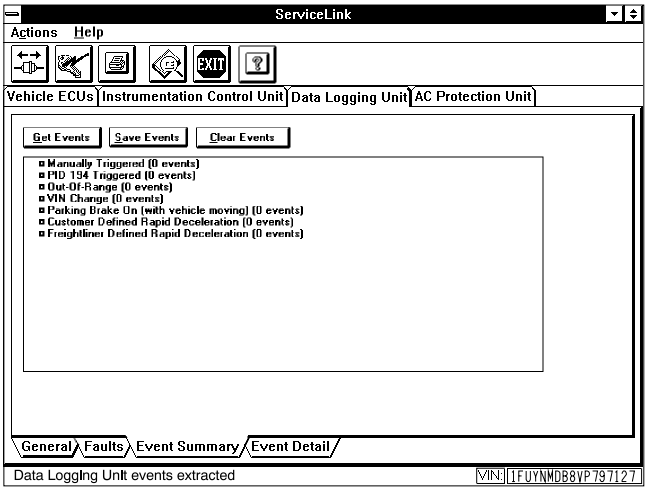
Fig. 4, Review All Reporting ECU Specifications Screen (with DLU connected)



12/13/96 f120083a

Fig. 5, Review Data Logging Unit Specifications Screen

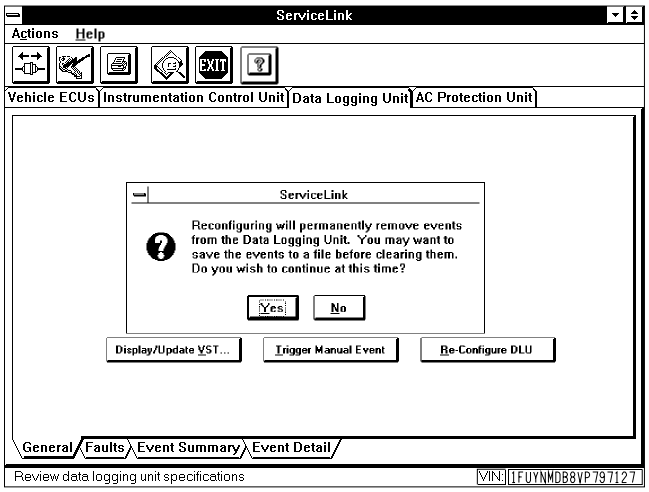
7. Display a list of events recorded by the DLU.
   - 7.1 From this screen, click the "Event Summary" bottom tab folder.
   - 7.2 Click on the "Get Events" button.
   - 7.3 Turn off the ignition keyswitch.
   - 7.4 When the dialog box appears, click on the OK button to display the "Data Logging Unit Events Extracted" screen. See **Fig. 6**.



12/13/96 f120084a

Fig. 6, Data Logging Unit Events Extracted Screen

8. Reconfigure the DLU to its original factory settings.
   - 8.1 Click the "General" bottom tab folder to display the "Review Data Logging Unit Specifications" screen again. See **Fig. 5**.
   - 8.2 Click on the "Reconfigure DLU" button. When the "Reconfigure DLU" dialog box appears, click on the OK button to continue. See **Fig. 7**.
   - 8.3 If the computer is connected to the network, ServiceLink will respond with a message, "Accessing the Freightliner Host..." When the dialog box appears, click on the OK button.
   - 8.4 After the computer has connected, a status bar will appear, counting to completion. When the status bar has finished its count and indicated 100% completion of this action, a message appears indicating that the program is being loaded into the DLU. When the message disappears from the screen, look in the lower left-hand corner of the screen for the status note "Parameter File Updated."



12/13/96 f120085a

Fig. 7, Reconfigure DLU Dialog Box

9. Exit ServiceLink.
10. Disconnect the diagnostic connector from the vehicle.

On-Vehicle Reconfiguring, ServiceLink Version 2

Before starting, make sure of the following:

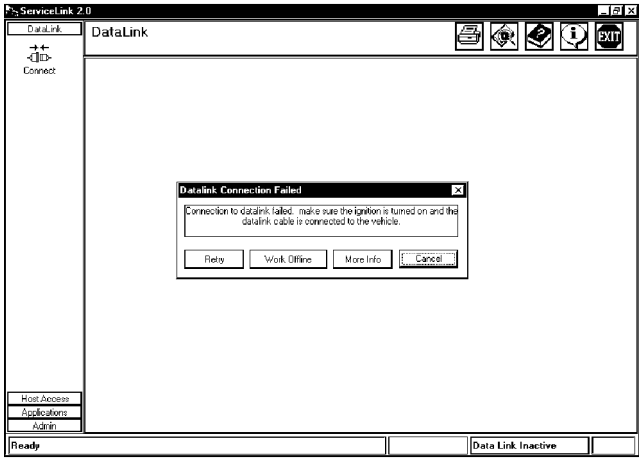
- The computer is on and running Windows.
- The computer is either connected to the Freightliner network or has been set up for RAS access, via a modem, to the Freightliner host.
- There is a flexible vehicle interface cable connected to the adapter in the computer.

NOTE: The Freightliner help desk, 1–503–735–7877, is available 24 hours a day to assist with problems during DLU reconfiguring.

1. Connect the computer to the diagnostic connector on the vehicle.
2. Turn the ignition keyswitch to the "ON" position.
3. Start ServiceLink Version 2.

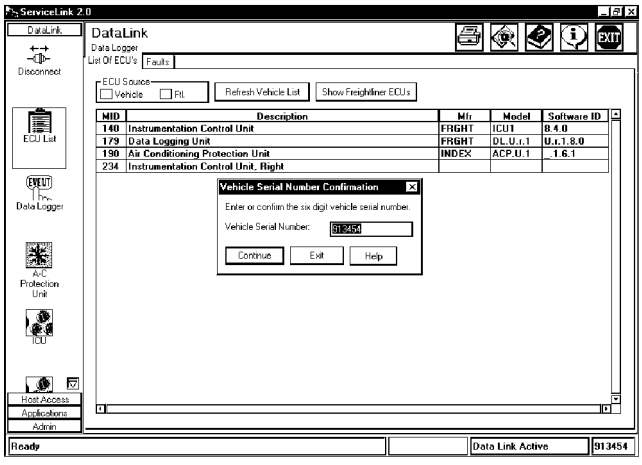
NOTE: Starting ServiceLink before turning the ignition on will result in a dialog box indicating the DataLink connection failed. See **Fig. 8**. If this happens, make sure the ignition is turned on and the datalink cable is connected to the vehicle, then click "Retry".

4. The serial number of the vehicle is automatically downloaded when the "Vehicle Identification Confirmation" dialog box appears. Click the "Continue" button. See **Fig. 9**.



07/07/98 f542608

Fig. 8, DataLink Connection Failed



07/07/98 f542609

Fig. 9, Vehicle Serial Number Confirmation

5. In response, the ServiceLink software displays the "List of ECU's" tab screen. See **Fig. 10**.

   From this screen, click the "Data Logger" icon on the left side of the screen. This will display the General Data Logger screen. See **Fig. 11**

Data Logging Unit Reconfiguring

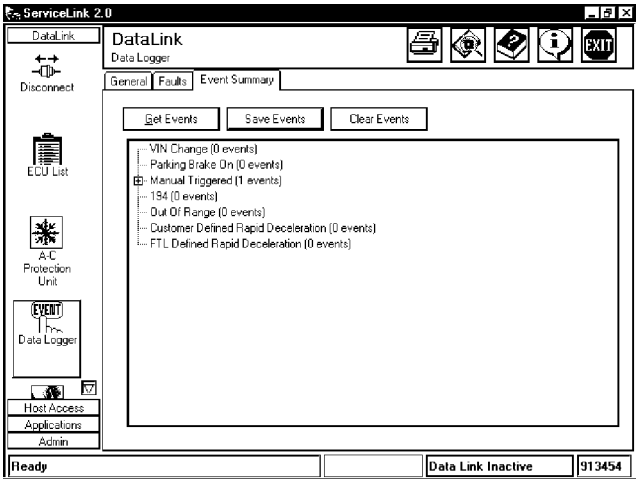
07/07/98 f542611

Fig. 11, General Data Logger

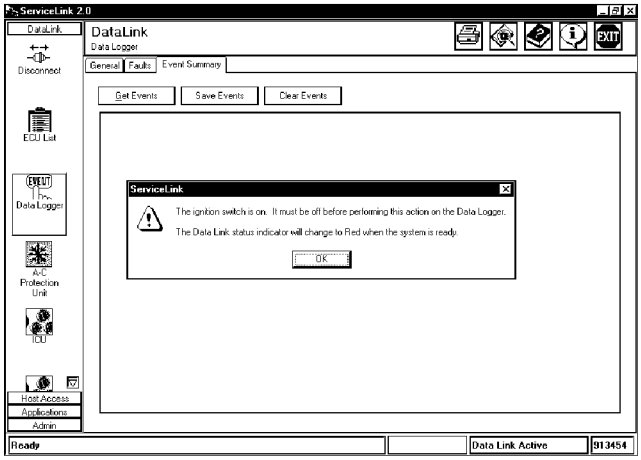


07/07/98 f542616

Fig. 13, Get Events, Event Summary

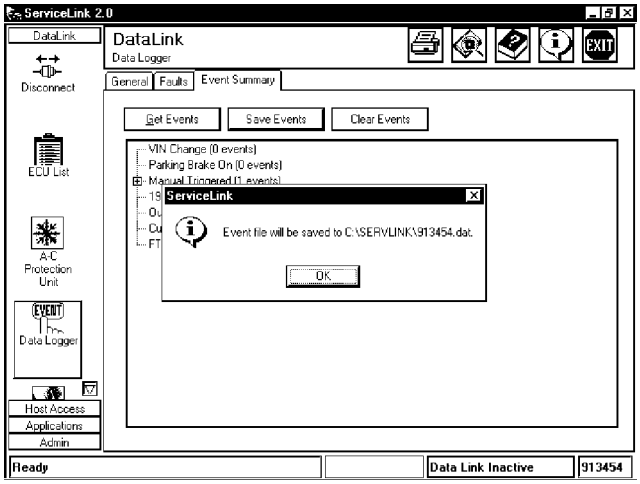
6. Display a list of events recorded by the DLU.
   - 6.1 From this screen click the "Event Summary" tab near the top of the screen. See **Fig. 12**.
   - 6.2 Turn off the ignition keyswitch.
   - 6.3 Click the "Get Events" button. See **Fig. 13**.

   NOTE: Clicking the "Get Events" button with the ignition on will result in an error message. See **Fig. 14**. Turn the ignition off and click "OK".
   - 6.4 If desired, click "Save Events" (see **Fig. 15**), then "OK". This will save the file to C:\SERVLINK\ *123456*.dat, where *123456* represents the vehicle serial number.
   - 6.5 To clear events, click the "Clear Events" button. This will remove all events from the DLU. Click "Yes" to clear events, or "No" to cancel. See **Fig. 16**.
7. Reconfigure the DLU to its original factory settings.



07/07/98 f542613

Fig. 14, Ignition Switch On Error Message



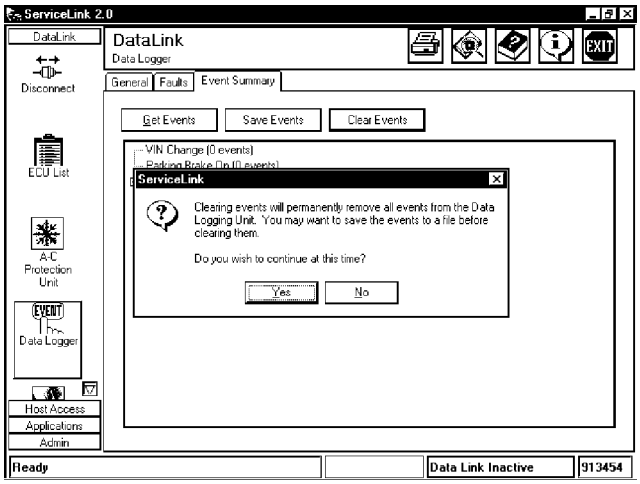
07/07/98 f542617

Fig. 15, Save Destination Confirmation

NOTE: Reconfiguring will delete all events. For instructions on saving event information before reconfiguring, see the previous step.

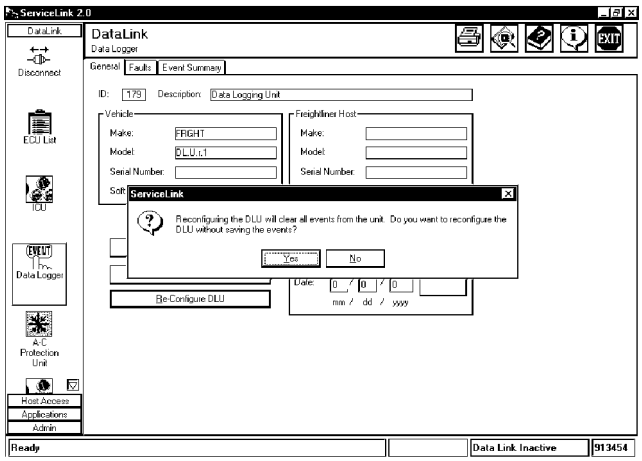
7.1 Click the "General" tab near the top of the screen to display the General Event Data Logger screen again. See **Fig. 11**.

7.2 Click on the "Reconfigure DLU" button. See **Fig. 17**. When the "Reconfigure DLU" dialog box appears, click on the "Yes" button to continue. ServiceLink will now reconfigure. This will take two or three minutes.



07/07/98 f542618

Fig. 16, Clear Events Confirmation



07/07/98 f542614

Fig. 17, Reconfiguring Confirmation

7.3 When finished, ServiceLink will display a dialog box "Data logger profile update complete." See **Fig. 18**. Click "OK".

8. To exit ServiceLink, click the exit icon at the upper right corner of the screen.

9. Disconnect the diagnostic connector from the vehicle.

Fig. 19, Kent-Moore Tool J-42139

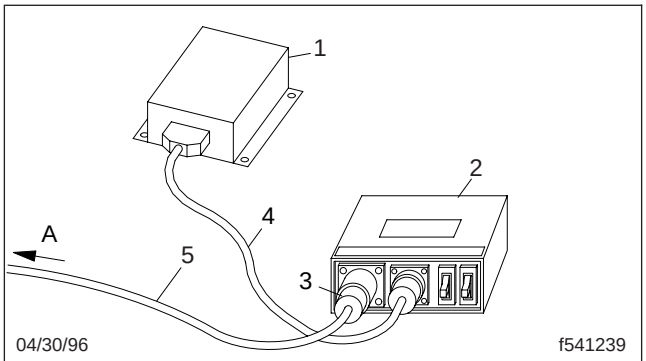
Off-Vehicle Reconfiguring, ServiceLink Version 1

Before starting, make sure of the following:

- The computer is capable of running ServiceLink. ServiceLink will run on Windows 3.1 or Windows for Workgroups 3.11.
- The computer is either connected to the Freightliner network or has been set up for RAS access, via a modem, to the Freightliner host.
- There is a Flexible Vehicle Interface cable connected to the adapter in the computer.
- The technician knows the vehicle serial number for the unit that needs to be reprogrammed.
- Kent-Moore Tool J–42139 is available to simulate the vehicle wiring and power supply. See **Fig. 19**. To order this tool, call the Kent-Moore Tool Company at 1–800–328–6657.

NOTE: The Freightliner help desk, 1–503–735–7877, is available 24 hours a day to assist with problems during DLU reconfiguring.

1. Connect the gray connector of the adapter harness to the connector on the DLU (the pink and blue connectors are not used). Connect the adapter harness to Kent-Moore tool J–42139. See **Fig. 20**.



04/30/96 f541239

A. To Computer

3. Diagnostic Connector
4. Adapter Harness
5. Flexible Vehicle Interface Cable

Fig. 20, DLU Reprogramming Set-Up

NOTE: The adapter harness is included with Kent-Moore tool J–42139.

2. Connect the diagnostic connector from the computer to Kent-Moore tool J–42139.
3. Turn on Kent-Moore tool J–42139.
4. Start ServiceLink.
5. When the "Verify Connections" dialog box appears, use the IGN switch on Kent-Moore tool J–42139 to simulate vehicle ignition. Flip this switch to the ON position. At the computer, click on the OK button when the dialog box appears. See **Fig. 1**.

6. Type in the 6-digit serial number of the vehicle when the "Vehicle Identification Confirmation" dialog box appears. Then click the "Continue" button. See **Fig. 3**.
7. In response, the ServiceLink software displays the "Review All Reporting ECU Specifications" screen showing folders with tabs at both the top and bottom. See **Fig. 4**.

   From this screen, click the "Data Logging Unit" top tab folder to display the "Review Data Logging Unit Specifications" screen. See **Fig. 5**.
8. Display a list of events recorded by the DLU.
   - 8.1 From this screen, click the "Event Summary" bottom tab folder.
   - 8.2 Click on the "Get Events" button.
   - 8.3 Turn off the IGN switch on Kent-Moore tool J–42139.
   - 8.4 When the dialog box appears, click on the OK button to display the "Data Logging Unit Events Extracted" screen. See **Fig. 6**.
9. Reconfigure the DLU to its original factory settings.
   - 9.1 Click the "General" bottom tab folder to display the "Review Data Logging Unit Specifications" screen again. See **Fig. 5**.
   - 9.2 Click on the "Re-configure DLU" button. When the "Re-configure DLU" dialog box appears, click on the Yes button to continue. See **Fig. 7**.
   - 9.3 If the computer is connected to the network, ServiceLink will respond with a message, "Accessing the Freightliner Host..." When the dialog box appears, click on the OK button.
   - 9.4 After the computer has connected, a status bar will appear, counting to completion. When the status bar has finished its count and has indicated 100% completion of this action, a message appears indicating that the program is being loaded into the DLU. When the message disappears from the screen, look in the lower left-hand corner of the screen for the status note "Parameter File Updated."
10. Exit ServiceLink.
11. Turn off the power switch on Kent-Moore tool J–42139 and disconnect it from the diagnostic connector on the computer and the gray connector of the adapter harness. Disconnect the other end of the gray connector from the back of the DLU.

Off-Vehicle Reconfiguring, ServiceLink Version 2

Before starting, make sure of the following:

- The computer is capable of running ServiceLink. ServiceLink will run on Windows 95.
- The computer is either connected to the Freightliner network or has been set up for RAS access, via a modem, to the Freightliner host.
- There is a flexible vehicle interface cable connected to the adapter in the computer.
- The technician knows the vehicle serial number for the unit that needs to be reprogrammed.
- Kent-Moore Tool J–42139 is available to simulate the vehicle wiring and power supply. See **Fig. 19**. To order this tool, call the Kent-Moore Tool Company at 1–800–328–6657.

NOTE: The Freightliner help desk, 1–503–735–7877, is available 24 hours a day to assist with problems during DLU reconfiguring.

1. Connect the gray connector of the adapter harness to the connector on the DLU (the pink and blue connectors are not used). Connect the adapter harness to Kent-Moore tool J–42139. See **Fig. 20**.

NOTE: The adapter harness is included with Kent-Moore tool J–42139.

2. Connect the diagnostic connector from the computer to Kent-Moore tool J–42139.
3. Turn on Kent-Moore tool J–42139.
4. Turn on the IGN switch on the Kent-Moore tool.
5. Start ServiceLink.
6. When the "Vehicle Serial Number Confirmation" dialog box appears, type in the 6-digit serial

Data Logging Unit Reconfiguring

number of the vehicle. Then click the "Continue" button. See **Fig. 9**.

7. In response, the ServiceLink software displays the "List of ECU's" tab screen. See **Fig. 10**.

   From this screen, click the "Data Logger" icon on the left side of the screen. This will display the General Data Logger screen. See **Fig. 11**.

8. Display a list of events recorded by the DLU.

   8.1 From this screen click the "Event Summary" tab near the top of the screen. See **Fig. 12**.

   8.2 Turn off the IGN switch on Kent-Moore tool J–42139.

   8.3 Click the "Get Events" button. See **Fig. 13**.

   NOTE: Clicking the "Get Events" button with the IGN switch on will result in an error message. See **Fig. 14**. Turn the IGN switch off and click "OK".

   8.4 If desired, click "Save Events" (see **Fig. 15**), then "OK". This will save the file to C:\SERVLINK\ *123456*.dat, where *123456* represents the vehicle serial number.

   8.5 To clear events, click the "Clear Events" button. This will remove all events from the DLU. Click "Yes" to clear events, or "No" to save events to a file before clearing. See **Fig. 16**.

9. Reconfigure the DLU to its original factory settings.

   NOTE: Reconfiguring will delete all events. For instructions on saving event information before reconfiguring, see the previous step.

   9.1 Click the "General" tab near the top of the screen to display the General Data Logger screen again. See **Fig. 11**.

   9.2 Click on the "Reconfigure DLU" button. See **Fig. 17**. When the "Reconfigure DLU" dialog box appears, click on the "Yes" button to continue. ServiceLink will now reconfigure. This will take two or three minutes.

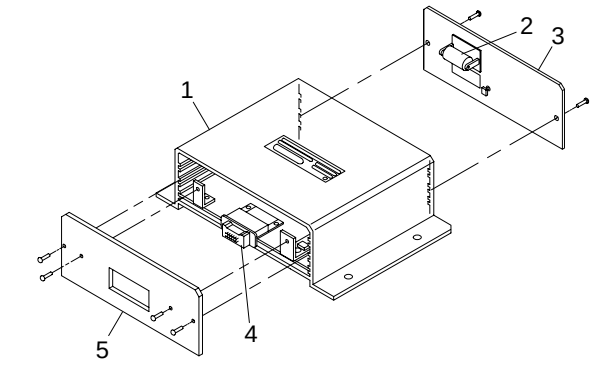
   9.3 When finished, ServiceLink will display a dialog box "Data logger profile update complete." See **Fig. 18**. Click "OK".

10. To exit ServiceLink, click the exit icon at the upper right corner of the screen.

11. Turn off the power switch on Kent-Moore tool J–42139 and disconnect it from the diagnostic connector on the computer and the gray connector of the adapter harness. Disconnect the gray connector, at the other end of the adapter harness, from the back of the DLU.

General Information

NOTE: The data logging unit or DLU (see **Fig. 1**) monitors data transmitted on the vehicle datalink. When an event occurs, the DLU saves a factory-defined set of vehicle data. See **Subject 050** for further information.



1. Data Logging Unit
2. Battery
3. Top Cover
4. Harness Connector
5. Bottom Cover

Fig. 1, Data Logging Unit

The DLU stores vehicle data in its memory if the following events occur:

- An event is triggered manually by pushing the event key on the keypad.
- An abnormal vehicle or driving condition occurs, as predefined in the DLU settings, and is specifically broadcast by an ECU. For example, low oil pressure, high or low engine coolant or oil temperature, or the parking brake is on.
- An abnormal, out of range, Freightliner selected and defined value occurs.

The events are stored with a date and time stamp. The DLU communicates with ServiceLink to configure or view logged events. The DLU does not store or transmit active or historic fault messages. If the DLU is not working properly, follow the procedures below.

Troubleshooting

"DATA RECORDER/NOT RESPONDING" MESSAGE

1. If the message NO DATALINK ACTIVITY is also displayed, troubleshoot this problem first. See SB 54-75.
2. Check the VEHICLE ECU list with ServiceLink.
3. If there is no entry on the VEHICLE ECU screen, continue troubleshooting the datalink.
   - 3.1 If the DLU and the ICU (instrumentation control unit) appear on the ServiceLink screen, VEHICLE ECUs, check wire 442B to the ICU. See **Fig. 2**.
   - 3.2 Disconnect the left (pink) ICU connector and check for 5 volts between terminal A2 and ground.
   - 3.3 If you measure 5 volts here, the ICU is not processing the event request.
   - 3.4 Replace the ICU with a test unit known to be good, turn the ignition switch ON, and press the event key.
   - 3.5 Check again for 5 volts between terminal A2 and ground.
   - 3.6 If you do not measure 5 volts here, check wire 442B to the DLU for an open or short to ground. See **Fig. 2**.
4. If the DLU does not appear on the screen VEHICLE ECUs, troubleshoot the DLU connections.
   - 4.1 Disconnect and then reconnect the DLU connector. See **Fig. 3**. If the problem disappears, check the DLU part number on the label. If the part number is A22–43854–000 or –001, replace the unit with a new part numbered A22–43854–004 or –005.
   - 4.2 Check circuit breakers 3D and 3E at the B-pillar PDM. See **Fig. 4**. If one of the circuit breakers has failed, check the wiring for a short to ground. Repair or replace the circuit breaker.
   - 4.3 With the ignition switch ON, check the voltage at the circuit breaker input. If there

9. DLU Battery Circuit Breaker (3E)
10. Fuse
11. Ignition Circuit Breaker
12. Ground (left-hand corner of cab floor)

Fig. 2, Data Logging Unit Wiring Diagram

is no battery voltage, check the wiring to the main PDM. See **Fig. 2**.

4.4 Check the voltages and the ground connection on the DLU connector. If one of the measurements is out of spec, check the wiring to the B-pillar PDM. Repair or replace wiring as necessary.

4.5 Check the datalink connection at the DLU connector. First disconnect the connector to the DLU and then turn the ignition switch to ON.

4.6 Use a multimeter set to the AC scale to check for a datalink signal on the twisted pair pins A5 and A6, at the vehicle harness connector. See **Fig. 2**.

4.7 Check for an unstable, fluctuating voltage of one to three volts between the two wires of the twisted pair.

4.8 If the voltage is not within this range, check the wires to the B-pillar datalink junction for damage, loose connections, etc. and repair or replace wiring as necessary.

4.9 Check the DLU connector connection and the pins for damage. See **Fig. 3**.

4.10 If necessary, replace the DLU with a new unit.

"CMPTR CONTROLLER NORESPONSE179S254 07" MESSAGE

NOTE: This message indicates a rollcall fault. During the ignition sequence the ICU polls the datalink for ECUs which are being broadcast. If any ECU, which should be present on the vehicle, is not broadcasting, the ICU generates and displays a fault. This message (CMPTR Controller NoResponse179s254 07) indicates that communication with the DLU has failed.

1. Turn the ignition switch OFF and then back ON, to start the ignition sequence.
2. Use ServiceLink to check if the DLU appears on the VEHICLE ECUs screen list.
3. If the DLU appears on the list, but the ICU does not, check the J1587 twisted pair datalink between the datalink junction and the dash datalink junction, behind the waste bin, for damage, loose connections, etc. See **Fig. 2**.

IMPORTANT: Three different datalink wiring versions exist, one for vehicles built through August 1996, one for vehicles built from August 1996 to June 1997, and another for vehicles built from June 1997. See SB 54-75.

4. If the DLU is not listed on the screen VEHICLE ECUs, disconnect and then reconnect the DLU connector. See **Fig. 3**.

Troubleshooting

4.1 If the problem disappears, check the DLU part number on the label. If the part number is A22–43854–000 or –001, replace the unit with a new part numbered A22–43854–004 or –005.

4.2 Check circuit breakers 3D and 3E at the B-pillar PDM. See **Fig. 4**.

4.3 If a circuit breaker has failed, check the wiring for a short to ground and repair or replace wiring as necessary.

4.4 With the ignition switch ON, check the voltage at the circuit breaker input. If there is no battery voltage, check the wiring to the main PDM. See **Fig. 2**.

4.5 Check voltage and the ground connection on the DLU connector. If one of the measurements is out of spec, check the wiring to the B-pillar PDM and repair or replace wiring as necessary.

4.6 Check the datalink connection at the DLU connector. First disconnect the connector to the DLU and then turn the ignition switch to ON.

4.7 Use a multimeter set to the AC scale to check for a datalink signal on the twisted pair pins A5 and A6, at the vehicle harness connector. See **Fig. 2**.

4.8 Check for an unstable, fluctuating voltage of one to three volts between the two wires of the twisted pair.

4.9 If the voltage is not within this range, check the wires to the B-pillar datalink junction for damage, loose connections, etc. and repair or replace wiring as necessary.

4.10 Check the DLU connector connection and the pins for damage. See **Fig. 3**.

4.11 If necessary, replace the DLU with a new unit.

"MEMORY FULL" MESSAGE

1. Use ServiceLink to retrieve events, then save the events if necessary.
2. Delete events and press the event key again.

NOTE: This message will only appear on vehicles having an ICU1 software version lower than 8.4.0. Select VEHICLE INFORMATION to display the software version on the ICU1. The MEMORY FULL message will appear on the ICU1 display when you push the event key while saving an event. Wait at least two minutes after pushing the event key before saving a second event.

"STILL RECORDING LAST EVENT" MESSAGE

This message appears if two event requests, using the event key, have been made less than two minutes apart.

NO REACTION ON THE ICU SCREEN AFTER PUSHING THE EVENT KEY

1. Ensure that the ICU has not been replaced with an ICU2L version. There are no keypad functions on the ICU2L version.

NOTE: The ICU2L version contains a 1-line by 6-character dash driver display screen. The original version contains a 2-line by 20-character display.

2. Turn the ignition switch OFF and then back ON again. If a keypad fault message appears on the ICU display, check the fault with ServiceLink. See **Section 54.03**, Subject 300.
3. If no fault message appears, disconnect the keypad and measure the resistance between pin H and pin E, at the keypad connector.

NOTE: Resistance should measure approximately 365 ohms. With the event button pushed, resistance should measure approximately 50 ohms.

4. Replace the keypad if you cannot measure these values.

THE DLU DOES NOT SAVE EVENTS

1. Check for messages indicating a DLU problem.

2. If the ICU screen displays DATA BEING RECORDED, after pressing the event key, and there is no stored data when viewing DLU events with ServiceLink, reconfigure the DLU. See **Subject 110** in this section and SB 54-58.
3. If there is still a problem, replace the DLU with a unit known to be good, reconfigure the DLU, and check to see that the problem has disappeared.

LOSS OF SAVED EVENT INFORMATION

The DLU is equipped with a backup battery to support the ECU memory in case the DLU is disconnected from the vehicle battery. If saved event information is being lost, replace the DLU battery. See **Fig. 1**.

DLU BATTERY

The DLU battery is located in the DLU top cover. See **Fig. 1**.

IMPORTANT: If the battery is removed, all saved event information will be lost. Use ServiceLink to save event information onto the workshop computer.

For a diagram of the data logging unit wiring harness, see **Fig. 1**.

Fig. 1, Data Logging Unit Wiring Harness

General Information

An air restriction indicator (**see Fig. 1**) or gauge indicates how much air filter capacity has been used and how much remains. It registers the actual maximum restriction of the filter element (or elements, if two air cleaners are installed) when the engine is operating at full load.

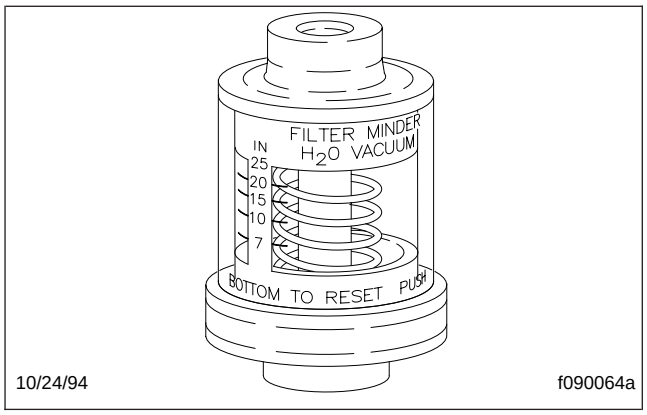

Fig. 1, Standard Air Restriction Indicator

Two types of spring-loaded air restriction indicators and one type of gauge with a pointer dial are available. The standard air restriction indicator is mounted on the air cleaner intake piping (**see Fig. 2**) and has a reset button located at the end opposite the mounting fitting.

The other type of indicator is mounted on the auxiliary instrument panel (**see Fig. 3**). There is a reset button on the face of the indicator.

An optional mechanical dial gauge can also be mounted in the auxiliary instrument panel (**see Fig. 4**).

Inside the air restriction indicator is a yellow index marker that retains the reading so that the remaining capacity can be read even after the engine is shut down. To reset the indicator, press the reset button. The dial gauge automatically resets itself whenever the engine is shut down.

The air restriction gauge and tap fittings can sometimes become plugged from moisture or engine vapors, possibly causing an incorrect reading.

IMPORTANT: Most engine degreasers are harmful to the polycarbonate (Lexan) plastics that are used in air restriction gauges. When

4. Reset Button

Fig. 2, Standard Air Restriction Indicator Mounted on the Intake Piping

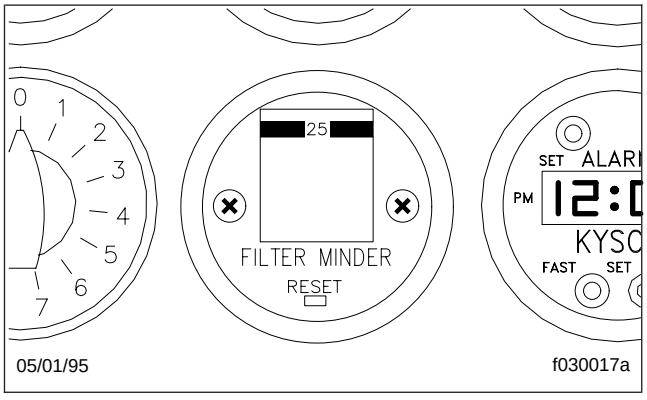

Fig. 3, Optional Air Restriction Indicator Mounted in the Auxiliary Instrument Panel

cleaning an engine or other components, avoid getting degreaser on these plastic parts.

General Information

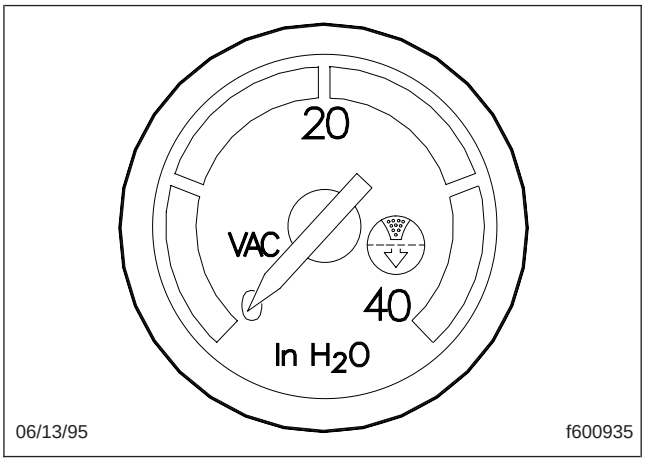

Fig. 4, Optional Air Restriction Dial Gauge Mounted in the Auxiliary Instrument Panel

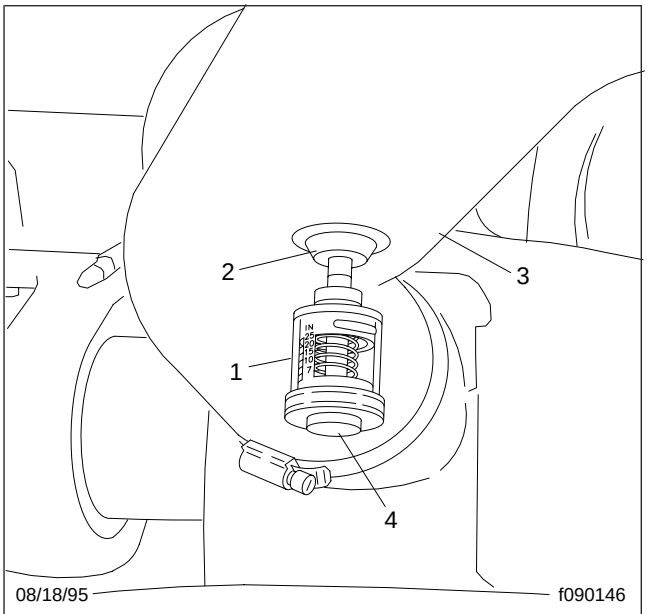
Air Restriction Indicator/Gauge Replacement

Replacement

AIR RESTRICTION INDICATOR (MOUNTED ON THE AIR INTAKE PIPING)

1. Chock the tires, then tilt the hood. For instructions, refer to the vehicle driver's manual.
2. Using a wrench, unscrew the indicator from the air intake piping. **See Fig. 1.**



1. Air Restriction Indicator
2. Mounting Fitting
3. Air Intake Piping
4. Reset Button

Fig. 1, Standard Air Restriction Indicator

3. Install the new air restriction indicator in the fitting. Tighten it securely.

NOTE: The fitting in the intake duct is a special fitting incorporating an orifice and a filter. Be sure that the correct fitting is installed.

4. Remove the chocks from the tires.

AIR RESTRICTION INDICATOR/ GAUGE (MOUNTED IN THE AUXILIARY INSTRUMENT PANEL)

1. Apply the parking brakes, chock the tires, and shut down the engine.
2. Remove the auxiliary instrument panel. For instructions, refer to **Section 54.03**. Pull the panel out to gain access to the back of the air restriction indicator/gauge.
3. Remove the nuts and lockwashers that attach the mounting bracket to the indicator/gauge. Disconnect the air line.
4. Replace the indicator/gauge in the auxiliary instrument panel.
5. Connect the air line. Install the mounting bracket, using the mounting nuts and lockwashers.
6. Install the auxiliary instrument panel. For instructions, refer to **Section 54.03**.
7. Remove the chocks from the tires.

Problem—No Restriction Reading

Problem—No Restriction Reading	
Possible Cause	**Remedy**
The indicator leaks.	Remove the air restriction indicator. Apply a vacuum to the indicator until the yellow index marker reaches the red line. With your thumb on the mounting fitting, close the end of the indicator airtight. Hold in the reset button. The yellow index marker will drop slightly and then not move unless the indicator has a leak. If the indicator is functioning properly, install it and press the reset button. If the yellow index marker continues to move, replace the air restriction indicator. Repeat the troubleshooting procedure to verify that the new indicator does not leak. When the indicator is functioning properly, install it and press the reset button.
The intake pipe fitting or vacuum hose is plugged (panel-mounted indicator/gauge).	Remove the air restriction indicator/gauge. Apply a vacuum to the indicator until the yellow index marker reaches the red line. Connect the indicator/gauge to the intake pipe fitting or yellow hose (as appropriate), and reset the indicator/gauge. The yellow index marker or dial will fully return to zero unless the fitting or vacuum hose is plugged. (A slow return is normal due to the safety filter in the fitting.) If the indicator/gauge is functioning properly, reset the indicator/gauge. Return the indicator/gauge to its mounting. If the yellow index marker or dial does not fully return to zero, clear the fitting or vacuum hose and repeat the procedure.
The vacuum hose leaks (panel-mounted indicator/gauge).	First, check to be sure that the indicator is not leaking (see instructions above). Disconnect both ends of the vacuum hose. Apply vacuum to the indicator/gauge until the indicator reaches the red line. Connect the indicator/gauge to the vacuum hose and close the other end of the hose airtight. Reset the indicator/gauge. The yellow index marker or dial will drop slightly and then not move unless the vacuum hose has a leak. If the indicator/gauge is functioning properly, install the vacuum hose and return the indicator/gauge to the dash mounting; reset the indicator/gauge. If the yellow index marker or dial continues to move, replace the vacuum hose. Repeat the troubleshooting procedure to verify that the new hose does not also leak. When the indicator/gauge functions properly, install the vacuum hose and return the indicator/gauge to the panel mounting; reset the indicator/gauge.
Engine airflow is too low to generate a reading.	Turbocharged engines must be at full load to pull full engine airflow. Restrictions can be simulated by gradually closing off air intake. If there is still no restriction reading, check for leaks in the indicator/gauge or vacuum hose, as appropriate, and take corrective action.

Problem—High Restriction Readings

Problem—High Restriction Readings	
Possible Cause	**Remedy**
The element(s) is (are) plugged or poorly cleaned.	Ultra-fine particles are difficult to remove, and cleaning may not sufficiently lower the restriction. Carefully attempt to unplug or clean the element(s); if unsuccessful, install a new filter element or elements.
The safety filter is plugged (if equipped).	Do not clean the safety filter. Replace it with a new one.

Troubleshooting

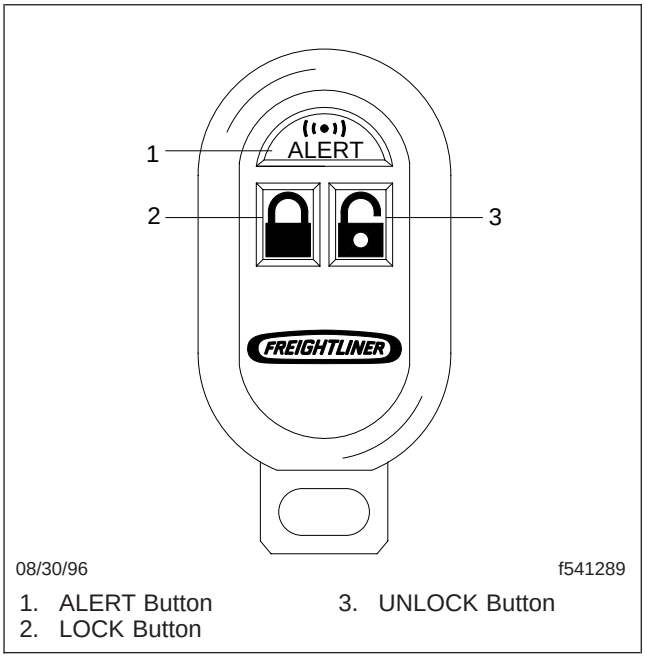
Problem—High Restriction Readings	
Possible Cause	**Remedy**
The air cleaner(s) is (are) undersized.	The air cleaner may be too small if a larger engine has been installed. Replace the undersized unit(s) with properly-sized air cleaner(s).
The air restriction indicator is too close to the intake of an engine blower or turbo.	Under certain circumstances, air turbulence near the blower intakes may cause a high vacuum reading. Locate the indicator away from the blower intake by at least 1-1/2 times the diameter of the intake tube.
The intake screens or ducts are plugged.	Check the system upstream from the air restriction indicator and remove any debris. Check for damage or improper installation, and take any necessary corrective action.
Heavy snow or rain.	Temporary high restriction can occur during a rain or snow storm and disappear after drying out. However, the cold air may be so dense that high restriction may not reduce the engine power before the element(s) is (are) damaged. If the indicator/gauge reads maximum restriction (red line), check the element(s) for damage and replace if necessary.

General Information

The Meritor keyless security system is a complete vehicle security system. It locks and unlocks the doors, protects against theft, and provides security for the driver while sleeping or resting inside the vehicle.

The system consists of the following components:

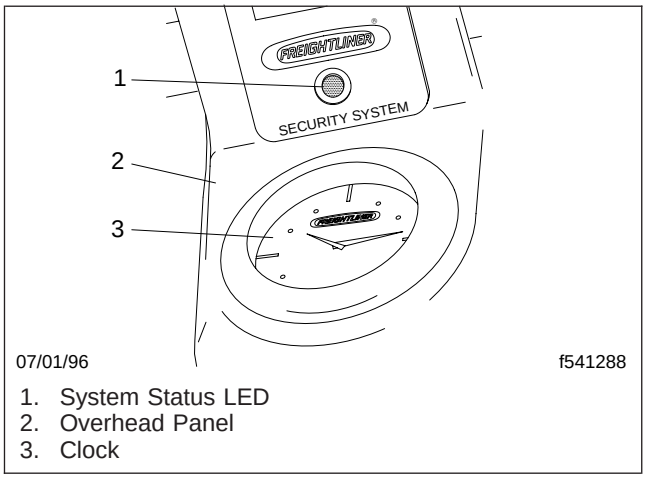
- A hand-held radio frequency transmitter that looks like a key chain fob. It acts as a remote control for locking the doors, unlocking the doors, or placing the system on alert. Each system allows as many as four different fobs. See **Fig. 1**.
- A red system status LED (light-emitting diode) mounted on the overhead panel above the clock. The LED flashes slow or fast to indicate what state the system is in: armed, alert, alarmed, or violated. It is off when the system is disarmed. See **Fig. 2**.



1. ALERT Button
2. LOCK Button
3. UNLOCK Button

Fig. 1, Key Chain Fob (radio transmitter)

- A Meritor relay module mounted behind the right-hand B-pillar electrical compartment door that arms and disarms the system and programs the fobs. See **Fig. 3**, Ref. 1.



1. System Status LED
2. Overhead Panel
3. Clock

Fig. 2, Red System Status LED

- A program switch on the Meritor relay module that places the relay module in the learning mode, which is the only state in which the system can learn fob ID codes. The switch is shown in its normal, or OFF, state (toggle pointing up). See **Fig. 3**, Ref. 2.
- A security system electronic control module (ECM), also mounted behind the right-hand B-pillar electrical compartment door, that monitors all the entry points, controls the door locks, operates the alarm, and interrupts the power to the engine, as necessary. There is also a PDM (power distribution module) relay module mounted on top of the left-hand side of the ECM. See **Fig. 3**, Refs. 3 and 6.

CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables and the electrical connectors at the side of the ECM and the bottom of the relay module. See Subject 110 in this section for instructions. Electric currents produced during electric welding can damage various electronic components on the vehicle.

For system schematics and harness drawings, see **Specifications 400**.

For fob programming procedures, see **Subject 100**. The fob is powered by a small watch battery. For battery replacement procedures, see **Subject 130**.

5. B-Pillar Security Harness
6. PDM Relay Module

Fig. 3, Keyless Security System B-Pillar Components

Principles of Operation

The fob has three push-buttons: LOCK, UNLOCK, and ALERT. When a button is pushed, the fob sends a radio frequency signal to the ECM. The signal contains a unique vehicle access code that identifies the individual fob, plus codes that indicate which button has been pushed.

The ECM detects the signal sent by the fob, amplifies it and converts it to a digital sequence.

If the LOCK button is pressed, the ECM arms the system. It locks the two cab doors, begins to monitor

all the entry points (the two cab doors, the sleeper cab access door, and the two baggage doors, as installed), and instructs the relay module to start flashing the system LED at the slow rate. If any entry points are open, the ECM sounds the horn and flashes the cab marker lights twice. If the ignition keyswitch is turned off, the ECM interrupts ignition power to the engine.

The driver may be inside or outside the vehicle. However, if the engine is running at the time the LOCK button is pressed, the system still enters the armed state, except that the engine is not immobilized. This improves security for the occupant as well as comfort while sleeping or resting, because the system is armed, and the heating or air conditioning is operating without draining any batteries.

Once the system is armed, the alarm functions activate whenever one of the entry points is opened. In the alarmed state, the ECM does the following:

- Immobilizes the vehicle by cutting off power between the ignition keyswitch and the engine electronic control unit (ECU).
- Sounds the horn in pulses of 0.5 second on, 0.5 second off.
- Flashes the cab marker lights in pulses of 0.5 second on, 0.5 second off.
- Changes the blink rate of the LED from slow to fast.

If the UNLOCK button is pressed, the ECM disarms the system, if armed. It unlocks all the entry points, discontinues its monitoring of the entry points, instructs the relay module to stop flashing the system LED, and restores ignition power to the engine, if interrupted.

If the ALERT button is pressed, the ECM executes the unlock sequence and also activates the vehicle alarm functions (see above). To cancel an ALERT (to turn off the alarm), press the UNLOCK button.

Once activated, the alarm sequence continues for 30 seconds unless deactivated by pressing the UNLOCK button on the fob. After 30 seconds in the alarmed state, the system automatically enters the violated state.

In the violated state, the horn does not sound and the cab marker lights do not flash, but the engine is still immobilized and the LED continues to blink at the fast rate. The vehicle remains in this state until the UNLOCK button is pressed.

The units described above are linked into a system by six wiring harnesses that allow control of the various functions such as interrupting engine ignition, flashing the cab marker lights, pulsing the horn, and controlling the door entry points. These six harnesses are:

- The main security harness (see **Fig. 4**), connecting the PDM to the B-pillar security harness and the right-hand door harness.
- The B-pillar security harness (see **Fig. 5**), connecting the B-pillar components (ECM, Meritor relay module, program switch, PDM relay module) to the main security harness, the sleeper cab security harness, and the LED security harness.
- The PDM security harness (see **Fig. 4**), connecting the PDM to the bulkhead security harness.
- The bulkhead security harness (see **Fig. 6**), connecting the PDM security harness to the left-hand door harness.
- The sleeper cab security harness (see **Fig. 7**), connecting the B-pillar security harness to the door switches in the sleeper cab, if installed.
- The LED security harness (see **Fig. 5**), connecting the B-pillar security harness to the system LED.

Fob Programming

The security system ECM can store up to four fob identification codes. Once the first fob has been programmed, there are never any vacant memory locations.

IMPORTANT: As a security measure, all fobs must be coded during the same programming sequence. The first fob code is stored in all four memory locations. Taken together, these ensure that only the vehicle owner's fobs can be programmed into the system. If additional fobs are programmed, they over-write the original code in locations two, three, and four, in that order.

The ECM provides a 20-second time period to program each fob. If the fob is not programmed within this time span, the system will exit the programming sequence.

After each valid code storage sequence, the system LED will indicate the completion of a learning cycle by turning off the LED for approximately 0.5 second, and unlocking the doors.

To program a fob, do the following steps:

1. With the ignition keyswitch turned off, turn the program switch ON (flip the toggle DOWN). See **Fig. 1**.
2. Now turn the ignition keyswitch on. Note that the system LED illuminates continuously. See **Fig. 2**. This indicates that the ECM is ready to begin the learning sequence.

NOTE: If the LED does not illuminate continuously at this point, repeat the first two steps.

3. On the fob, press down both the LOCK and UNLOCK buttons at the same time and hold them down for at least three seconds. See **Fig. 3**. If the code was learned, the system LED flashes and the doors unlock.

IMPORTANT: If no valid code was received, the system does not erase any stored data in that memory location. This is a security measure to ensure that a fob ID cannot be erased accidentally.

4. Repeat the above step to program additional fobs, up to a total of four.
5. When the programming sequence is over, return the system to normal operation by turning the program switch OFF (flip the toggle UP).

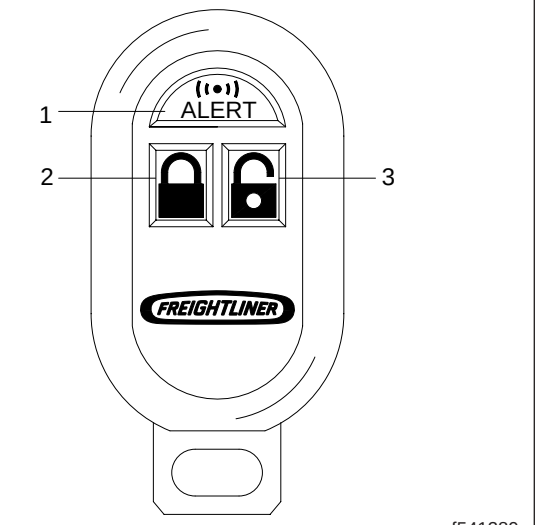
3. Clock

Fig. 2, Red System Status LED

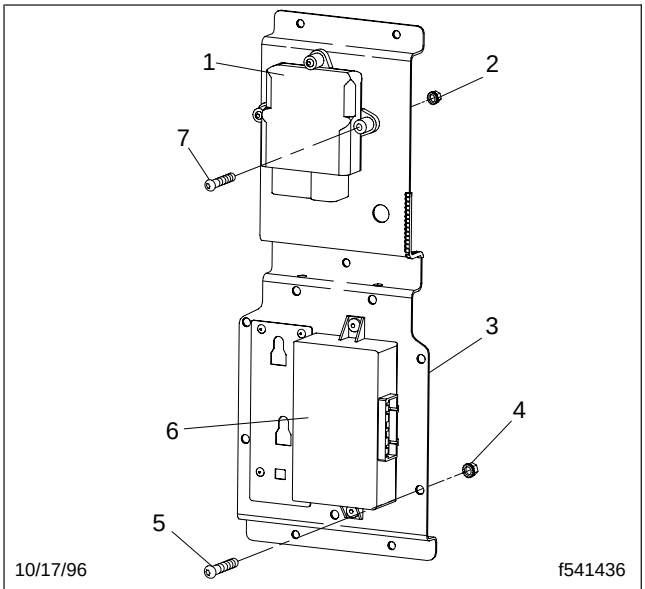


1. ALERT Button
2. LOCK Button
3. UNLOCK Button

Fig. 3, Key Chain Fob (radio transmitter)

Electronic Control Module Replacement

1. Apply the parking brakes and chock the tires. Disconnect the batteries.
2. Open the electrical compartment door on the right-hand B-pillar, behind the seat. The keyless security system modules are mounted on the long bracket above the daytime running light module. The electronic control module (ECM) is below the Rockwell relay module. See **Fig. 1**.



1. Rockwell Relay Module
2. Kep Nut (6–32)
3. Bracket
4. Kep Nut (10–24)
5. Machine Screw (10–24)
6. Electronic Control Module
7. Machine Screw (6–32)

Fig. 1, Electronic Control Module and Rockwell Relay Module

3. Remove the ECM.
   - 3.1 Remove the electrical connector from the side of the ECM.
   - 3.2 Remove the two 10–24 machine screws and kep nuts at the top and bottom of the ECM.
   - 3.3 Remove the ECM from the bracket.
4. Install the new ECM.
   - 4.1 Install the two 10–24 machine screws and kep nuts at the top and bottom of the ECM. Tighten them 13 lbf·ft (18 N·m).
   - 4.2 Connect the electrical connector in the side of the ECM.
5. Connect the batteries and check the keyless security system for correct operation.

NOTE: Program the fob identification codes into the new ECM. For detailed instructions, see **Subject 100**.

6. Remove the chocks from the tires.

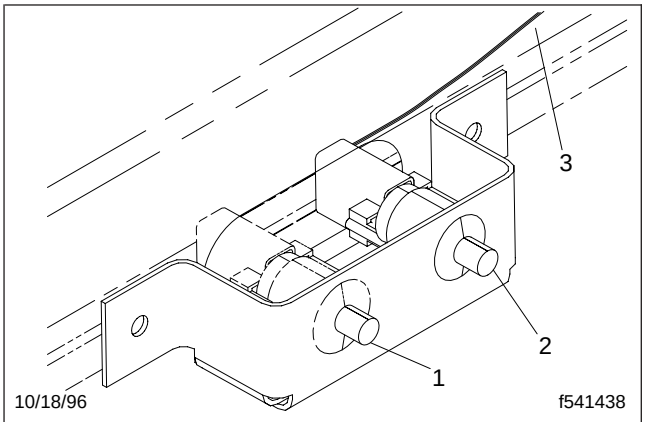
Rockwell Relay Module Replacement

1. Apply the parking brakes and chock the tires. Disconnect the batteries.
2. Open the electrical compartment door on the right-hand B-pillar, behind the seat. The keyless security system modules are mounted on the long bracket above the daytime running light module. The Rockwell relay module is above the ECM. See **Fig. 1**.
3. Remove the Rockwell relay module.
   - 3.1 Remove the electrical connector from the bottom of the Rockwell relay module.
   - 3.2 Remove the three 6–32 machine screws and kep nuts at the top and sides of the Rockwell relay module.
   - 3.3 Remove the Rockwell relay module from the bracket.
4. Install the new Rockwell relay module.
   - 4.1 Install the three 6–32 machine screws and kep nuts at the top and sides of the ECM. Tighten them 84 lbf·in (940 N·cm).
   - 4.2 Connect the electrical connector in the bottom of the ECM.
5. Connect the batteries and check the keyless security system for correct operation.
6. Remove the chocks from the tires.

Baggage Door Switch Replacement

Replacement

1. Apply the parking brakes and chock the tires. Disconnect the batteries.
2. Open the baggage door with the switch that needs replacing. The alarm switch is aft of the light switch. See **Fig. 1**.



Left-hand switch shown; right-hand opposite

1. Light Switch
2. Alarm Switch
3. Sleeper Cab Security Harness

Fig. 1, Baggage Door Switches Installed

3. Remove the switch. See **Fig. 2**.

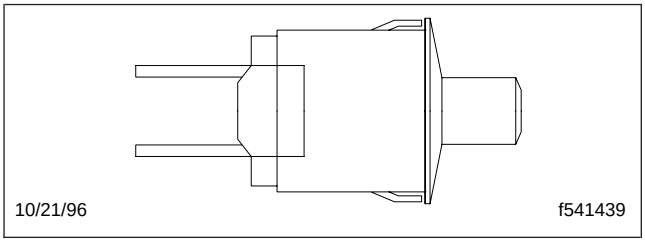


Fig. 2, Baggage Door Switch

   3.1 Remove the electrical connector from the base of the switch.

   3.2 Press in the prongs on the side of the switch and remove it through the front of the bracket.

4. Install the new switch.

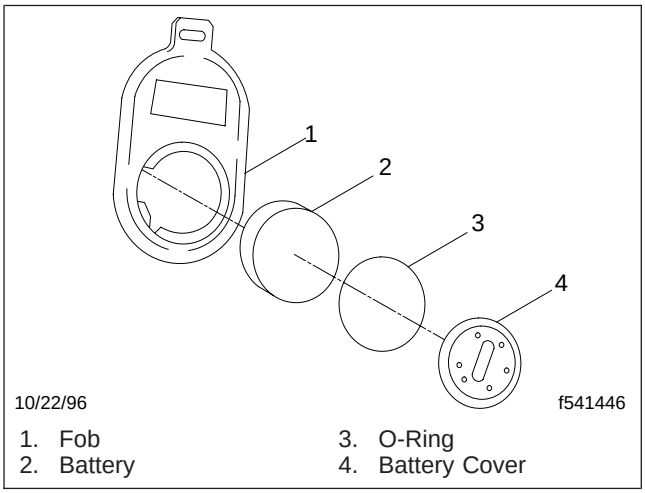
   4.1 Holding in the prongs on the side of the switch, press the switch into the hole in the bracket.

   4.2 Connect the electrical connector to the base of the switch.

5. Connect the batteries and check the switch for correct operation.
6. Remove the chocks from the tires.

Replacement

1. Open the battery cover on the back of the fob with a suitable coin or other thin piece of metal. Twist off the cover. See **Fig. 1**.



1. Fob
2. Battery
3. O-Ring
4. Battery Cover

Fig. 1, Fob Battery

2. Remove the battery and the O-ring installed inside the cover. Save the O-ring for later installation.
3. Install the new battery.
   - 3.1 Insert the new battery into the fob. Make sure the battery is right side up.
   - 3.2 Install the O-ring as removed. If the O-ring is damaged, or there are signs of moisture inside the fob, replace the O-ring.
   - 3.3 Twist on the battery cover and check it to make sure it is tight.
4. Check the fob for correct operation.

Troubleshooting

The keyless security system is mission critical—that is, situations can occur where the engine does not run if the system is not functioning properly. Here are some of the common problems:

- The vehicle doesn't start.
- The key fob doesn't work (doors don't lock or unlock).
- Relays chatter behind the B-pillar.
- The horn sounds, even though the horn button has not been pressed.
- The horn does not sound during an alert or an alarm.
- The marker lights do not flash during an alert or an alarm.
- The LED does not come on when the system is armed, or during an alert or alarm.
- When the vehicle batteries are switched on, the marker lights and/or LED come on, and/or the horn sounds.
- The alarm does not activate when one of the entry points is opened: either cab door, any baggage door, or the sleeper cab access door.

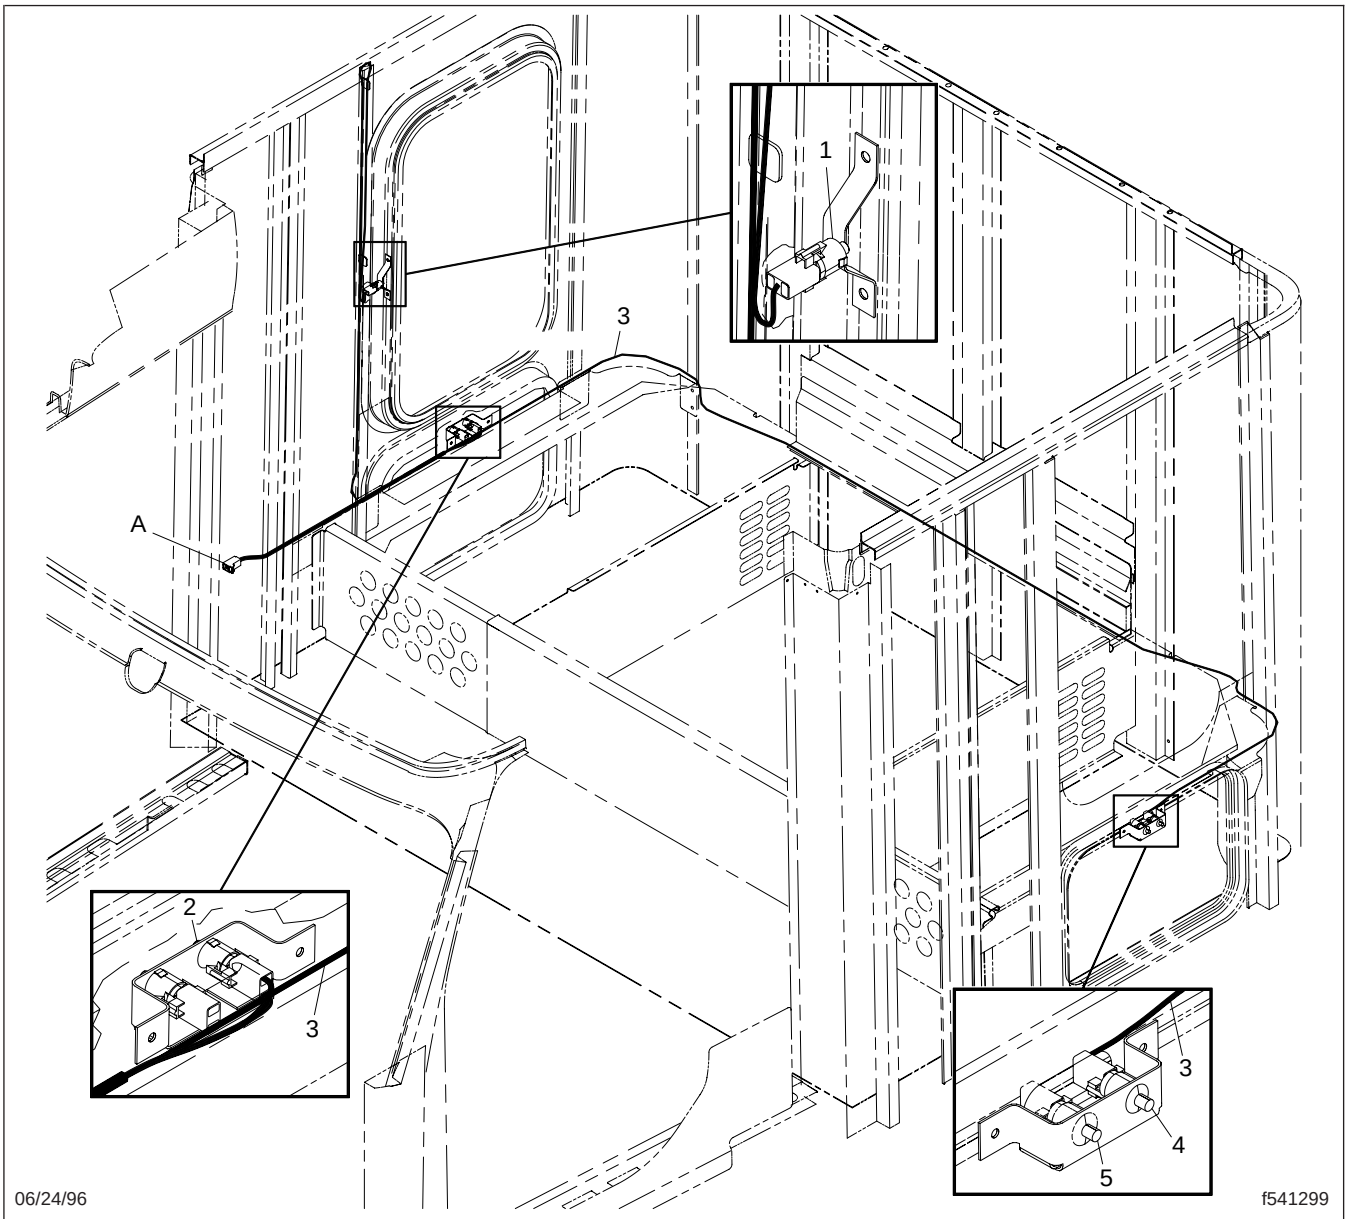
If any of these problems appear, do the following steps in order until the system works correctly. These steps are in a logical sequence, with the most common problems coming first.

1. Program the fob ID into the system, following the instructions under "How To Program the Fobs." When the programming is complete, make sure the program switch is turned OFF.

   If nothing responds, check the batteries in the fob and replace them if necessary. Check the ECM connectors to make sure the security system ECM is receiving power, and fix as necessary. Repeat the fob programming.

   If some components (LED, marker lights, horn, door actuators, ignition) respond but not others, or if the ECM relays click, go to the next step.
2. Check all door closures, including the sleeper cab access door and the baggage doors. See **Fig. 1**. Fix as required.
3. Trace the wiring for each non-working component. See **Table 1**.

Troubleshooting



A. To B-Pillar Harness

1. Alarm Switch (sleeper cab access door)
2. Alarm Switch (right-hand baggage door)
3. Sleeper Cab Security Harness
4. Alarm Switch (left-hand baggage door)
5. Light Switch (left-hand baggage door)

Fig. 1, Sleeper Cab Security Harness

Keyless Security System Wiring Checks	
Component	**Wiring Check**
Red System Status LED	Check tape connection for security. See **Fig. 2**.
Cab Door Actuator	Remove the kick panel from the cab door (the one with the non-working actuator). See **Fig. 3**. Check the electrical connector for good contact. Reconnect if necessary. Check the wires and pin cavities for continuity, and repair/replace as needed. Remove the electrical cover from the dash to expose the power distribution module (PDM). On the PDM, find connector G. Check wire 443 and pin cavity GA for continuity and repair/replace as needed. See **Fig. 4**.
Door Switch(es): Baggage Door or Sleeper Cab Access Door	Check the door with the non-working switch. Make sure the switch is pressed in when the door is closed. Lift the lower bunk bed, and check the switch wires and grounds for continuity. Repair/replace as needed. See **Fig. 1**. Open the right-hand B-pillar electrical compartment door, and check the sleeper cab harness connector for good contact. Reconnect if necessary. Check wires GND and GND2 and pin cavities A and B for continuity. Repair/replace as needed. See **Fig. 5**.
Horn	Remove the dash panel to expose the horn connector and cannon plug BL (left-hand plug). See **Fig. 6**. Check the horn electrical connector for good contact. Reconnect if necessary. Check pin cavity J4 on the cannon plug for continuity, and repair/replace as needed. Go to the PDM and find connector N on the bottom of the PDM. See **Fig. 7**. Check wire 24A and pin cavity ND8 for continuity. Repair/replace as needed.
Cab Marker Lights	Go to the PDM and find connector N on the bottom of the PDM. See **Fig. 7**. Check wire 46 and pin cavity NC5 for continuity. Repair/replace as needed.
Ignition Keyswitch	Ignition Power: Go to the PDM and find connector A. Check wire 81C and pin cavity AB4 for continuity. Repair/replace as needed. See **Fig. 4**. Battery Power: Go to the PDM and find connector E. Check wires EE and EF, and pin cavities EE and EF for continuity. Repair/replace as needed. Check the Optional Switch 1 (location 44) and Optional Switch 2 (location 47) circuit breakers, and replace if necessary. Discrete ECM Power: Go to the PDM and find connector A. Check wire D439 and pin cavity AC1 for continuity. Repair/replace as needed. Also, go to the B-pillar electrical compartment and check wires D439A and D439B, and pin connectors 14 and 15 on the ECM connector for continuity. Repair/replace as needed.

Table 1, Keyless Security System Wiring Checks

4. Check pin crimp connections. Repair as needed.
5. Check the pin connections on the ECM for good contact, and repair as needed.

Tweeter

Removal

1. Shut down the engine and set the parking brake. Chock the front tires.
2. Remove the Torx®-head screw attaching the tweeter grille to the front of the arm rest cover assembly. See **Fig. 1**.
3. Remove the tweeter grille by gently prying it away from the arm rest cover assembly. Begin prying at the forward end of the grille.
4. At the mirror lower bracket cover on the outside of the vehicle, remove the access tab to uncover the bolt that passes through the door and attaches to the tweeter bracket.
5. Remove the bolt.
6. Remove the two fasteners attaching the tweeter to the inner door panel.
7. Remove the front arm rest cover to access the wires attached to the tweeter. Then, disconnect the speaker wires from the wire harness.

IMPORTANT: Do not remove the heat shrink tube from the speaker wire. Disconnect the wires by pulling the tweeter away from the door, and then disconnecting the wires from the wire harness inside the door.

8. Remove the fastener attaching the tweeter bracket to the tweeter.

Installation

1. Attach the tweeter bracket to the tweeter. Orient the tweeter wires so that they remain in a "6 o'clock" position when the tweeter is installed.
2. Connect the tweeter wires to the speaker wiring harness inside the door.
3. Attach the tweeter speaker assembly to the door inner panel.
4. Install the front arm rest cover.
5. Install the bolt that attaches through the door to the tweeter bracket. Install the access tab on the mirror lower bracket cover.
6. Install the tweeter grille into the door panel by inserting the tab at the aft edge of the grille into the slot in the door panel.
7. Install the Torx-head screw.

5-1/4-inch Midrange

Removal

1. Shut down the engine and set the parking brake. Chock the front tires.
2. Gently pry the midrange speaker grille away from the speaker, prying from the front edge of the grille. See **Fig. 1**.
3. Remove the four Torx-head screws attaching the speaker to the inner door panel.
4. Remove the speaker.
5. Disconnect the speaker wires from the speaker wiring harness.

Installation

1. Connect the speaker wires to the speaker wiring harness inside the inner door panel.
2. Attach the speaker to the door panel using the four Torx-head screws.
3. Install the grille by inserting the tabs on the aft edge of the grille into the slots provided. Snap the forward edge of the grille into position.

6 x 9-inch Full Range

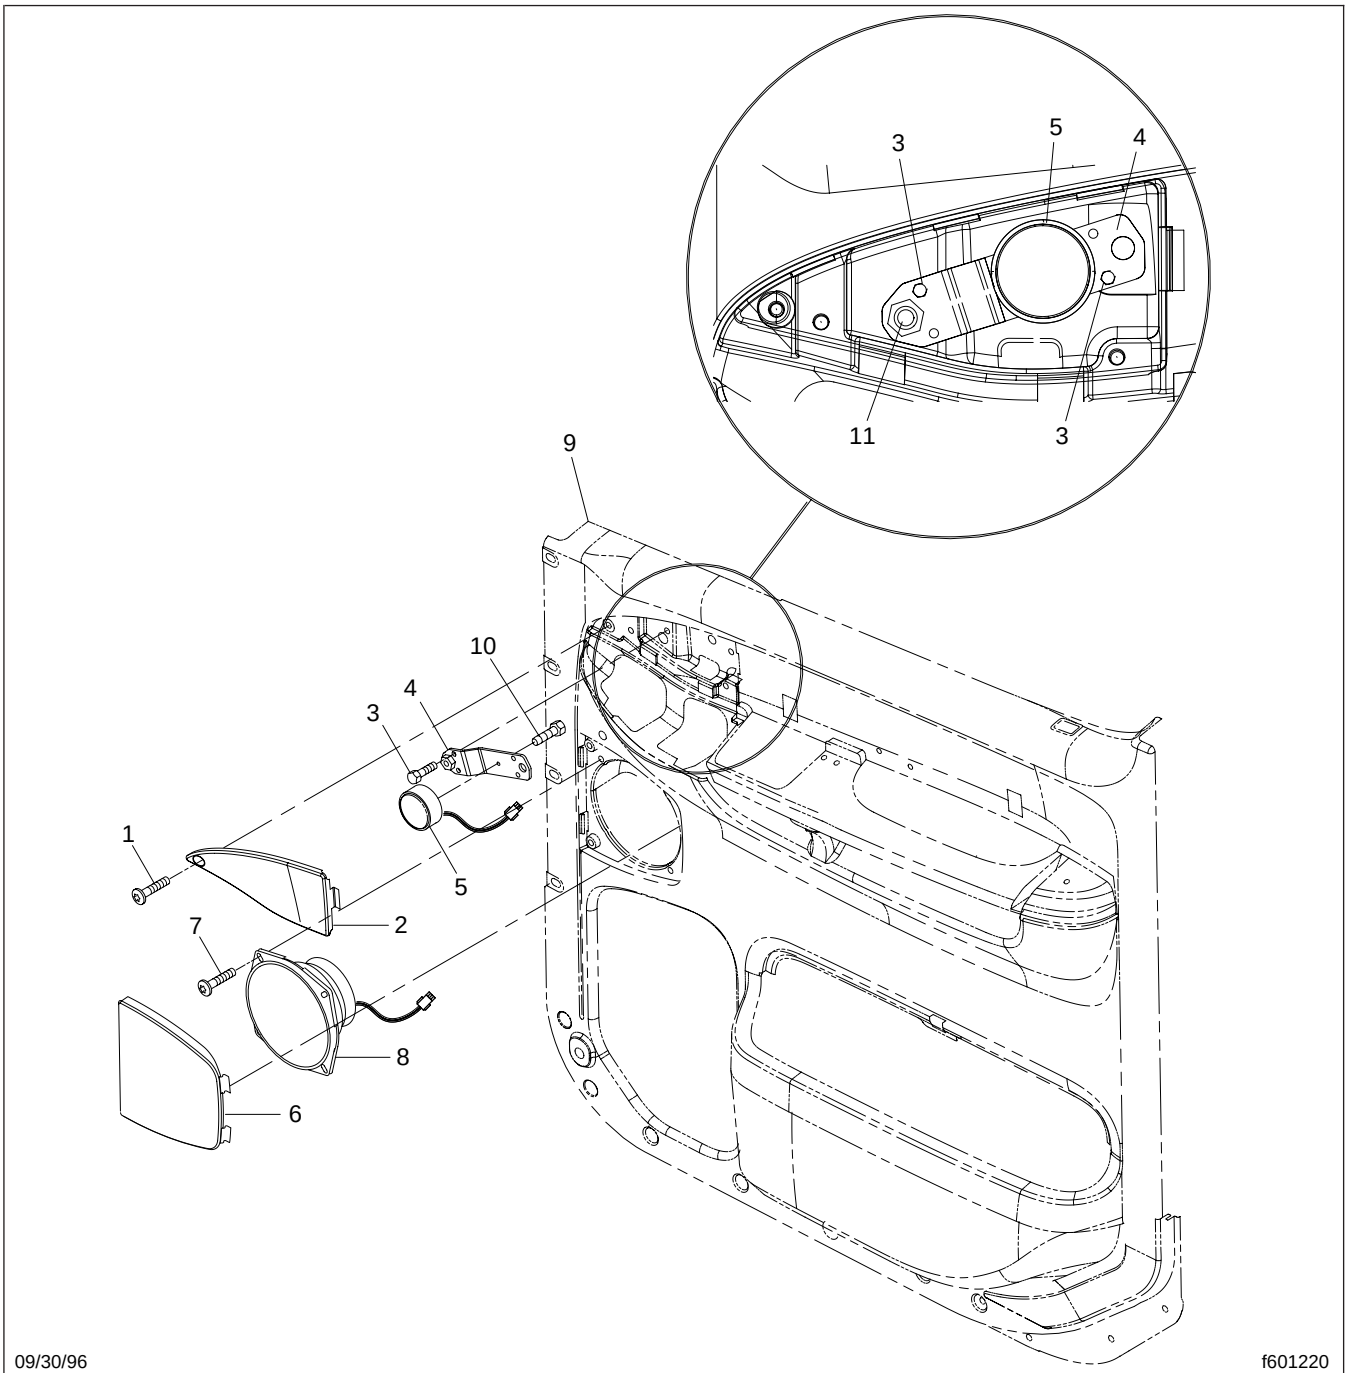
Removal

The location of the full range speakers depends on the type of vehicle. In raised-roof vehicles, the speakers are mounted in the roof cap above the upper bunk. In mid-roof cab vehicles, the speakers are mounted on the underside of the rear overhead shelves in the upper rear sleeper corners.

NOTE: In mid-roof cab vehicles without the rear overhead shelves, the speakers are 5-1/4-inch speakers, and are mounted in the upper rear sleeper corners.

1. Shut down the engine and set the parking brake. Chock the front tires.

Speaker Removal and Installation



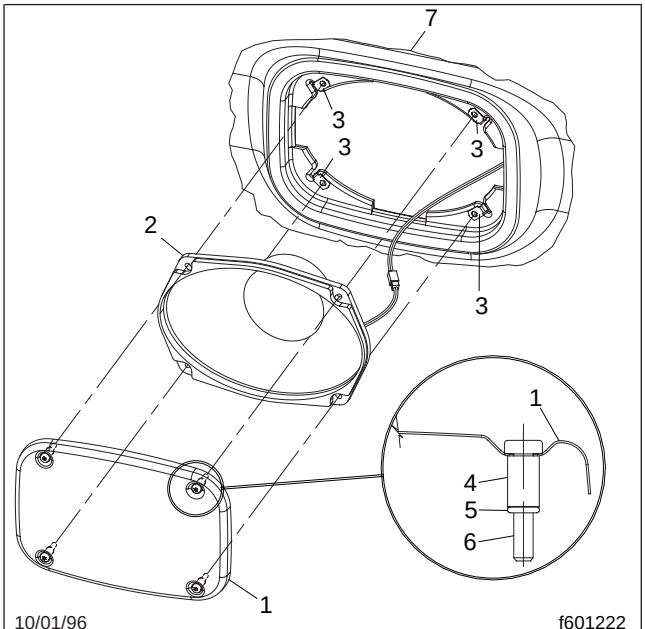
1. Torx-head Screw
2. Tweeter Grille
3. Bracket Fastener
4. Tweeter Bracket
5. Tweeter Speaker
6. Midrange Grille
7. Midrange Fastener
8. Midrange Speaker
9. Door
10. Tweeter-to-Bracket Fastener
11. Weld-nut for Door Bolt

Fig. 1, Tweeter and Midrange Speaker Installations (righthand door)

WARNING

WARNING: Be careful when removing the speaker grille and speaker. The speaker is heavy, and because the speaker is attached with the same fasteners as the speaker grille, the speaker may fall suddenly from the speaker opening during removal, resulting in personal injury or property damage.

2. Remove the four fasteners attaching the grille and the speaker to the cab interior components. Then, remove the grille and the speaker. See **Fig. 2**.



1. Speaker Grille
2. Bass Speaker
3. J-Clip
4. Spacer
5. O-ring
6. Screw
7. Cab Interior Panel

Fig. 2, Bass Speaker Assembly

NOTE: The speaker grille and speaker are held in place by four screw-spacer-O-ring combinations. Be sure to set aside these components for installation.

3. Disconnect the speaker wires from the speaker wire harness.

Installation

1. Build up the speaker grill attachment standoffs as shown in **Fig. 2**, and as follows: Insert the four fastening screws through the four speaker grille mounting holes. Then slip the spacers over the screws and secure with the O-rings.
2. Be sure the four J-clips are in place on the speaker cut-out area to receive the screws.
3. Connect the speaker wires to the speaker wire harness.
4. Install the speaker and speaker grille.

Subwoofer

Removal

1. Shut down the engine and set the parking brake. Chock the front tires.
2. Raise the bunk to access the underbunk storage area and the subwoofer assembly. See **Fig. 3**.
3. Disconnect the subwoofer wiring harness from the subwoofer power amplifier.
4. Remove the press-fit grilles from the individual speakers.
5. Remove the nylon locknuts that secure the grille retaining rings.
6. Remove the subwoofer assembly from the underbunk storage area by pulling the assembly away from the bunk partition until all eight screws are free.

NOTE: The subwoofer is installed and removed as an assembly. Proceed to the next step if replacing subwoofer assembly components.

7. Disassemble the subwoofer assembly. See **Fig. 4**.
   - 7.1 Remove the speaker guard from the speaker and panel assembly.
   - 7.2 Remove the nuts and washer securing the speakers to the panel.
   - 7.3 Remove the clamps that secure the speaker wires to the back of the panel.
   - 7.4 Remove the speakers from the panel.

7. Outer Underbody Sill
8. Clips
9. Subwoofers
10. Amplifier

Fig. 3, Subwoofer/Amplifier Assembly

Installation

1. Assemble the subwoofer speaker assembly.
   - 1.1 Install each speaker onto the back (flat side) of the panel with four screws. Orient the speakers with the speaker wire terminals facing down in the "6 o'clock" position.
   - 1.2 Secure the wire harness to the back of the panel with clamps as shown in **Fig. 4**.
   - 1.3 Install the nuts and washers onto the screws to secure the speakers to the panel. The nuts and washers should be within the routed-out area of the panel.

     NOTE: The screws are intentionally long for later installation.
   - 1.4 Attach the speaker and panel assembly to the guard. See **Fig. 4**.
   - 1.5 Route the wire harness through the hole in the lower corner of the guard.
2. Position the subwoofer assembly into the under-bunk storage area as shown in **Fig. 3** so that the eight screws protruding from the forward face of the assembly fit the holes in the bunk partition and carpet.
3. Install the grille retaining rings onto the screws. Secure each screw with a nylon locknut.
4. Install the press-fit grilles over the retaining rings.

5. Connect the subwoofer wiring harness to the harness from the subwoofer power amplifier.

Overhead Console Speaker Grille Removal and Installation

Removal and Installation

The triangular-shaped speaker grille mounted to the center bottom of the overhead console does not cover a specific speaker at this location. If a CB radio is installed in the overhead console, however, the speaker grille allows the sound from the CB radio speaker to be heard. Removing the speaker grille also allows access to the center portion of the console for installation purposes.

To remove and install the speaker grille:

1. Using a regular screwdriver, and taking care not to mark or bend the grille itself, gently pry the forward portion of the grille free of the console.

NOTE: The speaker grille has four tabs to keep it in place on the overhead console along the edge of the grille.

2. Install the grille by positioning it onto the console and then gently tapping it into place.

Freightliner supplies two principal wiring harnesses to each engine. The 12-volt (12V) engine harness supplies alternator power to the starter and various appliances. The electronic engine harness communicates data between the electronic control module (ECM), various data-gathering devices, and the cab information systems.

For a view of the harness routing for the C–10/C–12/3176 engines, see **Fig. 1**.

For detailed harness routing for the C–10/C–12/3176 engines, see **Fig. 2**.

For a view of the harness routing for the 3406 engine, see **Fig. 3**.

For detailed harness routing for the 3406 engine, see **Fig. 4**.

For a schematic of the electronic engine wiring, see **Fig. 5**.

For a drawing of the electronic engine harness, see **Fig. 6**. For a detailed diagram and table showing the pin cavities and wire numbers assigned to the 31-pin electronic engine connector at the cab interface, see **Fig. 7**.

NOTE: The cab interface of the electronic engine connector is on the engine side of the frontwall.

For a drawing of the 12V engine harness, see **Fig. 8**.

The circuitry going to the other side of the frontwall passes through the electronic engine connector into the main cab harness as an electronic engine overlay for the Caterpillar engines. For a schematic of the electronic engine overlay for the main cab harness, see **Fig. 9**. For a detailed view of the engine overlay wiring, see **Fig. 10** and **Fig. 11**.

For a drawing of the electronic engine overlay for the main cab harness, see **Fig. 12**. For a detailed diagram and table showing the pin cavities and wire numbers assigned to the 31-pin electronic engine connector at the engine interface, see **Fig. 13**.

NOTE: The engine interface of the electronic engine connector is on the cab side of the frontwall. Since some of the wiring numbers are different on the cab side, this connector is shown twice, once from each end. For the wiring on the engine side, see **Fig. 7**.

For the engine brake wiring schematic, see **Fig. 14**. For the engine brake harness, see **Fig. 15**.

CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables and the engine electronic control module (ECM) connector at the ECM. See Fig. 5 and Fig. 6. Electric currents produced during electric welding can damage various electronic components on the vehicle.

Specifications

Freightliner supplies two principal wiring harnesses to each engine. The 12-volt (12V) engine harness supplies alternator power to the starter and various appliances. The electronic engine harness communicates data between the electronic control module (ECM), various data-gathering devices, and the cab information systems. In addition, a power harness supplies battery power to the engine ECM.

For a view of the harness routing for the N14 engine, see **Fig. 1**.

For detailed harness routing for the N14 engine, see **Fig. 2**.

For a view of the harness routing for the M11 engine, see **Fig. 3**.

For detailed harness routing for the M11 engine, see **Fig. 4**.

For a schematic of the electronic engine and power harness wiring, see **Fig. 5**. For a detailed view of the power harness and engine ECM end of the electronic engine harness, see **Fig. 6**. For a detailed view of the cab interface (electronic engine connector) end of the electronic engine harness, see **Fig. 7**.

For a drawing of the electronic engine harness, see **Fig. 8**. For a detailed diagram and table showing the pin cavities and wire numbers assigned to the three major multi-pin connectors on this harness, see the following:

- For the 28-pin engine ECM connector, see **Fig. 9**.
- For the 21-pin engine ECM connector, see **Fig. 10**.
- For the 31-pin electronic engine connector at the cab interface, see **Fig. 11**.

NOTE: The cab interface of the electronic engine connector is located on the engine side of the frontwall.

For a drawing of the 12V engine harness, see **Fig. 12**.

For a drawing of the power harness, see **Fig. 13**.

The circuitry going to the other side of the frontwall passes through the electronic engine connector into the main cab harness as an electronic engine overlay for the Cummins engines. For a schematic of the electronic engine overlay for the main cab harness, see **Fig. 14**. For a detailed view of the engine overlay wiring, see **Fig. 15** and **Fig. 16**.

For a drawing of the electronic engine overlay for the main cab harness, see **Fig. 17**. For a detailed diagram and table showing the pin cavities and wire numbers assigned to the 31-pin electronic engine connector at the engine interface, see **Fig. 18**.

NOTE: The engine interface of the electronic engine connector is located on the cab side of the frontwall. Since some of the wiring numbers are different on the cab side, this connector is shown twice, once from each end. For the wiring on the engine side, see **Fig. 11**.

For engine brake wiring, see **Fig. 15** and **Fig. 16**.

CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables and the engine electronic control module (ECM) electrical connector at the ECM. See Fig. 5, Fig. 6, Fig. 9, and Fig. 10. Electric currents produced during electric welding can damage various electronic components on the vehicle.

the main cab harness as an electronic engine overlay for the Detroit Diesel engines. For a schematic of the electronic engine overlay for the main cab harness, see **Fig. 13**. For a detailed view of the engine overlay wiring, see **Fig. 14** and **Fig. 15**.

For a drawing of the electronic engine overlay for the main cab harness, see **Fig. 16**. For a detailed view of the engine overlay harness drawing, see **Fig. 17** and **Fig. 18**. For a detailed diagram and table showing the pin cavities and wire numbers assigned to the 31-pin electronic engine connector (engine interface), see **Fig. 19**.

NOTE: The engine interface end of the electronic engine connector is on the cab side of the frontwall. Since some of the wiring numbers are different on the cab side, this connector is shown twice, once from each end. For the wiring on the engine side, see **Fig. 9**.

For engine brake wiring, see **Fig. 20** and **Fig. 21**.

⚠ CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables and the engine electronic control module (ECM) electrical connector at the ECM. See Fig. 4, Fig. 5, and Fig. 8. Electric currents produced during electric welding can damage various electronic components on the vehicle.

General Information

The HighwayMaster® mobile communications system combines phone and satellite capabilities. It includes the following components, as shown in **Fig. 1**:

- A control unit for processing all vehicle communications, mounted in the cab (see **Fig. 2**)
- A cellular telephone handset and cradle, mounted on the dash console (see **Fig. 3**)
- A text display unit for satellite communications, mounted on the upper dash panel (see **Fig. 3**)
- A hands-free microphone, mounted on top of the display unit (see **Fig. 3**)
- A speaker, mounted on the cab wall above the driver's seat (see **Fig. 4**)
- A cellular antenna for telephone communications, normally mounted on the passenger's side outside cab wall or on the back of the cab (see **Fig. 5**)
- A GPS (global positioning system) antenna for satellite communications, normally mounted on the back of the cab (see **Fig. 6**)
- The cables necessary to connect the various components together

Each of these components can be replaced separately. See the appropriate subject for replacement procedures.

- For control unit replacement, see **Subject 100**
- For handset replacement, see **Subject 110**
- For display unit replacement, see **Subject 120**
- For microphone replacement, see **Subject 130**
- For speaker replacement, see **Subject 140**
- For cellular antenna replacement, see **Subject 150**
- For GPS antenna replacement, see **Subject 160**

Before use, the control unit must be activated to receive data through the cellular and satellite networks. Also, the system must receive an authorization from Customer Care, HighwayMaster's technical support facility, that a system module has been assigned and that the information about it has been stored in ACUS, a database maintained by AT & T.

NOTE: When replacing a control unit, make sure the new unit has been activated before turning it on for the first time.

To operate successfully, the information must be accurate, and include the following:

1. TIN (Truck Identification Number)—a number generated by HighwayMaster for billing purposes
2. CID (Customer Identification Number)—a number generated by HighwayMaster for customer reporting and tracking
3. MIN (Mobile Identification Number)—the phone number of the cellular modem, which is found on a decal on the side of the control unit
4. ESN (Electronic Serial Number)—an electronically encoded serial number in the control unit, which is also found on the decal on the side of the control unit
5. Tractor Number—the vehicle ID number
6. System Module Serial Number—the serial number of the control unit, which is also found on the decal on the side of the control unit
7. Text Display Serial Number—the serial number of the display unit, which is found on a decal on the back of the display unit
8. Handset Serial Number—the serial number of the handset, which is found on on a metal tag on the back of the handset

Principles of Operation

START-UP CYCLE

Each time the engine is started, the HighwayMaster system goes into its start-up cycle. When the system is functioning properly, it goes through the following steps:

1. The display shows the underline prompt (_).
2. The display reads "Checking Cellular Service" and then changes to "Registering Unit for Service."
3. Once the unit has been registered, the display reads either "HighwayMaster Service Area" (if you are in an area where HighwayMaster pro-

vides cellular coverage) or "HighwayMaster" (if you are out of the coverage area).

4. When fully operational, the handset is illuminated and the display shows from three to seven bars.

The screen saver timer is a feature that allows the display to go blank if the system has not been used for a programmable number of minutes. The timer can be set to anywhere from 1 to 240 minutes in 1-minute intervals.

HANDSET KEYPAD

In addition to having all the features of a telephone, the handset also functions as a keypad for programming the HighwayMaster system. The function keys on the handset also allow access to the memory functions of the system. The up and down keys allow scrolling through the information stored in memory

- The SND (Send) key is used to start a call and to transmit information. Pressing SND when receiving a call activates the hands-free microphone and the voice recognition system.
- The END key is used to end a hands-free call and get the system ready to receive new information.
- The PWR (Power) key turns the system on and off.

- The CHK (Check) key is used to check information, such as NAV status.
- The RCL (Recall) key is used to recall information stored in memory.
- The STO (Store) key is used to store information in memory, including telephone numbers and programming codes.
- The F (Function) key calls up the programming menu, allowing you to set functions such as the screen saver timer.

- The CLR (Clear) key is used to clear information from the display.

VOICE RECOGNITION

For greater driver convenience, the system can be operated by voice commands, using the hands-free microphone and the voice recognition system.

The control unit contains the voice recognition system which allows the speaker to respond to voice commands. To test the voice recognition system, press the END key on the handset. If the speaker says "Ready," the voice recognition system is working.

POWER OFF DELAY

Power off delay is a feature that allows the HighwayMaster system to remain in operation for a programmable number of hours after the vehicle is shut off. The delay can be set to anywhere from 0 to 12 hours in 1-hour intervals.

PERSONAL AND AUTHORIZED CALLING

The personal calling feature allows drivers, at their own expense, to use the HighwayMaster system to make personal calls, providing they have an AT & T TrueChoice ^{SM} calling card.

Both personal and authorized phone numbers can be stored in memory for easier dialing.

Authorized numbers are used for company business. They are stored in memory by the trucking company using special codes, allowing the driver to call dispatchers, terminals, and customers at company expense.

Replacement

The HighwayMaster® control unit is normally mounted on a mounting tray attached to the wall of the baggage compartment. On day cabs, and in other cases where space does not permit it to be mounted in this location, the control unit is mounted with its mounting plate attached directly to the cab deck.

IMPORTANT: Before attempting to install a new control unit, fax the serial number, electronic serial number, and mobile identification number of the unit to HighwayMaster at 1–214–930–7244. These numbers are found on the decal on the side of the control unit.

1. Set the parking brake, chock the tires, and disconnect the batteries.
2. Gain access to the control unit. Normally it is installed under the bunk on the right-hand side of the cab.
3. Remove the cables attached to the control unit. See **Fig. 1**.

5. Power Cable
6. Display Cable
7. Phone Cable
8. GPS Antenna Cable
9. Datalink Cable

Fig. 1, Control Unit and Cables

3.1 Remove the round 1-pin connector on the cellular antenna cable from the plug on the side of the front casing.

3.2 Remove the round 3-pin connector on the power cable from the plug on the bottom of the case.

3.3 Remove the 9-pin connector on the display cable from the plug on the bottom of the case.

3.4 Remove the connector on the phone cable from the phone plug on the bottom of the case.

3.5 Remove the round 1-pin connector on the GPS antenna cable from the plug on the bottom of the case.

3.6 Remove the 15-pin connector on the datalink cable from the plug on the bottom of the case.

4. Remove the two SEM screws attaching the control unit to the mounting plate and lift the two lugs on the other end of the control unit out of the slots provided on the mounting plate.

NOTE: It is not necessary to remove the mounting plate to replace the control unit. Do the following step only if it is necessary to replace the mounting plate or to change the mounting of the control unit.

5. Remove the 1/4–20 capscrews (3/4-inch long), washers, and locknuts attaching the mounting plate to the mounting tray. See **Fig. 2** for installations using the mounting tray and **Fig. 3** for installations with the mounting plate attached directly to the cab deck or other cab structure.
6. If removed, attach the mounting plate to the mounting tray or cab structure, as required.
7. Insert the lugs in the control unit into the slots in the mounting plate. Install the SEM screws and tighten them until snug.
8. Connect the batteries.
9. Connect the display, phone, and both antenna cables to the control unit, as removed. Check all cables for good connections at both ends.
10. Connect the datalink cable to the control unit, as removed. Check the cable for good connections at both ends. See **Fig. 4**.

2. Mounting Plate
3. Cab Deck
4. 1/4–20 Flatwasher
5. 1/4–20 Locknut

Fig. 3, Removing the Mounting Plate from the Cab Rear Deck

IMPORTANT: Do not connect the power cable until battery power has been restored. Before connecting power to the unit, call HighwayMaster Customer Care at 1–800–647–6693 to confirm the unit has been initialized from the host.

11. With battery power restored, connect the power cable to the control unit, as removed. Check the cable for good connections at both ends. See **Fig. 5**.

12. Initialize the control unit.

    12.1 On the handset, press the following sequence of keys:

    - "STO," "9," "9," "SND"
    - "STO," "0," "1," "SND"

    NOTE: If the display does not read "TRANSMISSION SUCCESSFUL," first press the key sequence "STO," "0," "1," "SND" again. If that does not work, call HighwayMaster Customer Care at 1–800–647–6693 and follow their instructions.

    12.2 When the display reads "TRANSMISSION SUCCESSFUL," type in this key sequence:

    - "5," "9," "8," "2," "0," "0," "CHK"

    12.3 When the display reads "GPS HAS REACHED NAV STATUS," the system is ready to operate.

    If the display does not read "GPS HAS REACHED NAV STATUS," see **Troubleshooting, 300**.

13. Place a voice call. Test the system for correct operation, including the hands-free microphone, volume control, and voice recognition, and make adjustments as needed. For more information, see **Troubleshooting, 300**.

14. Ask Customer Care to issue a returned materials authorization number (RMA). Enter this number on a "Service Record/Installation Acknowledgment" form and send the form back to HighwayMaster along with the old control unit.

15. Return the old control unit to HighwayMaster, using the address label provided. Send it to the following address: HighwayMaster Repair Depot, ATTN: Roy Moultrie, 2300 Highway 79 South, Guntersville AL 35976.

16. Restore the cab to normal operating condition.

17. Remove the chocks from the tires.

Replacement

The HighwayMaster® handset and cradle are normally mounted on a pedestal attached to the upper dash assembly (center panel).

IMPORTANT: Before attempting to install a new handset, fax the serial number of the unit to HighwayMaster at 1–214–930–7244. The serial number is found on a metal tag on the back side of the handset.

1. Set the parking brake, chock the tires, and disconnect the batteries.
2. Remove the handset cord from the pickup (mounted on the pedestal). See **Fig. 1**.

Display Unit Replacement

Replacement

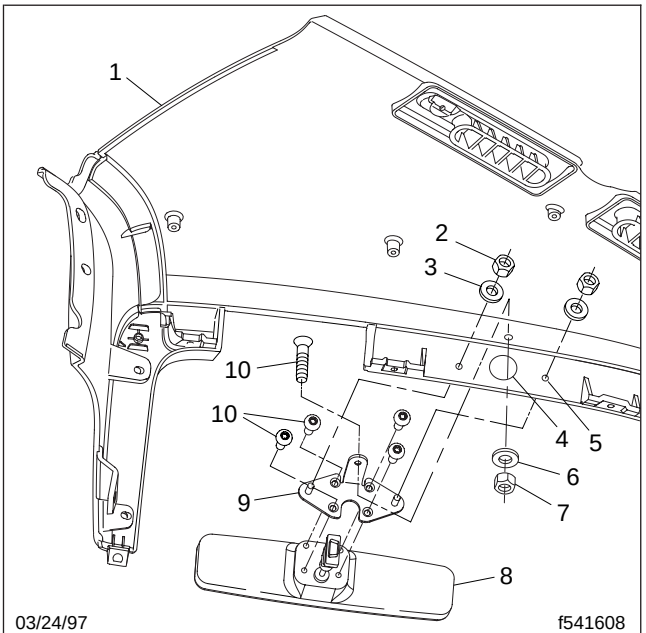
The HighwayMaster® display unit is normally mounted on the auxiliary dash panel.

IMPORTANT: Before attempting to install a new display unit, fax the serial number of the unit to HighwayMaster at 1–214–930–7244. The serial number is found on the decal on the back side of the control unit.

1. Set the parking brake, chock the tires, and disconnect the batteries.
2. Unclip the microphone from the microphone bracket. If the bracket is damaged, remove the two speed clips attaching it to the upper dash assembly and replace the bracket.
3. Remove the 10–32 machine screw from the prong of the display bracket. Remove the locknuts and washers from the studs on the back of the display unit. See **Fig. 1**.
4. Remove the display bracket, with the display unit attached, from the dash. Pull the two wires (display unit and microphone) out of the dash. When the connectors are sufficiently exposed, disconnect the wires and mark them for later assembly. See **Fig. 2**.

NOTE: If necessary, reach under the dash to disconnect the display and microphone wires.

5. Remove the four 10–32 machine screws attaching the display bracket to the display unit.
6. Attach the electrical connectors to the display unit and microphone, as removed.
7. Install the new display unit on the display bracket, using the four 10–32 machine screws.
8. Position the display bracket on the upper dash assembly as shown in **Fig. 3**. Make sure the studs on the back of the display bracket pass through the fastener holes on the front of the upper dash assembly. See **Fig. 4**.
9. Attach the #10 washers and 10–24 locknuts to the studs. Attach the display bracket to the dash with 10–32 machine screw.
10. Install a new microphone bracket, if removed. Clip the microphone to the microphone bracket.



NOTE: The auxiliary dash panel has been removed for clarity.

Replacement

The HighwayMaster® speaker is normally installed on the driver's side of the cab. On factory installations, it is on the B-pillar (see **Fig. 1**); on aftermarket installations, it is on the cab wall above the window (see **Fig. 2**).

3.1 Loosen the knobs on each side of the speaker and remove the speaker from the speaker bracket.

3.2 Pull the speaker cable wire and connector out through the hole in the cab wall. If necessary, remove the upholstery panel.

Fig. 4, Speaker Mounting (factory installation)

4.2 If installed, remove the two 10–16 self-tapping screws and washers attaching the mounting angle to the cab wall.

5. If removed, install the mounting angle and speaker bracket. Use the removed fasteners.

6. Install the speaker.

   6.1 Insert the knobs on each side of the new speaker into the slots in the speaker bracket.

   6.2 Route the new speaker cable through the drill hole and connect it to the electrical connector on the end of the cab speaker cable.

   6.3 When the cable has been properly routed and connected, tighten the knobs on the speaker until firm and tight.

7. Check the B-pillar speaker cable for good connections at both ends. See **Fig. 3**.

Replacement

The HighwayMaster® GPS (global positioning system) antenna is normally installed on the back of the cab. On factory installations, it is on the roof cap on the passenger's side; on aftermarket installations, it is on the back of the cab.

1. Set the parking brake, chock the tires, and disconnect the batteries.
2. Loosen the M12 nylon hexnut from the GPS antenna bracket. Remove the antenna. See **Fig. 1** for factory installations and **Fig. 2** for aftermarket installations.

Troubleshooting

When the engine is started, the HighwayMaster system goes into its start-up cycle. When the system is functioning properly, it goes through the following steps:

1. The display shows the underline prompt (_).
2. The display reads "Checking Cellular Service" and then changes to "Registering Unit for Service."
3. Once the unit has been registered, the display reads either "HighwayMaster Service Area" (if you are in an area where HighwayMaster provides cellular coverage) or "HighwayMaster" (if you are out of the coverage area).
4. When fully operational, the handset is illuminated and the display shows from three to seven bars.

Use this cycle as a diagnostic check. If the system does not go through all of these steps, see the appropriate troubleshooting table below.

Problem—The HighwayMaster System Has No Power

Problem—The HighwayMaster System Has No Power	
Possible Cause	**Remedy**
The vehicle is not running.	With the transmission in neutral and the parking brake set, start the engine and check to see if the system goes through the complete start-up cycle.
The circuit breaker is blown or missing.	Check the 10-amp circuit breaker in position #7, Block B3, of the auxiliary power distribution module (PDM) inside the left-hand B-pillar electrical compartment. Replace any damaged components.
There are loose connections.	Carefully check all of the connections on the power, phone, display, speaker, and both antenna cables. Connect as necessary.
The power cable needs replacing.	Disconnect the power cable to the auxiliary PDM. Then disconnect the power cable from the control unit. With the power cable reconnected to the auxiliary PDM, turn the ignition keyswitch on. Now insert the negative lead of a digital voltmeter into the right-hand cavity on the connector. Insert the positive lead into another cavity, and check for voltage. When finished, check the other end of the cable. If the voltage at either end reads less than 11 volts, or more than 13.5 volts, replace the power cable.
The control unit is broken.	Replace the control unit. See **Subject 100** for detailed instructions.

Problem—The HighwayMaster System Has Intermittent Power

Problem—The HighwayMaster System Has Intermittent Power	
Possible Cause	**Remedy**
The circuit breaker is loose or defective.	Check the 10-amp circuit breaker in position #7, Block B3, of the auxiliary power distribution module (PDM) inside the left-hand B-pillar electrical compartment. Replace any damaged components.
There are loose connections.	Carefully check all of the connections on the power, phone, display, speaker, and both antenna cables. Repair/replace as necessary.

Troubleshooting

Problem—The HighwayMaster System Has Intermittent Power	
Possible Cause	**Remedy**
The power cable needs replacing.	Disconnect the power cable from the auxiliary PDM. Then disconnect the power cable from the control unit. With the power cable reconnected to the auxiliary PDM, turn the ignition keyswitch on. See **Fig. 1**. Now insert the negative lead of a digital voltmeter into the right-hand cavity on the connector. Insert the positive lead into another cavity, and check for voltage. When finished, check the other end of the cable. If the voltage at either end reads less than 11 volts, or more than 13.5 volts, replace the power cable.
The control unit is broken.	Replace the control unit. See **Subject 100** for detailed instructions.

Problem—When the Ignition Keyswitch Is Turned Off, the HighwayMaster System Also Turns Off

Problem—When the Ignition Keyswitch Is Turned Off, the HighwayMaster System Also Turns Off	
Possible Cause	**Remedy**
The power off delay is not set or is set to 0.	Call the host operator to set the delay to the desired time, from 1 to 12 hours.
There are loose connections in the phone cables.	Disconnect the power cable from the auxiliary PDM. Now disconnect and reconnect the phone cables, making sure the connectors seat properly. See **Fig. 2** and **Fig. 3**. Reconnect the power cable to the auxiliary PDM.
The power plug is installed incorrectly.	Check the installation of the power plug and reposition it if necessary.
The control unit is broken.	Replace the control unit. See **Subject 100** for detailed instructions.

Problem—The Handset Does Not Illuminate

Problem—The Handset Does Not Illuminate	
Possible Cause	**Remedy**
The handset is not correctly connected to the pickup.	Turn the unit off. Check the connection of the handset cord to the pickup and turn the unit back on.
There are loose connections in the phone cables.	Disconnect the power cable from the auxiliary PDM. Now disconnect and reconnect the phone cables, making sure the connectors seat properly. See **Fig. 2** and **Fig. 3**. Reconnect the power cable to the auxiliary PDM.
The handset is broken.	Turn the unit off. Replace the handset with a spare handset and turn the unit back on. If the handset now illuminates, replace the handset. See **Subject 110** for detailed instructions.
The phone cable assembly needs replacing.	Disconnect the power cable from the auxiliary PDM. Now connect a spare phone cable assembly, making sure the connectors seat properly. See **Fig. 2** and **Fig. 3**. Reconnect the power cable to the auxiliary PDM. If the handset now illuminates, replace the phone cable assembly.

Problem—The Keypad on the Handset Does Not Function

Problem—The Keypad on the Handset Does Not Function	
Possible Cause	**Remedy**
The handset is damaged.	Check the handset for physical damage, disconnected wires, and broken seals.
There are sticky keys in the keypad.	Try several keys to see if any key responds. If some keys respond but others do not, clean the keypad. Turn the unit off. Spray on some contact cleaner and wipe off the keypad until it is dry. Turn the unit back on and check the keys again. Repeat if necessary.
The handset is broken.	Turn the power off. Replace the handset with a spare handset and turn the power back on. If the handset now illuminates, replace the handset. See **Subject 110** for detailed instructions.

Troubleshooting

Problem—The Keypad on the Handset Does Not Function	
Possible Cause	**Remedy**
The phone cable assembly needs replacing.	Disconnect the power cable from the auxiliary PDM. Now connect a spare phone cable assembly, making sure the connectors seat properly. See **Fig. 2** and **Fig. 3**. Reconnect the power cable to the auxiliary PDM. If the handset now illuminates, replace the phone cable assembly.

Problem—The Display Is Blank, but the Handset and Control Unit Have Power

Problem—The Display Is Blank, but the Handset and Control Unit Have Power	
Possible Cause	**Remedy**
The screen saver is set to a short period of time.	On the handset, press "F" (function) and "Send." Use the arrow key to move down the menu to get to "Set Screen Saver Timer." Enter any number from 1 to 240 to change the number of minutes before the display goes blank.
There are loose connections in the display cables.	Disconnect the power cable from the auxiliary PDM. Now disconnect and reconnect the display cables, making sure the connectors seat properly. See **Fig. 4** and **Fig. 5**. Reconnect the power cable to the auxiliary PDM.
The display cable assembly needs replacing.	Disconnect the circuit breaker. Now connect a spare display cable, making sure the connectors seat properly. See **Fig. 4** and **Fig. 5**. Reconnect the circuit breaker. If the display now works, replace the display cable assembly.
The display unit is broken.	Replace the display unit. See **Subject 120** for detailed instructions.

Problem—The Display Shows Only the Underline Prompt (_)

Problem—The Display Shows Only the Underline Prompt (_)	
Possible Cause	**Remedy**
The screen saver is set to a short period of time.	On the handset, press "F" (function) and "Send." Use the arrow key to move down the menu to get to "Set Screen Saver Timer." Enter any number from 1 to 240 to change the number of minutes before the display goes blank.
There are loose connections in the display cables.	Disconnect the circuit breaker. Now disconnect and reconnect the display cables, making sure the connectors seat properly. See **Fig. 4** and **Fig. 5**. Reconnect the circuit breaker.
The display unit is broken.	Replace the display unit. See **Subject 120** for detailed instructions.
The display cable assembly needs replacing.	Disconnect the circuit breaker. Now connect a spare display cable, making sure the connectors seat properly. See **Fig. 4** and **Fig. 5**. Reconnect the circuit breaker. If the display now works, replace the display cable assembly.
The control unit is broken.	Replace the control unit. See **Subject 100** for detailed instructions.

Problem—The Display Shows Only the "HighwayMaster" Message

Problem—The Display Shows Only the "HighwayMaster" Message	
Possible Cause	**Remedy**
The vehicle is outside the coverage area.	The display is functioning correctly. Move the vehicle to a covered area and the message will change to "HighwayMaster Service Area."
The cellular antenna is missing.	Replace the cellular antenna, making sure the tab is bent down enough to make contact with the antenna base. See **Subject 150** for detailed instructions.
The cellular antenna connector is broken.	Inspect the connector (at the control unit) for damage. Replace the connector, and check the display again. See **Fig. 6**. If the display is still not correct, ask Customer Care (1–800–647–6693) to download a SID table.
The control unit is broken.	Replace the control unit. See **Subject 100** for detailed instructions.

Problem—The Display Gives Scrambled Information

Problem—The Display Gives Scrambled Information	
Possible Cause	**Remedy**
The system needs to be restarted.	Call Customer Care at 1–800–647–6693 and request a remote restart. Remove power from the system for one minute. Reconnect the power and reinitialize the control unit. See **Subject 100** for detailed instructions.

Problem—The Microphone Does Not Work, Or Broadcasts Noise

Problem—The Microphone Does Not Work, Or Broadcasts Noise	
Possible Cause	**Remedy**
There is interference from wind, or other electrical sources.	Check the microphone with the window rolled up and all electrical appliances off.
The connection with the display cable is bad.	Check the connection with the display cable and make sure it is properly connected. For a more secure connection, wrap electrical tape around the connector.
The microphone wire is damaged.	Check the microphone wire for damage. Replace the microphone if any is found. See **Subject 130** for detailed instructions. Test the system again with the new microphone installed.
The display cable assembly needs replacing.	Disconnect the circuit breaker. Now connect a spare display cable, making sure the connectors seat properly. See **Fig. 4** and **Fig. 5**. Reconnect the circuit breaker. If the display now works, replace the display cable assembly.
The control unit is broken.	Replace the control unit. See **Subject 100** for detailed instructions.

Troubleshooting

Problem—The GPS (Satellite) System Does Not Provide Actual Position Data, or Provides It Infrequently

Problem—The GPS (Satellite) System Does Not Provide Actual Position Data, or Provides It Infrequently	
Possible Cause	**Remedy**
The system has not reached "NAV" status.	On the handset keypad, enter "589200," followed by "CHK." When the display reads "GPS HAS REACHED NAV STATUS," call the host operator and ask for an actual position on the vehicle. If the operator still does not have an actual, ask for an immediate data exchange (F2) to download the data.
There are loose connections on the GPS antenna.	Check all of the antenna connections for condition. See **Fig. 7**. Repair/replace as necessary.
The GPS antenna and/or cable is damaged.	Check the GPS antenna and cable for damage. Repair or replace any damaged parts as necessary. On the handset keypad, enter "589200," followed by "CHK." When the display reads "GPS Has Reached NAV Status," call the host operator and ask for an actual position on the vehicle. If the operator still does not have an actual, ask for an **immediate data exchange (F2)** to download the data.
The HighwayMaster system is not registered properly.	Call Customer Care at 1–800–647–6693 to check the registration status of the system.
The control unit is broken.	Replace the control unit. See **Subject 100** for detailed instructions.

Problem—The Speaker Does Not Work

Problem—The Speaker Does Not Work	
Possible Cause	**Remedy**
The handset is not properly seated in the cradle.	Check that the handset is seated properly. Turn the power on, and press the "End" button. If the speaker is operating, it will respond by saying "Ready."
The display unit is broken.	Disconnect the circuit breaker. Now connect a spare display unit. Reconnect the circuit breaker, and press the "End" button. If the speaker now operates, replace the display unit. See **Subject 120** for detailed instructions.
The display cable assembly needs replacing.	Disconnect the circuit breaker. Now connect a spare display cable, making sure the connectors seat properly. See **Fig. 4** and **Fig. 5**. Reconnect the circuit breaker, and press the "End" button. If the speaker now operates, replace the display cable assembly.
The voice recognition system in the control unit is broken.	Replace the control unit. See **Subject 100** for detailed instructions.

Problem—The HighwayMaster System Does Not Receive Status Codes or Authorized Numbers

Problem—The HighwayMaster System Does Not Receive Status Codes or Authorized Numbers	
Possible Cause	**Remedy**
The registration codes were never entered.	On the handset keypad, enter "STO," "99," and "SEND." When the display reads "HighwayMaster Service Area," enter "STO," and "01." Keep repeating this step until the Display reads "Transmission Successful." Check the status codes by entering "STO" "01," and the up arrow (↑) to scroll through the codes. Similarly, check the authorization numbers by entering "RCL," "#," "01," and the up arrow (↑) to scroll through the numbers.
The control unit has not been initialized.	Call the host operator to request initialization and repeat the procedure above.
The HighwayMaster system is not registered properly.	Call Customer Care at 1–800–647–6693 to check the registration status of the system.
The control unit is broken.	Replace the control unit. See **Subject 100** for detailed instructions.

Problem—The HighwayMaster System Will Not Power Off

Problem—The HighwayMaster System Will Not Power Off	
Possible Cause	**Remedy**
The power off delay has been set.	Call the host operator to reset the delay.
The electrical connections are not in the correct place.	Check all the electrical connections from the auxiliary power distribution module to the control unit. Repair/ replace as necessary.
The control unit is broken.	Replace the control unit. See **Subject 100** for detailed instructions.

Problem—The Driver Is Unable To Call Personal Numbers

Problem—The Driver Is Unable To Call Personal Numbers	
Possible Cause	**Remedy**
The driver does not have a valid AT & T calling card.	Ask the driver to call AT & T to obtain a valid calling card.
The personal calling feature is not active.	Call Customer Care at 1–800–647–6693 and ask them to active the personal calling feature.

IMPORTANT: The level II ICU is also known (on ServiceLink) as the ICU2L.

General Description

This section covers the instrumentation control unit, level II (level II ICU). Since October, 1997, it has been the standard ICU. Before October, 1997, the original version of the ICU (ICU1) was the standard (and only) ICU. For more information about the original version of the ICU, see **Section 54.03**.

NOTE: For information about the optional level III ICU (installed on vehicles since May, 1998), see **Section 54.19**.

LEVEL II ICU (ICU2L)

The level II ICU (ICU2L) is a basic electronic dashboard that accepts input from electrical/magnetic vehicle sensors and converts it into digital output that can be fed to an electronic gauge. Only air gauges operate mechanically.

The level II ICU has only one 16-bit microprocessor. This eliminates the need for the right-hand (blue) connectors found on the original ICU.

There can be up to 14 removable gauges (11 electronic, one electromechanical, and two mechanical) on the driver's instrument panel. The level II ICU can not drive gauges located on the auxiliary instrument panel.

DASH MESSAGE CENTER

The heart of the level II ICU is the dash message center. It has two parts: a set of 18 warning and indicator lights similar to those found on a conventional lightbar, and a dash driver display screen. The dash driver display screen is a 1-line by 6-character vacuum fluorescent display.

The information that can be provided by the message center includes:

- odometer readings
- a listing of active faults
- a "no datalink activity" alert message

Principles of Operation

IGNITION SEQUENCE

When the ignition is turned on, the level II ICU (ICU2L) runs through the ignition sequence. See **Fig. 1** for the standard level II ICU.

If the headlights are turned on, the screen displays the odometer and waits for the ignition to be turned on.

IMPORTANT: When the ignition is first turned on, all the electronic gauges (except the voltmeter) complete a full sweep of their dials, the warning and indicator lights light up, and the buzzer sounds for three seconds.

The following indicator lights go on during the ignition sequence:

- High Coolant Temperature Warning
- Low Engine Oil Pressure Warning
- Low Air Pressure Warning
- Park Brake On Indicator
- All engine warning lights, including Engine Protection, Check Engine, and Stop Engine (Cummins only)
- All ABS warning lights, including Wheel Spin, Tractor ABS, and Trailer ABS (if installed)

NOTE: While the engine and ABS warning lights go on during the ignition sequence, they are not controlled by the level II ICU, but by their own system ECU (electronic control unit).

Once the ignition keyswitch has been turned on, the ICU performs a self-test, looking for active faults. During the first half of the self-test, all segments of the display illuminate. During the second half of the self-test, the software revision level is displayed.

If there are no active faults, the screen displays the odometer.

If the standard level II ICU has received active fault codes from other devices, it displays them, one after the other, until the parking brake is released, or the ignition keyswitch is turned off.

NOTE: The screen displays a code, called the message identifier (MID), indicating the elec-

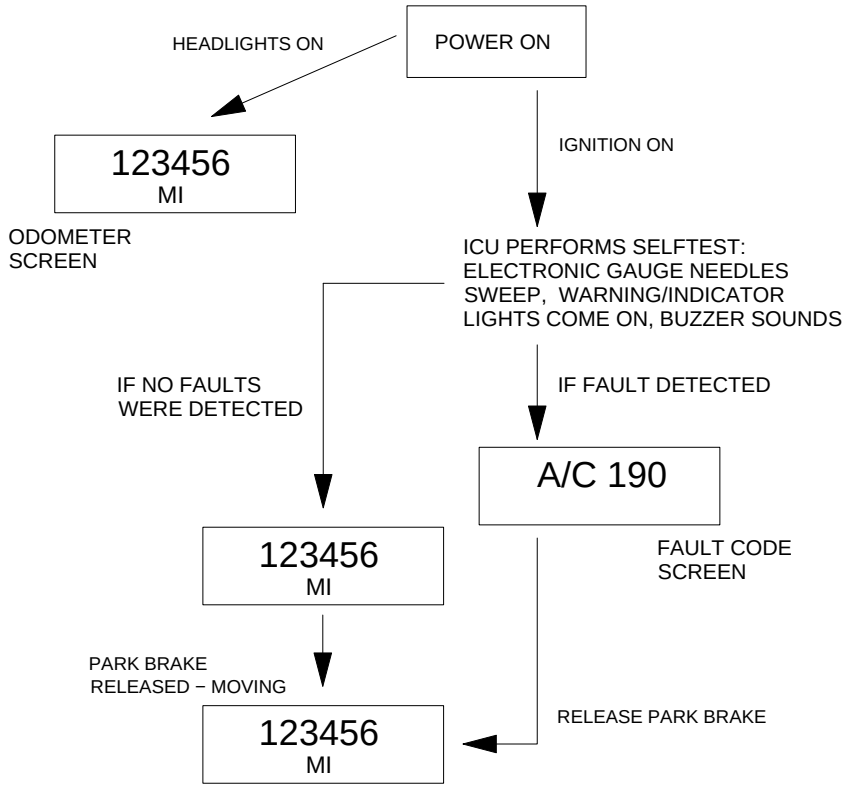
General Information

tronic control unit or system that is not functioning properly.

Example: If the air conditioning system or air conditioning protection unit is not functioning properly, the screen displays "A/C190." For a complete list of possible screen displays, see **Specifications, 400**.

To troubleshoot the Qualcomm system, have an incoming test message sent to the unit in the vehicle and make sure that it is received properly.

To troubleshoot the HighwayMaster system, see Section 54.13, **Troubleshooting, 300**.



10/03/97 f040395

During the first half of the self-test, all segments of the display illuminate. During the second half of the self-test, the software revision level is displayed.

NOTE: If there is more than one fault, the level II ICU displays them, one after another, changing every three seconds, until the park brake is released.

Fig. 1, Ignition Sequence, Standard Level II ICU (ICU2L)

IMPORTANT: The ICU will report a fault for the Qualcomm or HighwayMaster communications systems when the system control unit, or ECU, is connected properly and the system is working correctly.

Once the parking brake is released, the level II ICU displays the odometer again.

ODOMETER

The odometer is a six-digit display with no decimal point. The odometer only displays significant figures (no leading zeros), until the vehicle has traveled one

million miles or kilometers (km). At one million miles (km), the odometer resets itself to 000000, and then continues to display leading zeros.

Example: 456 = 456 miles (km)

000456 = 1,000,456 miles (km)

When first installed, the odometer starts at 0 miles (or km). When the level II ICU is replaced, the odometer does not start with the engine miles (km), but starts again from 0 and cannot be changed, either up or down.

IMPORTANT: Although the odometer uses data supplied by the engine ECM to update its count, it keeps its own mileage starting from the zero point, which marks where it was first installed.

The odometer can be set to display in either miles or kilometers. For procedures, see **Subject 110**.

ALERT SCREEN

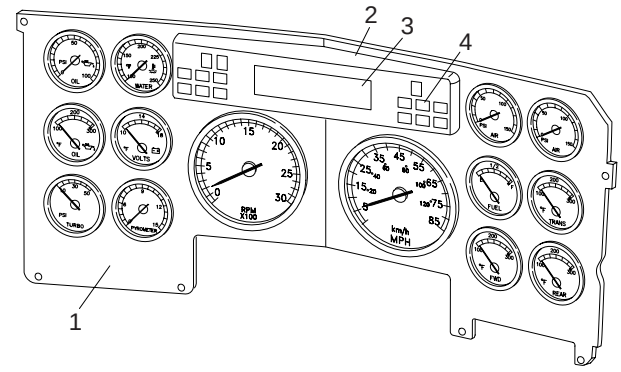
This screen appears when there is no activity on the datalink. The screen displays "NODATA."

Level II Instrumentation Control Unit Replacement

IMPORTANT: The level II ICU is also known (on ServiceLink) as the ICU2L.

Replacement

The instrumentation control unit, level II (level II ICU) includes the driver's instrument panel, the ICU housing, and the dash message center (all installed as one unit). See **Fig. 1**.



1. Driver's Instrument Panel
2. Dash Message Center
3. Dash Driver Display Screen
4. Warning and Indicator Lights

Fig. 1, Driver's Instrument Panel

To replace a complete level II ICU with a new set of gauges, see "Level II ICU (With Gauges)." To replace a level II ICU and reinstall the old set of gauges, see "Level II ICU (Without Gauges)."

To replace individual gauges, switches, or flipper valves, see **Section 54.03, Subject 110**. To replace light bulbs (gauge light, or warning and indicator light), see **Section 54.03, Subject 120**. To replace the warning buzzer, see **Section 54.03, Subject 130**. To replace the dash driver display screen, see **Section 54.03, Subject 140**.

NOTE: For auxiliary instrument panel replacement, see **Section 54.03, Subject 100**.

Level II ICU (With Gauges)

1. Remove the left-hand dash panels. Be sure the screws that attach the dash panel trimtop to the upper dash assembly have been removed. For instructions, see **Section 60.08, Subject 100**.
2. Remove the screw that attaches the dash panel trimtop to the lower dash panel. This screw is located on the far left of the trimtop.

CAUTION

Electronic components of the ICU are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU circuitry.

3. Remove the fasteners from the driver's instrument panel. See **Fig. 2**. Fasteners used on the level II ICU are T25 Torx dog-point screws. See **Fig. 3**.
   - 3.1 Remove the bezel from the dash message center, exposing the two screws underneath it. For more information, see **Section 54.03, Subject 140**.
   - 3.2 Remove the two screws underneath the dash message center bezel.
   - 3.3 Remove the four screws on the bottom of the driver's panel.
   - 3.4 Remove the two screws on the sides of the driver's panel.

CAUTION

When removing the ICU, the wiring harness may have to be loosened before the driver's panel can be pulled free of the dash. Do not forcibly pull the driver's panel from the dash. This may disconnect wires from the harness electrical connectors on the back of the ICU housing and damage them.

4. Pull the old ICU away from the dash.
   - 4.1 From behind the ICU housing, disconnect the two electrical connectors on the left-hand side.

   IMPORTANT: Bleed off all air before trying to remove the air hoses.

4.2 Disconnect all air hoses. Using a paint pen, mark the hoses for ease of installation.

5. Remove the old ICU from the dash. See **Fig. 4**.

5.1 Remove the three screws and speed nuts that attach the dash panel trimtop to the old ICU.

5.2 Install the dash panel trimtop on the new level II ICU (ICU2L).

6. Install the level II ICU on the dash.

6.1 Connect the air hoses to the air gauges as marked on removal.

6.2 Connect the two electrical connectors, as removed.

6.3 Place the new level II ICU in the dash and install the fasteners. Be sure to install the fasteners that attach the dash panel trimtop to the upper dash assembly and lower dash panel.

IMPORTANT: A typical warning and indicator light layout is shown in **Fig. 5**.

7. Install the dash message center. See **Fig. 4**.

7.1 Remove the bezel from the dash message center on the new level II ICU.

⚠ CAUTION

Be careful not to scratch the new bezel when replacing the lightbar legends. Scratches on the inside of the bezel are visible from the front.

7.2 Take the bezel from the old level II ICU and, using fingers, tweezers, or a small pair of needlenose pliers, gently remove any of the optional plastic legends in-

Level II Instrumentation Control Unit Replacement

Fig. 4, ICU Housing

stalled in the bezel. Install these in the new bezel, being careful not to scratch it.

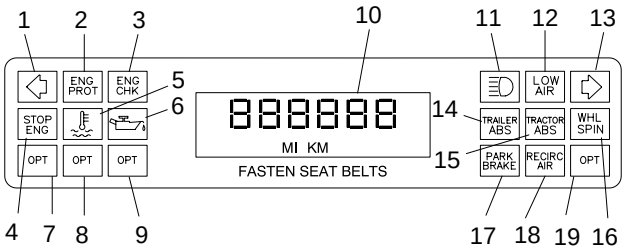
7.3 Snap the bezel into place.

8. Check the gauge layout of the new unit and compare it to the old unit.

IMPORTANT: If any positions are different, replace the gauge for that position with the correct gauge from the old unit. For gauge replacement procedures, see **Section 54.03, Subject 110**.

9. Turn on the ignition and test the operation of the new level II ICU. All the electronic gauges (except the voltmeter) should make one complete sweep and return to their normal indicating positions; the warning and indicator lights should turn on, then off.

Level II Instrumentation Control Unit Replacement



NOTE: Typical installation shown. Location and function of optional lights may vary.

1. Left Turn Indicator
2. Engine Protection Warning & Indicator
3. Check Engine Indicator
4. Stop Engine Warning (Cummins engine only)
5. High Coolant Temperature Warning (optional)
6. Low Oil Pressure Warning (optional)
7. Optional Indicator 3
8. Optional Indicator 2
9. Optional Indicator 1
10. Dash Driver Display Screen
11. High Beam Indicator
12. Low Air Warning
13. Right Turn Indicator
14. Trailer ABS Warning (optional)
15. Tractor ABS Warning
16. Wheel Spin Warning
17. Park Brake On Indicator
18. Recirc Air Warning (optional)
19. Optional Indicator 4

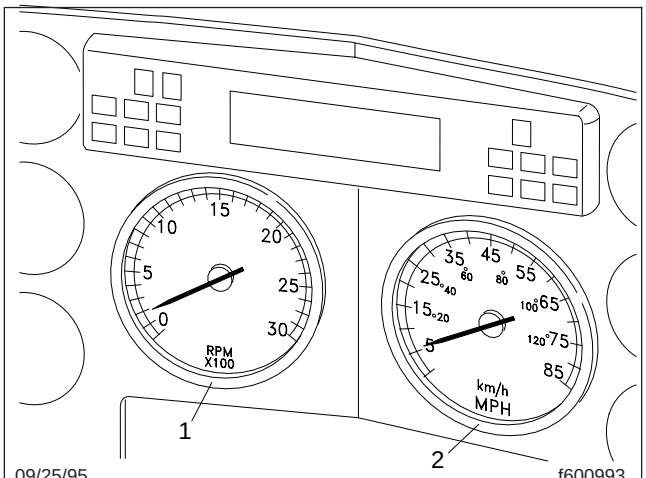
Fig. 5, Dash Message Center, Level II ICU (ICU2L)

If any gauges are not working properly, they will need to be serviced or replaced.

NOTE: Mechanical (air) gauges do not make a sweep.

Level II ICU (Without Gauges)

1. Remove the left-hand dash panels. For instructions, see **Section 60.08, Subject 100**.
2. Remove the fasteners from the driver's instrument panel and dash panel trimtop. See **Fig. 2**. Fasteners used on the level II ICU (ICU2L) are T25 Torx dog-point screws. See **Fig. 3**.
   - 2.1 Remove the bezel from the dash message center, to expose the two screws underneath it. Remove these two screws.
   - 2.2 Remove the four screws on the bottom of the driver's panel.
   - 2.3 Remove the two screws on the sides of the driver's panel.
3. Note the gauge layout for later installation and remove all the gauges. For instructions, see **Section 54.03, Subject 110**. Set aside the gauges for later installation in the new panel.
   - 3.1 Remove the two large-face gauges from the center of the driver's panel. See **Fig. 6**.



1. Tachometer 2. Speedometer

Fig. 6, Driver's Panel Gauge Layout (large-face gauges)

   - 3.2 Remove the small-face gauges (six maximum) from the left-hand side of the driver's panel. See **Fig. 7**.
   - 3.3 Remove the small-face gauges (six maximum) from the right-hand side of the driver's panel. See **Fig. 8**.

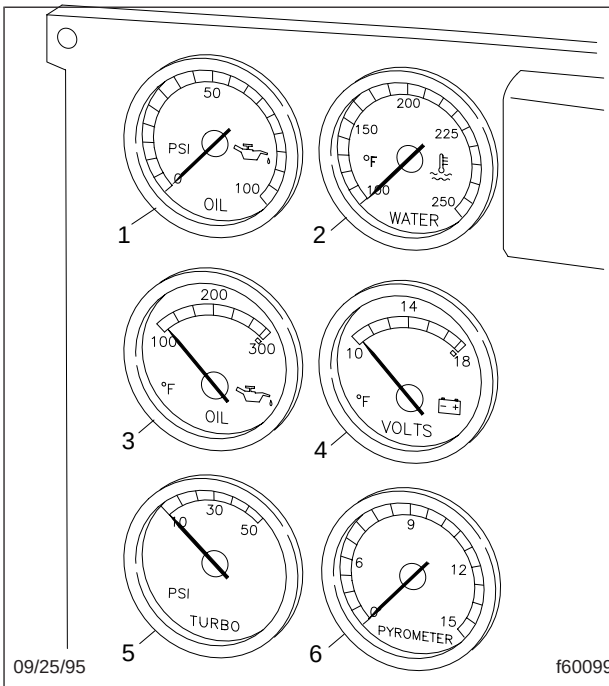
CAUTION

Laying gauges face down for more than one day could allow the oil-dampening fluid to leak out, causing dial movement to become erratic.

4. Pull the old ICU away from the dash.
   - 4.1 From behind the ICU housing, disconnect the two electrical connectors on the left-hand side.

IMPORTANT: Bleed off all air before trying to remove the air hoses.

Level II Instrumentation Control Unit Replacement



NOTE: Gauge layouts may vary. To work properly, gauges must be installed in their correct locations.

1. Oil Pressure Gauge
2. Water Temperature Gauge
3. Oil Temperature Gauge
4. Voltmeter
5. Turbo Air Pressure Gauge
6. Pyrometer

Fig. 7, Driver's Panel Gauge Layout (left-hand side)

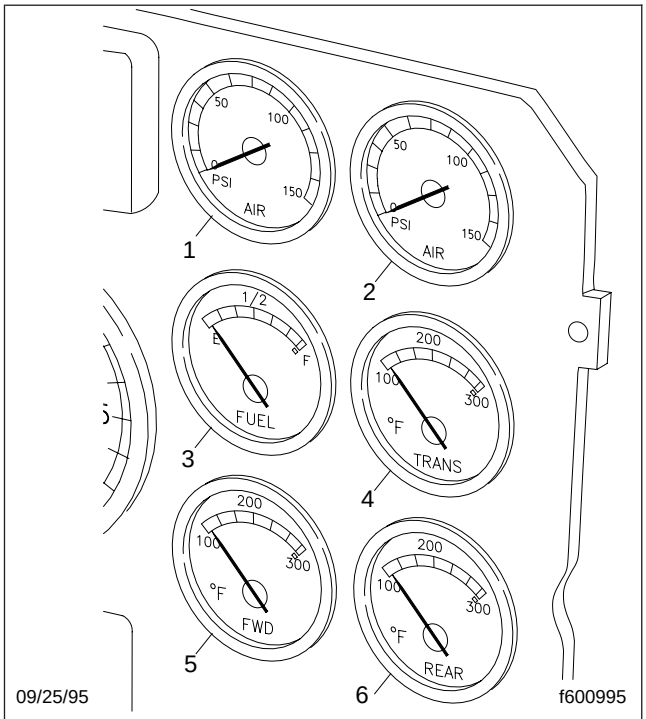
4.2 Disconnect all air hoses. Using a paint pen, mark the hoses for ease of installation.

CAUTION

When removing the old ICU, the wiring harness may have to be loosened before the driver's panel can be pulled free of the dash. Do not forcibly pull the driver's panel from the dash. This may disconnect wires from the harness electrical connectors on the back of the ICU housing and damage them.

5. Remove the old ICU from the dash. See **Fig. 4**.

5.1 Remove the three screws and speed nuts that attach the dash panel trimtop to the old ICU.



NOTE: Gauge layouts may vary. To work properly, gauges must be installed in their correct locations.

1. Primary Air Pressure Gauge
2. Secondary Air Pressure Gauge
3. Fuel Gauge
4. Transmission Fluid Temperature Gauge
5. Forward Axle Temperature Gauge
6. Rear Axle Temperature Gauge

Fig. 8, Driver's Panel Gauge Layout (right-hand side)

5.2 Install the dash panel trimtop on the new level II ICU (ICU2L).

6. Install a new level II ICU in the dash.

6.1 Install all the fasteners as removed, including the fasteners that attach the dash panel trimtop to the upper dash assembly and lower dash panel.

6.2 Connect the two electrical connectors, as removed.

6.3 Install all gauges in the positions from which they were removed. Insert each gauge into its correct hole and twist clockwise about 1/8 turn, until seated.

Level II Instrumentation Control Unit Replacement

7. Snap the dash message center bezel into place, using the four small tabs on the sides of the bezel.
8. Turn on the ignition and test the operation of the gauges. All the electronic gauges (except the voltmeter) should make one complete sweep and return to their normal indicating positions; the warning and indicator lights should turn on, then off.

NOTE: Mechanical (air) gauges do not make a sweep.

IMPORTANT: The level II ICU is also known (on ServiceLink) as the ICU2L.

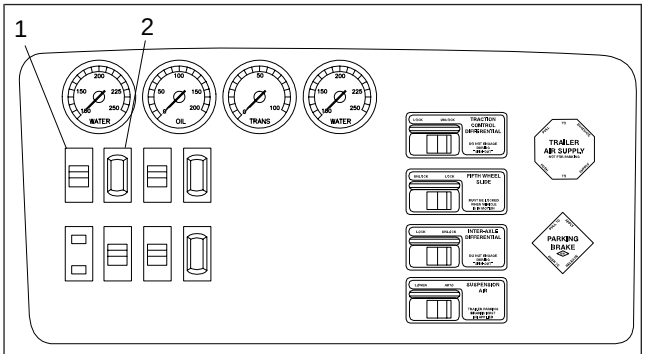
Changing

Using the Cruise Control Switches

The odometer can display the distance the vehicle has traveled in either miles or kilometers. The choice of units is selectable using the cruise control switches.

To change the display, do the following steps.

1. Shut down the engine and set the parking brake.
2. Turn the ignition keyswitch ON.
3. Turn the cruise control on (cruise control on/off switch). See **Fig. 1**.



07/29/98 f541126

To switch from miles to kilometers, turn the cruise control on. Then press and hold down the set switch until the "MI" display starts to blink.

1. On/Off Switch
2. Set Switch

Fig. 1, Cruise Control Switches

4. With the cruise control on, press and hold down the cruise control set switch until the odometer display begins to blink. After about 5 seconds, the "MI" display at the bottom of the screen will change to "KM" (or "KM" will change to "MI," depending on what units were previously set). See **Fig. 2**.

Fig. 2, Dash Message Center, Level II ICU

Switching From Miles to Kilometers on Vehicles With Cummins Engines

On vehicles equipped with the ICU2L and a Cummins engine, perform the following procedure to change the odometer units from miles to kilometers or from kilometers to miles.

1. Shut down the engine and set the parking brake.
2. Remove the circuit breakers for the engine ECU from the main power distribution module.
3. Connect the vehicle to ServiceLink.
4. Turn the ignition key to the ON position.
5. Start ServiceLink.

NOTE: It is okay for the ICU2L to display the message NODATA at this time.

Level II Instrumentation Control Unit Display Changing

6. Click the "Admin" tab. Click the "Downloads" button. Download the ODOCON.exe application. Locate and double click the ODOCON.exe file to launch the application.
7. Specify the communication adaptor to be used and click Start to convert the odometer units. The application will display results of the conversion in the status box.
8. Click the "Exit" button to exit the application.
9. Verify that the odometer units have changed from MI to KM, or KM to MI.
10. Turn the ignition key to the OFF position.
11. Disconnect the ServiceLink PC from the vehicle datalink.
12. Install the circuit breakers for the engine ECU.

Troubleshooting

The instrumentation control unit (ICU) receives messages and faults transmitted by other ECUs on the J1587 datalink.

NOTE: There are also some warnings that are controlled by sensor inputs to the ICU.

The ICU presents warning information via lamps in the panel. Active fault codes are abbreviated in the driver display.

Ignition Sequence

When the ignition switch is turned ON, the ICU performs an ignition sequence. The electronically driven gauges sweep from zero to full scale and then back to zero. The parking brake, low air pressure, high coolant temperature, and low oil pressure warning/indicator lights also activate for approximately three seconds.

NOTE: The battery voltage, primary air, and secondary air gauges are not electronically driven and do not sweep.

System Fault Analysis

The ICU indicates active fault codes by displaying a three-letter code, which is an abbreviation for the system with the fault.

For lists of MIDs, PIDs, SIDs, and FMIs, see **Section 54.03, Specifications 400**. For more information on these code groups and how to read them, see "Fault Codes" in this subject.

To correct an active fault, see the following sources:

- Engine ECM (MID 128)—use the engine manufacturer's literature.
- ABS ECU (MID 136)—see **Section 42.08, Subject 300** or use the antilock brake system manufacturer's literature.
- ICU (MID 140)—see this section.
- DLU (MID 179)—see **Section 54.06**.
- ACPU (MID 190)—see **Section 83.02, Subject 300**.

IMPORTANT: To begin troubleshooting active fault codes, do not turn the ignition switch OFF and then ON. It is not uncommon for a fault to disappear when ignition power is removed, only to return again when the vehicle has left the shop.

1. Correct the active fault.
2. To verify that the problem is corrected and that the fault code is no longer displayed as active, turn the ignition switch OFF and then ON.
3. Start the vehicle.

NOTE: In some cases, it may be necessary to drive the vehicle to confirm that a fault has been repaired.

Datalink Activity

1. If the alert message "NO DATA" is displayed, check the J1587 datalink wiring (twisted pairs).
2. Verify that all ECUs are connected.
3. Verify that the ECU J1587+ is connected to the datalink J1587+ and that ECU J1587– is connected to datalink J1587–.

Gauges

NOTE: The procedures under the "Gauges" heading apply only to electronic gauges; the air gauges and voltmeter do not sweep.

Gauge Does Not Sweep

If a particular gauge does not sweep during the ignition sequence, there is a problem either with the gauge or the ICU.

1. Turn the gauge counterclockwise and remove it from the ICU housing.
2. Install a gauge known to be good and repeat the ignition sequence.
3. If the test gauge sweeps full scale and back to zero, replace the original gauge with a new one. For replacement instructions, see **Section 54.03, Subject 110**.
4. If the test gauge does not sweep, replace the ICU. For replacement instructions, see **Subject 100** in this section.

NOTE: If the ICU has failed, replace the complete ICU housing. Remove all gauges, the

message center bezel, and the wood grain panel. Install these parts in the new ICU housing.

Gauge Does Sweep

If a gauge malfunctions but sweeps during the ignition sequence, the ICU is not at fault.

1. Check the circuits that supply input signals to the ICU.
2. Check the engine ECM programming.

NOTE: Use the technician diagnostic routine (TDR), provided with ServicePro, to help determine the cause of the problem.

Warning/Indicator Lights

Light Does Not Illuminate

The parking brake, low air pressure, high coolant temperature, and low oil pressure warning/indicator lights should illuminate during the ignition sequence.

IMPORTANT: The following lights do not illuminate during the ignition sequence:

A. ENG PROT indicator light input WL002

B. CHK ENG indicator light input WL003

C. STOP ENG indicator light input WL007 (used on Cummins engines only)

D. TRAC ABS indicator light input WL011

If a warning/indicator light other than those listed above does not illuminate during the ignition sequence, either the light bulb is bad or the ICU is malfunctioning. Replace the light bulb with a test bulb known to be good and repeat the ignition sequence.

1. Remove the message center bezel and replace the bulb with a test bulb. Use the bulb replacement tool provided.
2. If the test bulb lights, replace the original bulb with a new one. For replacement instructions, see **Section 54.03, Subject 120**.

   If the test bulb does not light, replace the ICU. For replacement instructions, see **Subject 100** in this section.

Light Illuminates

If a warning/indicator light malfunctions but illuminates during the ignition sequence, the ICU is not at fault.

Check the circuits that supply input signals to the ICU. These lights are activated by either a 12V power input or a ground input.

NOTE: Use the technician diagnostic routine (TDR), provided with ServicePro, to help determine the cause of the problem.

Buzzer

Buzzer Does Not Operate

If the buzzer does not activate during the ignition sequence, either the buzzer or the ICU is malfunctioning. The buzzer is mounted behind the tachometer.

1. Install a buzzer known to be good and repeat the ignition sequence.
2. If the test buzzer functions, replace the original buzzer with a new one. For replacement instructions, see **Section 54.03, Subject 130**.

   If the test buzzer does not function, replace the ICU. For replacement instructions, see **Subject 100** in this section.

Buzzer Does Operate

If the buzzer operates during the ignition sequence but does not work properly for another function, there is a problem with ICU input circuits.

1. Check the circuits that supply input signals to the ICU.
2. Check the ECU programming corresponding to the buzzer function.

Dash Driver Display Screen

Screen Does Not Activate

If the dash driver display screen does not activate during the ignition sequence, either the display screen itself or the ICU is malfunctioning. The dash driver display screen is mounted behind the message center bezel.

1. Install a dash driver display screen known to be good and repeat the ignition sequence.

2. If the test screen functions, replace the original dash driver display screen with a new one. For replacement instructions, see **Section 54.03, Subject 140**.

   If the test screen does not function, replace the ICU. For replacement instructions, see **Subject 100** in this section.

Screen Does Activate

If the dash driver display screen operates during the ignition sequence, but the odometer does not display properly, the ICU is faulty.

ICU Small Gauges

The oil pressure, coolant temperature, oil temperature, and turbo air pressure gauges are driven electronically by the ICU using data inputs from the engine ECM. The ICU receives digital data from the engine ECM via the J1587 datalink.

1. To determine whether the fault lies in the ICU or the gauge input circuits, use the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be elsewhere, use ServiceLink, or the engine manufacturer's diagnostic software tool, and determine if there is an active engine ECM fault code related to the problem.
3. If an active fault code is displayed, follow the engine manufacturer's instructions to correct the problem.

   If no active fault code is displayed, check the datalink connection from the engine ECM to the ICU.
4. Check the datalink for cross-wired connections from all ECUs.

Voltmeter

The voltmeter is driven by the voltage input to the ICU. The voltmeter should function with the ignition switch in the ON position.

1. Replace a problem gauge with a test gauge known to be good and turn the ignition ON.
2. If the test gauge indicates 11 to 14V, replace the original gauge with a new one.

   If the test gauge indicates lower than 11V or higher than 14V, check input voltages to the ICU as follows:

   2.1 Check the 12V battery circuit: pin D14 and wire 437.

   2.2 Check the 12V ignition circuit: pin D15 and wire 437A.

   2.3 Check the ground circuit: pin D13 and wire GND1.
3. Troubleshoot and repair any of the above circuits that shows a malfunction.

   If all the circuits above are functioning, replace the ICU. For replacement instructions, see **Subject 100**.

Pyrometer

The pyrometer is electronically driven by the ICU. The pyrometer input circuit to the ICU contains a thermocouple mounted on the turbocharger exhaust port and a thermocouple amplifier module (TAM). The thermocouple senses the exhaust temperature and sends a small voltage signal to the TAM. The TAM amplifies this voltage signal by a factor of 100 (typically 0 to 8 VDC) and sends it on to the ICU. The ICU receives the analog voltage signal from the TAM and converts it to the digital signal that drives the pyrometer.

1. To determine whether the fault lies in the ICU or the gauge input circuits, use the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be in the gauge input circuits, check for 12 VDC of ignition power at the vehicle side connector to the TAM (circuit 218). The TAM is located just above the right-hand wheel well. Repair a malfunctioning circuit if necessary.
3. Warm up the engine fully so that the thermocouple reaches operating temperature. Then shut down the engine and turn the ignition back on.

NOTE: Do not measure voltage using chassis ground as a reference.

4. Check the voltage output signal of the TAM.

Example: 300°F (150°C) = 5.14 VDC (acceptable); 480°F (250°C) = 9.16 VDC (unacceptable).

NOTE: To measure TAM output voltage, gain access to the circuits at the right-hand wheel well or at the ICU connector pin C6 (218A+) and pin D6 (218A–).

4.1 Check between circuits 218A+ (positive lead) and 218A– (negative lead). Voltage should be 4 to 8 VDC, depending on temperature.

4.2 If this measurement is not within the tolerances, then either the TAM or the thermocouple is malfunctioning.

NOTE: The TAM's output should be 100 times greater than the thermocouple output (TAM output = 5.14 VDC, thermocouple output = 0.0514 VDC).

NOTE: Do not measure voltage using chassis ground as a reference.

5. Check the voltage output signal of the thermocouple.

   Example: 300°F (150°C) = 0.0514 VDC (acceptable); 480°F (250°C) = 0.0916 VDC (unacceptable).

   NOTE: To measure thermocouple output voltage, gain access to the circuits at the right-hand wheel well.

   5.1 Check the voltage between circuits. The voltage should be between 0.04 and 0.08 VDC.

   5.2 If this measurement is out of tolerance, the thermocouple is malfunctioning. Replace a malfunctioning thermocouple as required.

   If this measurement is within tolerance, but the measurement in the previous step was out of tolerance, the TAM is malfunctioning. Replace a malfunctioning TAM as required.

6. Check the circuits from the TAM to the ICU.

   6.1 Check for continuity between circuit 218A+ and ICU left-hand connector pin C6.

   6.2 Check for continuity between circuit 218A– and pin D6.

   6.3 Repair a malfunctioning circuit if necessary.

Transmission Temperature Gauge

The transmission temperature gauge is electronically driven by the ICU. The ICU input circuit contains a temperature sensor (thermistor) mounted in the transmission housing. The sensor causes a voltage drop across its leads corresponding to the transmission temperature. The ICU measures the voltage drop and converts it to a digital signal, which drives the electronic transmission temperature gauge.

1. To determine whether the fault lies in the ICU or the gauge input circuits, use the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be in the gauge input circuits, check the resistance of the temperature sensor at the transmission. The resistance between the two sensor pins is typically 5250 ohms to 172 ohms. Replace the sensor if necessary.

   Examples: 32°F (0°C) = 5250 ohms; 77°F (25°C) = 5000 ohms.
3. Check the continuity of the sensor-to-ICU circuits on the ICU connector. Repair a malfunctioning circuit if necessary.

   3.1 Check for continuity between wire 30 and pin C12.

   3.2 Check for continuity between wire 30G and pin C13.

Drive Axle Temperature Gauges

The temperature gauges for the forward-rear and rearmost drive axles are electronically driven by the ICU. The input circuits to the ICU contain temperature sensors (thermistors) mounted in the drive axle housings. The sensor causes a voltage drop across its leads corresponding to the axle temperature. The ICU measures the voltage drop and converts it to a digital signal, which drives the electronic gauges.

1. To determine whether the fault lies in the ICU or the gauge input circuits, use the "Gauges" procedure above.

2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be in the gauge input circuits, check the resistance of the rear axle temperature sensors. The resistance between the two sensor pins is typically 5250 ohms to 172 ohms. Replace the sensor if necessary.

   Examples: 32°F (0°C) = 5250 ohms; 77°F (25°C) = 5000 ohms.

3. Check the continuity of the circuits from the forward-rear drive axle sensors to the ICU connector. Repair a malfunctioning circuit if necessary.

   3.1 Check for continuity between wire 42 and pin A10.

   3.2 Check for continuity between wire 42G and pin A11.

4. Check the continuity of the circuits from the rearmost drive axle sensors to the ICU connector. Repair a malfunctioning circuit if necessary.

   4.1 Check for continuity between wire 43 and pin B2.

   4.2 Check for continuity between wire 43G and pin B4.

Fuel Level Gauge Diagnosis

The fuel level gauge is controlled by the ICU using a variable resistance input from the fuel level sending unit that is located in the fuel tank. The fuel level sending unit resistance varies linearly from 31±2Ω with a full tank to 247±3Ω when empty.

If the ICU3 is measuring a resistance greater than 284Ω between circuit 47 and ground, a fault will be set for fuel level circuit open. If the ICU3 is measuring less than 23.5Ω between circuit 47 and ground, a fault will be set for fuel level circuit shorted low. ServiceLink may be used to monitor for these faults. The gauge will read empty until the measurement from the sensor is between 284Ω and 23.5Ω. Refer to **Table 1** for the fuel level diagnostic procedure.

NOTE: If the fuel level sensor is below the minimum resistance (short to ground) or above the maximum (open), the fuel gauge will read empty. Shorting the fuel sensor wires will not drive the gauge to full scale.

Fuel Level Gauge Diagnosis

Step	Test Procedure	Test Result	Action
1	If a 100 ohm resistor is available, disconnect the fuel level sender connector and place the resistor across circuit 47 and ground in the wiring harness connector to simulate the fuel level sending unit. Turn the ignition to the ON position and observe the fuel gauge. If, after gauge initialization, the gauge points very closely to the half tank mark, then the wiring and ICU are all operating correctly. Jump to Step 4 if there is no problem with the wiring and ICU. Does the fuel level gauge stay at empty even though there is fuel in the tank or is the complaint an inaccurate and intermittent reading? Note - turn the ignition to OFF and disconnect the batteries before continuing.	Stays at Empty	Go to Step 2.
		Inaccurate or Intermittent	Go to Step 4.

Troubleshooting

Fuel Level Gauge Diagnosis			
Step	**Test Procedure**	**Test Result**	**Action**
2	Disconnect the connector at the fuel level sender and measure the resistance of the sender. What is the resistance of the sender?	Greater than 284Ω or Less than 23.5Ω	Go to Step 4.
		Between 284Ω and 23.5Ω	Go to Step 3.
3	Connect the fuel level sender and disconnect the connectors on the back of the ICU. Measure the resistance in the vehicle wiring between circuit 47 in connector pin D1 and the ground circuit in connector pin D2. What is the resistance of the circuit?	Greater than 284Ω	Troubleshoot and repair an open circuit on either circuit 47 or the ground between the ICU connector and the fuel level sender.
		Between 284Ω and 23.5Ω	This is the valid resistance range. If the fuel tank is full and the resistance is close to 31Ω, replace the ICU. Otherwise no problem is indicated.
		Less than 23.5Ω	Troubleshoot and repair a short to ground on circuit 47 between the ICU connector and the fuel level sender.
4	Remove the fuel sending unit from the fuel tank. Connect an ohm meter to the pins at the fuel level sender connector. Slowly move the level of the float arm from full to empty. See **Fig. 1**. Does the resistance vary linearly from 31±2Ω to 247±3Ω?	Yes	Troubleshoot and repair for corrosion or an intermittent connection in the circuitry between the ICU and the fuel level sender.
		No	Replace the fuel level sending unit.

Table 1, Fuel Level Gauge Diagnosis

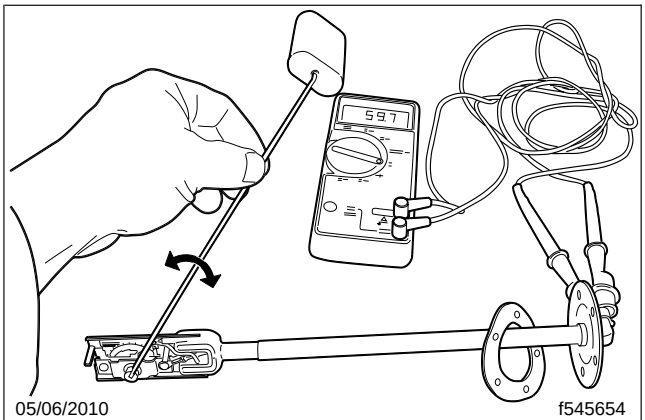

Fig. 1, Testing the Fuel Level Sending Unit

Fault Codes

The ICU displays fault codes received over the J1587/J1708 serial data network. The ICU will also indicate faults with the network. Use the trouble-shooting information in the appropriate section of the workshop manual for the system indicating a fault.

Fault Code Screens

Fault code screens provide troubleshooting information in a brief, easy-to-read format.

NOTE: The Level II ICU (ICU2L) is only able to display messages from the following devices:

- MID 128 - Engine
- MID 136 - ABS
- MID 140 - ICU

IMPORTANT: The level II ICU is also known (on ServiceLink) as the ICU2L.

The instrumentation control unit, level II (level II ICU) has only one microprocessor, on the left. The two connectors are pink. Connector #1 has 24 pins, numbered A1 through A12, and B1 through B12. Connector #2 has 32 pins, numbered C1 through C16, and D1 through D16.

See **Fig. 1** for a schematic of the wiring and pinout connections for the level II ICU (ICU2L).

To fully identify fault codes, see **Section 54.03**, Specifications, 400, for a complete list of parameter identifiers (PIDs), sub-system identifiers (SIDs), and failure mode identifiers (FMIs).

General Description

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

⚠ CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables and the CWS Central Processing Unit (CPU) 32-pin connector, ground cable, and antenna cable at the bottom of the CPU. See Subject 170 in this section for instructions. Electric currents produced during electric welding can damage various electronic components on the vehicle.

The Eaton VORAD EVT–200 is a computerized radar collision warning system (CWS) which will alert a driver to objects in front of and to the side of the vehicle. Additional warning time, to prevent potential rear-ending of other vehicles, is provided by alerting the driver to stationary or slow moving objects in front of the vehicle or to objects toward which your vehicle is creeping. The system provides three levels of alerts to indicate the interval to a vehicle ahead travelling at normal speeds. An optional right-side sensor detects objects alongside the vehicle, where they cannot be seen.

The system is able to monitor and maintain data on up to 20 moving or stationary objects within its range. It provides information in fog, rain, or snow conditions, as well as in darkness. A trip recorder option monitors and records the time spent at specific following intervals, driver times, maximum speeds, time spent at various speeds, engine idle time, and average speed. The accident reconstruction option will store two ten minute segments of information on a driver's card and can assist in reconstructing events leading up to an accident. The driver's card can also be programmed as a personal electronic ID card with the driver's name and employee number.

Components consist of one or two in-cab display units, the front mounted antenna assembly, side sensor(s), turn sensor assembly, the central processing unit (CPU), the antenna cable, antenna mounting plate, and associated wiring harnesses.

⚠ WARNING

The collision warning system is intended only as an aid to an alert and conscientious driver. The system may provide little or no warning of pedestrians or animals on the road, head-on collisions, or cross traffic at intersections. Do not rely solely on the system to operate the vehicle; always use the system with the rearview mirrors and other instrumentation. The system will not warn of many possible hazards, is not a substitute for safe driving procedures, and will not compensate for driver impairment. Failure to drive safely and use the system properly could result in personal injury and property damage.

Principles of Operation

The forward-looking CWS operates by transmitting and receiving low power, high frequency, radar (microwave) signals between the vehicle and objects in front of it. These signals determine changes in distance and speed between the vehicle and the object. This information is then used to inform the driver of a potential collision by visual and auditory alerts. To be detected, an object must be within the field of view of the antenna's radar beam. It must also provide a surface that can reflect the radar beam back to the antenna assembly. The side sensor(s) (motion detector) detects objects alongside the vehicle.

The antenna assembly compares the frequencies between the transmitted and received signals. It converts the information to a digital format and outputs it to the CPU for processing. The CPU in turn sends signals to activate the appropriate lights and alarms. The antenna is mounted to aim directly in front of the host vehicle. It has a range of up to 350 feet (107 meters) for moving objects and 220 feet (67 meters) for stationary and slow moving objects.

The side sensor range is set to detect vehicles in the adjacent lane. It also provides information to the CPU for processing.

The turn sensor assembly consists of a magnet, mounted to the steering shaft, which rotates past a sensor, mounted in a fixed position on the steering column. At two to four degrees of steering wheel rotation, the magnet will rotate past the sensor and in-

General Information

dicate to the CPU that a turn is being made. Because the antenna may see objects alongside the road when the vehicle is turning, audible alerts are cancelled by the CPU when the turn sensor indicates a turn in progress.

The CPU processes the information it receives from the antenna assembly, J1587 (vehicle speed), side sensor(s), turn sensor assembly, brake circuit, and turn signal circuit. It sends signals to the driver display unit and side sensor display to illuminate lights and signals the driver display unit to sound alerts over the speaker.

The driver display unit (DDU), if so configured, controls power to the system, speaker volume, and the range threshold of alerts to objects in the road. It also controls the storage of the first ten minute segment of accident reconstruction data onto the driver's card.

The side sensor display (SSD) contains red and yellow alert lights, indicating if an object is detected or not. The red light indicates a detected object. The yellow light indicates no object detected. Both the side sensor display and the driver display unit have a light intensity adjusting light sensor.

Replacement

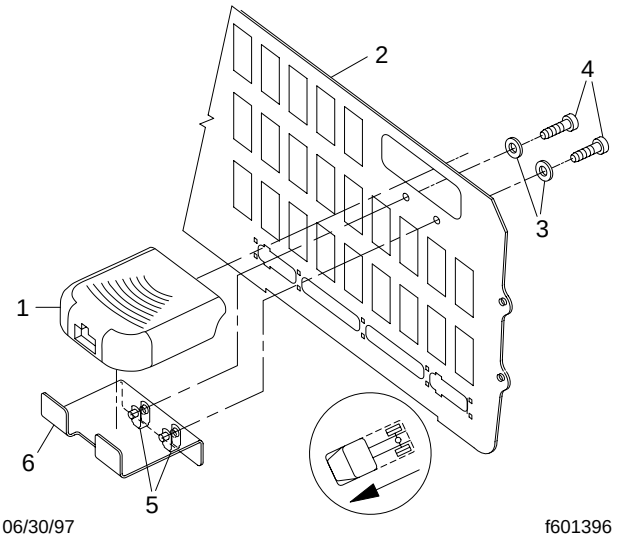
IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: Removal of the driver display unit requires gaining access to the inside of the auxiliary instrument panel. See **Group 60** of the vehicle workshop manual for specific procedures for removal and installation of the dash panels. See **Subject 190** in this section for DDU test procedures.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Remove the instrument center-panel trim, the HVAC/radio trimplate, and the right-hand dash trimcap.
3. Remove the four Torx®-head screws securing the auxiliary instrument panel to the dash assembly.
4. Gain access to the rear (forward side) of the auxiliary panel by pulling the panel toward you.
5. Remove the two Torx-head screws which attach the driver display unit mounting bracket to the auxiliary panel. See **Fig. 1** .
6. Withdraw the display unit, with its mounting bracket attached, and disconnect the electrical harness.

NOTE: If replacing the display unit or the bracket, carefully separate the unit from the bracket. It is attached with a two-sided adhesive. Remove all of the old adhesive. Install new adhesive and attach the display unit to the bracket.

7. To install the DDU, connect the electrical harness to the display unit.
8. Place the display unit, with bracket attached, behind the auxiliary panel and insert it into the panel.
9. Install and tighten the two bracket mounting Torx-head screws.



1. Driver Display Unit (DDU)
2. Auxiliary Panel (seen from the rear)
3. Washer
4. Torx-Head Screw
5. J-Clip
6. DDU Mounting Bracket

Fig. 1, Driver Display Unit (DDU)

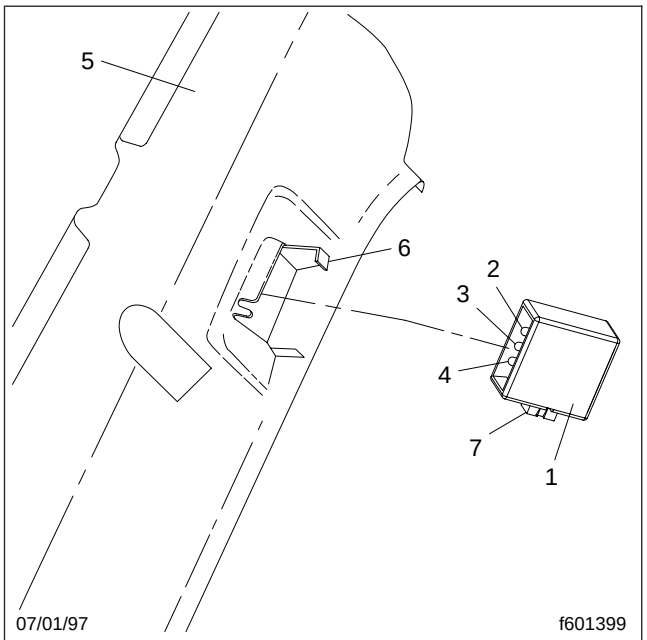
10. Carefully push the auxiliary panel into position, against the dashboard assembly.
11. Install and tighten the four panel Torx-head screws.
12. Install the right-hand trimcap, the HVAC/radio trimplate, and the instrument center-panel trim.
13. Remove the chocks from the tires and connect the batteries.

Replacement

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: See **Subject 190** in this section for Side Sensor Display test procedures.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Remove the two Torx®-head screws securing the passenger grab handle to the passenger side A-pillar. Remove the handle.
3. Pull the door trim edging back to expose the edge of the inner A-pillar trim cover. Remove the cover. See **Fig. 1** .
4. Release the plastic retaining clip securing the side sensor display to the A-pillar cover. Remove the display.
5. Disconnect the electrical harness from the display.
6. To install the SSD, connect the harness to the display.
7. Insert the display into the A-pillar cover and ensure it is secured with the plastic retaining clip.
8. Put the A-pillar cover in position on the A-pillar.
9. Press the door trim edging into place.
10. Place the grab handle in position. Install and securely tighten the mounting screws.
11. Remove the chocks from the tires and connect the batteries.



1. Side Sensor Display (SSD)
2. Red Alert Light (vehicle detected)
3. Light Sensor
4. Yellow Alert Light (no vehicle detected)
5. Inner A-Pillar Trim Cover
6. SSD Retaining Clip
7. Electrical Harness Connector

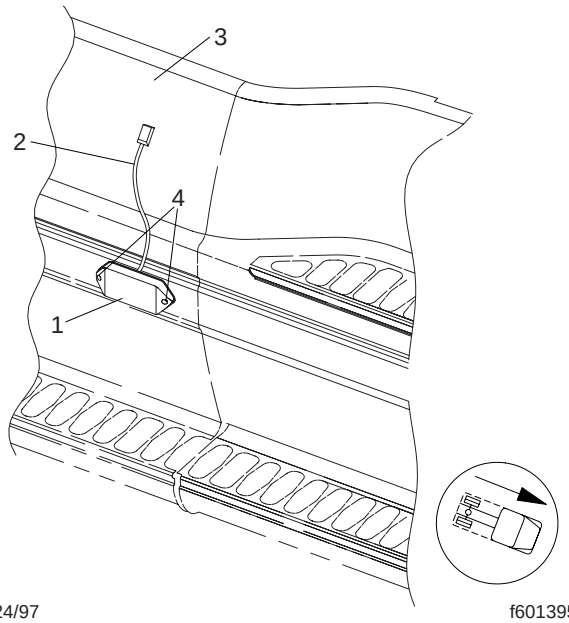
Replacement

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: See **Subject 190** in this section for Side Sensor test procedures.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Remove the two Torx®-head screws and nuts securing the side sensor to the center air-fairing panel. See **Fig. 1** .



1. Side Sensor
2. Side Sensor Harness
3. Center Air-Fairing Panel
4. Torx-Head Mounting Screw

Fig. 1, Side Sensor

3. Pull the sensor and gasket away from the panel.
4. Reach through the fuel access door, or up between the side-fairing and fuel tank, and locate the sensor harness. Cut any tie straps securing the sensor harness and pull the mated connectors out through the sensor mounting hole and disconnect them.
5. To install the sensor, place the gasket behind the sensor, locate the two side sensor harness connector ends, and join them together.
6. From the outside, feed the harness through the hole in the fairing panel.
7. Position the sensor gasket against the fairing panel, behind the sensor, and secure the assembly to the fairing panel with the two Torx-head screws and nuts.
8. Reach up between the side-fairing and the fuel tank and make a service loop in the excess side sensor harness. Secure the service loop to the aluminum side-fairing mounting rail with tie straps.
9. Remove the chocks from the tires and connect the batteries.

Replacement

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: See **Subject 190** in this section for Turn Sensor Assembly test procedures (Steering Test), **Subject 180** for Initial Adjustments, and **Subject 200** for On-Road Checks and Final Adjustments.

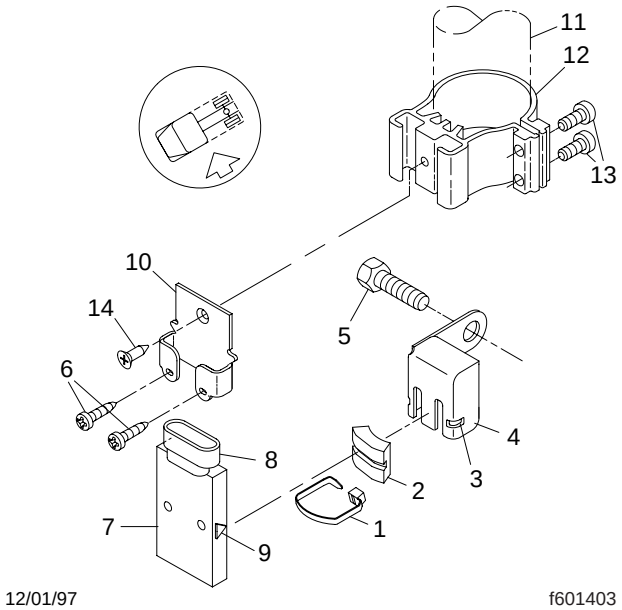
1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.

NOTE: The turn sensor assembly consists of the sensor, the mounting plate, and the sensor mounting collar (attached to the steering column), and the magnet and its bracket, attached to the steering knuckle.

2. Remove the driver's knee bolster at the bottom of the steering column.
3. Remove two mounting nuts and the carpeted cover assembly below the driver's knee bolster.
4. Reach around to the front side of the steering column and disconnect the turn sensor electrical harness from the sensor. See **Fig. 1** .

NOTE: If the sensor mounting collar has not been indexed to the steering column with alignment marks, make alignment marks before moving the collar.

5. Loosen the two Torx®-head screws that secure the sensor mounting collar to the steering column and twist the collar around to gain access to the sensor.
6. Remove the single Phillips-head screw attaching the sensor mounting plate and turn sensor to the sensor mounting collar. Slide the sensor mounting plate and sensor out of the sensor mounting collar.
7. Take note of the position in which the sensor is mounted in the mounting plate and remove the two Phillips-head screws that secure the sensor to the mounting plate. Remove the sensor.



1. Tie Strap
2. Magnet
3. Tie Strap Notch
4. Magnet Bracket
5. Steering Knuckle Pinch Bolt
6. Phillips-Head Screw
7. Turn Sensor
8. Electrical Harness Connector
9. Reference Arrow
10. Sensor Mounting Plate
11. Steering Column
12. Sensor Mounting Collar
13. Torx-Head Screw
14. Phillips-Head Screw

Fig. 1, Turn Sensor Assembly

NOTE: Older versions of the sensor (also used in other applications) may have a spacer plate included with them. An older version will have a stepped area to accommodate the sensor. Do not forget to include the spacer plate when assembling this type. The later type sensor does not have a separate spacer plate. If replacing an older type sensor with a new one, you do not need the spacer plate.

8. Place the new sensor in the mounting plate, in the same position as the old one. Install and tighten the two Phillips-head screws. Then slide the plate with the sensor into the sensor mount-

Turn Sensor Assembly Replacement

ing collar and secure it with the single Phillips-head screw.

9. To remove and replace the sensor mounting collar, remove the two Torx-head screws and expand the collar enough to clear the steering column.

NOTE: If the collar itself is not being replaced with a new one, align the existing collar marks with the existing marks on the steering column. Tighten the Torx-head mounting screws. If the collar is being replaced, ensure that the sensor and magnet are approximately aligned with the front wheels pointing straight ahead. Tighten the mounting screws.

10. To replace the magnet only, cut the tie strap securing it to the bracket.

NOTE: With the wheels pointing straight ahead, access the magnet by turning the steering wheel 180 degrees, in either direction, so that the magnet faces you.

11. Place the new magnet against the bracket, curved side forward, so that the ends fit securely into the bracket slots.
12. Position the magnet firmly at the top of the slots.
13. Secure the magnet to the bracket with a small tie strap. Ensure that the tie strap is retained by the small notches on the sides of the bracket, that it is fully recessed in the slot, and that the knot or block is clear of the magnet face.

IMPORTANT: The steering knuckle pinch bolt and nut must be replaced any time they are removed from the steering knuckle, as when removing or replacing the magnet bracket. Torque the pinch bolt nut to 37 lbf·ft (50 N·m).

NOTE: If the pinch bolt is replaced, secure the magnet bracket while torquing the nut, so that the bracket does not rock or move out of position. Also, the magnet bracket can be mounted in two positions on the steering knuckle. If replacing a bracket, observe the original mounting position and install the new part the same way.

14. Position the sensor mounting collar vertically so that the small arrow on the side of the sensor aligns with the approximate center of the magnet, either above or below the tie strap.

NOTE: Also adjust the collar so that its bottom edge is flush with the bottom edge of the steering column lower bearing housing.

15. Adjust the clearance between the sensor and the magnet by rotating or pivoting the magnet bracket under the pinch bolt. Clearance should be approximately 1/8 inch (3 mm).
16. See **Subject 180** in this section for alignment procedures if the magnet-to-sensor alignment was disturbed.
17. Remove the chocks from the tires and connect the batteries.

Replacement

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: See **Subject 190** in this section for Antenna Assembly test procedures, **Subject 180** for Initial Adjustments, and **Subject 200** for On-Road Checks and Final Adjustments.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Remove the four Torx®-head screws which secure the antenna assembly mounting brackets to the antenna mounting plate. See **Fig. 1** .
3. Pull the antenna assembly forward to gain access to the antenna cable attachment.

NOTE: It may be necessary to cut tie straps or unfasten harness clamps at the front crossmember, where an antenna cable service loop is provided. Gain a sufficient length of cable to pull the antenna assembly forward and access the cable connection.

4. Unscrew the nylon nut and hold it back against the uniboot to gain access to the knurled nut. See **Fig. 2** .
5. Unscrew the knurled nut and carefully withdraw the cable from the antenna.

⚠ CAUTION

There are two keyways forming part of the inner antenna cable plastic connector end, close to the pins. The cable connector will fit into the antenna assembly in one position only. Use caution when inserting the connector so as not to damage the pins.

6. To install the antenna assembly, carefully insert the cable, correctly aligned, while holding back the uniboot, into the antenna assembly and tighten the knurled nut securely.

10. Remove the chocks from the tires and connect the batteries.

Replacement

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Inside the cab, use a flat-bladed screwdriver to turn the two camlock fasteners and open the passenger-side B-pillar door.
3. Cut the tie straps holding the antenna cable to the tie strap anchors on the CPU. See **Fig. 1** .
4. Cut the tie straps securing the cable to the other harnesses in the B-pillar cavity.
5. Slide the antenna cable boot, at the CPU connection, back to expose the knurled nut. See **Fig. 2** .
6. Unscrew the knurled nut and carefully withdraw the cable from the CPU.
7. Remove the three screws securing the passenger-side threshold tread plate and remove the plate.
8. Remove the three screws and the plastic trim cover over the seat belt retractor, below the B-pillar door.
9. Remove the rubber grommet surrounding the antenna cable in the floor, and feed the cable through the floor, out of the cab. See **Fig. 3** .
10. Outside the vehicle, open the passenger-side fuel access door to see the cable routing.
11. Cut the tie straps securing the antenna cable to the side sensor cable. Cut tie straps where the cable is routed up and over the HVAC lines and down to the frame rail.

NOTE: It may be helpful to tilt the hood, for better visibility, before attempting to detach the cable from the other harnesses along the frame rail.

12. Cut the tie straps from the anchor blocks on the frame rail bolts. Release the cable from the other harnesses along the entire length of the antenna cable along the right-hand frame rail, up to the antenna assembly at the front closing crossmember.
13. Remove the antenna assembly from the antenna mounting plate. See **Subject 140** in this section for instructions.
14. Remove the cable from the vehicle.
15. To install the cable, work from underneath the front of the vehicle. Route the antenna connector end of the new cable, with the uniboot, forward, through the air recirculation shield, and through

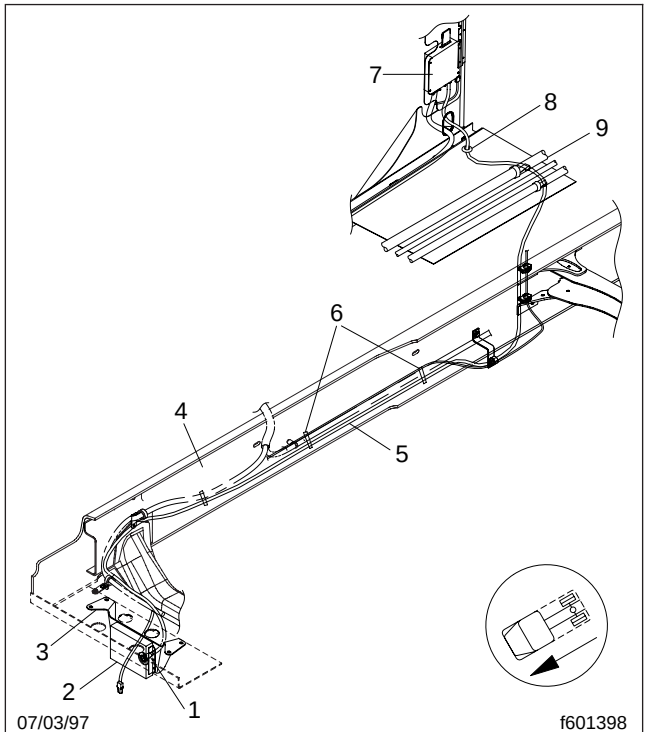
the hole in the mounting plate. Hold the uniboot back and carefully insert the cable, correctly aligned, into the antenna assembly and tighten the knurled nut securely.

⚠ CAUTION

There are two keyways forming part of the inner antenna cable plastic connector end, close to the pins. The cable connector will fit into the antenna assembly in one position only. Use caution when inserting the connector so as not to damage the pins.

16. Ensure that the O-ring is in position on the antenna and securely tighten the nylon nut over it.
17. Install the antenna and securely tighten the four Torx-head screws which attach it to the mounting plate.

NOTE: If the antenna assembly is removed from the mounting plate, even with the mounting brackets left attached, it will be necessary to realign the antenna.



1. Antenna Cable Connector (at antenna)

6. Tie Strap
7. Central Processing Unit (CPU)
8. Rubber Grommet (in cab floor)
9. HVAC Lines

Fig. 3, Antenna Cable Routing

18. At the point where the cable passes through the mounting plate, make a service loop in the cable approximately 12 inches (30 cm) in length. The entire loop will be 24 inches (60 cm). Route and loop the cable to the left, on top of the front closing crossmember. Secure the cable in the looped position with tie straps to the other harnesses running across the crossmember.
19. Next, route the cable to the right, over the front closing crossmember, and then rearward, along the right-side frame rail. Secure the cable to the wire bundles with tie straps along its full length.

20. At the point where the side sensor is located, route the cable under the frame rail, and up and over the HVAC lines.
21. Secure the cable to the HVAC lines and the side sensor harness with tie straps.
22. Pass the cable into the cab, through the hole in the floor by the B-pillar door, and install the rubber grommet in the floor, around the cable.
23. Route the cable through the lower opening in the B-pillar compartment.
24. Carefully insert the cable, correctly aligned, into the CPU and tighten the knurled nut securely.

⚠ CAUTION

There are two keyways forming part of the inner antenna cable plastic connector end, close to the pins. The cable connector will fit into the CPU in one position only. Use caution when inserting the connector so as not to damage the pins.

25. Slide the boot all the way over the knurled nut.

NOTE: Route the antenna cable beneath the 32-pin connector harness attached to the CPU, to cradle and protect the 32-pin connector harness.

26. Install new tie strap anchors on the CPU and secure the cable to the tie strap anchors.
27. Route the remaining excess cable up along the existing harnesses in the compartment. Secure it to the harnesses in a loop, with tie straps.
28. Install the plastic trim cover over the seat belt retractor and install the three screws.
29. Install the threshold trim plate and the three screws.
30. Close the B-pillar door and secure it with the camlock fasteners.
31. Remove the chocks from the tires and connect the batteries. Lower the hood if it was opened previously.

Replacement

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Remove the antenna assembly.

NOTE: See **Subject 140** in this section for instructions on replacement of the antenna assembly.

3. With the antenna assembly removed, withdraw the antenna cable through the hole in the mounting plate.
4. Hold the heads of the four radiator mounting bracket/antenna mounting plate capscrews from above and remove the nuts below the mounting plate. See **Fig. 1**.
5. Remove the mounting plate from the vehicle.
6. To install, place the mounting plate in position with the four capscrews extending through the holes in the radiator bracket/mounting plate.
7. Install the four nuts and torque them to 28 lbf·ft (38 N·m).

NOTE: Push the plate back against the mounting capscrews while tightening the nuts. This ensures that the plate is perpendicular to the vehicle's longitudinal axis.

8. Insert the antenna cable through the mounting plate hole, connect the cable to the antenna, and install the antenna assembly onto the mounting plate.

⚠ CAUTION

There are two keyways forming part of the inner antenna cable plastic connector end, close to the pins. The cable connector will fit into the antenna assembly in one position only. Use caution when inserting the connector so as not to damage the pins.

7. Torx-Head Screw
8. Antenna Assembly
9. Antenna Cable Connector
10. Adjustment Slot (location of 5/32-inch Allen setscrew)

Fig. 1, Antenna Mounting Plate

NOTE: If the antenna assembly is removed from the mounting plate, even with the mounting brackets left attached, it will be necessary to realign the antenna.

9. Remove the chocks from the tires and connect the batteries.

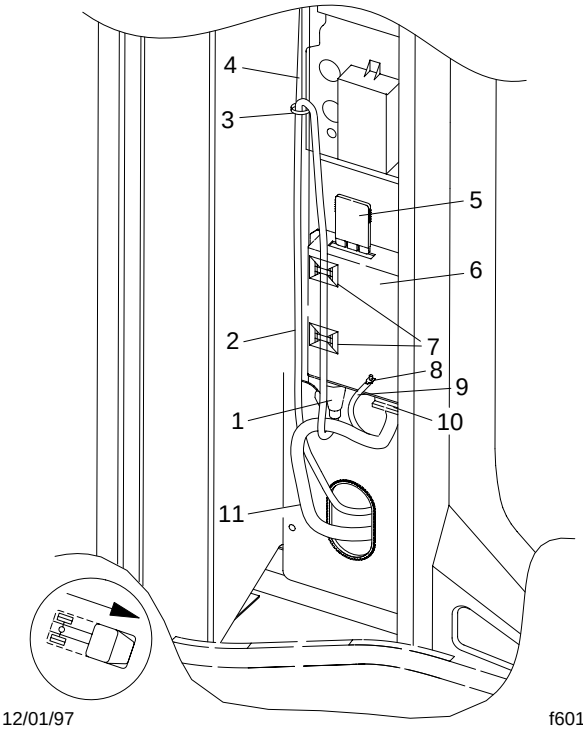
Replacement

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: Before replacing a CPU, confirm that there is a problem. Visually inspect the unit and confirm that all connections, power and grounds, are good. Check for a blown fuse or tripped circuit breaker. Check the condition of the pins in all connectors and cavities. Examine the wiring and look for physical damage to the insulation, corrosion, or the effects of heat. See **Subject 300** in this section for CPU fault codes and troubleshooting procedures.

IMPORTANT: It is necessary, if possible, to view the configuration parameters of the old CPU with ProLink and record them before removing the old CPU from the system.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Inside the cab, remove the B-pillar door vinyl trim cover from the passenger side B-pillar door, by pulling it away from its Velcro fasteners.
3. Turn the two camlock fasteners with a flat-bladed screwdriver and open the B-pillar door.
4. Cut the tie straps securing the antenna cable to the tie strap anchors on the CPU. Cut the tie strap securing the uppermost portion of the cable. See **Fig. 1** .
5. Remove the four Torx®-head screws and locknuts attaching the CPU to the B-pillar door. Remove the CPU from the door. See **Fig. 2** .
6. Disengage the push lock connector and carefully withdraw the 32-pin harness connector from the CPU.
7. At the bottom of the CPU, remove the nut from the ground stud and remove the ground wire from the stud.



1. Antenna Cable Boot
2. Antenna Cable
3. Tie Strap
4. Location of Other Harnesses
5. Driver's Card
6. Central Processing Unit (CPU)
7. Tie Strap Anchor

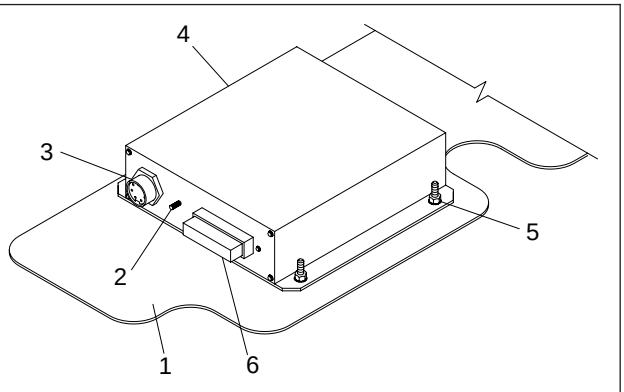
10. 32-Pin Connector
11. 32-Pin Connector Harness

Fig. 1, B-Pillar Cavity

8. Slide back the antenna cable boot, unscrew the knurled nut, and carefully withdraw the cable from the CPU.
9. Remove the driver's card, if present, from the old CPU and insert it into the new CPU.
10. To install, place the new CPU in position against the inside of the B-pillar door.
11. Insert the four Torx-head screws, from the outside of the door, through the CPU mounting holes.
12. Install the four locknuts and tighten them securely.

Central Processing Unit (CPU) Replacement



06/30/97 f601400

1. B-Pillar Door
2. Ground Stud
3. Antenna Cable Connector
4. CPU
5. Torx-Head Screw and Locknut
6. 32-Pin Harness Connector

Fig. 2, Central Processing Unit (CPU)

13. Place the ground wire ring terminal over the ground stud on the bottom of the CPU. Install and tighten the nut securely.

NOTE: Route the antenna cable beneath the 32-pin connector harness, attached to the CPU, to cradle and protect the 32-pin harness.

14. Carefully connect the 32-pin harness connector to the CPU.
15. Carefully insert the antenna cable, correctly aligned, into the CPU and tighten the knurled nut securely.

⚠ CAUTION

There are two keyways forming part of the inner antenna cable plastic connector end, close to the pins. The cable connector will fit into the CPU in one position only. Use caution when inserting the connector so as not to damage the pins.

16. Install new tie strap anchors on the CPU and secure the antenna cable to the anchors with tie straps.
17. Secure the excess length of cable to the other harnesses, near the top of the B-pillar compartment, in a loop, with a tie strap.
18. Close the B-pillar door and secure it by turning the two camlock fasteners.
19. Attach the vinyl trim cover to the B-pillar door with the Velcro fasteners.

NOTE: When replacing a CPU with a new unit, it is necessary to verify the system's configuration using ProLink. Follow the steps below to verify that a new CPU is configured identically to the one it is replacing.

20. Access the ProLink SET UP menu.
21. Ensure that the current parameters of the new CPU are identical to those of the CPU it is replacing.
22. Select BIT CONFIGURATION from the SETUP menu.
23. Ensure that the current parameters of the new CPU are identical to those of the CPU it is replacing.
24. Select FLAGS CONFIGURATION from the SETUP menu.
25. Ensure that the current parameters of the new CPU are identical to those of the CPU it is replacing.
26. After you have ensured that the new CPU is configured identically to the old one, press FUNC to return to the SETUP menu and clear all fault codes.
27. Remove the chocks from the tires and connect the batteries.

General Information

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

The two components requiring initial adjustment, after removal and installation, are the turn sensor assembly and the antenna assembly .

No special tools are required to make the initial adjustments to the turn sensor assembly.

For initial adjustments to the antenna assembly, a good quality digital level is recommended.

NOTE: Perform these initial adjustments when the turn sensor, sensor mounting plate, sensor mounting collar, antenna assembly, antenna assembly mounting brackets, or antenna mounting plate are removed or replaced. Perform the initial adjustments before performing the On Road Checks and Final Adjustments.

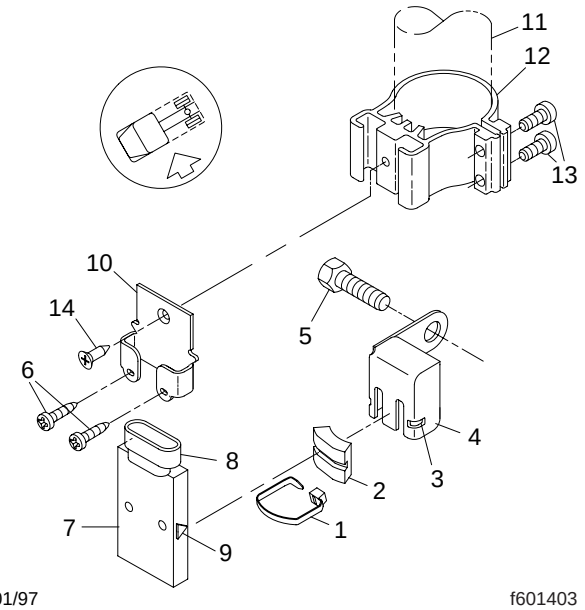
Initial Turn Sensor Assembly Adjustment

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Gain access to the turn sensor assembly. See **Subject 130** in this section for instructions.

IMPORTANT: If the steering knuckle pinch bolt and nut are removed (to remove or replace the magnet bracket), they must be replaced with new parts and the nut torqued to 37 lbf·ft (50 N·m). Be sure to secure the magnet bracket when torquing the nut, to prevent the bracket from rocking or moving out of position.

NOTE: If either the magnet, or magnet bracket (or both) is removed or replaced, no initial adjustments are required. Simply install the components as they were previously mounted. However, ensure that 1/8 inch (3 mm) clearance exists between the sensor and the magnet. If the original sensor mounting collar is being reinstalled, align the marks on the collar with the marks on the steering column. If there are no alignment marks, be sure to make them before removing the collar. See **Subject 130** for turn sensor assembly replacement instructions. If a new sensor, sensor mounting plate, or sensor mounting collar is being installed, follow the steps below.

3. Turn the steering wheel so that the front wheels are pointing straight ahead.
4. Expand the new sensor mounting collar (with sensor attached) and place it around the steering column. See **Fig. 1** .



12/01/97 f601403

8. Electrical Harness Connector
9. Reference Arrow
10. Sensor Mounting Plate
11. Steering Column
12. Sensor Mounting Collar
13. Torx-Head Screw
14. Phillips-Head Screw

Fig. 1, Turn Sensor Assembly

Initial Adjustments

5. Install the Torx®-head screws, but do not tighten them fully.
6. Adjust the collar vertically so that the small arrow on the side of the sensor aligns with the approximate center of the magnet, either above or below the tie strap.

NOTE: Also adjust the collar so that its bottom edge is flush with the bottom edge of the steering column lower bearing housing.

7. Roughly align the sensor and magnet horizontally so that they center upon each other when the front wheels are pointed straight ahead.
8. Securely tighten the sensor mounting collar screws.
9. Remove the chocks from the tires and connect the batteries.

Initial Antenna Assembly Adjustment

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.

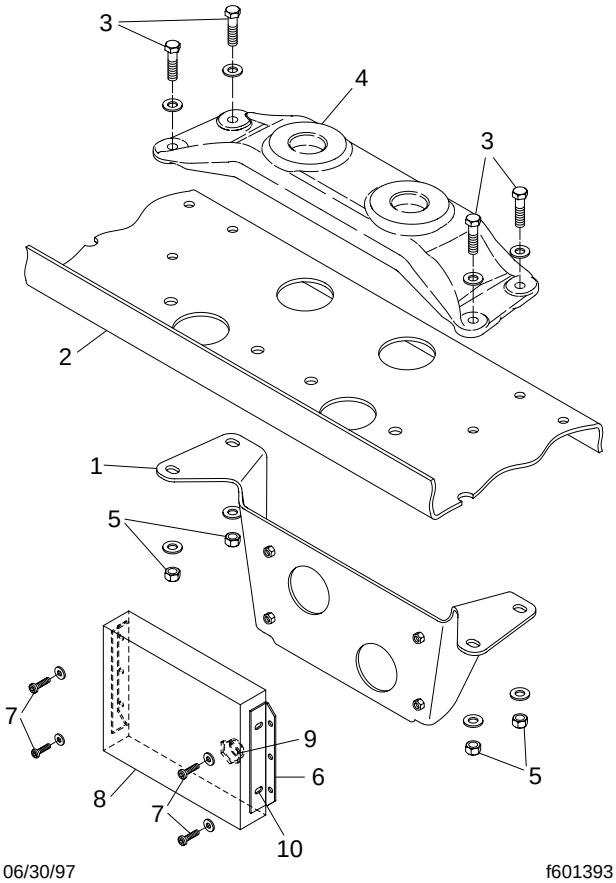
IMPORTANT: The vehicle must be parked on a level surface to properly perform the Initial Antenna Assembly Adjustment procedure.

2. Place the digital level on the frame rail, behind the cab. The vehicle as well as the ground surface needs to be approximately level.

NOTE: Take note of the angle of the vehicle and/or ground surface. You must compensate for any deviation from absolute level.

3. Loosen the four adjusting setscrews (two on each antenna mounting bracket) with a 5/32-inch Allen wrench. See **Fig. 2** .
4. Push the antenna assembly all the way back in the mounting bracket adjustment slots, so that the antenna is flush with the antenna mounting plate, and only snug the setscrews.

NOTE: Push the antenna assembly back, flush with the antenna mounting plate, to accomplish the initial antenna assembly left-to-right adjustment. This adjustment is also dependent upon the proper installation of the mounting plate.



1. Antenna Mounting Plate
2. Front Closing Crossmember
3. Radiator Mounting Bracket/Antenna Mounting Plate Capscrew
4. Radiator Mounting Bracket
5. Nut
6. Antenna Assembly Mounting Bracket
7. Torx-Head Screw
8. Antenna Assembly
9. Antenna Cable Connector
10. Adjustment Slot (location of 5/32-inch Allen setscrew)

Fig. 2, Antenna Assembly

When installing the mounting plate, be sure to push the mounting plate back and hold it against the four mounting plate capscrews as the nuts are being tightened.

5. Place the digital level vertically against the face of the antenna. The initial vertical antenna setting

is one degree down. Look for a reading of 89 degrees (or 91 degrees), depending on level readout.

NOTE: If the vehicle is angled down because it is parked on an unlevel surface, add the number of degrees off from level to the one degree down. If the vehicle is angled up, subtract the number of degrees off from level to the one degree down. For example, if the vehicle is angled down 2.7 degrees the antenna angle must be 3.7 degrees down which will produce a reading of 86.3 degrees (or 93.7 degrees), depending on level readout.

6. Adjust the antenna out from either the top or bottom to obtain the required degree reading on the level.
7. Tighten the setscrews securely.
8. Check the vertical setting to be sure it is still set at the required degree angle.
9. If the vertical setting has changed, repeat the procedure.
10. Remove the chocks from the tires and connect the batteries.

Component Checks

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

MPSI PROLINK® 9000

To properly test and diagnose problems with the Eaton VORAD collision warning system an MPSI ProLink 9000 hand-held tester with an Eaton VORAD diagnostic cartridge is required. The initial or default EVT-200 Diagnostic menu consists of three sub menus: Setup, Checkout, and Error Log. Verify system configuration of the Central Processing Unit (CPU) with the setup menu. Use the checkout menu to test the functions of the various components. Display fault codes using the error log menu.

NOTE: Use only a digital ohmmeter when performing tests to avoid damaging electronic components.

COMPONENT CHECKS USING THE CHECKOUT MENU

NOTE: Before selecting CHECKOUT, select SETUP and verify system configuration. This ensures proper operation of the CHECKOUT menu during component function tests.

The various components of the collision warning system can be activated using this menu. Some checks require assistance from the technician. The technician will be asked, via the ProLink, if the expected event occurred. Use the UP and DOWN arrow keys to scroll the selection arrow. Select the CHECKOUT menu from the initial EVT-200 Diagnostic menu by placing the selection arrow next to CHECKOUT and pressing ENTER.

NOTE: The following component checks are performed with the vehicle stationary.

Side Sensor Display (BSD) Test

1. Select BSD TEST from the CHECKOUT menu.
2. Place the selection arrow next to the side sensor display.

NOTE: If the vehicle has only one side sensor, there will be an N/A value displayed for the other side sensor.

3. Press ENTER to toggle the state of the side sensor display light.
4. The indicator light on the side sensor display will match the RED or YELLOW message shown on the ProLink.
5. Press FUNC to exit the BSD TEST and return to the CHECKOUT menu.

Side Sensor (BSS) Test

1. Select BSS TEST from the CHECKOUT menu.
2. Place the selection arrow next to the side sensor you are testing.

NOTE: If the vehicle has only one side sensor, there will be an N/A value displayed for the other side sensor.

3. Wave your hand in front of the side sensor.
4. As you wave your hand, the message displayed on the ProLink will change from NO to YES.

NOTE: The message OPEN/SHORT will appear if the side sensor power source is disconnected.

5. Press FUNC to exit the BSS TEST and return to the CHECKOUT menu.

Driver Display Unit (DDU) Test

1. Select DDU TEST from the CHECKOUT menu.

NOTE: At the lamp test line, the RED, YELLOW, and ORANGE range control alert lights will toggle automatically. Each will illuminate individually on the display as the ProLink indicates their color.

2. On the DDU, rotate the left knob (volume control) left to right, fully through its range. The percentage value for the LEFT KNOB on the ProLink display will change from 0 to 100 percent.
3. Now rotate the right knob (range control) left to right, fully through its range. The percentage value for the RIGHT KNOB on the ProLink display will change from 0 to 100 percent.
4. Push in the right knob (range control) and hold it until the display indicates PUSH.

Component Checks

5. Press FUNC to exit the DDU TEST and return to the CHECKOUT menu.

Speaker Test

1. Select the SPEAKER TEST from the CHECK-OUT menu.
2. Place the selection arrow next to the particular sound to be tested and press ENTER.

NOTE: When performing this test, sound volume is always at maximum. Adjusting the volume knob (left knob) on the DDU will have no effect.

3. Listen for the specific sound from the DDU speaker.
4. Repeat the procedure to test each of the six different sounds.
5. Press FUNC to exit the SPEAKER TEST and return to the CHECKOUT menu.

Antenna Test

1. Select ANTENNA TEST from the CHECKOUT menu.
2. Have an assistant walk toward the front of the antenna.

NOTE: The antenna will only detect a moving object.

3. Note the RANGE reading on the ProLink.
4. Ensure that the RANGE reading is approximately correct.
5. Press FUNC to exit the ANTENNA TEST and return to the CHECKOUT menu.

Turn Signal Test

1. Select TURN SIGNAL TEST from the CHECK-OUT menu.
2. Place the selection arrow next to the right-side turn signal.

NOTE: There will be an N/A value displayed for the turn signal on the left-hand side.

3. Move the turn signal lever into position to activate the turn signal for the right-hand side.
4. The ProLink display for that turn signal position will change from OFF to ON.
5. Press FUNC to exit the TURN SIGNAL TEST and return to the CHECKOUT menu.

Brake Test

1. Select BRAKE TEST from the CHECKOUT menu.
2. Depress the brake pedal when the ProLink display indicates PRESS BRAKE PEDAL.

NOTE: If the system is not configured for a brake signal BIT test, there will be an N/A value displayed.

3. The BRAKE message on the display will change from OFF to ON when the brake pedal is depressed.
4. Press FUNC to exit the BRAKE TEST and return to the CHECKOUT menu.

Steering Test

1. Ensure that the front wheels of the vehicle are pointed straight ahead.
2. Select STEERING TEST from the CHECKOUT menu.

NOTE: On the ProLink display at the MAG POS line, two characters are displayed to the left and a single character to the right. The two characters on the left indicate left- and right-side activation or non-activation of the sensor. An asterisk (*) indicates that the sensor is being activated by the magnet. A dash (-) indicates that the sensor is not being activated. The single character on the right indicates a count of the magnet position (4 = one full turn of the steering wheel).

3. With the vehicle’s wheels pointed straight ahead, turn the steering wheel clockwise far enough to move the magnet clear of the turn sensor and then back to center. The display will change from ** to -* to - - through this range of motion.
4. With the vehicle’s wheels pointed straight ahead, turn the steering wheel counterclockwise far enough to move the magnet clear of the turn sensor and then back to center. The display will change from ** to *- to - - through this range of motion.

5. After turning the steering wheel in both directions, observe that the ProLink display STATUS line changes from WAITING to PASSED. This indicates that both the left and right sides of the sensor are functioning properly.

NOTE: When the turn sensor and magnet are aligned correctly, the ProLink display will indicate two asterisks (**) at the MAG POS line for a vehicle traveling in a straight line at normal highway speeds.

6. Press FUNC to exit the STEERING TEST and return to the CHECKOUT menu.

Turn Sensor Assembly

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

⚠ WARNING

The following on-highway procedures require two people in the vehicle. A second person is needed to observe the ProLink display and make a note of final adjustments to be made to the turn sensor mounting collar position. Do not attempt these procedures alone as this could result in loss of control of the vehicle and possible physical injury and property damage.

NOTE: These procedures are intended to be performed only on an interstate highway, freeway, or similar roadway. Perform these procedures only after performing the Initial Adjustments, when a turn sensor, sensor mounting plate, or sensor mounting collar has been removed or replaced. See **Subject 180** in this section for instructions.

1. Drive the vehicle straight ahead at normal highway speed.
2. Using ProLink, have the assistant access CHECKOUT, STEERING TEST. Look for two asterisks (**) on the ProLink display.
3. Confirm that the turn sensor assembly is properly aligned by verifying that two asterisks appear while driving the vehicle in a straight line at normal highway speeds of 50 to 55 mph (80 to 88 km/h).

NOTE: In this condition, as slight normal corrections are made with the steering wheel, one or more asterisks may disappear. Broad turns of the steering wheel, greater than 45 degrees, will cause both asterisks to disappear. If two asterisks (**) do not appear while driving in a straight line, adjust the turn sensor assembly.

⚠ WARNING

Only attempt these procedures where at least two lanes are available for use and traffic is light. Improperly performing these procedures could result in loss of control of the vehicle and possible physical injury and property damage.

4. Adjust the turn sensor assembly to the vehicle's traveling centerline by marking the top center position of the steering wheel (12 o'clock position) with tape. Do this as the vehicle is proceeding in a straight line down the highway at normal highway speeds of 50 to 55 mph (80 to 88 km/h).
5. Pull the vehicle off the road in a safe location and shut off the engine. Position the steering wheel with the marker tape at the same top center position (12 o'clock position).
6. Loosen the two Torx®-head screws on the sensor mounting collar and adjust the position of the turn sensor to the centerline of the magnet. See **Subject 180** in this section for instructions. Tighten the collar screws securely.

Antenna Assembly

NOTE: These procedures are intended to be performed only on an interstate highway, freeway, or similar roadway where at least two lanes in your direction are available for use. Perform these procedures only after performing the Initial Adjustments when an antenna assembly, antenna assembly mounting brackets, or antenna mounting plate have been removed or replaced. See **Subject 180** for instructions.

1. Drive the vehicle straight ahead at normal highway speeds of 50 to 55 mph (80 to 88 km/h).

⚠ WARNING

Only attempt these procedures where at least two lanes are available for use and traffic is light. Improperly performing these procedures could result in loss of control of the vehicle and possible physical injury and property damage.

On-Road Checks and Final Adjustments

2. Confirm that the system is monitoring only the vehicle traveling immediately ahead of the host vehicle.

NOTE: The DDU should display following distance information only for the vehicle traveling immediately ahead, by illuminating the number 1 or number 2 alert light. The DDU should not display following distance information for vehicles in the left or right lanes, ahead of the host vehicle, while the host vehicle is traveling in a straight line.

3. If the system is monitoring vehicles in the left or right lane, while traveling in a straight line, adjust the antenna assembly.
4. To adjust the antenna assembly to the vehicle's traveling centerline, first pull the vehicle off the road in a safe location and shut off the engine.
5. Loosen the two Allen setscrews in the antenna mounting bracket only on the side you wish to adjust.
6. Increase the horizontal side mounting angle of the antenna from which the system is monitoring vehicles traveling in the adjacent lane. See **Subject 180** for instructions. Tighten the Allen setscrews securely.

NOTE: Pull the side of the antenna on which vehicles are being detected forward. If the system is detecting vehicles in the adjacent lane on the right-hand side, pull the right-hand side of the antenna forward. If the system is detecting vehicles in the adjacent lane on the left-hand side, pull the left-hand side of the antenna forward.

Troubleshooting

IMPORTANT NOTIFICATION: Service upon the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

COMPONENT TROUBLESHOOTING

When a current active fault is detected by the system, the red fail light on the DDU illuminates until the cause of the condition is corrected. It is possible to read fault codes either on the DDU, by placing it in failure display mode, or with ServiceLink or ProLink.

Active and inactive fault codes may be blinked out over the DDU when the system is placed in failure display mode by holding the volume control knob down upon vehicle start up. Display active codes by turning the range knob to MIN and inactive codes by turning the knob to MAX. Codes will be blinked on the red fail light. The light will blink as many times as the first digit of the fault code number, pause approximately 3/4 of a second, and then blink as many times as the second digit. Additional fault codes are blinked out at intervals of approximately eight seconds. After all the fault codes have been displayed, the sequence repeats. This process continues until the system is turned off. ServiceLink version 1.3 will only allow you to read the codes as MID (message identifier), SID (subsystem identifier), and FMI (failure mode identifier) numbers, which correspond to the specific fault codes.

Beyond simply determining which fault codes are present, it is necessary to use an MPSI ProLink 9000 tester equipped with a VORAD cartridge. Make the various basic checks below before proceeding to the more detailed troubleshooting procedures in the following tables.

1. Confirm that there is a problem.
2. Before replacing any component, make continuity checks with a digital volt/ohm meter.
3. Confirm that all connections, power and grounds, to either the vehicle or components, are good.
4. Check for a blown fuse or tripped circuit breaker.
5. Check the condition of pins in all connectors and cavities.
6. Examine the wiring of the suspect component. Look for physical damage to the insulation, corrosion, and the effects of heat.
7. Examine the external components (antenna assembly, cable, side sensor) for damage or corrosion.

Component Troubleshooting (DDU Green Light-SSD Red Light)		
Symptom	**Cause/Source**	**Remedy**
DDU green ON light blinks eight times.	An event is stored on the driver's card.	NOTE: The ON light will blink rapidly eight times when the system is activated, or when the card is removed and reinserted, indicating an event has been stored on the accident reconstruction segment. There is still one open memory segment available to store accident reconstruction data.

Troubleshooting

Component Troubleshooting (DDU Green Light-SSD Red Light)		
Symptom	**Cause/Source**	**Remedy**
SSD red light illuminates continuously.	CPU not receiving side sensor information/side sensor.	1. — Confirm that the vehicle has a side sensor. If not, verify that the left and right turn signal BIT setting is OFF. * 2. — Check the connection or for damage to the main CPU harness. 3. — Check the connection or for damage to the three-pin extension harness of the main harness pigtail connector and the side sensor. 4. — While performing the BSS test, wave your hand in front of the right side sensor to verify that the correct signal is being received. * 5. — Disconnect the three-pin side sensor and CPU connectors. Check for corrosion or a recessed pin.

* A ProLink diagnostic tool equipped with an EVT–200 cartridge is required for this procedure.

Table 1, Component Troubleshooting (DDU Green Light-SSD Red Light)

Component Troubleshooting (Warning Tones-Volume Knob)		
Symptom	**Cause/Source**	**Remedy**
No warning tones audible.	Speaker not functioning, steering magnet not detected, brake signal incorrect/ DDU, turn sensor assembly, brake input or configuration setting.	1. — Verify that the volume control knob is turned all the way to the right. 2. — Turn the system off and back on. Turn the volume control knob and listen for a tone. 3. — Verify that the DDU connection is good. 4. — Perform the speaker test to verify that a tone is heard from the DDU speaker. 5. — Verify that the magnet is properly aligned with the turn sensor assembly. 6. — Perform the steering test to verify that the sensor correctly detects the magnet position. * 7. — Verify that the brake BIT setting is correctly configured in the CPU. * 8. — Perform the brake test to verify that the correct signal is received when the pedal is depressed. *
Warning tones audible when brakes applied.	Incorrect input signal/ brake input.	NOTE: Stationary, slow-moving, and following distance warning tones are disabled when the brake pedal is depressed. Creep and side sensor alerts are audible when the brake pedal is depressed. 1. — Perform the brake test to confirm receipt of the correct signal when the brake pedal is depressed. * 2. — Verify that the brake BIT setting is correctly configured in the CPU. * 3. — Verify that brake logic is correctly configured in the CPU. *

Component Troubleshooting (Warning Tones-Volume Knob)		
Symptom	**Cause/Source**	**Remedy**
Side sensor warning tones not consistent with condition.	Incorrect input signal/ turn signal input.	1. — Verify that a double tone is not audible when you wave your hand in front of the side sensor with only the brake pedal depressed (turn signal not activated). 2. — Verify that the turn signal BIT setting is correctly configured in the CPU. * 3. — Perform the turn signal test to confirm receipt of the correct signal when the turn signal is applied. *
No system ON/OFF capability.	Hardware configuration.	NOTE: Some models have a non-adjustable feature which prevents the operator from turning off the system. This is a feature requested by the original purchaser.
The volume knob does not reduce the volume.	System configuration/ DDU.	NOTE: System parameters can be configured to limit volume to a minimum level, but only with a ProLink diagnostic tool. If the owner or fleet manager allows full adjustment of the volume level, follow the procedure below. 1. — Verify that the MIN VOL setting is zero. * 2. — Perform the DDU test to confirm proper operation of the left knob. * 3. — Check that the DDU is properly connected and not damaged. 4. — Check that the main harness to the CPU is properly connected and not damaged.

* A ProLink diagnostic tool equipped with an EVT–200 cartridge is required for this procedure.

Table 2, Component Troubleshooting (Warning Tones-Volume Knob)

Component Troubleshooting (Range Knob-Detected Vehicles)		
Symptom	**Cause/Source**	**Remedy**
The range knob does not change the alert levels.	Software configuration/ DDU.	NOTE: System parameters can be configured to prevent the operator from reducing range threshold levels. This configuration can only be changed with a ProLink diagnostic tool. If the owner or fleet manager allows adjustment of the range levels, follow the procedure below. 1. — Verify that the RANGE ENABLE configuration is ON. * 2. — Perform the DDU test to confirm proper operation of the right knob. * 3. — Check that the DDU is properly connected and not damaged. 4. — Check that the main harness to the CPU is properly connected and not damaged.
Front antenna detects vehicles in one adjacent lane with no vehicle in front of host vehicle.	Antenna misaligned/ antenna assembly.	Adjust the antenna horizontal alignment in the direction opposite the detected-side lane to align the antenna assembly to the vehicle's traveling centerline. NOTE: See **Subject 180** and **Subject 200** in this section for antenna alignment procedures.

Troubleshooting

Component Troubleshooting (Range Knob-Detected Vehicles)		
Symptom	**Cause/Source**	**Remedy**
Front antenna detects vehicles in both left and right adjacent lanes with no vehicle in front of host vehicle.	Radar side lobes extended/antenna assembly.	1. — Confirm that the antenna assembly is mounted at the minimum height or above. 2. — Confirm that the antenna assembly is mounted securely. 3. — Confirm that the radar beam's path is unobstructed and that no movement of surrounding body panels is being detected. NOTE: Contact Eaton VORAD at (800) 840–7970 for additional assistance.
Front antenna loses or ignores detected vehicles within 100 feet (30 meters) in front of host vehicle.	Tracking module error/ antenna assembly.	1. — Confirm that the antenna assembly is aligned correctly. 2. — Check the antenna cable connection to the CPU and the antenna assembly. NOTE: Remove the uniboot to check the cable connection at the antenna assembly. 3. — Inspect the antenna assembly, the cable, and the CPU for corrosion or damage. NOTE: If the component listed in the Cause/Source column has been replaced, perform a road test afterward to confirm that the condition has been resolved.

* A ProLink diagnostic tool equipped with an EVT–200 cartridge is required for this procedure.

Table 3, Component Troubleshooting (Range Knob-Detected Vehicles)

FAULT CODE TROUBLESHOOTING USING THE ERROR LOG MENU

1. Select ERROR LOG from the initial EVT-200 Diagnostic menu.

NOTE: ERROR LOG provides a list of all the fault codes detected by the system. A BIT (Built-In Test) is performed every 15 seconds by the system to determine the condition of the components and internal processes. Faults that occur are logged as fault codes in the system's memory. The first line of the ERROR LOG menu displays the code number and the code status, either active or inactive.

2. Place the selection arrow next to the first line of the ERROR LOG menu. The first fault code in the error log is displayed.

NOTE: The second line of the ERROR LOG menu displays the name of the current fault. The third line (CLR CT/MIN) displays the number of occurrences of the current fault and the total number of minutes it has been continuously occurring. The fourth and fifth lines of the menu indicate the date and time of the first and last occurrences, respectively, of the fault.

3. Return the display arrow to the active or inactive code line.
4. Press ENTER and the next fault code with its information is displayed.
5. Continue to press ENTER to display all logged fault codes with their information.

NOTE: It may be helpful in diagnosing or solving a problem to know if some action will remove a fault. Clear the count on a particular fault by following the steps below.

6. Select the fault code for which the count is to be cleared as in steps 2 and 3 above.
7. Place the display arrow on the CLR CT/MIN line.
8. Press ENTER to clear the fault's count.

To get to the Eaton VORAD main menu, press FUNC in the initial EVT-200 Diagnostic menu. The EVT-200 Diagnostic menu is the default menu and comes on initially. Once at the Eaton VORAD main menu screen, you may select active or inactive faults. The name, FMI code, and count for active and inactive faults are displayed here. Failure Mode Identifiers (FMI) numbers describe a specific type of failure detected in a specific system.

9. Press the left or up arrow key to display the previous active or inactive fault.
10. Press the right or down arrow key to display the next active or inactive fault.
11. Press FUNC to return to the Eaton VORAD main menu.

NOTE: At the CLEAR FAULT CODES line, accessed from the Eaton VORAD main menu, you can clear all fault codes from system memory. Be sure this is what you want to do as all BIT data will be reinitialized when all fault codes are cleared.

12. Press ENTER if you want to clear all fault codes and then select DIAGNOSTICS from the Eaton VORAD main menu to return to the EVT-200 Diagnostic menu.

Fault Code Troubleshooting (Codes 11-16)				
Fault Code *	**Cause/Source**	**SID**	**FMI**	**Remedy**
11/RAM	Scratch memory error/CPU	254	12	CPU internal component failure. Cannot be repaired in the field. †
12/FLASH	Program memory error/CPU	254	12	CPU internal component failure. Cannot be repaired in the field. †
13/FPGA	Gate array will not program/CPU	254	12	CPU internal component failure. Cannot be repaired in the field. †
14/DSP	Digital signal processor will not program/CPU	254	12	CPU internal component failure. Cannot be repaired in the field. †
15/BATTERY	Internal battery low/ CPU	254	12	CPU internal component failure. Cannot be repaired in the field. †
16/NVRAM	Internal non-volatile data memory corrupted/CPU	254	12	CPU internal component failure. Cannot be repaired in the field. †

* MID (message identifier) # 219 applies to all the fault codes in this table. This MID has been assigned to collision avoidance radar.

† The CPU must be returned to the manufacturer for repair.

Table 4, Fault Code Troubleshooting (Codes 11-16)

Troubleshooting

Fault Code Troubleshooting (Codes 17-22)				
Fault Code *	**Cause/Source**	**SID**	**FMI**	**Remedy**
17/NO DSP DATA	CPU not receiving antenna data/ antenna cable, antenna assembly, CPU	254	9	1. — Check the antenna cable connection to the CPU and the antenna assembly. NOTE: Remove the uniboot to check the cable connection at the antenna assembly. 2. — Disconnect the antenna cable at both ends and inspect for damage to the connector pins or for pins pushed into the connector. 3. — Inspect the antenna assembly, the cable, and the CPU for corrosion or damage. 4. — Replace the first component listed in the Cause/Source column. Road test the vehicle and determine if the same fault occurs. If it does, replace the next listed component and perform all the preceding elements of the procedure until the fault no longer occurs after road testing.
21/FREQUENCY INJ	Radar frequency test signal error/ CPU, antenna assembly	2	8	1. — Check the antenna cable connection to the CPU and the antenna assembly. NOTE: Remove the uniboot to check the cable connection at the antenna assembly. 2. — Disconnect the antenna cable at both ends and inspect for damage to the connector pins or for pins pushed into the connector. 3. — Inspect the antenna assembly, the cable, and the CPU for corrosion or damage. 4. — Install the software version 106, or higher. Contact Eaton VORAD at (800) 840–7970 for assistance. 5. — Replace the first component listed in the Cause/Source column. Road test the vehicle and determine if the same fault occurs. If it does, replace the next listed component and perform all the preceding elements of the procedure until the fault no longer occurs after road testing.
22/F/E DATA or CLK	Antenna data communication link bad/CPU, antenna assembly, antenna cable	2	2	1. — Check the antenna cable connection to the CPU and the antenna assembly. NOTE: Remove the uniboot to check the cable connection at the antenna assembly. 2. — Disconnect the antenna cable at both ends and inspect for damage to the connector pins or for pins pushed into the connector. 3. — Inspect the antenna assembly, the cable, and the CPU for corrosion or damage. 4. — Replace the first component listed in the Cause/Source column. Road test the vehicle and determine if the same fault occurs. If it does, replace the next listed component and perform all the preceding elements of the procedure until the fault no longer occurs after road testing.

* MID (message identifier) # 219 applies to all the fault codes in this table. This MID has been assigned to collision avoidance radar.

Table 5, Fault Code Troubleshooting (Codes 17-22)

Fault Code Troubleshooting (Codes 23-51)				
Fault Code *	**Cause/Source**	**SID**	**FMI**	**Remedy**
23/MICROWAVE XMIT	Antenna radar not transmitting/antenna assembly, antenna cable	1	2	1. — Check the antenna cable connection to the CPU and the antenna assembly. NOTE: Remove the uniboot to check the cable connection at the antenna assembly. 2. — Disconnect the antenna cable at both ends and inspect for damage to the connector pins or for pins pushed into the connector. 3. — Inspect the antenna assembly, the cable, and the CPU for corrosion or damage.
31/BRAKE	Vehicle brake input connection not detected/brake input	3	5	1. — Confirm that the brake light bulbs are good. 2. — Confirm that the brake switch operates correctly. 3. — Perform the brake test and confirm that the correct signal is received when the pedal is depressed. † 4. — Confirm that brake logic is correctly configured in the CPU. † 5. — Confirm that the brake input wire is connected to the proper source. 6. — Ensure that the main harness to CPU connection is good and that the harness is not damaged. NOTE: If the vehicle is equipped with LED tail lights and the fault code persists, even after confirming steps 1 through 6, contact Eaton VORAD at (800) 840–7970 for assistance.
42	No faults found	–	–	–

Troubleshooting

Fault Code Troubleshooting (Codes 23-51)				
Fault Code *	**Cause/Source**	**SID**	**FMI**	**Remedy**
51/R. STEERING	Right steering sensor input not connected/turn sensor assembly	5	5	1. — Resolve fault codes 17 through 23, if present, before proceeding. 2. — Perform the steering test and confirm that the left and right sides of the sensor correctly detect magnet position. † 3. — Check the turn sensor assembly connection and for damage to the sensor assembly. 4. — Check continuity on all the sensor wires. See **Specifications 400** in this section for a wiring schematic. 5. — Confirm that the value of pin number eight, in the bottom row of the main harness connector, changes from more than five volts to less than two volts when the magnet passes over the right sensor. 6. — Check the main harness to the CPU connection and for damage to the main harness. 7. — Replace the turn sensor assembly, clear all the fault codes, activate the system, and check to see if the fault reappears. 8. — Replace the first component listed in the Cause/Source column. Road test the vehicle and determine if the same fault occurs. If it does, replace the next listed component and perform all the preceding elements of the procedure until the fault no longer occurs after road testing.

* MID (message identifier) # 219 applies to all the fault codes in this table. This MID has been assigned to collision avoidance radar.

† A ProLink diagnostic tool equipped with an EVT–200 cartridge is required for this procedure.

Table 6, Fault Code Troubleshooting (Codes 23-51)

Fault Code Troubleshooting (Codes 52-61)				
Fault Code *	**Cause/Source**	**SID**	**FMI**	**Remedy**
52/L. STEERING	Left steering sensor input not connected/turn sensor assembly	5	5	1. — Resolve fault codes 17 through 23, if present, before proceeding. 2. — Perform the steering test and confirm that the left and right sides of the sensor correctly detect magnet position. † 3. — Check the turn sensor assembly connection and for damage to the sensor assembly. 4. — Check continuity on all the sensor wires. See **Specifications 400** in this section for a wiring schematic. 5. — Confirm that the value of pin number eight, in the top row of the main harness connector, changes from more than five volts to less than two volts when the magnet passes over the left sensor. 6. — Check the main harness to the CPU connection and for damage to the main harness. 7. — Replace the turn sensor assembly, clear all the fault codes, activate the system, and check to see if the fault reappears. 8. — Replace the first component listed in the Cause/Source column. Road test the vehicle and determine if the same fault occurs. If it does, replace the next listed component and perform all the preceding elements of the procedure until the fault no longer occurs after road testing.
53/STR MISALIGNED	Steering sensor misaligned to magnet on column/ turn sensor assembly	5	13	1. — With the vehicle stopped, place the steering wheel in that position (front wheels straight ahead), as when the vehicle was traveling in a straight line at normal highway speeds of 50 to 55 mph. 2. — Perform the steering test to confirm that the left and right sensors correctly detect magnet position. †
61/ SPEEDOMETER	Speed input not detected/speed input, configuration setting	6	5	1. — Confirm that the speed input has the correct source. † 2. — Confirm that the speed mode is correctly configured to the vehicle's electronic speed data line. † 3. — Perform the speedometer test to confirm the speedometer's accuracy against the vehicle speed. † 4. — Check the main harness to the CPU connection and for damage to the main harness. 5. — Twist the system's positive and negative J1587 speed input wires one full turn every 1-1/2 inches (38 mm), to shield against radio frequency interference.

* MID (message identifier) # 219 applies to all the fault codes in this table. This MID has been assigned to collision avoidance radar.

† A ProLink diagnostic tool equipped with an EVT–200 cartridge is required for this procedure.

Table 7, Fault Code Troubleshooting (Codes 52-61)

Troubleshooting

Fault Code Troubleshooting (Codes 71-74)				
Fault Code *	**Cause/Source**	**SID**	**FMI**	**Remedy**
71/RIGHT SIGNAL	Right turn signal input not detected/ turn signal input, configuration setting	7	5	1. — Confirm that the vehicle has a right side sensor. If not, confirm that the right turn signal BIT setting is OFF. † 2. — Confirm that the turn signal bulbs are good. 3. — Confirm that the turn signal switch operates properly. 4. — Confirm that the right turn signal input is connected to the right turn signal lead. 5. — Perform the turn signal test to confirm that the correct input is received when the right turn signal is activated. † 6. — Verify that pin number 2, on the top row of the main harness connector, receives 12 volts when the right signal is activated. 7. — Check the main harness to the CPU connection and for damage to the main harness.
72/RIGHT BSS	Right side sensor not communicating with CPU/right side sensor	10	5	1. — Confirm that the vehicle has a right side sensor. If not, confirm that the right turn signal BIT setting is OFF. † 2. — Perform the BSS test to confirm that the correct signal is received when you wave your hand in front of the right side sensor. † 3. — Check the three-pin extension harness connections at the main harness pigtail connector and at the side sensor. Check the harness for damage. 4. — Unplug the three-pin side sensor and CPU connectors. Inspect for corrosion or a recessed pin. 5. — Check the main harness to the CPU connection and for damage to the main harness.
73/LEFT SIGNAL	Configuration setting	8	5	Confirm that the left turn signal BIT setting is OFF. †
74/LEFT BSS	Second side sensor not communicating with CPU/second side sensor	11	5	1. — Confirm that the vehicle has a second side sensor. 2. — Perform the BSS test to confirm that the correct signal is received when you wave your hand in front of the left side sensor. † 3. — Check the three-pin extension harness connections at the main harness pigtail connector and at the side sensor. Check the harness for damage. 4. — Unplug the three-pin side sensor and CPU connectors. Inspect for corrosion or a recessed pin. 5. — Check the main harness to the CPU connection and for damage to the main harness.

* MID (message identifier) # 219 applies to all the fault codes in this table. This MID has been assigned to collision avoidance radar.

† A ProLink diagnostic tool equipped with an EVT–200 cartridge is required for this procedure.

Table 8, Fault Code Troubleshooting (Codes 71-74)

Fault Code Troubleshooting (Codes 91-93)				
Fault Code *	**Cause/Source**	**SID**	**FMI**	**Remedy**
91/VOLUME	Volume knob not functioning/DDU	9	5	1. — Perform the DDU test to confirm proper operation of the left knob. † 2. — Check the DDU connection and for damage to the DDU. 3. — Check the main harness to the CPU connection and for damage to the main harness.
92/RANGE	Range knob not functioning/DDU	9	5	1. — Perform the DDU test to confirm proper operation of the right knob. † 2. — Check the DDU connection and for damage to the DDU. 3. — Check the main harness to the CPU connection and for damage to the main harness.
93/DRVR DISP UNIT	DDU not communicating with CPU/DDU, CPU, harness	9	5	1. — Perform the DDU test to verify that the DDU operates properly. † 2. — Check the DDU connection and for damage to the DDU. 3. — Verify that the driver is not disconnecting the DDU. 4. — Check the main harness to the CPU connection and for damage to the main harness. 5. — Replace the first component listed in the Cause/Source column. Road test the vehicle and determine if the same fault occurs. If it does, replace the next listed component and perform all the preceding elements of the procedure until the fault no longer occurs after road testing.

* MID (message identifier) # 219 applies to all the fault codes in this table. This MID has been assigned to collision avoidance radar.

† A ProLink diagnostic tool equipped with an EVT–200 cartridge is required for this procedure.

Table 9, Fault Code Troubleshooting (Codes 91-93)

IMPORTANT NOTIFICATION: Servicing of the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

See **Fig. 1** for a schematic of the Collision Warning System wiring and components.

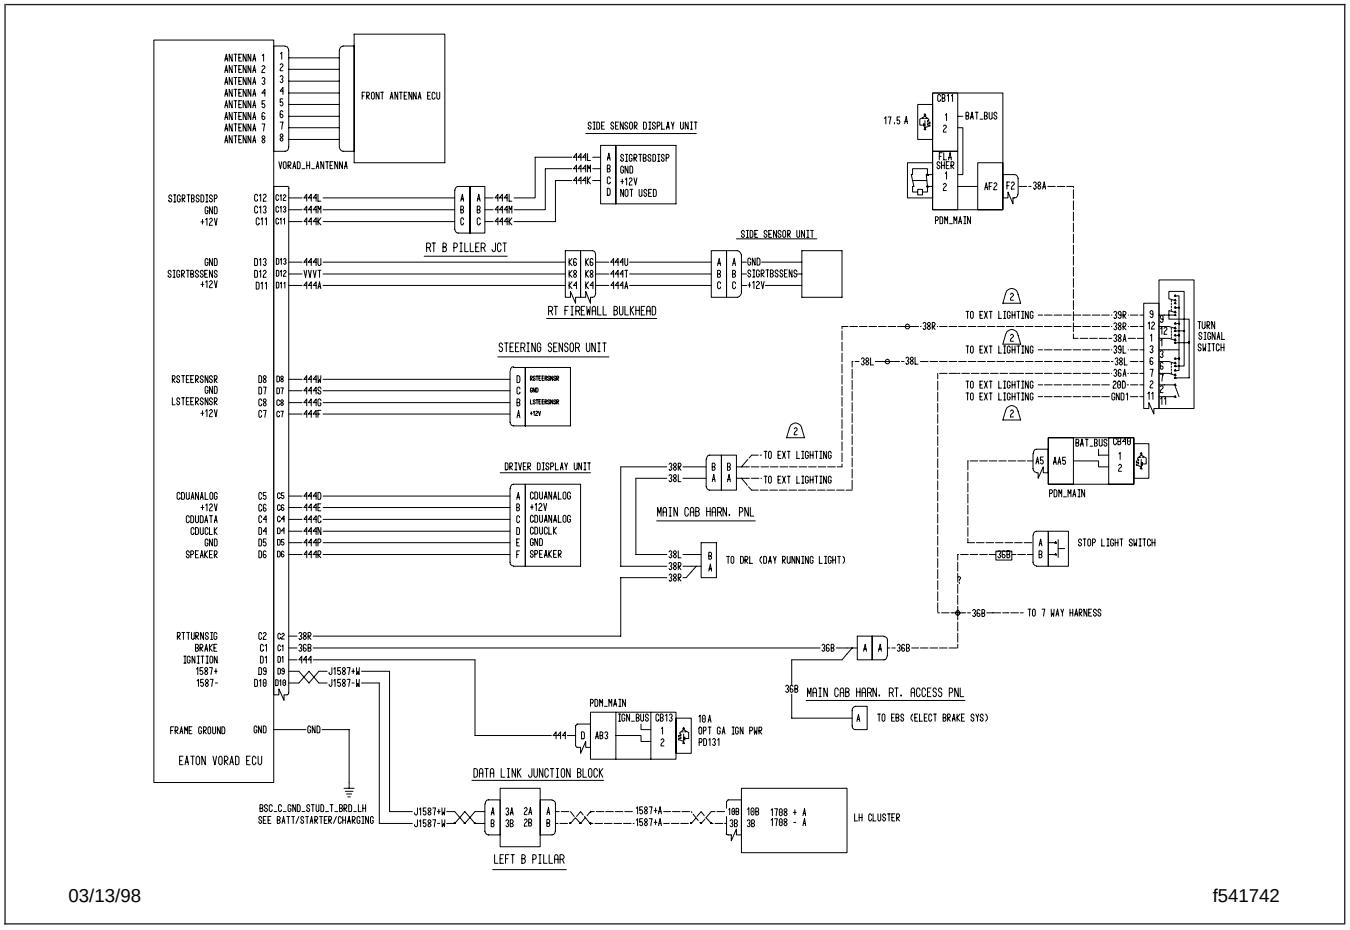


Fig. 1, Wiring Diagram (VORAD EVT-200 collision warning system)

See **Fig. 2** for a schematic of the Collision Warning System overlay harness.

Table 2, Component Specifications

General Information

Vehicles built before November 28, 1997 have a low coolant level (LCL) reservoir at the side of the surge tank. The coolant level probe inserts into this reservoir. See **Fig. 1**. The connector on the probe attaches directly to the frontwall harness. For frontwall harness wiring, see **Specifications, 400** in Section 54.00.

2. Coolant Level Probe
3. Low Coolant Level Reservoir
4. Return Line
5. Surge Tank

Fig. 1, Probe Mounted In Reservoir

On vehicles built from November 28, 1997, the coolant level probe inserts directly into the surge tank. On these vehicles, the connector on the probe attaches to a special LCL overlay harness which connects between the electronic engine harness and the frontwall harness. For overlay harness wiring, see **Specifications, 400** in this section.

Vehicles with Cummins and Caterpillar engines have a control module installed on the side of the surge tank lower bracket. See **Fig. 2** for these vehicles. On these engines, an electronic engine overlay harness provides 5V power to the control module.

Vehicles with Detroit Diesel engines have no control module. See **Fig. 3** for these vehicles.

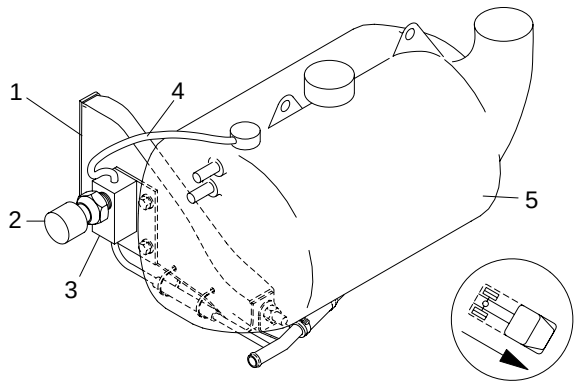
Probe In Reservoir

IMPORTANT: Vehicles built before November 28, 1997 have a low coolant level (LCL) reservoir at the side of the surge tank. The coolant level probe inserts into this reservoir. On vehicles built from November 28, 1997, the coolant level probe inserts directly into the surge tank.

REMOVAL

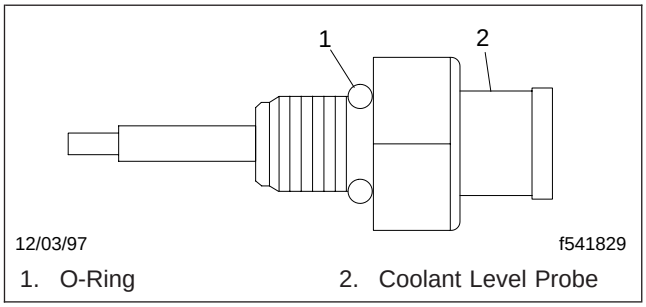
1. Set the parking brake and chock the tires.
2. Clamp off the two lines going to the LCL reservoir. See **Fig. 1**.



Other hoses removed for clarity.
1. Surge Tank Lower Bracket
2. Coolant Level Probe
3. Low Coolant Level Reservoir
4. Return Line
5. Surge Tank

Fig. 1, Probe In Reservoir

3. Disconnect the electrical connector at the rear of the probe.
4. Have a container ready to catch the coolant that runs out. Then slowly unscrew the coolant level probe.
5. Check the O-ring in the base of the probe and replace it if damaged or worn. See **Fig. 2**.
6. Plug the hole in the reservoir with a 3/8-inch pipe plug.



1. O-Ring
2. Coolant Level Probe

Fig. 2, O-Ring, Coolant Level Probe

INSTALLATION

1. Remove the 3/8-inch pipe plug from the hole in the reservoir.
2. Screw the coolant probe into the threaded hole in the reservoir until the threads bottom out and the probe is firmly in place.
3. Attach the electrical connector to the rear of the probe.
4. Remove the clamps from the coolant lines.
5. Check the coolant level in the surge tank and add coolant if necessary.
6. Run the engine and check for leaks around the coolant level reservoir. Make sure there are no kinks in the coolant lines at either the LCL reservoir or the coolant level probe.
7. Remove the chocks from the tires.

Probe In Surge Tank

REMOVAL

1. Set the parking brake and chock the tires.

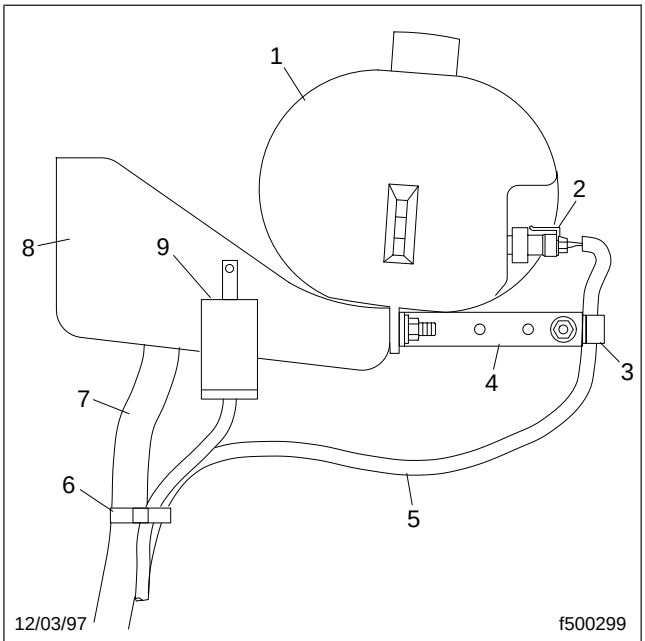
⚠ WARNING

Drain the coolant only when the coolant and engine are cool. Draining it when these are hot could cause severe personal injury due to scalding.

2. Drain the coolant out of the surge tank, at least to the level of the coolant probe. The coolant can be drained by disconnecting the clamps on the makeup line at the bottom of the surge tank and placing the hose in a suitable container.

Coolant Probe Removal and Installation

3. Disconnect the electrical connector at the rear of the probe. See **Fig. 3** for vehicles with Caterpillar (CAT) or Cummins (CUM) engines. See **Fig. 4** for vehicles with Detroit Diesel (DDEC) engines.



Hoses removed for clarity.
1. Surge Tank
2. Coolant Level Probe
3. Surge Tank Clamp
4. Overlay Harness Bracket
5. LCL Overlay Harness
6. Tie Strap
7. Electronic Engine Harness
8. Surge Tank Lower Bracket
9. Control Module

3. Surge Tank Clamp
4. Overlay Harness Bracket
5. LCL Overlay Harness
6. Surge Tank Clamp
7. Electronic Engine Harness
8. Tie Straps
9. Surge Tank Lower Bracket

Fig. 4, Probe In Surge Tank, DDEC Engines

3. Fill the surge tank with coolant. For instructions, see **Subject 100** in Section 20.01.
4. Run the engine and check for leaks around the surge tank.
5. Remove the chocks from the tires.

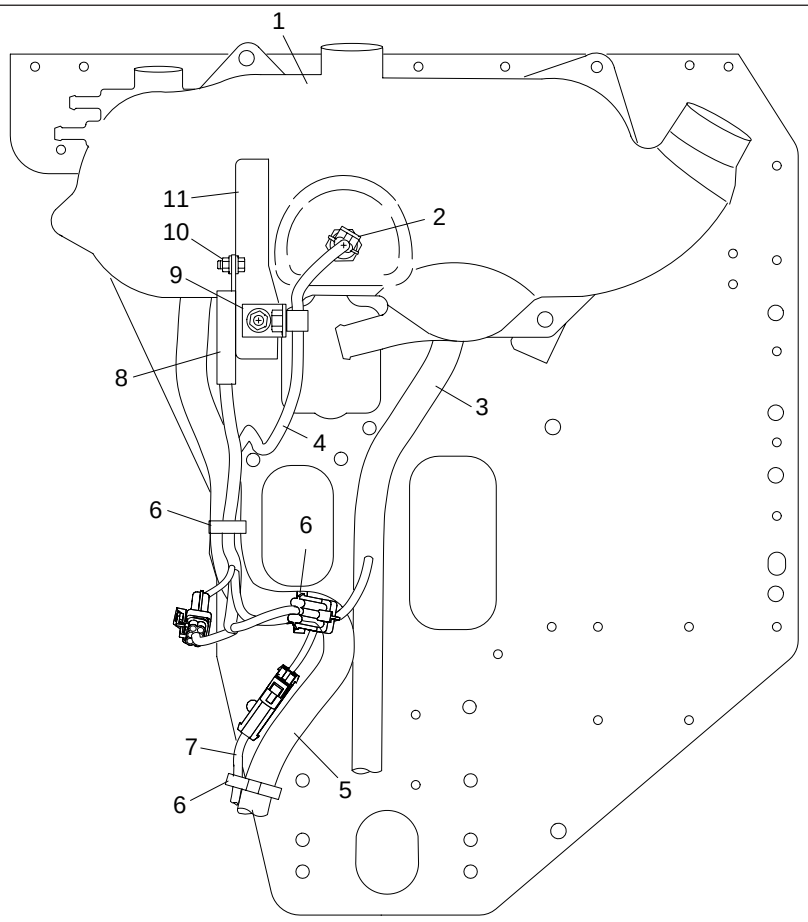
NOTE: Vehicles with Detroit Diesel engines have no control module.

Removal

1. Set the parking brake and chock the tires.
2. Disconnect the electrical connector from the bottom of the control module. See **Fig. 1**.
3. Remove the 1/4–20 locknut from the surge tank lower bracket.
4. Remove the control module from the mounting capscrew.

Installation

1. Position the control module on the mounting capscrew and tighten the locknut 84 lbf·in (940 N·cm).
2. Attach the electrical connector to the base of the module.



12/04/97 f500301

Fig. 1, Control Module

Control Module Removal and Installation

3. Run the engine and check for proper operation of the control module (no false indications of low coolant level).
4. Remove the chocks from the tires.

Cummins CELECT Plus Software

NOTE: The following information applies only to vehicles with a Cummins engine. If the vehicle was built before August 1, 1997, and has a Caterpillar (CAT) or Detroit Diesel (DDC) engine, skip down to "Coolant Sensor Reservoir Inspection."

If the vehicle was built on or after August 1, 1997, and has a Cummins or CAT engine, skip down to "Coolant Level Warning System Test (CAT and Cummins)." For vehicles built on or after August 1, 1997 with Detroit Diesel engines, skip down to "Coolant Level Probe Test (DDC)."

On Cummins CELECT Plus engines, phase 3.6.2 software (or earlier versions) can give a false low coolant level indication on the J1587 databus, even when the engine ECM does not show a problem.

To correct the problem, Cummins has released phase 3.7 software beginning with the following engine serial numbers and build dates listed in **Table 1**. Engines with serial numbers previous to those listed in **Table 1** that have experienced problems of this type need to have the engine ECM recalibrated. Use the phase 3.7 software that was released to the field with the March 1997 CD-ROM to recalibrate the ECM.

Engine Model	Engine Serial Number	Engine Build Date
N14	11839154	06Mar97
M11	34853386	07Mar97

Table 1, Cummins Engine Phase 3.7 Software

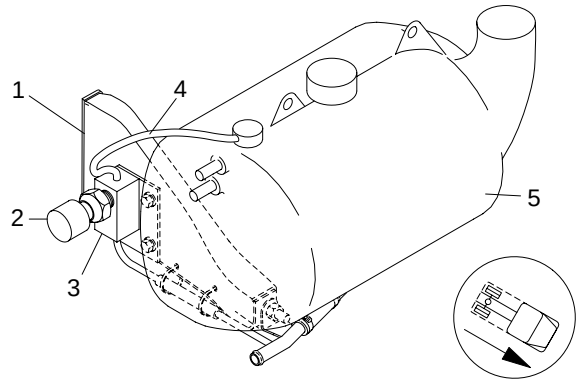
Any Cummins dealer can do this recalibration, and some Freightliner dealers may also be able to do it.

If this does not correct the problem, do the procedure under "Coolant Sensor Reservoir Inspection."

Coolant Sensor Reservoir Inspection

NOTE: The following information applies to vehicles with any type of engine built before August 1, 1997. Do this procedure first on CAT or DDC engines. On Cummins engines, try this procedure only after the software replacement has been done and has failed to correct the problem.

1. Check the coolant level in the surge tank. With the engine cold, there must be coolant at or above the "min" mark.
2. Disconnect the small return line at the top of the surge tank. See **Fig. 1**.



12/18/97 f500289a

Other hoses removed for clarity.

1. Surge Tank Lower Bracket
2. Coolant Level Probe
3. Coolant Sensor Reservoir
4. Return Line
5. Surge Tank

Fig. 1, Coolant Sensor Reservoir

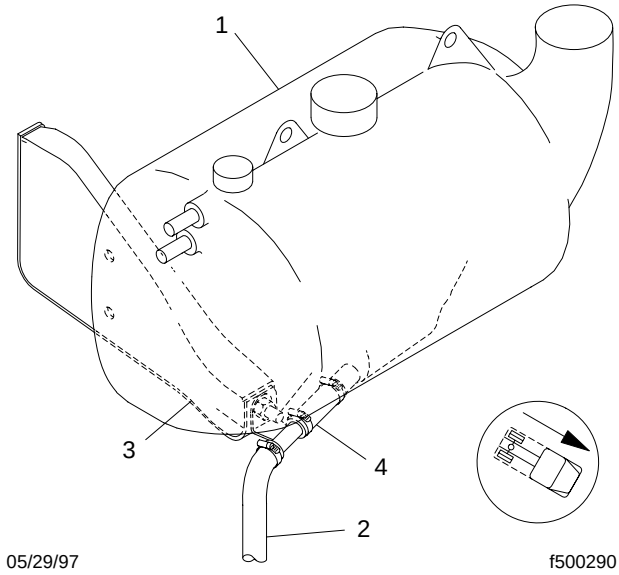
3. Move the open end of this line below the level of the coolant level sensor in the coolant sensor reservoir. The coolant sensor reservoir is the small rectangular metal chamber on the inboard side of the surge tank lower bracket.

   If coolant flows out of the return line, reconnect this line, making sure it is free of kinks.

   If coolant does not flow out of the return line, there is an obstruction in the system.
4. Check the coolant sensor reservoir for fluid. Disconnect the electrical connector and slowly unscrew the coolant level sensor. If no coolant runs out, or very little, there was not enough coolant

in the reservoir to cover the sensor, leading to a low coolant level indication.

5. Remove the obstruction and work coolant back into the reservoir by moving the large makeup line hose back and forth several times. See **Fig. 2**.



05/29/97 f500290

1. Surge Tank
2. Makeup Line
3. Surge Tank Lower Bracket
4. Hose Connector

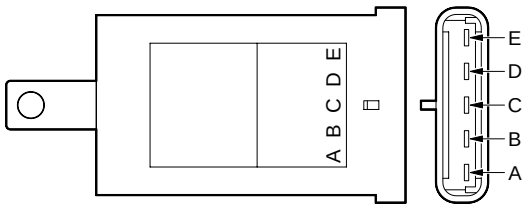
Fig. 2, Makeup Line

Coolant Level Warning System Test (CAT and Cummins)

NOTE: Do this test only on vehicles built after August 1, 1997 with a CAT or Cummins engine. Vehicles with DDC engines do not have a low coolant level module. For these vehicles, skip down to "Coolant Level Probe Test DDC)."

LOW COOLANT LEVEL MODULE

1. Disconnect the low coolant level module from the connector.
2. Connect a 5V power source to the unit.



07/02/98 f542015

A. Circuit PROB (coolant level probe)
B. Circuit LNOR (normal level signal)
C. Circuit LGND (ground)
D. Circuit LLOW (low level signal)
E. Circuit L+5V (5-volt power)

Fig. 3, Low Coolant Level Module

NOTE: For the following steps, see **Fig. 3**.

3. Attach the power supply positive lead to pin E and the negative lead to pin C.
4. Connect a jumper wire between pin A (probe) and pin C (ground) to simulate a normal coolant level sensor reading (probe in coolant).
   - 4.1 Use a digital multimeter to measure the voltage. The digital multimeter should read approximately 5 volts when connected to pin B (positive meter lead) and pin C (negative meter lead).
   - 4.2 The digital multimeter should read approximately 0 volts when connected to pin D (positive meter lead) and pin C (negative meter lead).
5. Disconnect the jumper wire between pin A and pin C to simulate a low coolant level sensor reading.
   - 5.1 The digital multimeter should read approximately 0 volts when connected to pin B (positive meter lead) and to pin C (negative meter lead).
   - 5.2 The digital multimeter should read approximately 5 volts when connected to pin D (positive meter lead) and to pin C (negative meter lead).

COOLANT LEVEL PROBE

1. Check for leaks around the area where the probe attaches to the surge tank. Replace the O-ring if needed. See **Fig. 4**.

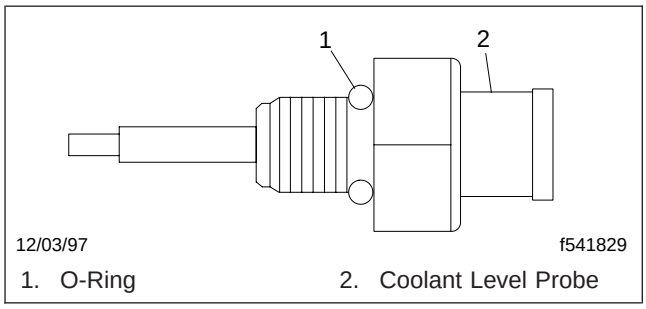


Fig. 4, Coolant Level Probe

2. Disconnect the metri-pack connector from the coolant level probe. Attach a 5V power source to the two pins on the probe. Connect the digital multimeter, still set on the high (20VDC) scale, and measure the voltage across the two pins.

   If the meter shows approximately 5VDC, the coolant level probe is OK.

   If the meter shows low voltage, replace the coolant level probe.

NOTE: Disregard the minus (–) sign on negative voltages.

Coolant Level Probe Test (DDC)

NOTE: Do this test only on vehicles built after August 1, 1997 with a DDC engine. For vehicles with CAT or Cummins engines, see "Coolant Level Warning System Test (CAT and Cummins)."

1. Check for leaks around the area where the probe attaches to the surge tank. Replace the O-ring if needed. See **Fig. 4**.
2. Disconnect the metri-pack connector from the coolant level probe.
3. Set a digital multimeter on high scale (20VDC) and attach it between the cavities in the connector.

   If the meter reads approximately 5 VDC, go to the next step.

   If the meter reads very little or no voltage, check circuits D115 and D953 and repair or replace, as necessary.

NOTE: Disregard the minus (–) sign on negative voltages.

4. With the metri-pack connector still disconnected, attach a 5V power source to the two pins on the probe and measure the voltage across the two pins of the probe.

   If the meter shows approximately 5VDC, the coolant level probe is OK.

   If the meter shows low voltage, replace the coolant level probe.

Specifications

On vehicles built before November 28, 1997, the low coolant probe connects directly to the frontwall harness. For frontwall harness wiring, see **Specifications, 400** in Section 54.00.

On vehicles built from November 28, 1997, the low coolant probe connects to a low coolant level (LCL) overlay harness, which connects in between the electronic engine harness and the frontwall harness. For a schematic of the LCL wiring, see **Fig. 1** for Caterpillar (CAT) and Cummins (CUM) electronic engines and **Fig. 2** for Detroit Diesel (DDEC) electronic engines.

For a drawing of the LCL overlay harness, see **Fig. 3** for CAT and CUM electronic engines and **Fig. 4** for DDEC electronic engines.

On CAT and CUM engines, an electronic control module draws 5V power through the electronic engine overlay harness. For a drawing of the electronic engine overlay harness, see **Fig. 5** for CAT and **Fig. 6** CUM electronic engines.

General Information

The speedometer and tachometer are controlled by the instrumentation control unit (ICU). Therefore, there are no DIP switches on the back of the speedometer or tachometer.

For speedometers, the magnetic sensor feeds the raw data to the engine electronic control unit (ECU), where the calibration parameters are stored. The engine ECU then transmits the corrected speed information over the J1587 databus to the ICU. The ICU then feeds it to the gauge head.

For tachometers, the engine ECU senses engine rpm internally and transmits a signal directly to the ICU via the J1587 databus. There is no rpm sensor installed on the flywheel, therefore no sensor installation or wiring to check for the tachometer.

Basic Diagnostics

When the ignition keyswitch is turned on, all of the electronic dash gauges on the driver's panel, including the speedometer and tachometer, make one complete sweep and return to their normal indicating positions. This is a diagnostic test of the electronic gauges and the instrumentation control unit (ICU).

NOTE: Non-electronic gauges, such as the voltmeter, or any of the air pressure gauges (primary air, secondary air, application air) do not sweep.

Always start by checking the gauge sweep. If a particular gauge does not sweep normally, but the others do, the fault is in the gauge or the ICU. If the gauge sweeps normally, but does not function properly at other times, the fault lies elsewhere: in the electronic engine programming, in the sensor (speedometer only), or in the wiring.

Potential problems with wiring and the datalink connection can be diagnosed on the ICU by checking the "Datalink Activity" visual display under "Vehicle Information." A large number of arrows pointing both up and down indicates intermittent connections on the datalink. If the datalink connection is missing or bad, the "No Datalink Activity" message appears.

To help define the nature of the problem further, the ICU displays fault codes for certain problems. Bad gauge heads and incorrect engine programming can lead to inaccurate or non-working gauges. ServiceLink displays these engine and dash fault codes also.

Only after checking these sources should it be necessary to check the installation of the magnetic sensor or the wiring itself.

Troubleshooting Step By Step

There are no DIP switches on the back of the speedometer or tachometer. For speedometers, the magnetic sensor feeds the raw data to the engine electronic control unit (ECU), where the calibration parameters are stored. The engine ECU then transmits the corrected speed information over the J1587 databus to the ICU. The ICU then feeds it to the gauge head. For tachometers, the engine ECU senses engine rpm internally and transmits a signal directly to the ICU via the J1587 databus.

NOTE: There is no rpm sensor installed on the flywheel, and therefore no sensor installation or wiring to check for the tachometer.

INACCURATE GAUGE

To recalibrate an inaccurate gauge, use the engine manufacturer's software to reprogram the engine ECU. For instructions, see the appropriate engine manufacturer's service manual.

NEITHER GAUGE WORKING

If neither gauge is working (no gauge deflection at all), and the odometer is also not working, do the following steps in order until the problem is corrected:

1. Turn on the ignition keyswitch and check for a full dial sweep. If neither gauge sweeps, check the engine wiring and the ICU.
2. Check for datalink activity. If there is no datalink activity, check the datalink wiring to the ICU (wires 1708+ and 1708–).
3. Go to the "Datalink Status" screen. If datalink usage reads less than 10%, check the engine wiring to the ICU.
4. Check the ICU and engine faults using ServiceLink. For more information, see "Electronic Troubleshooting."
5. Check the speedometer magnetic sensor for correct installation and proper operation. For more information, see "Troubleshooting the Speedometer Magnetic Sensor."
6. Using a variable multimeter set on ohms, check the wiring for resistance. For more information, see "Troubleshooting the Wiring."

ONE GAUGE NOT WORKING

If only one gauge (speedometer or tachometer) is not working, and the odometer and the other gauges are working OK, do the following steps in order until the problem is corrected:

1. Turn on the ignition keyswitch and check for a full dial sweep. If the gauge does not sweep, replace it with a gauge known to be in good work-

ing order. Check the working gauge for a full dial sweep. If the dial still does not sweep, replace the ICU.

2. If the gauge does sweep, but it still does not work correctly, check for active fault codes, using either the ICU itself, or ServiceLink. For more information, see "Electronic Troubleshooting."

3. On speedometers only, check the magnetic sensor for correct installation and proper operation. For more information, see "Troubleshooting the Speedometer Magnetic Sensor."

   On both tachometers and speedometers, check the engine faults using ServiceLink. For more information, see "Electronic Troubleshooting."

4. Using a variable digital multimeter set on ohms, check the wiring for resistance. For more information, see "Troubleshooting the Wiring."

Electronic Troubleshooting

READING FAULT CODES ON THE DASH DRIVER DISPLAY

The fault codes used to troubleshoot speedometers and tachometers contain three groups of fault numbers, for example: 140 008 06. The fault numbers that are used (MIDs, PIDs, SIDs, and FMIs) are listed in the J1587 specifications. Here is an explanation of these numbers:

- Message Identifiers (MIDs)—The first fault number identifies the electronic control unit that is transmitting the fault. It is called a message identifier, or MID. For tachometers, the MID is 140 (dash left microprocessor); for speedometers, it is 142 (dash right microprocessor).
- Dash Fault Numbers—The second fault number consists of a three-digit dash fault number that identifies the component in which the fault was detected. The coding used for these fault numbers can be either parameter identifiers (PIDs), or sub-system identifiers (SIDs). The fault number for the tachometer is 008, and for the speedometer 022.
- Failure Mode Identifiers (FMIs)—This two-digit fault number at the end of each fault code helps to identify faults in the data being supplied to the component. It is called a Failure Mode Identifier, or FMI. The FMI gives information about where the fault lies. Is the circuit shorted, or open? For a list of FMIs that apply to the speedometer and tachometer, see **Table 1**.

Failure Mode Identifiers (FMIs)	
FMI	**Description and Comments**
00	Above normal operating range
01	Below normal operating range
02	Erratic, intermittent, or incorrect data
05	Current below normal or open circuit
06	Current above normal or circuit shorted to ground
07	Device not responding
08	Abnormal frequency
10	Abnormal rate of change
11	Not identifiable
12	Bad intelligent device or component
13	Out of calibration

Table 1, Failure Mode Identifiers (FMIs)

The ICU displays the fault code on the first line of the dash driver display on the left side of the screen and a short text description of the MID on the right. On the second line of the display, the ICU gives a short text description of the fault number (PID or SID) and FMI. See **Table 2**.

Example: The message screen displays the following fault code: 140 008 06, and the text messages INSTRCLSTR and DR07 COIL – SHORT.

1. The first fault number is the MID. A MID of 140 indicates that the data is coming from the dash left microprocessor (INSTRCLSTR).

2. The second fault number is the dash fault number. A dash fault number of 008 indicates that the data is coming from the tachometer (DR07 COIL).

3. The third fault number is the FMI. An FMI of 06 indicates that there is a short in the tachometer circuit (SHORT).

ICU Fault Message Explanation				
Screen Message	**Description**	**MID**	**Fault No.**	**FMI**
140 008 06 INSTRCLSTR DR07 COIL – SHORT	Tachometer Coil Shorted	140	008	06
140 008 05 INSTRCLSTR DR07 COIL – OPEN	Tachometer Coil Open	140	008	05
142 022 06 INSTRCLSTR DR08 COIL – SHORT	Speedometer Coil Shorted	142	022	06
142 022 05 INSTRCLSTR DR08 COIL – OPEN	Speedometer Coil Open	142	022	05

Table 2, ICU Fault Message Explanation

Therefore, this fault code indicates a short inside the tachometer coil. Replace the faulty gauge with one in good working order.

READING FAULT CODES USING SERVICELINK

On ServiceLink, the same codes appear, but in the form of a table which can be read on the computer monitor. There is a column for each fault number, and following each fault number is a column providing an description. For an example, see **Table 3**.

NOTE: In this table, the dash fault numbers are replaced by PIDs (parameter identifiers) or SIDs (sub-system identifiers). The "type" column identifies the type of fault coding, whether PID or SID. The "ID" column identifies the actual fault number.

ServiceLink can read codes from any electronic control unit installed on the vehicle, including the engine ECU. Whereas the ICU MIDs indicate a bad gauge or a bad ICU, the engine MIDs indicate incorrect engine programming, bad speed/timing circuits, or bad engine rpm sensing.

ServiceLink Fault Messages						
MID	**Description**	**Type**	**ID**	**Description**	**FMI**	**Description**
140	Instrument Cluster, Left	PID	008	Tachometer	06	Ground
140	Instrument Cluster, Left	PID	008	Tachometer	05	Open
142	Instrument Cluster, Right	PID	022	Speedometer	06	Ground
142	Instrument Cluster, Right	PID	022	Speedometer	05	Open
128	Engine #1	SID	031	Tachometer Signal Output	01	Low
128	Engine #1	PID	084	Vehicle Speed Signal	00	High
128	Engine #1	PID	084	Vehicle Speed Signal	01	Low
128	Engine #1	PID	084	Vehicle Speed Signal	02	Erratic
128	Engine #1	PID	084	Vehicle Speed Signal	08	Abnl Freq
128	Engine #1	PID	084	Vehicle Speed Signal	10	Abnl Rate
128	Engine #1	PID	084	Vehicle Speed Signal	11	Not Identifiable
128	Engine #1	PID	084	Vehicle Speed Signal	12	Bad
128	Engine #1	PID	190	Engine RPM Signal	00	High
128	Engine #1	PID	190	Engine RPM Signal	02	Erratic
128	Engine #1	PID	190	Engine RPM Signal	08	Abnl Freq
128	Engine #1	PID	190	Engine RPM Signal	10	Abnl Rate

Table 3, ServiceLink Fault Messages

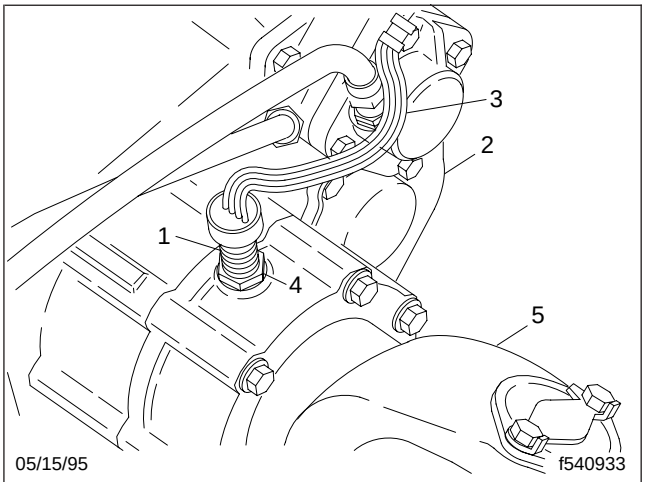
Troubleshooting

For corrective action on engine faults, see the applicable engine manufacturer's manual. If correcting the engine programming still does not solve the problem, check the speedometer magnetic sensor and the wiring.

Troubleshooting the Speedometer Magnetic Sensor

One type of fault that can not be detected by the ICU is a faulty or improperly installed speedometer magnetic sensor. Follow the instructions below to replace or readjust the magnetic sensor.

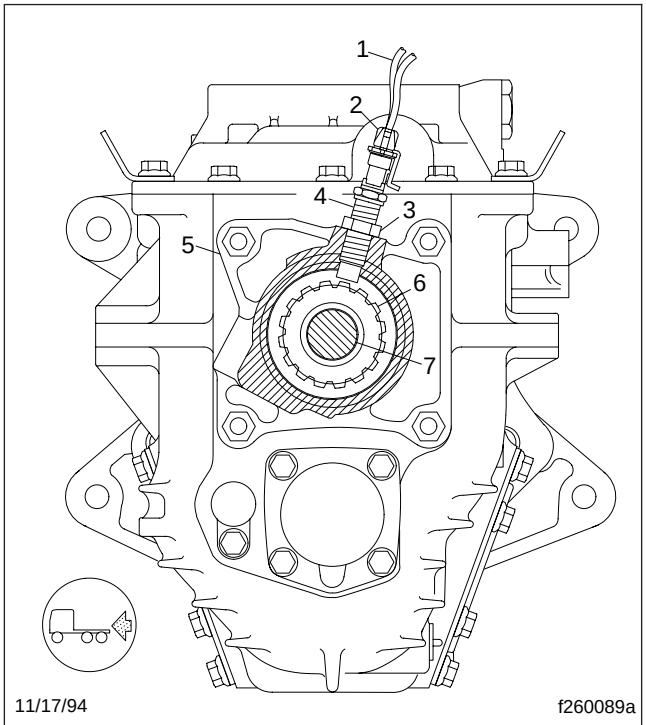
1. Apply the parking brakes, shut down the engine, and chock the tires.
2. Remove the magnetic sensor. See **Fig. 1**.
   - 2.1 Disconnect the electrical connector.



1. Magnetic Sensor
2. Transmission Housing
3. Sensor Wiring
4. Jam Nut
5. Drive Yoke

Fig. 1, Magnetic Sensor Installation

   - 2.2 Loosen the magnetic sensor jam nut. Turn the magnetic sensor until it comes out of the transmission bearing cover.
   - 2.3 On Rockwell transmissions only, check the bearing cover for an O-ring. Remove the O-ring if it did not come off with the sensor.
3. If installing a new sensor, leave the plastic shim on the end of the sensor. This shim serves as a gap gauge. On Rockwell transmissions only, install a new O-ring on the bearing cover.
4. Insert the sensor into the transmission and make sure it is properly adjusted. See **Fig. 2**.



NOTE: Eaton FS4005 series transmission shown

1. Speedometer Wiring
2. Electrical Connector
3. Jam Nut
4. Magnetic Sensor
5. Transmission Bearing Cover
6. Transmission Tailshaft Tone Wheel
7. Transmission Output Shaft

Fig. 2, Magnetic Sensor Installation (cutaway view)

   - 4.1 Back off the jam nut to the outboard end of the sensor.
   - 4.2 Turn the sensor by hand into the transmission bearing cover until it bottoms out inside the transmission.
   - 4.3 If no plastic shim is installed on the sensor, back the sensor out one-half turn.

NOTE: If the plastic shim is installed, do not back out the sensor. The gap has already been set by the plastic shim.

IMPORTANT: Maintain the correct sensor adjustment. Otherwise, the speedometer will not read correctly.

5. With the gap correctly adjusted, tighten the sensor jam nut and attach the electrical connector.
   5.1 Hold the sensor in place to keep it from turning. Tighten the jam nut 18 lbf·ft (25 N·m).
   5.2 Attach the electrical connector and make sure it is securely locked into place.
6. Remove the chocks from the tires.
7. Test drive the vehicle and check that the speedometer is operating correctly. If there is no speedometer reading, it may mean that the magnetic sensor was not adjusted correctly. Readjust the sensor or replace it with a new one, using the installation steps above.

Troubleshooting the Wiring

On the tachometer, the only wiring to troubleshoot is the wiring between the engine ECU and the ICU. On the speedometer, first troubleshoot the wiring from the magnetic sensor.

SPEEDOMETER MAGNETIC SENSOR TO ENGINE ECU

NOTE: Do these checks when troubleshooting the speedometer only.

1. Check the wiring between the magnetic sensor and the engine ECU.
   1.1 Check for an open circuit by connecting the ohmmeter leads to the engine ECU connector. See **Table 4** for sensor wire and pin numbers. Depending on engine type, the resistance measured should fall within 788 to 964 ohms.
   1.2 If the measured resistance is within the acceptable range, go to the next step.

   If the resistance is above the acceptable range, there is an open circuit in the wiring between the magnetic sensor and the engine ECU connector. Repair or replace any damaged wiring.

   If the resistance is below the acceptable range, there is a short circuit in the wiring between the magnetic sensor and the engine ECU connector. Repair or replace any damaged wiring.
2. Check the wiring between the magnetic sensor and the engine ECU for a short circuit to ground.
   2.1 Connect the positive lead from an ohmmeter to each wire and pin terminal, as above, and connect the negative lead to a good ground. If there is no short to ground, the ohmmeter should read infinite ohms. If there is a short to ground, the ohmmeter should read low ohms.
   2.2 If the resistance measured was less than infinite ohms, repair the short to ground in the respective circuit wiring.

ENGINE ECU TO ICU

NOTE: Do these checks when troubleshooting either the tachometer or the speedometer.

1. Check the wiring between the engine ECU connector and the electronic engine connector.
   1.1 Check for an open circuit by connecting the ohmmeter leads to the engine ECU connector. See **Table 5** for datalink wire and pin numbers by engine type. The resistance should measure 400 ohms. Any reading between 360 and 440 ohms is acceptable.
   1.2 If the measured resistance is within the acceptable range, go to the next step.

   If the resistance is above the acceptable range, there is an open circuit in the wiring between the engine ECU connector and the electronic engine connector. Repair or replace any damaged wiring.

   If the resistance is below the acceptable range, there is a short in the wiring between the engine ECU connector and the electronic engine connector. Repair or replace any damaged wiring.
2. Check the wiring between the electronic engine connector and the ICU.
   2.1 Connect the ohmmeter leads to pins 28 and 29 on the electronic engine connector

Troubleshooting

(wiring circuit numbers 1587+ and 1587–, respectively). In each case, the resistance should measure 400 ohms. Any reading between 360 and 440 ohms is acceptable.

2.2 If the measured resistance is within the acceptable range, go to the next step.

If the resistance is above the acceptable range, there is an open circuit in the wiring between the electronic engine connector and the ICU. Repair or replace any damaged wiring.

If the resistance is below the acceptable range, there is a short in the wiring between the electronic engine connector and the ICU. Repair or replace any damaged wiring.

3. Check the ICU pin connectors. Check pins A11 and B2 on the left-hand ICU connector (pink connector) for poor contact and bent or broken pins. Repair the pins or replace the connector as necessary.

Speed Sensor Wire and Pin Numbers in the Engine ECU		
Engine	**Wire Numbers**	**Pin Numbers**
Caterpillar (40-pin engine ECU connector)	C784 (+)	18
	C785 (–)	12
Cummins (28-pin engine ECU connector)	N03 (+)	3
	N07 (–)	7
Detroit Diesel (30-pin engine ECU connector)	D556 (+)	E2
	D557 (–)	E3

Table 4, Speed Sensor Wire and Pin Numbers in the Engine ECU

J1587 Datalink Wire and Pin Numbers in the Engine ECU		
Engine	**Wire Numbers**	**Pin Numbers**
Caterpillar (40-pin engine ECU connector)	C793 (+)	7
	C792 (–)	9
Cummins (28-pin engine ECU connector)	N27 (+)	27
	N08 (–)	8
Detroit Diesel (30-pin engine ECU connector)	D900 (+)	C2
	D901 (–)	C1

Table 5, Datalink Wire and Pin Numbers in the Engine ECU

General Information

The low voltage disconnect (LVD) module is located on the engine tunnel plate behind the dash lower console, or behind the HVAC cover assembly, depending on the configuration.

The low voltage disconnect module monitors battery voltage levels. If battery voltage falls below 12.3 volts, a red LED on the LVD flashes for 1 minute. If no action is taken during the 1 minute that the LED is flashing, an alarm starts beeping slowly for 30 seconds. If no action is taken to reduce the load after 30 seconds, the alarm then beeps quickly for 30 seconds. At the end of this 30 second interval, the LVD removes power to predetermined cab and sleeper circuits and a warning light on the dash illuminates.

NOTE: If the voltage at the batteries is checked just before the LVD cuts off power, the voltage may be lower than the cut off voltage of 12.3 volts. This is normal operation since the power-off function is triggered at 12.3 volts and the load is still draining the batteries. Once these accessories are shut off, the batteries typically recover to about 12.3 volts under the power-restore threshold of 12.8 volts (nominal).

As long as the battery voltage is under the power restore threshold, these accessories will not come back on. Either the truck must be started to bring the battery voltage back up, or a battery charger must be installed.

The LVD module provides input to the power distribution module to control the following cab circuits:

- Option 1 (circuit 44S)
- Option 2 (PDM address PD 47S)
- Dome light (PDM address PD 43S)
- Cigarette lighter (PDM address PD 41S)
- Sleeper (E-box) (PDM address PD 10S)
- Utility light (PDM address PD 15S)

The LVD module provides input to the power distribution module to control the following sleeper circuits:

- Main dome light (circuit 41S)
- Power receptacles #2, and #3 (circuits 57A, 57B, and 57C)
- Read/bag light (circuit 41R)
- Optional battery power (OPT)
- HVAC breaker (circuit 98)

When the battery voltage reaches 13.1 volts, or if the vehicle is started, the LVD module automatically reconnects power to the predetermined circuits.

The LVD module has a 60-second time delay to prevent false triggering and is equipped with internal short circuit protection, over-current protection, transient-voltage suppression, and thermal protection.

The LVD module has two terminal post connections and a ten-position connector. For the LVD module wiring diagram, see **Specifications 400**.

The two terminal post connections are V-in and V-out.

- The V-in terminal (circuit 14D) is the voltage supply input from the frontwall power stud.

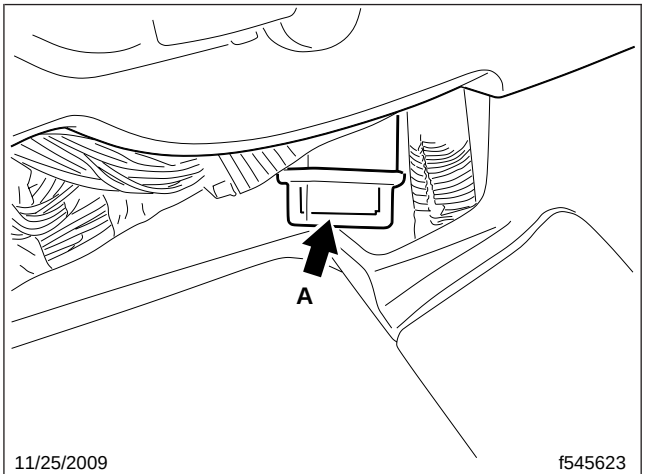
  Power is supplied to the V-in terminal by a 50 amp fuse located near the passenger-side footwell. See **Fig. 1**.

- The V-out terminal (circuit 14BS) is the controlled voltage output from the LVD module to the ISO bus power input terminal of the power distribution module (predetermined cab and sleeper circuits). It also supplies power to the buzzer diode.

Three of the terminals in the 10-position connector are used for the LVD system.

- The ground terminal (circuit GND) supplies ground for the module and is connected to the main ground junction box (MGJB).
- The buzzer diode control terminal (circuit 447J) supplies ground to the buzzer diode, which sounds when the LVD module detects low voltage.
- The V-sense terminal (circuit 447B) is used by the LVD module to monitor the level of battery voltage and is connected to 5-amp fuse B in the PNDB.

General Information



A. The 50 amp fuse is located near the passenger-side footwell.

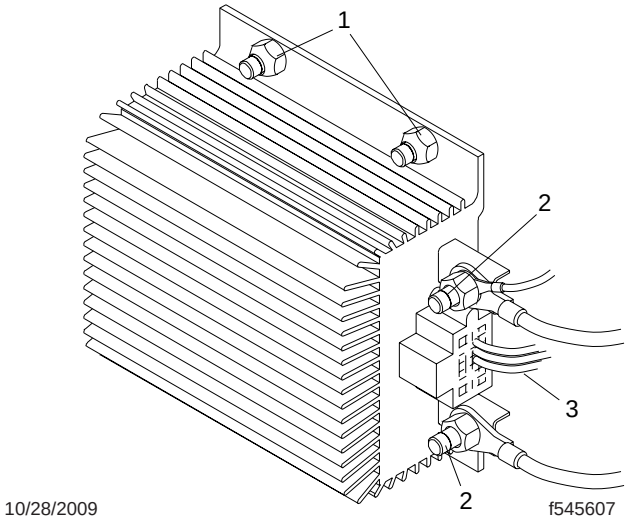
Fig. 1, 50 Amp Fuse

Low Voltage Disconnect Module Removal and Installation

Removal

NOTE: There are two possible locations for the LVD. It is either installed behind the dash lower console, or on the engine tunnel behind the footwell HVAC cover.

1. Park the vehicle and chock the tires.
2. On vehicles with the LVD installed behind the lower dash panel, remove the dash lower console. On vehicles with the LVD installed on the engine tunnel behind the footwell HVAC cover assembly, remove the dash center cover, the right-hand upper dash cover, the footwell HVAC cover assembly, and the cup holder assembly. See **Section 60.08** for instructions.
3. Remove the two battery cables. See **Fig. 1**.



1. Mounting Bolts
2. Battery Cables
3. Connector Plug

Fig. 1, Low Voltage Disconnect Installation

4. Remove the connector plug from the LVD.
5. Remove the four nuts that secure the LVD to the engine tunnel.
6. Remove the LVD.

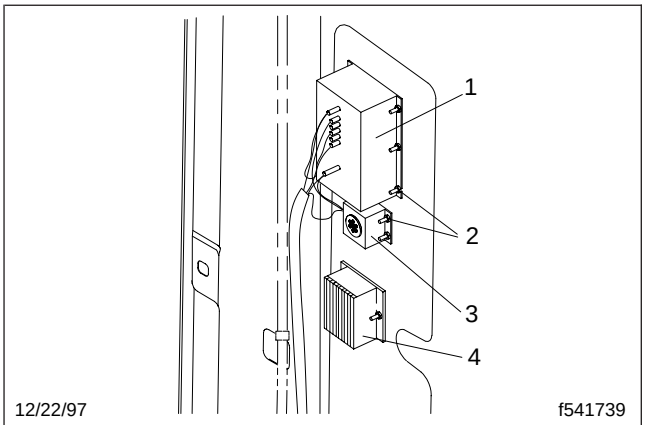
Installation

1. Secure the new LVD to the engine tunnel plate with four nuts. Tighten the nuts securely.
2. Install the connector plug.
3. Connect the battery cables.
4. Verify the operation of the LVD.
5. On vehicles with the LVD installed behind the dash lower console, install the dash lower console. On vehicles with the LVD installed on the engine tunnel, install the dash center cover, the right-hand upper dash cover, the footwell HVAC cover assembly, and the cup holder assembly. See **Section 60.08** for instructions.
6. Remove the chocks from the tires.

Low Voltage Disconnect Warning Buzzer Removal and Installation

Removal

1. Apply the parking brakes and chock the tires. Disconnect the batteries.
2. Open the electrical compartment door on the right-hand B-pillar, behind the seat. The low voltage disconnect warning buzzer is located below the low voltage disconnect module. See **Fig. 1.**



1. Low Voltage Disconnect Module
2. Mounting Hexnuts
3. Warning Buzzer
4. Daytime Running Lights Module

Fig. 1, Right-Hand B-Pillar Electrical Compartment

3. Remove the low voltage disconnect warning buzzer.
   - 3.1 Remove the electrical connector from the low voltage disconnect warning buzzer.
   - 3.2 Remove the two mounting hexnuts from the mounting studs attached to the B-pillar access door.
   - 3.3 Remove the low voltage disconnect warning buzzer from the electrical compartment door.

Installation

1. Install the low voltage disconnect warning buzzer onto the right-hand B-pillar electrical compartment door.
   - 1.1 Position the low voltage disconnect warning buzzer on the two mounting studs attached to the B-pillar electrical compartment door.
   - 1.2 Install the two mounting hexnuts and tighten them firmly.
   - 1.3 Install the electrical connector to the low voltage disconnect warning buzzer.
2. Close the electrical compartment door.
3. Connect the batteries and remove the chocks from the tires.

Functional Test

NOTE: If the LVD deactivates (removes power to the cab/sleeper loads), it needs to be reset prior to performing a functional test. If the batteries are discharged below 12.3 volts, charge the batteries before performing any troubleshooting procedures. The LVD can be reset by starting the engine. Once the LVD senses 13.1 volts or more, it resets automatically.

1. Shut down the engine.
2. Unplug the 10-position connector from the LVD.
3. Remove wire 447B from cavity E on the connector, and wrap a small piece of electrical tape around the exposed wire.
4. Insert the plug into the LVD with wire 447B still removed.

NOTE: The red LED indicator light on the LVD should turn ON when the connector is inserted.

5. Insert a metal conducting probe into cavity E of the connector, making sure contact is made between the metal probe and pin E on the LVD.
6. Connect a jumper wire between the terminal on wire 447B and the test probe inserted in cavity E.

NOTE: The electrical loads such as dome lights will remain OFF even though an electrical connection exists between circuit 447B and pin E. The LVD needs to be reset after removing the plug from the LVD.

7. Reset the LVD by starting the engine. The dome lights should come back ON, and the red LED indicator light on the LVD should turn OFF.
8. Shut down the engine.
9. Remove the metal test probe from cavity E.

NOTE: After removing the test probe, there will be a delay before the LVD disconnects the cab/sleeper loads. If equipped with the optional warning buzzer, it will sound for 60 seconds. After the time delay, the cab/sleeper loads (dome lights, for example) will shut OFF, and the optional warning buzzer will shut OFF.

10. Disconnect the jumper wire from 447B.
11. Remove the 10-position connector from the LVD.
12. Insert wire 447B into cavity E of the connector.
13. Insert the connector into the LVD.
14. Start the engine to reset the LVD.
15. If the LVD does not operate properly after performing the functional test, perform the troubleshooting procedures in this subject.

Troubleshooting Table

Low Voltage Disconnect System

Refer to **Table 1** to troubleshoot the low voltage disconnect system.

Refer to **Specifications 400** for a wiring diagram of the LVD.

NOTE: The warning alarm is an option that is not present on all vehicles. Verify that the vehicle has the warning alarm option. Some LVD modules are designed to disconnect at 12.3 volts. Check the option code to find out which model is under test.

Low Voltage Disconnect System Malfunctions	
Possible Cause	**Remedy**
Voltage goes below 12.1 volts without the LVD disconnecting.	See **Table 2**.
The LVD system is always activated – no power on the ISO terminal of the Main PDM.	See **Table 3**.
No warning alarm operation when LVD activates.	See **Table 4**.
LVD system cuts power to accessories when the key is in the OFF position.	See **Table 5**.

Table 1, Low Voltage Disconnect System Malfunctions

Troubleshooting

Voltage Goes Below 12.1 Volts Without the LVD Disconnecting			
Step	**Test Procedure**	**Test Result**	**Action**
1	Test the voltage at the BATT terminal on the PDM. Is the voltage at or below 12.1 volts?	Yes	Go to step 2.
		No	Without starting the engine, turn the headlights on, and as many electrical loads as manageable, to draw the batteries down. As the voltage drops to/below 12.1 volts, go to step 2.
2	Is the LED on the LVD module illuminated steady or flashing?	Flashing	Monitor the voltage at the ISO terminal of the PDM for the next two minutes. If the LVD is also equipped with an audible alarm, it will begin to beep after the LED flashes for one minute. Go to step 3.
		Illuminated	When the light is on steady, the LVD has disconnected voltage. Measure the voltage at the ISO terminal of the PDM. If there is still battery voltage at the ISO terminal of the main PDM, replace the defective LVD module. If battery voltage is not present at the ISO terminal, the LVD has properly disconnected power. There is no problem per the reported symptom.
		Steady	The module is not recognizing a low voltage situation. If battery voltage goes below 12.0 volts with no activity from the LVD, replace the LVD.
3	The alarm beeps slowly for 30 seconds then rapidly for 30 seconds. After the LED flashes for two minutes and is at the end of the alarm cycle, the LVD disconnects the output to the ISO terminal of the PDM and the LED illuminates steadily. Measure the voltage on the ISO terminal of the PDM. Is battery voltage present?	Yes	If the LED continues to flash for more than two minutes or if it is on steady, the module is not disconnecting power. Replace the LVD.
		No	The LVD disconnects power. There is no problem per the reported symptom. Reset the system by starting the engine. When system voltage is greater than 12.8 volts, the LVD will reconnect power to the ISO circuit.

Table 2, Voltage Goes Below 12.1 Volts Without the LVD Disconnecting

LVD System Always Activated			
Step	**Test Procedure**	**Test Result**	**Action**
1	Measure the voltage at the BAT terminal on the PDM. Is the voltage at or close to 0 volts?	Yes	Go to step 3.
		No	Measure the voltage on the ISO terminal of the PDM. If the voltage is at or close to 0 volts, go to step 2. Otherwise, go to step 3.

LVD System Always Activated			
Step	**Test Procedure**	**Test Result**	**Action**
2	Start the engine and measure the voltage on the BAT terminal of the PDM. When the voltage is above 12.8 volts, the LVD should reconnect power to the ISO terminal. If the voltage on the BAT terminal does not go above 12.8 volts, go to step 3. Otherwise, when it does, measure the voltage on the ISO terminal. Is battery voltage present?	Yes	The LVD is reconnecting power correctly. No further action is necessary.
		No	Check the 50-amp in-line fuse located in the passenger side footwell. If the fuse is open, determine the cause of the short; it could be the LVD module, or the wiring before or after it and through the PDM. Also, check the 5-amp fuse in the PNDB that sources the sense signal to the LVD. If the fuse is open, determine the cause of the short, which may be the LVD module or circuit 447B.
3	Measure the voltage at the batteries. Is battery voltage close to 12 volts?	Yes	Locate and repair an open circuit feeding the main PDM. Check the pass-through stud on the frontwall directly below the PDM and the 175-amp fuse, F3 in the PNDB.
		No	Recharge the vehicle batteries then repeat this testing.

Table 3, LVD System Always Activated

No Warning Alarm Operation When LVD Activates			
Step	**Test Procedure**	**Test Result**	**Action**
1	Measure the voltage at the BAT terminal on the PDM. Is the voltage at or above 12.4 volts?	Yes	Without starting the engine, turn the headlights and as many electrical loads as manageable on to draw the batteries down. As the voltage drops to/below 12.1 volts, go to step 2.
		No	Reset the LVD by starting the engine to bring system voltage above the disconnect threshold. When power is reconnected, repeat this test.
2	When the system voltage drops to the cut off threshold, the LED on the LVD module will begin to flash. After one minute of flashing, the alarm will begin to beep slowly if the LVD is equipped with alarm option. Does the alarm beep?	Yes	The system is working normally.
		No	The alarm is internal to the LVD and is not serviceable separately. Replace the LVD module.

Table 4, No Warning Alarm Operation When LVD Activates

LVD System Cuts Power to Accessories when the Key is in the OFF Position			
Step	**Test Procedure**	**Test Result**	**Action**
1	Measure the voltage at the batteries. Is the voltage above 12.4 volts?	Yes	Check the wiring at the LVD. Make sure circuit 14D is connected to the LVD V_In terminal, and that circuit 14BS is connected to the V_Out terminal. If not, switch the circuits.
		No	The LVD is working properly.

Table 5, LVD System Cuts Power to Accessories when the Key is in the OFF Position

For a wiring diagram of the low voltage disconnect system, see **Fig. 1**.

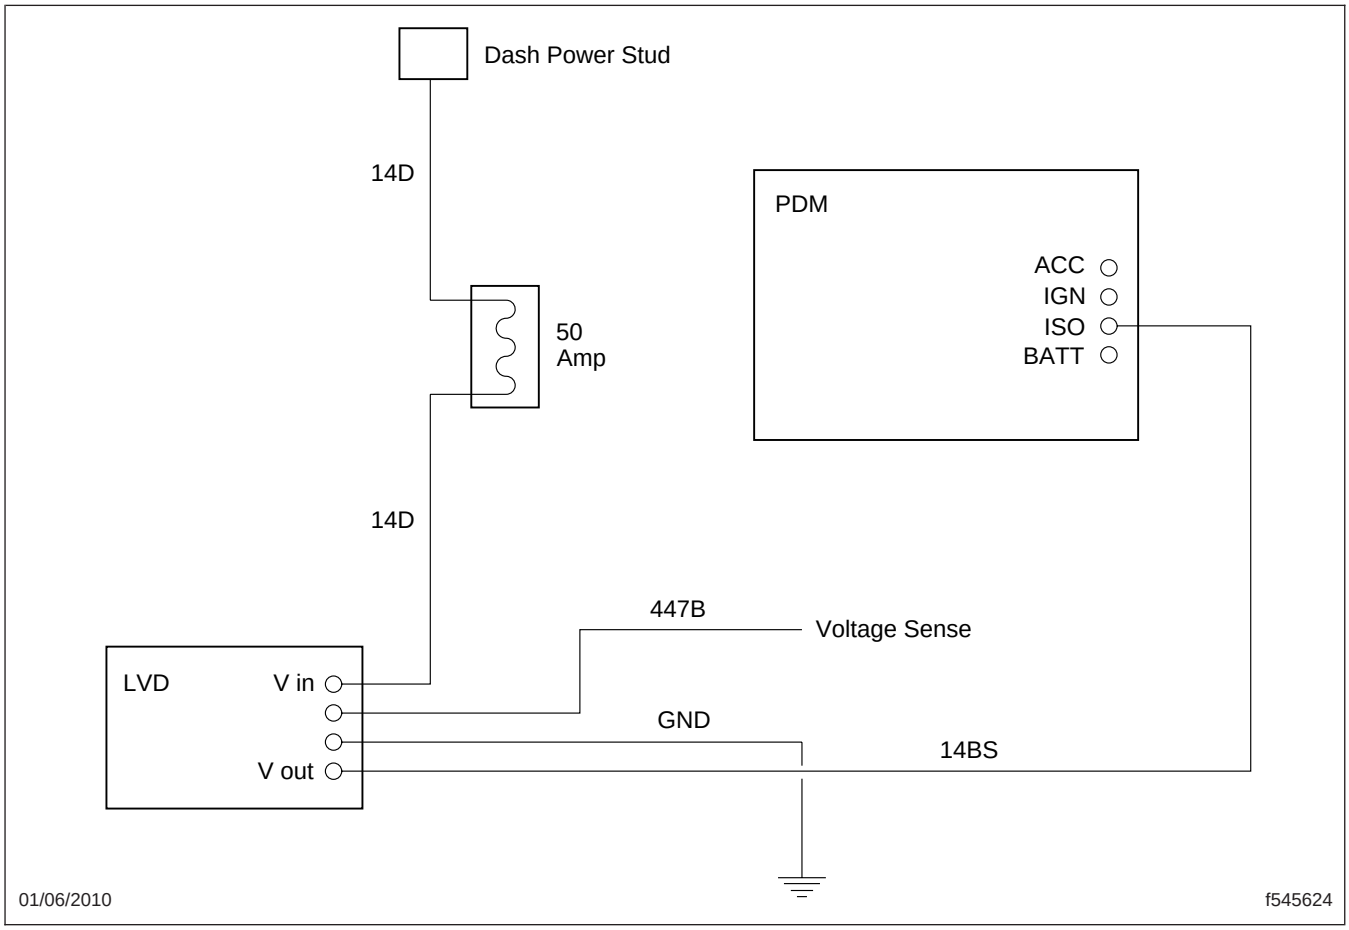


Fig. 1, Wiring Diagram, Low Voltage Disconnect System

IMPORTANT: The level III ICU is also known (on ServiceLink) as the ICU2M.

General Description

This section covers the optional instrumentation control unit, level III (level III ICU).

The original version of the ICU (ICU1) was installed on vehicles built until May, 1998 and was replaced by the level III ICU (ICU2M) on that date. For more information about the original version of the ICU, see **Section 54.03**.

NOTE: For information about the standard level II ICU, see **Section 54.14**.

LEVEL III ICU (ICU2M)

The level III ICU is an advanced programmable electronic dashboard that accepts input from electrical/magnetic vehicle sensors and converts it into digital output that can be fed to an electronic gauge. Only air gauges operate mechanically.

The level III ICU has only one 16-bit microprocessor. This eliminates the need for the right-hand (blue) connectors found on the original ICU, and allows enhanced programmability of the parameters that regulate how, and how long, data is displayed on the various alert and data screens.

There can be up to 14 removable gauges (11 electronic, one electromechanical, and two mechanical) on the driver's instrument panel.

Driver Message Center

The heart of the ICU is the Driver Message Center. It has two parts, a set of 18 warning and indicator lights similar to those found on a conventional lightbar, and a dash driver display screen. The dash driver display screen is a 2-line by 20-character vacuum fluorescent display that provides a wide range of information to the driver.

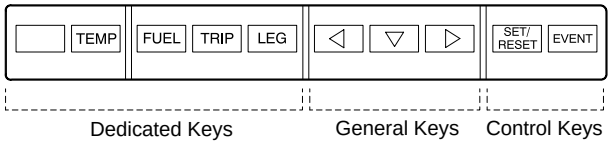
Some of the information that can be provided by the message center includes:

- odometer readings
- outside air temperature
- messages from remote locations such as company docks and offices, shipper's terminals, etc. (if equipped with a communications system, such as Qualcomm)
- trip information, such as trip miles and hours, idle hours, average mph, and leg miles and hours
- fuel information, such as fuel used and miles per gallon, fuel used idling, and PTO fuel used
- engine information, such as miles, hours, gallons of fuel used, and PTO fuel used
- diagnostic information, such as listings of active faults and troubleshooting information
- vehicle information, such as datalink operation and use data, dash part number, and software number

KEYPAD

The ICU is controlled by a keypad located on the auxiliary dash panel. See **Fig. 1**. This keypad, which has 10 keys, can be used to do the following things:

- Call up information onto direct access screens by pressing the appropriate key.
- Move about from screen to screen while the vehicle is stationary.
- Set up the display.
- Record significant data using the EVENT key.



To reset a screen, press the SET/RESET key twice.

Fig. 1, Keypad

NOTE: One key is blank and is not usable at this time.

To set, press the SET/RESET key once. To reset, press the SET/RESET key once. The confirmation screen appears: PUSH RESET AGAIN/TO CONFIRM CLEAR. Now press the SET/RESET key for a second time.

LEVEL III ICU ADVANCEMENTS

The level III ICU is installed, as an option, on vehicles built on or after May, 1998. It provides the features of the original ICU (with one exception), as well as the following advanced features not found on the original version:

- target miles per gallon (MPG), which allows easy comparison of actual fuel mileage to a target mileage.
- brightness control, which allows the brightness of the display to be adjusted independently of the panel lights.

NOTE: Temporarily, the "Faulty Speedo Gauge," or alternate speedometer, screen will not be available on the level III ICU.

Target MPG

The target MPG feature allows quick and easy checking of fuel economy through the "MPG Graph/ Target MPG..Odometer" screen. See **Fig. 2**.

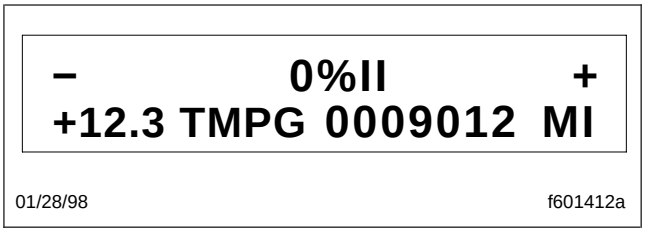


Fig. 2, MPG Graph/Target MPG..Odometer Screen

NOTE: Use the LEFT ARROW key to lower the target MPG, and the RIGHT ARROW key to raise it. Press the SET key to save the target MPG setting. For more information on how to set target MPG, see "Setup Information" later in this subject.

The "Target MPG" area is on the second line of the display, to the left of the odometer.

Example: A reading of "12.3 TMPG" indicates that the target MPG is 12.3 miles per gallon.

The "MPG Graph" on the first line of the display gives the same information in dynamic form. The "0%" mark in the center of the line represents the target MPG. Bars showing to the right of the display indicate that short term fuel economy is above the target; bars showing to the left of the display indicate that short term fuel economy is below the target.

Brightness Control

The panel light dimmer switch normally controls the brightness of all panel and gauge lights, including the level III ICU dash driver display. With the parking brake set, the ICU keypad can control the brightness of the display independently of the other lights. If the panel lights are set to maximum brightness, the display cannot be brightened any further.

NOTE: Use the LEFT ARROW key to dim the display, and the RIGHT ARROW key to brighten it. Press the SET key to save the brightness setting. For more information on how to set the brightness of the display, see "Setup Information" later in this subject.

When the parking brake is released, the arrow keys no longer work to change the brightness of the display, but the settings stay in effect unless the headlights are turned on. With the headlights on, the display dims slightly to adjust to night-time conditions.

Principles of Operation

IGNITION SEQUENCE

When the ignition is turned on, the level III ICU runs through the ignition sequence. See **Fig. 3**. If the headlights are turned on, the screen displays the odometer and waits for the ignition to be turned on.

IMPORTANT: When the ignition is first turned on, all the electronic gauges complete a full sweep of their dials, the warning and indicator lights light up for five seconds, and the alarm sounds for two seconds.

Once the ignition has been turned on, the screen displays the "Freightliner" message. At the same time, the ICU conducts a roll call of all the electronic control units (ECUs) installed on the vehicle, looking for active faults.

If there are no active faults, the screen displays the "Fasten Seat Belts/Odometer" screen.

If, however, the ICU has received active fault codes, or an electronic control unit (ECU) fails to respond to the roll call, it shows the "Active Faults" screen and displays the number of active faults, up to a total of eight. If desired, press RIGHT ARROW to see the active fault codes. Otherwise, press LEFT ARROW,

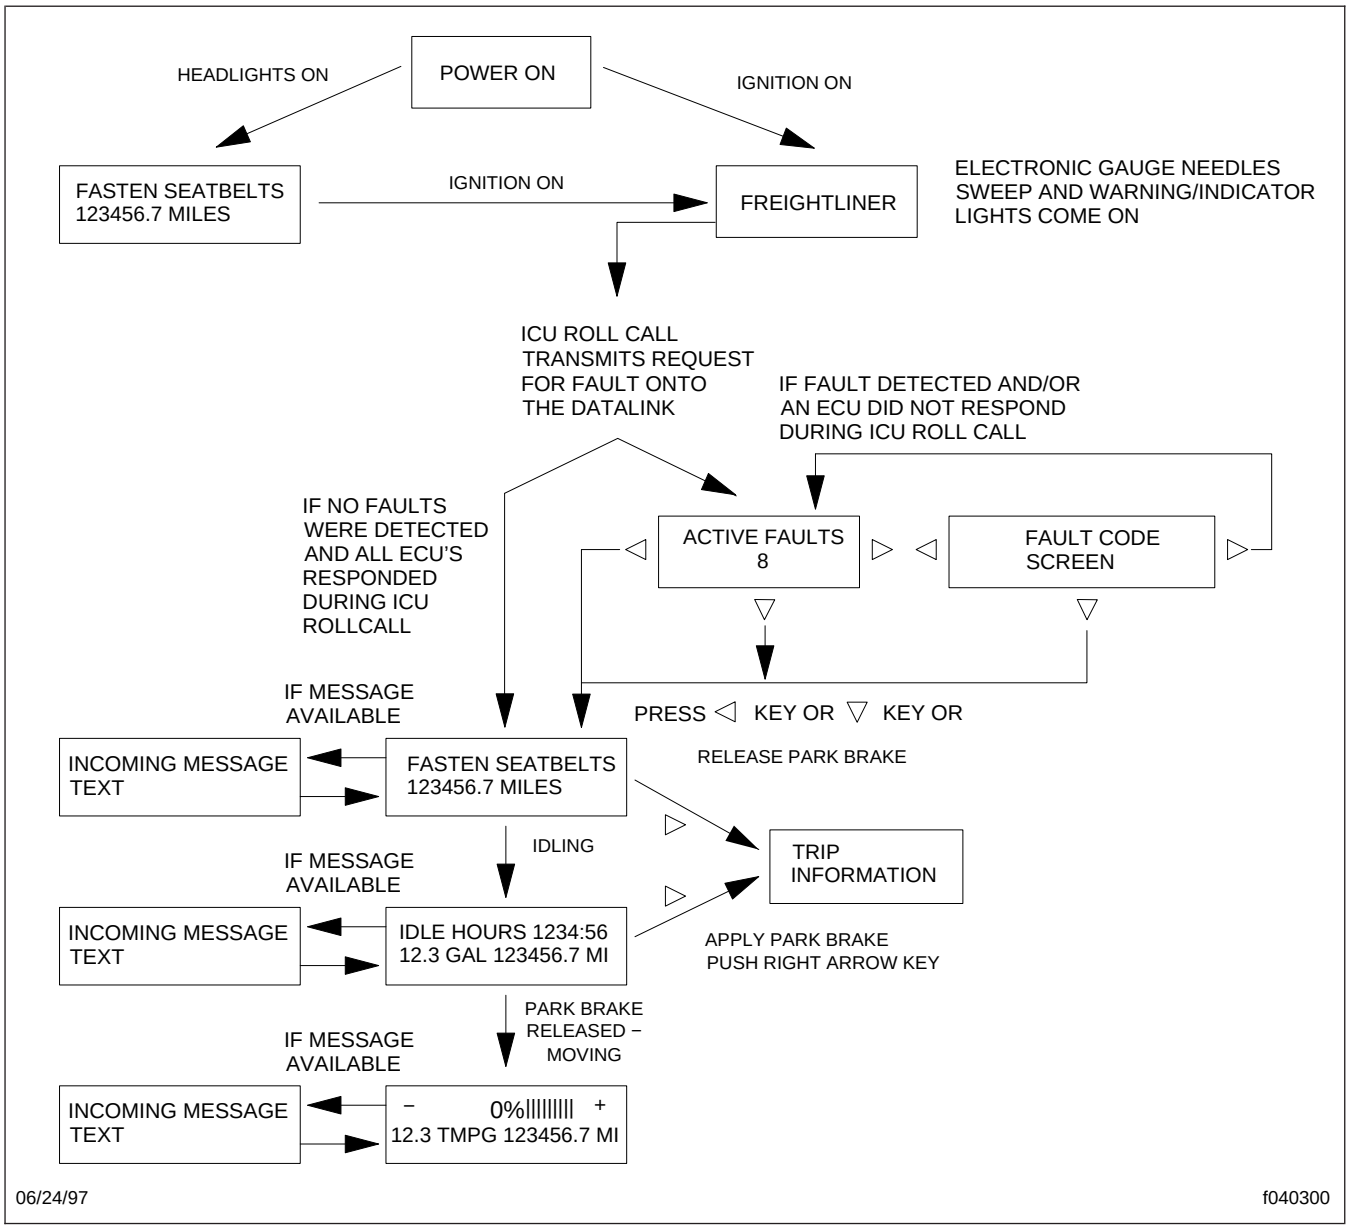

Fig. 3, Level III ICU Ignition Sequence

or, if the engine is on, release the parking brake to go on to the "Fasten Seat Belts/Odometer" screen.

Unless the engine is running, the ignition sequence ends with the "Fasten Seat Belts/Odometer" screen.

NOTE: At this point, if the vehicle has a communications system and an incoming message is available, it will be displayed. To dismiss the incoming message, press any key on the keypad.

With the engine idling (the vehicle not moving), the ignition sequence cycles on, and displays the "Idle Hours/Idle Gallons..Odometer" screen.

NOTE: To understand the information displayed on the message screen, here is an example of

screen layout. On the "Idle Hours/Idle Gallons..Odometer" screen (see **Fig. 4**), idle hours are displayed on the top line with the words "Idle Hours" on the left side of the screen and the number of hours on the right. On the bottom line, the number of idle gallons is on the left and the odometer miles are on the right, with a space in between.

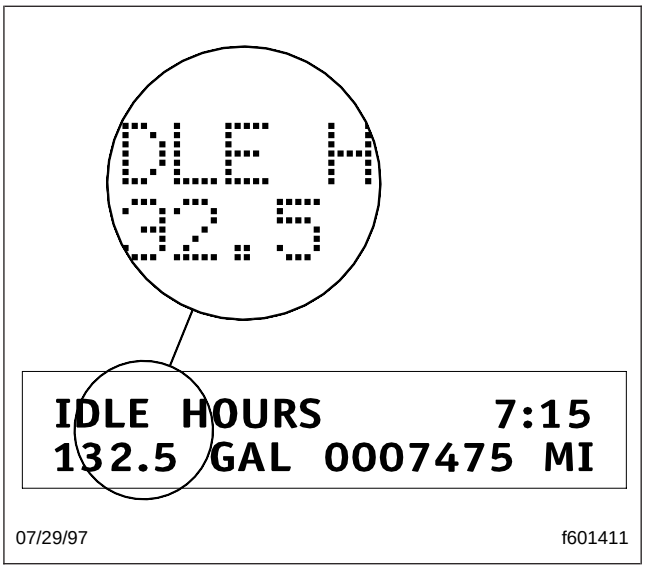

Fig. 4, Idle Hours/Idle Gallons..Odometer Screen

Once the parking brake is released (whether the vehicle is moving or not), the regular message screen display is the "MPG Graph/Target MPG..Odometer" screen. The Target MPG graph compares the actual short term fuel economy with the pre-set target value. The MPG value shows the actual target MPG. See **Fig. 2**.

NOTE: To set the target value, see "Setup Information" later in this subject.

ICU ROLL CALL

Each time the ignition keyswitch is turned on, the ICU roll call function requests data from each ECU on the databus. If the ECU does respond to this request, the databus is communicating with that ECU and no fault code is displayed.

NOTE: Each ICU is configured to receive responses from a list of selected ECUs, as installed on that particular vehicle.

If the ECU does not respond to this request, the ICU displays an active fault code that indicates the databus is not communicating with that ECU. For sample fault codes of this type, see **Table 1**.

If the ICU does not receive a signal on the J1587 datalink from one or more of the active ECUs, it displays a roll call fault. The roll call fault is displayed *only* on the dash driver display screen. It is not broadcast on the datalink; therefore, it cannot be read by ServiceLink.

NOTE: Although the reporting unit for this fault is the ICU, the message identifier (MID) of the non-responding unit is displayed (not broadcast on the datalink). This is not technically correct, but it is more informative, since it identifies the unit that is not responding.

IMPORTANT: The ICU will report a roll call fault for the Qualcomm or HighwayMaster communications systems when the system control unit, or ECU, is connected properly and the system is working correctly. This fault message occurs because the ECU cannot support the roll call function. If this happens, disable the roll call function for this device on the ICU parameter list. See **Table 1**.

To troubleshoot the Qualcomm system, have an incoming test message sent to the unit in the vehicle and make sure that it is received properly.

To troubleshoot the HighwayMaster system, see Section 54.13, **Troubleshooting, 300**.

ODOMETER

The odometer is a seven-digit display with one decimal point after the sixth digit, allowing it to display tenths of miles (or kilometers).

Roll Call Fault Codes	
Fault Code	**Description**
ENG Controller NoRESPONSE128s254 07	The engine ECM did not respond
Trans Controller NoRESPONSE130s254 07	The electronic transmission ECU did not respond
Brake Controller NoRESPONSE136s254 07	The antilock brake system (ABS) ECU did not respond
SUSP Controller NoRESPONSE150s254 07	The electronic suspension (ECAS) did not respond
CMPTR Controller NoRESPONSE179s254 07	The data logging unit (DLU) did not respond
Sat1 Controller NoRESPONSE181s254 07	The Qualcomm® communications system did not respond *
A/C Controller NoRESPONSE190s254 07	The air conditioning protection unit (ACPU) did not respond
Radar Controller NoRESPONSE219s254 07	The VORAD collision warning system did not respond
Sat1 Controller NoRESPONSE231s254 07	The HighwayMaster® communications system did not respond *
SPACE Controller NoRESPONSE232s254 07	The seat belt pre-tensioning system (SPACE) did not respond

* This system control unit cannot support the roll call function.

Table 1, Roll Call Fault Codes

When first installed, the odometer starts at 0.0 miles (or kilometers). When replaced, the odometer does not start with the engine miles, but starts again from 0.0 and cannot be changed, either up or down.

IMPORTANT: Although the odometer uses data supplied by the engine ECM to update its count, it keeps its own mileage starting from the zero point, which marks where it was first installed.

ALERT SCREENS

Alert screens can appear at any time, even when the vehicle is moving; they override the regular screen display. They are warnings, cautions, or other messages that require the driver's attention, but not all of them are critical to the operation of the vehicle.

Alert screens appear whenever the condition occurs. All priority 1 and 2 messages, plus "Turn Signal On" (priority 5) show the word "WARNING," blinking on and off, on the first line of the display.

NOTE: Warning messages always display at full brightness.

There are currently 10 alert screens arranged in six priority levels. See **Table 2**.

Priority 1 Screen

The "Park Brake On" screen overrides any other screen message.

General Information

Alert Screen Priority Levels	
Priority	**Alert Screen Description**
1	Park Brake On
2	Low Oil Pressure
	High Coolant Temp
	Low Coolant Level
	Low Voltage
3	HVAC Recirculation Messages (2)
4	Turn Signal On
5	Incoming Message
6	No Datalink Activity

Table 2, Alert Screen Priority Levels

The "Park Brake On" screen comes on, with the alarm sounding, only when the vehicle is moving at a speed greater than 2.5 miles per hour, or if the clutch is depressed. See **Fig. 5**. It can be dismissed, and the alarm turned off, only by releasing the parking brake.

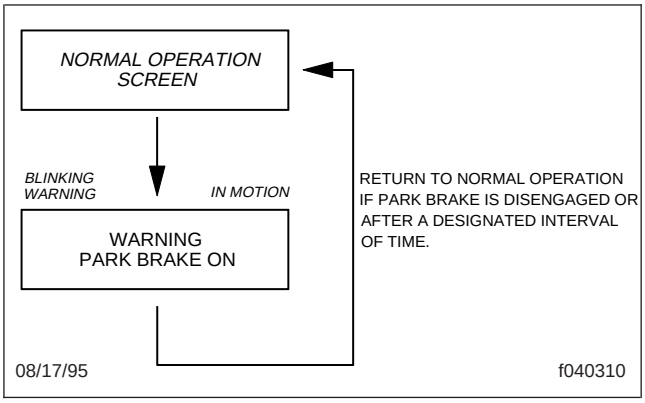

Fig. 5, Park Brake On

If the "Park Brake On" screen remains on after the brake is physically released, check the parking brake switch for proper function.

Priority 2 Screens

The "Low Oil Pressure" screen comes on whether the vehicle is idling or in motion. See **Fig. 6**.

The "High Coolant Temp" screen has the same priority as "Low Oil Pressure." See **Fig. 7**. The same is true of "Low Coolant Level" (see **Fig. 8**) and "Low Voltage" (see **Fig. 9**).

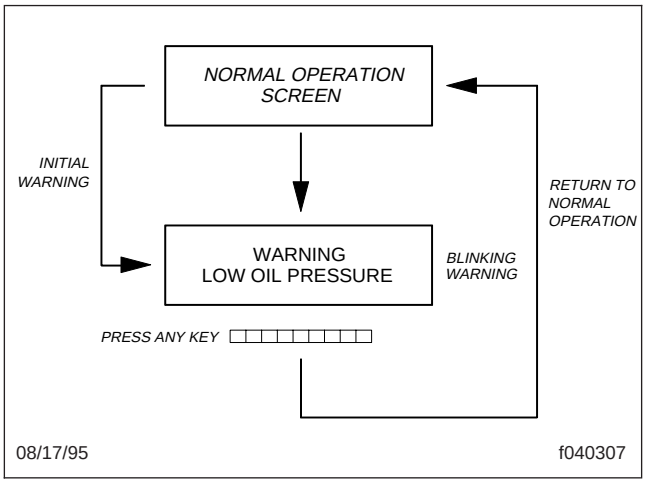

Fig. 6, Low Oil Pressure

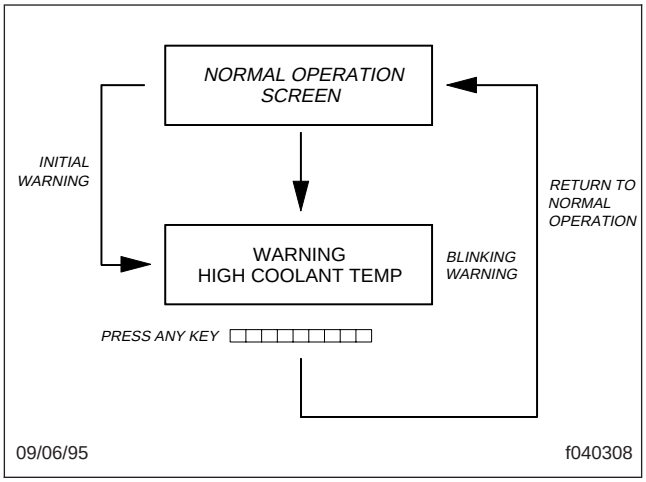

Fig. 7, High Coolant Temperature

Priority 2 screens appear on the dash display as soon as the message is received on the datalink and remain on until any key is pressed. After a key is pressed, the message is dismissed and the dash display returns to the previous screen.

If more than one alert screen message is received, pressing any key dismisses the first message and displays the next, and so on until all the messages have been received.

After 30 seconds, the message is displayed again, and can be dismissed, as before, by pressing any key.

NOTE: Priority 2 screens do not override the ignition sequence (the sequence that runs when

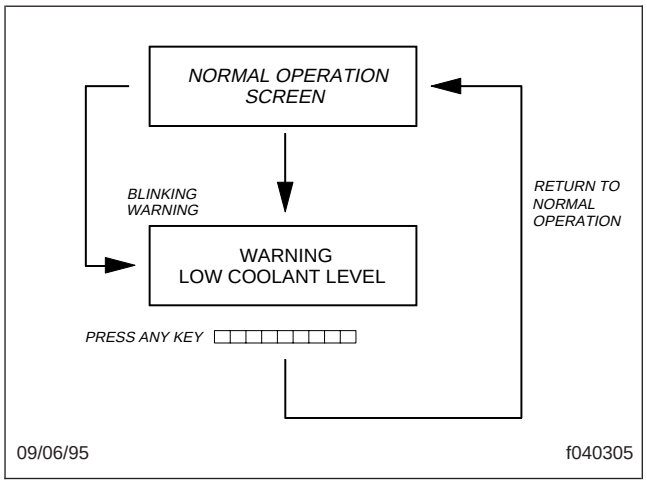

Fig. 8, Low Coolant Level

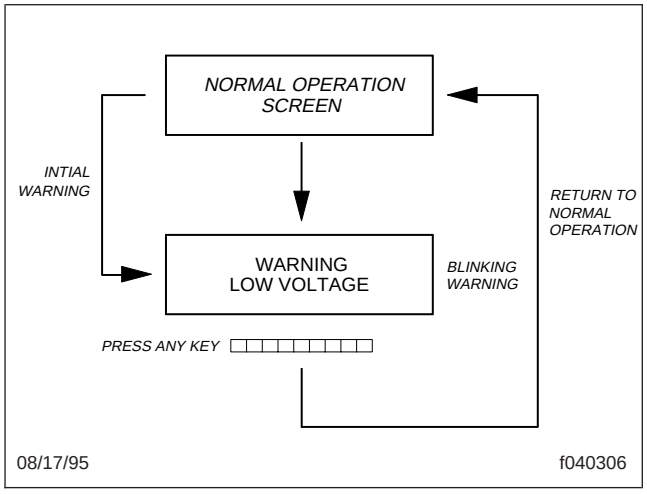

Fig. 9, Low Voltage

the ignition keyswitch is first turned on). Instead, they are displayed as active faults. Press RIGHT ARROW to see the active faults. For more information on the ignition sequence, see "Ignition Sequence" in this subject.

Priority 3 Screens

There are two HVAC (heating, ventilation, and air conditioning) recirculation screens: "Recirc Mode Engaged" and "Provide Fresh Air."

The "Recirc Mode Engaged" screen comes on whenever recirculated air is selected on the fresh/air recirculation switch, or the air circulation switch is rotated to the maximum air conditioning position. See **Fig. 10**. It displays one time only for seven seconds and notifies the driver that recirculated air is being used and that fresh air needs to be provided within at least 20 minutes.

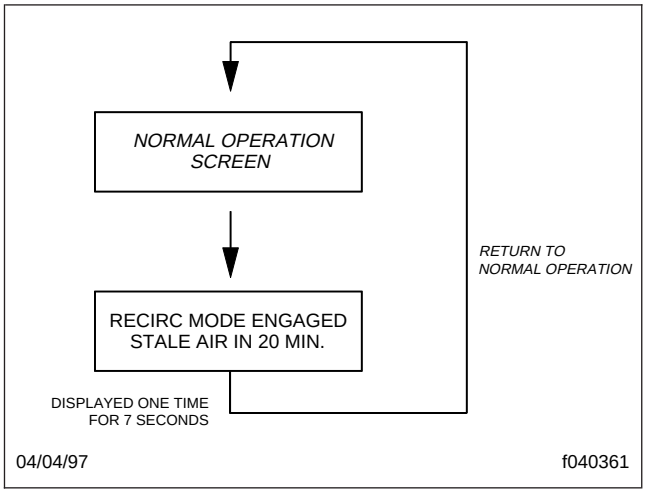

Fig. 10, Recirc Mode Engaged

If fresh air is not provided within that time span, the "Provide Fresh Air Message" is displayed. See **Fig. 11**. It displays for seven seconds every 254 seconds until the driver switches to fresh air, either by selecting fresh air on the fresh/air recirculation switch, or by rotating the air circulation switch away from maximum air conditioning and to one of the other positions.

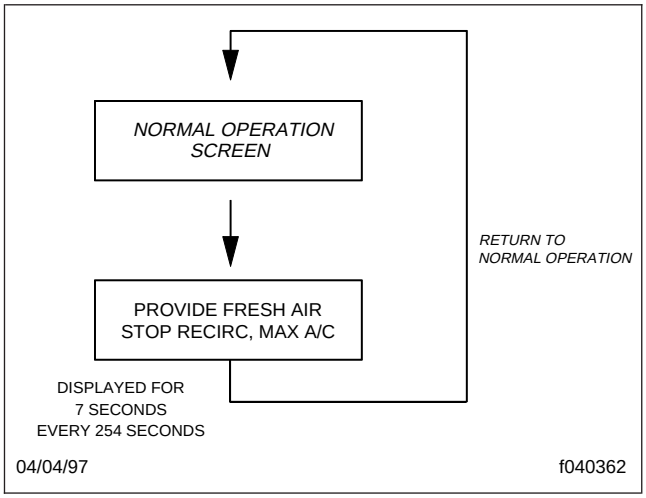

Fig. 11, Provide Fresh Air

Priority 4 Screen

The "Turn Signal On" screen is also connected to the alarm (the alarm connection can be disabled, if desired). See **Fig. 12**. It notifies the driver that the turn signal is on. On vehicles equipped with daytime running lights, the daytime running light is not on when the turn signal is flashing.

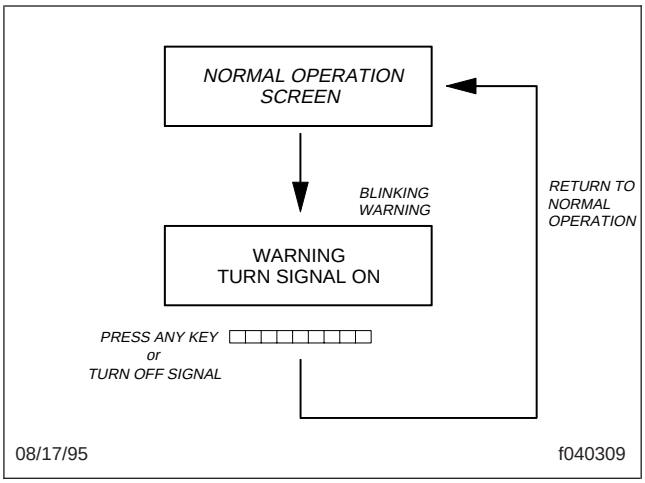

Fig. 12, Turn Signal On

To dismiss this screen, either turn off the turn signal, or press any key.

Priority 5 Screen

The "Incoming Message" screen comes on whenever the communications system receives a message. See **Fig. 13**. It displays one time only and can be dismissed by pressing any key.

NOTE: The "Incoming Message" screen will also display during the ignition sequence, if a message is available.

Priority 6 Screen

The "No Datalink Activity" screen comes on whenever the datalink is not receiving data. See **Fig. 14**.

This screen is a diagnostic tool. For information on how to use this screen to check the datalink wiring, see **Troubleshooting, 300**.

DIRECT ACCESS SCREENS

The driver can also override the regular screen display at any time by pressing the keypad to display

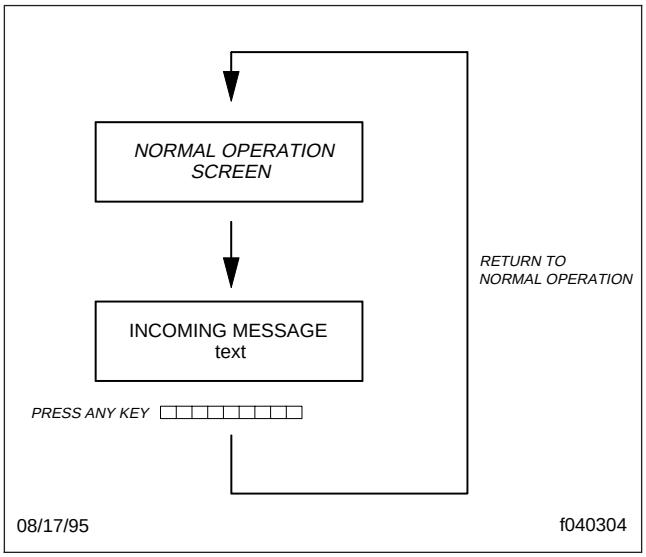

Fig. 13, Incoming Message

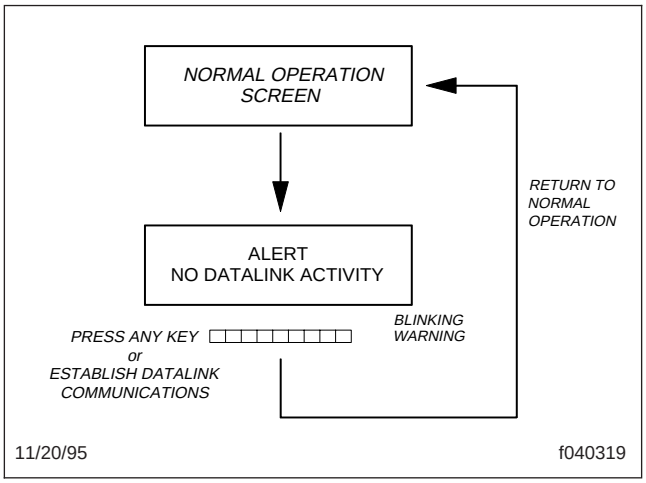

Fig. 14, No Datalink Activity

one of the direct access screens. For a list of the direct access screens, see **Table 3**.

To reset the data displayed on TRIP, FUEL or LEG screens back to zero, press the SET/RESET key twice with the screen displayed.

NOTE: Resetting "Trip Miles and Hours" also resets "Leg Miles and Hours."

Use the EVENT key to record data about a significant driving event (engine problem, driving problem, unusual vehicle operation, etc.). The other keys are used for informational purposes.

Key	Screen Contents	Reset?
TRIP	TRIP MILES 123456.7 TRIP HOURS 1234:56	Yes
FUEL	FUEL USED 12345.6 AVERAGE MPG 12.34	Yes
LEG	LEG MILES 123456.7 LEG HOURS 1234:56	Yes
EVENT	DATA BEING RECORDED	No
TEMP	OUTSIDE AIR TEMPERATURE -12F	No

Table 3, Direct Access Screens

NOTE: Normally, the screen displays DATA BEING RECORDED as shown in **Table 3**. However, if the memory in the data logger is full, the screen instead displays MEMORY FULL/DATA NOT RECORDED. If the data logger is not connected or not responding, the screen displays DATA RECORDER/NOT RESPONDING. If the EVENT key was pressed recently (within the last two minutes), the screen displays STILL RECORDING/LAST EVENT.

All keys display their data for a programmable period of time. This time period is a *resettable parameter* and can be set individually for each direct access screen.

Except for the Event screen, direct access screens can have their display time reset independently of each other, to display for from one to 254 seconds at a time, or to stay on until any key is pressed. Resetting the Trip, Fuel, or Leg screen in direct access also resets the display time for the corresponding screen when the vehicle is not moving. For more information, see "Stationary Access Screens."

The time of display on the Event screen cannot be reset except at the factory.

STATIONARY ACCESS SCREENS

The stationary access screens are a series of informational displays that give driver, maintenance, and setup information.

For reasons of safety, stationary access screens can be seen only when the vehicle is not moving and the parking brake is applied.

There are six sets of stationary access screens:

- Trip Information (see **Fig. 15**)
- Fuel Information (see **Fig. 15**)
- Engine Information (see **Fig. 15**)
- Diagnostic Information (see **Fig. 16**)
- Setup Information (see **Fig. 17**)
- Vehicle Information (see **Fig. 17**)

Each set of stationary access screens has a title screen followed by one or more data screens. To move forward and backward through these screens, use the three arrow keys as shown in **Fig. 15**, **Fig. 16**, and **Fig. 17**.

Trip Information

Trip information provides three data screens: "Trip Miles and Hours," "Idle Hours and Average MPH," and "Leg Miles and Hours." See **Fig. 15**.

"Trip Miles and Hours" displays the number of miles and hours driven since the start of the trip. At the start of a trip, press RESET (SET/RESET twice) to set trip miles and hours back to zero.

NOTE: Resetting "Trip Miles and Hours" also resets "Idle Hours and Average MPH."

"Idle Hours and Average MPH" displays the hours spent idling and the average miles per hour.

"Leg Miles and Hours" records the number of miles and hours driven since the start of the leg. At the start of a new leg, press RESET to set leg miles and hours back to zero.

NOTE: Resetting "Trip Miles and Hours" also resets "Leg Miles and Hours."

Fuel Information

Fuel information provides two data screens: "Fuel Used and Average MPG," and "Idle Gallons and PTO Gallons." See **Fig. 15**.

"Fuel Used and Average MPG" displays the gallons of fuel used since the last reset. At the start of a trip, after refueling, or whenever desired, press RESET (SET/RESET twice) to set fuel used and average miles per gallon back to zero.

General Information

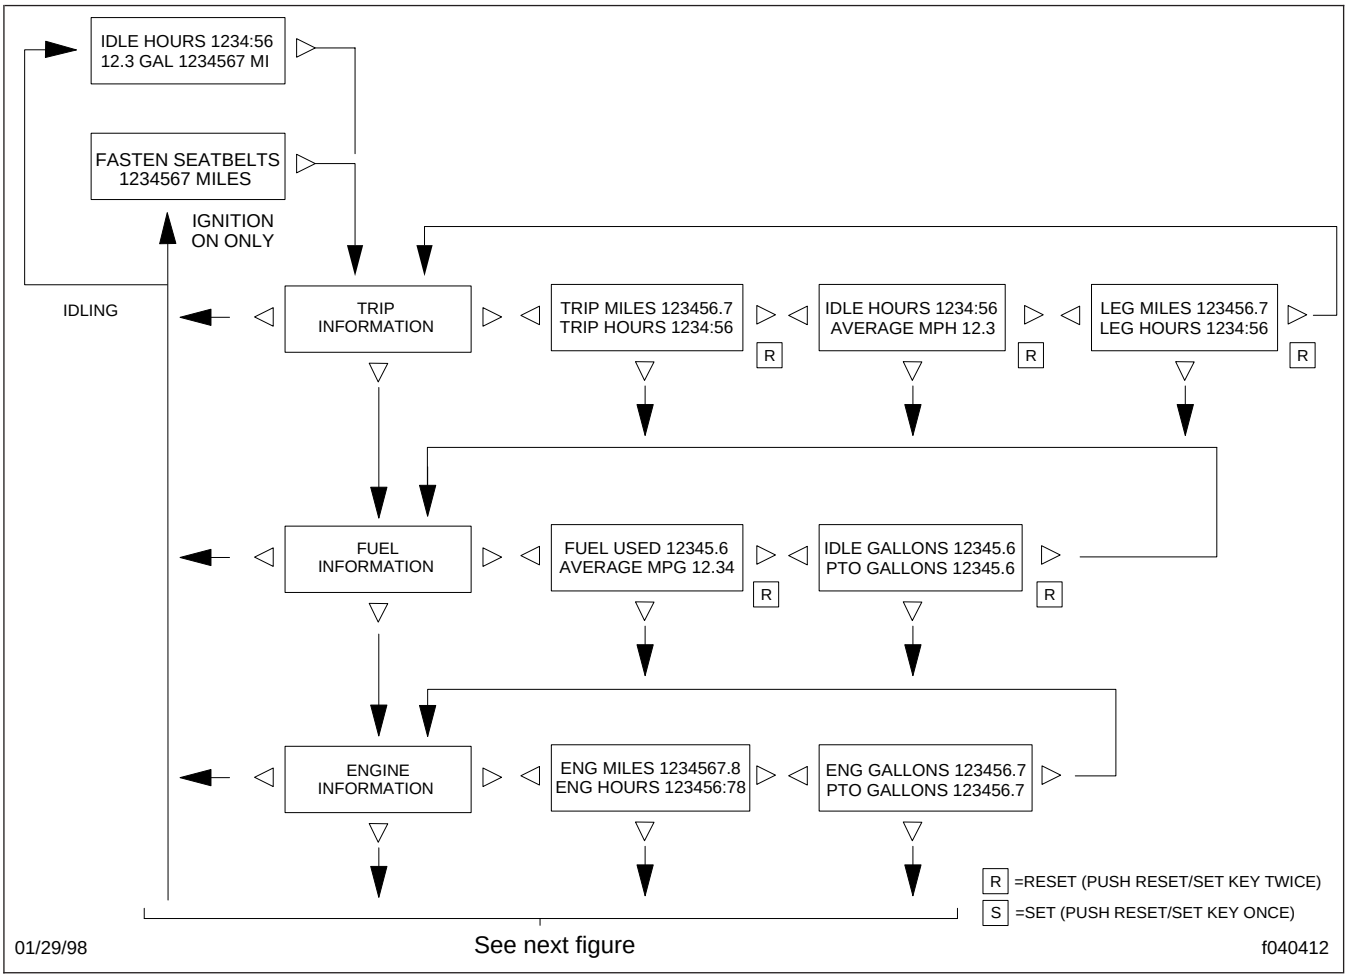

Fig. 15, Trip Information, Fuel Information, and Engine Information

NOTE: Resetting "Trip Miles and Hours" does not also reset "Fuel Used and Average MPG" or "Idle Gallons and PTO Gallons." Fuel Information must be reset separately.

"Idle Gallons and PTO Gallons" displays the gallons of fuel used idling and to operate the Power Take Off unit (if installed). At the start of a trip or whenever desired, press RESET to set idle gallons and PTO gallons back to zero.

Engine Information

Engine information provides two data screens: "Engine Miles and Hours," and "Engine Gallons and PTO Gallons." See **Fig. 15**.

"Engine Miles and Hours" displays the total miles and hours logged by the engine since installation.

NOTE: Engine information is supplied by the engine Electronic Control Module (ECM). It can be reset using engine diagnostic tools. For more information, see the engine manufacturer's manuals.

"Engine Gallons and PTO Gallons" displays the gallons of fuel used by the engine and PTO since installation.

Diagnostic Information

Diagnostic information provides two sets of data screens: "Active Faults," followed by a separate screen for each fault until all have been shown; and

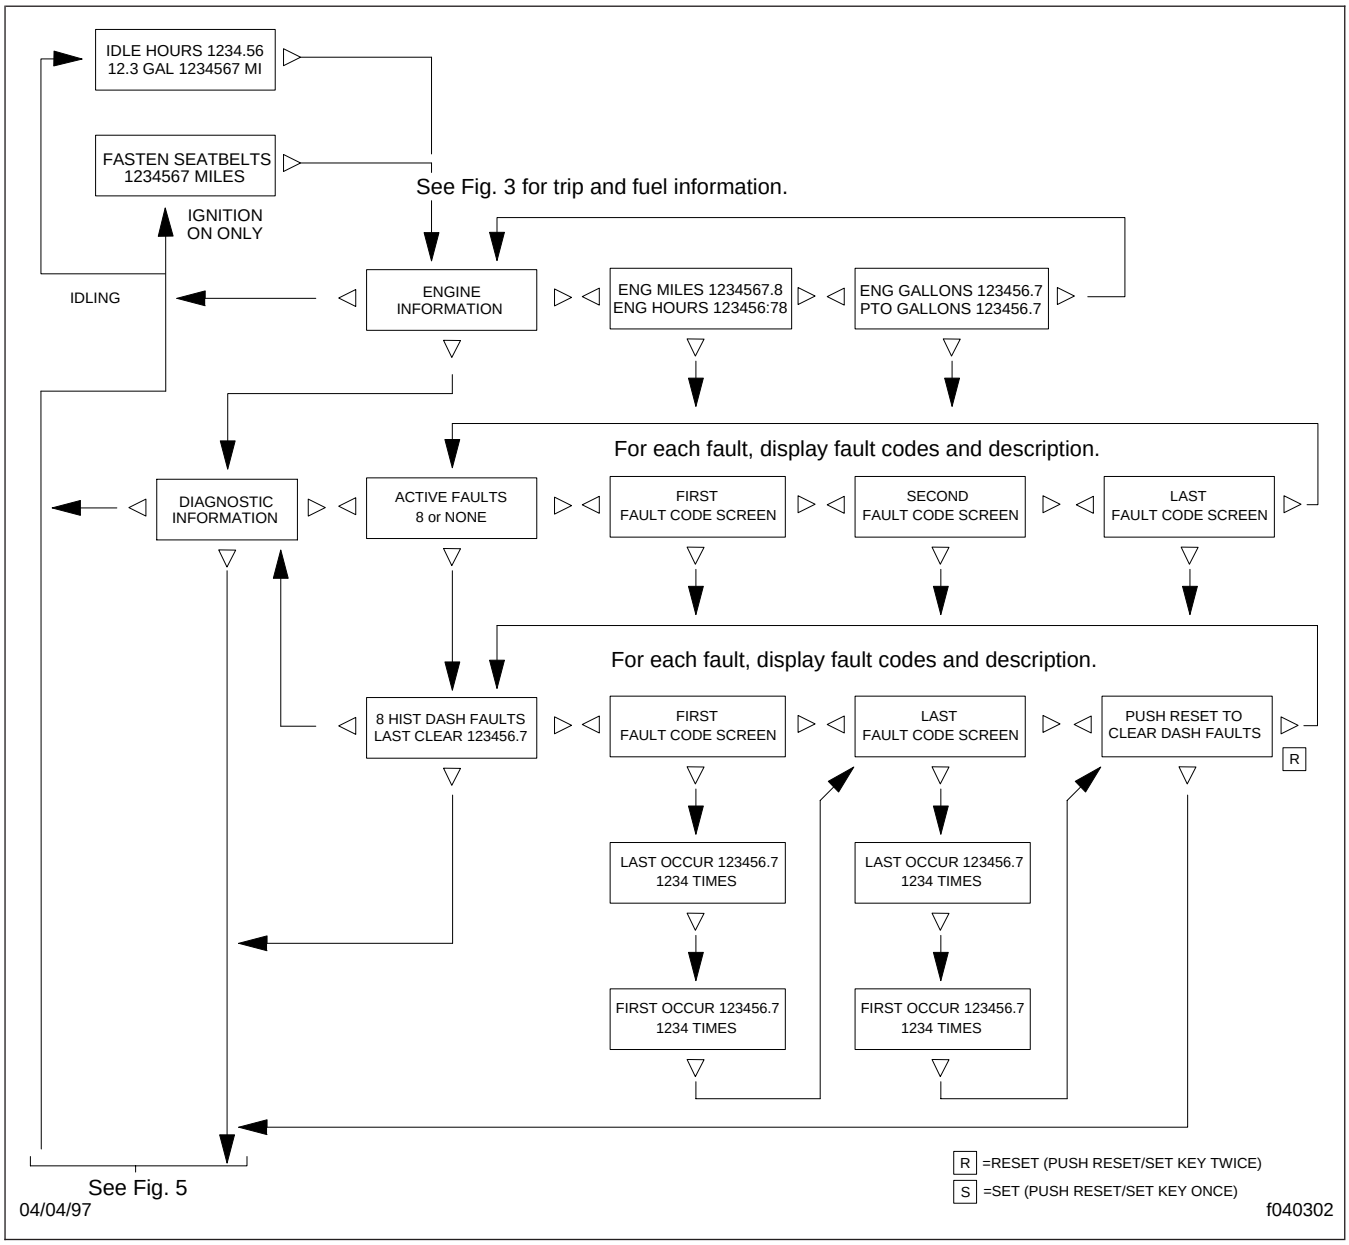

Fig. 16, Engine Information and Diagnostic Information

"Historical Dash Faults," also followed by a separate screen for each fault until all have been shown. See **Fig. 16**.

"Active Faults" cannot be reset. Active faults can be cleared only by correcting the fault.

"Historical Dash Faults" displays all dash faults since the last reset. The second line of the display shows the mileage the last time faults were cleared.

Setup Information

Setup information allows the user to change the target MPG, the brightness of the screen display, the

General Information

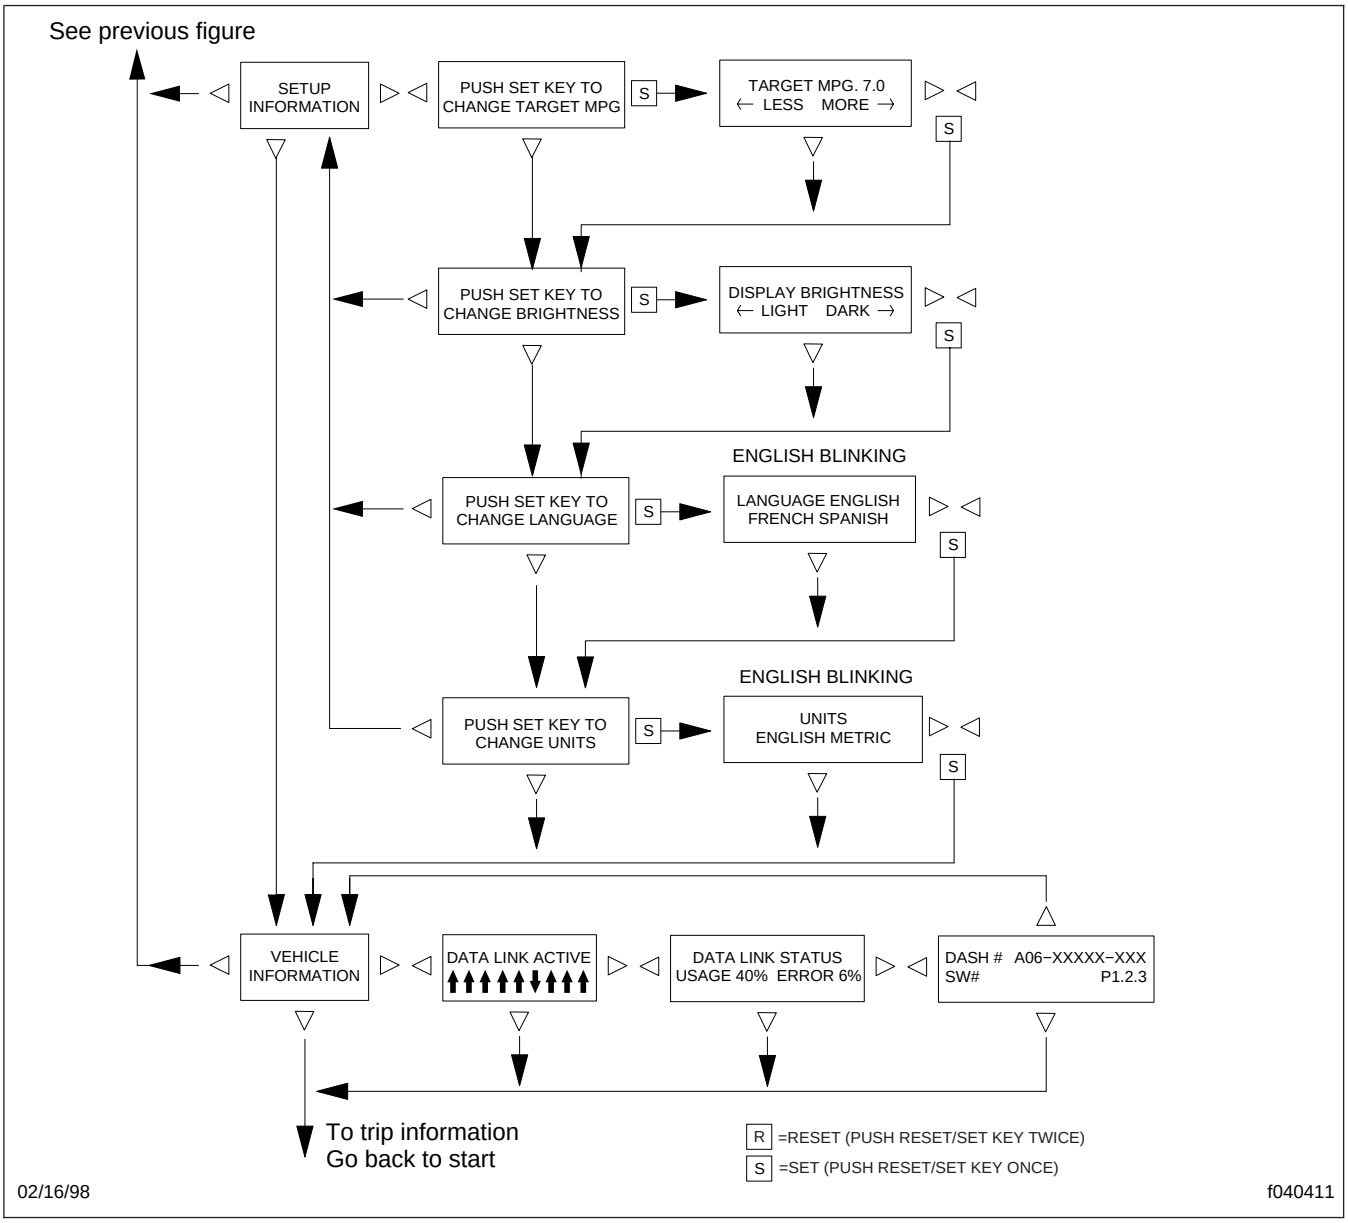

Fig. 17, Setup Information and Vehicle Information

language of the display (English, French, or Spanish), and the units of measurement (English/US conventional or metric).

When prompted by the screen, press SET (push the SET/RESET key once). The units that are settable will be blinking. Use the arrow keys (LEFT, RIGHT, and DOWN) until the display shows the desired setup. Press SET again when finished to save the new settings. See **Fig. 17**.

Vehicle Information

Vehicle information displays important vehicle information, including datalink activity and status, ICU part number, and software identification number.

The "Datalink Active" screen is a dynamic display that shows if the datalink unit is active at the given time. If all the arrows are pointing down, the ICU has not received any information on the datalink since the last time the ignition keyswitch was turned on.

The "Datalink Status" screen is also dynamic, showing current datalink use and error rate. The other screen, which shows the ICU part number and the software identification number, is informational only. See **Fig. 17**.

After vehicle information, pressing the DOWN ARROW takes you back to trip information, and so on.

Level III Instrumentation Control Unit Replacement

IMPORTANT: The level III ICU is also known (on ServiceLink) as the ICU2M.

Instrumentation Control Unit Replacement

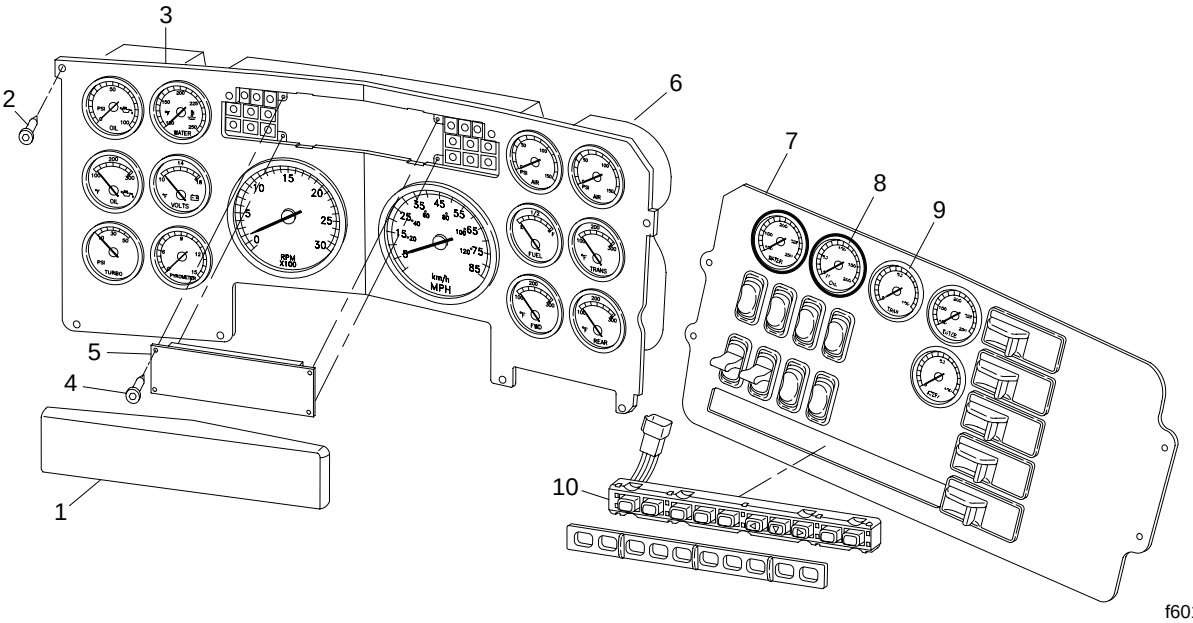
The Level III instrumentation control unit (level III ICU) includes the driver's instrument panel, the ICU housing, and the Driver Message Center (all installed as one unit). Input to the Level III ICU (ICU2M) comes from the keypad and the electronic gauges. See **Fig. 1**.

To replace the dash driver display screen, see Section 54.03, **Subject 140**. To replace the keypad, see Section 54.03, **Subject 150**.

NOTE: To remove the auxiliary instrument panel, see Section 54.03, **Subject 100**.

LEVEL III ICU (WITH GAUGES)

1. Remove the left-hand dash panels. Be sure the screws attaching the dash panel trimtop to the upper dash assembly have been removed. For instructions, see **Section 60.08**.



10/26/95 f601042

1. Message Center Bezel
2. Dog-Point Screw
3. Driver's Instrument Panel
4. Display Screen Screw
5. Dash Driver Display Screen
6. ICU Housing
7. Auxiliary Instrument Panel
8. Electronic Gauge
9. Mechanical Gauge
10. Keypad

Fig. 1, Instrumentation Control Unit, Level III (ICU2M)

To replace a complete ICU with a new set of gauges, see "Level III ICU (With Gauges)." To replace an ICU and reinstall the old set of gauges, see "Level III ICU (Without Gauges)."

To replace individual gauges, switches, or flipper valves, see Section 54.03, **Subject 110**. To replace light bulbs (gauge light, or warning and indicator light), see Section 54.03, **Subject 120**. To replace the warning buzzer, see Section 54.03, **Subject 130**.

2. Remove the screw attaching the dash panel trimtop to the lower dash panel. This screw is located on the far left of the trimtop.

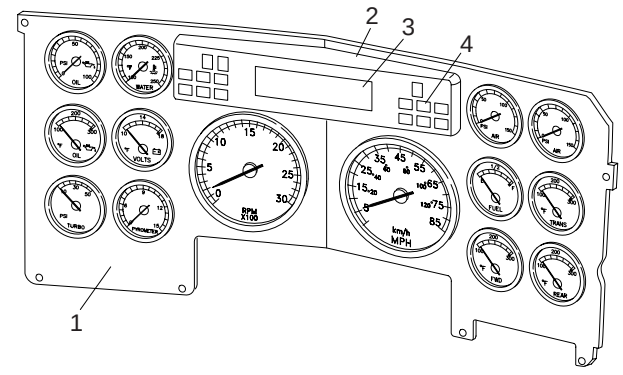
CAUTION

Electronic components of the level III ICU (ICU2M) are vulnerable to damage from static electricity. If available, wear a wrist grounding

Level III Instrumentation Control Unit Replacement

strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU circuitry.

3. Remove the fasteners from the driver's instrument panel. See **Fig. 2**. Fasteners used on the level III ICU are T25 Torx-head dog-point screws. See **Fig. 3**.



09/27/95 f600991

Fig. 3, Dog-Point Screw

3.1 Remove the bezel from the Driver Message Center, exposing the two screws underneath it. For more information, see **Subject 140**.

3.2 Remove the two screws underneath the Driver Message Center bezel.

3.3 Remove the four screws on the bottom of the driver's panel.

3.4 Remove the two screws on the sides of the driver's panel.

4. Pull the old ICU away from the dash.

4.1 From behind the ICU housing, disconnect the two pink connectors on the left-hand side of the housing.

4.2 Disconnect all air hoses. Using a paint pen, mark the hoses for ease of installation.

⚠ CAUTION

When removing the old ICU, the wiring harness may have to be loosened before the driver's panel can be pulled free of the dash. Do not forcibly pull the driver's panel from the dash. This may disconnect wires from the harness electrical connectors on the back of the ICU housing and damage them.

5. Remove the old ICU from the dash. See **Fig. 4**.

5.1 Remove the three screws and speed nuts attaching the dash panel trimtop to the old ICU.

5.2 Install the dash panel trimtop on the new level III ICU (ICU2M).

6. Install the level III ICU on the dash.

6.1 Connect the air hoses to the air gauges as marked on removal.

6.2 Connect the two color-coded electrical connectors, as removed.

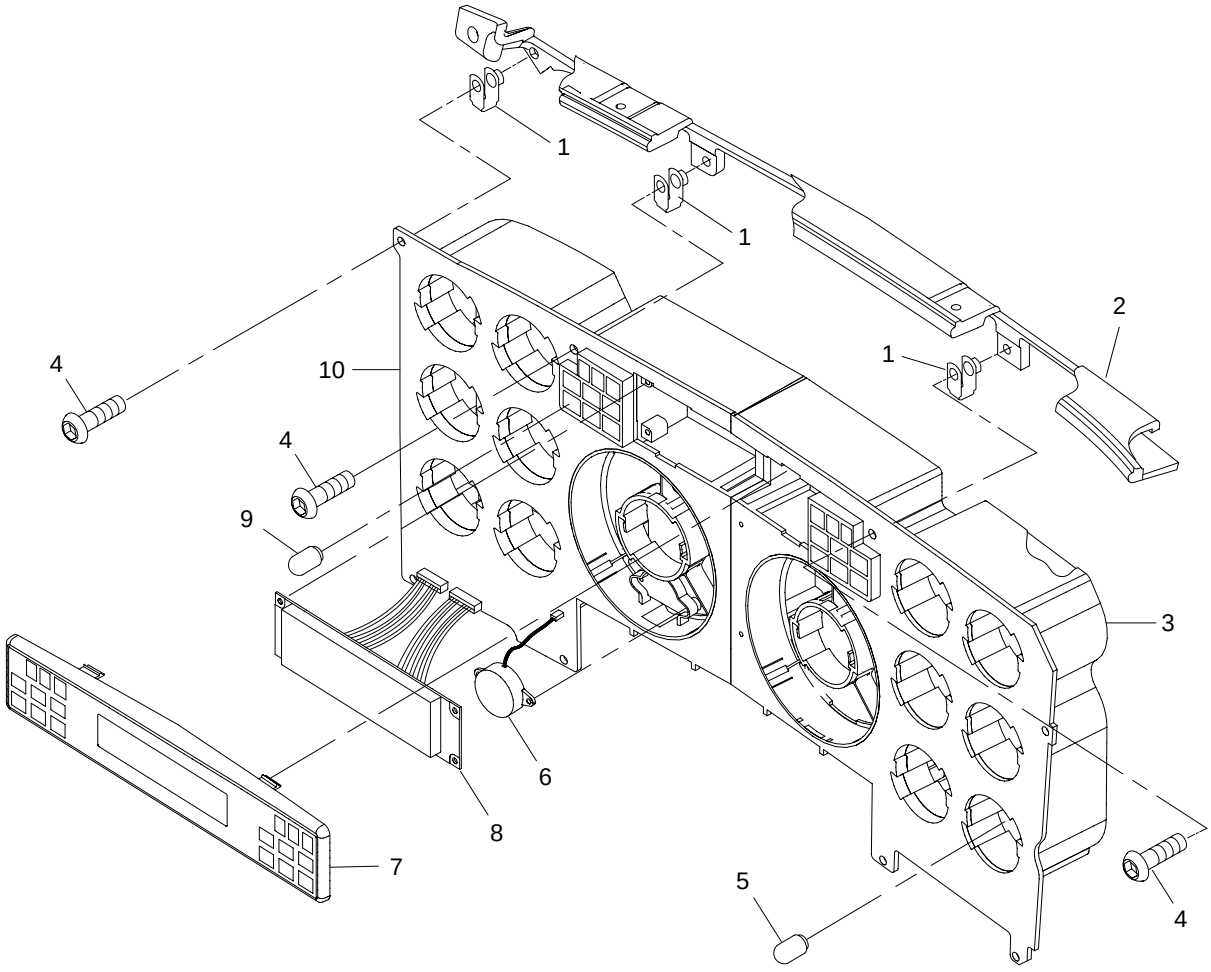
6.3 Place the new level III ICU in the dash and install the fasteners. Be sure to install the fasteners that attach the dash panel trimtop to the upper dash assembly and lower dash panel.

IMPORTANT: A typical warning and indicator light layout is shown in **Fig. 5**.

7. Install the Driver Message Center. See **Fig. 5**.

7.1 Remove the bezel from the Driver Message Center on the new level III ICU.

Level III Instrumentation Control Unit Replacement



04/18/97 f601357

NOTE: Gauges have been removed.

1. Speed Nut
2. Dash Panel Trimtop
3. ICU Housing, RH
4. T25 Dog-Point Screw
5. Gauge Light Bulb
6. Buzzer
7. Message Center Bezel
8. Dash Display Screen
9. Warning and Indicator Light Bulb
10. ICU Housing, LH

Fig. 4, ICU Housing

CAUTION

Be careful not to scratch the new bezel when replacing the lightbar legends. Scratches on the inside of the bezel are visible from the front.

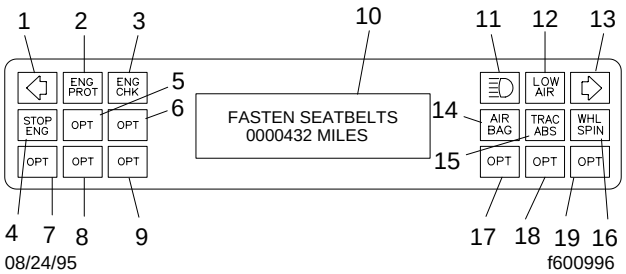
7.2 Take the bezel from the old ICU and, using fingers, tweezers, or a small pair of needle nose pliers, gently remove any of the optional plastic legends installed in the bezel. Install these in the new bezel, being careful not to scratch it.

7.3 Snap the bezel into place.

8. Check the gauge layout of the new unit and compare it to the old unit.

8.1 If any positions are different, replace the gauge for that position with the correct

Level III Instrumentation Control Unit Replacement



Typical installation shown. Location and function of optional lights may vary.

1. Left Turn Indicator
2. Engine Protection Warning & Indicator
3. Check Engine Indicator
4. Stop Engine Warning (Cummins engine only)
5. ECAS Failure Warning (optional)
6. ECAS Transfer Indicator (optional)
7. Trailer ABS Warning (optional)
8. Alternator No Charge Warning (optional)
9. Automatic Transmission Warning (optional)
10. Dash Driver Display Screen
11. High Beam Indicator
12. Low Air Warning
13. Right Turn Indicator
14. Air Bag Warning (optional)
15. Tractor ABS Warning
16. Wheel Spin Warning
17. Optional Indicator 6
18. Low Voltage Warning (optional)
19. Optional Indicator 8

Fig. 5, Driver Message Center, Level III ICU (ICU2M)

gauge from the old unit. For gauge replacement procedures, see **Subject 110**.

8.2 Reconfigure the ICU to its original factory settings. For instructions, see Section 54.03, **Subject 160**.

NOTE: Mechanical (air) gauges do not make a sweep.

9. Turn on the ignition and test the operation of the new level III ICU. All the electronic gauges (except the voltmeter) should make one complete sweep and return to their normal indicating positions; the warning and indicator lights should turn on, then off.

   If any gauges are not working properly, they will need to be serviced or replaced.

LEVEL III ICU (WITHOUT GAUGES)

1. Remove the left-hand dash panels. For instructions, see **Section 60.08**.
2. Remove the fasteners from the driver's instrument panel and dash panel trimtop. See **Fig. 2**. Fasteners used on the level III ICU (ICU2M) are 10-16 Torx-head dog-point screws. See **Fig. 3**.

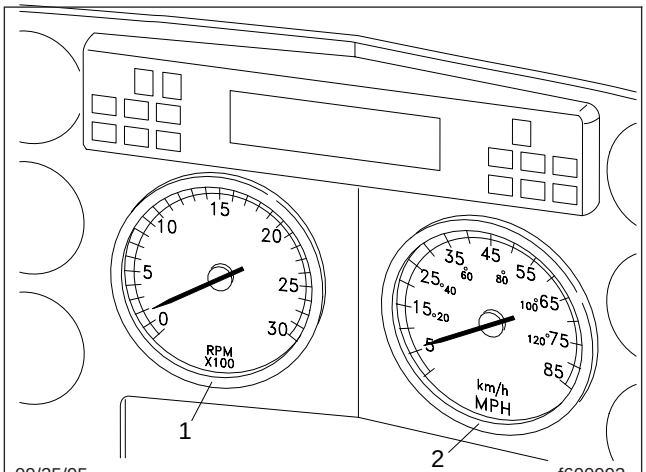
   2.1 Remove the bezel from the Driver Message Center, to expose the two screws underneath it. Remove these two screws.

   2.2 Remove the four screws on the bottom of the driver's panel.

   2.3 Remove the two screws on the sides of the driver's panel.

3. Note the gauge layout for later installation and remove all the gauges. For instructions, see **Subject 110**. Set aside the gauges for later installation in the new panel.

   3.1 Remove the two large-face gauges from the center of the driver's panel. See **Fig. 6**.

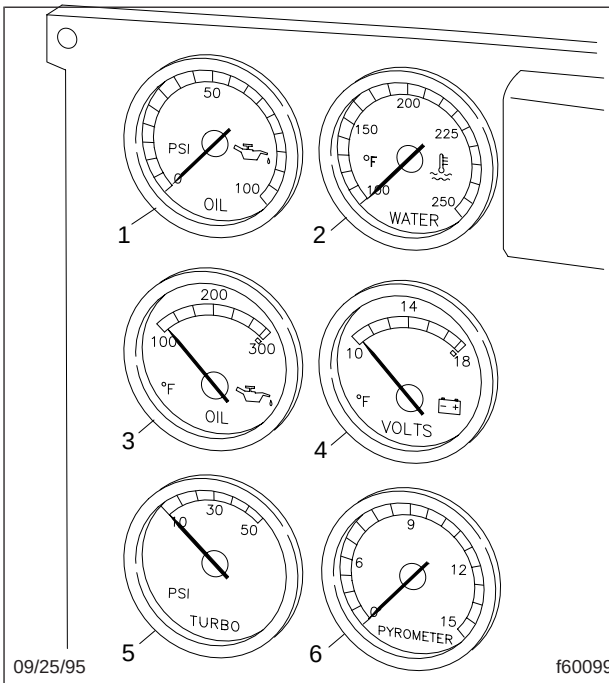


1. Tachometer 2. Speedometer

Fig. 6, Driver's Panel Gauge Layout (large-face gauges)

3.2 Remove the small-face gauges (six maximum) from the left-hand side of the driver's panel. See **Fig. 7**.

Level III Instrumentation Control Unit Replacement



Gauge layouts may vary. To work properly, gauges must be installed in their correct locations.

1. Oil Pressure Gauge
2. Water Temperature Gauge
3. Oil Temperature Gauge
4. Voltmeter
5. Turbo Air Pressure Gauge
6. Pyrometer

Fig. 7, Driver's Panel Gauge Layout (left-hand side)

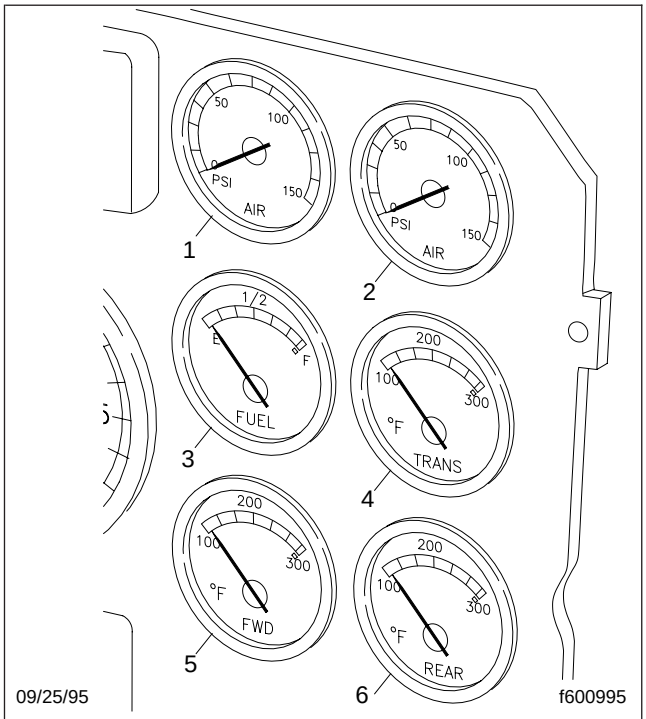
3.3 Remove the small-face gauges (six maximum) from the right-hand side of the driver's panel. See **Fig. 8**.

CAUTION

Do not lay gauges face down for long periods of time. The electronic gauges use an oil-dampening fluid that leaks out when the gauge is face down, causing dial movement to become erratic.

4. Pull the old ICU away from the dash.

4.1 From behind the ICU housing, disconnect the two pink connectors on the left-hand side of the housing.



Gauge layouts may vary. To work properly, gauges must be installed in their correct locations.

1. Primary Air Pressure Gauge
2. Secondary Air Pressure Gauge
3. Fuel Gauge
4. Transmission Fluid Temperature Gauge
5. Forward Axle Temperature Gauge
6. Rear Axle Temperature Gauge

Fig. 8, Driver's Panel Gauge Layout (right-hand side)

4.2 Disconnect all air hoses. Using a paint pen, mark the hoses for ease of installation.

CAUTION

When removing the old ICU, the wiring harness may have to be loosened before the driver's panel can be pulled free of the dash. Do not forcibly pull the driver's panel from the dash. This may disconnect wires from the harness electrical connectors on the back of the ICU housing and damage them.

5. Remove the old ICU from the dash. See **Fig. 4**.

5.1 Remove the three screws and speed nuts attaching the dash panel trimtop to the old ICU.

Level III Instrumentation Control Unit Replacement

5.2 Install the dash panel trimtop on the new level III ICU (ICU2M).

6. Install a new level III ICU in the dash.

6.1 Install all the fasteners as removed, including the fasteners attaching the dash panel trimtop to the upper dash assembly and lower dash panel.

6.2 Connect the two color-coded electrical connectors, as removed.

6.3 Install all gauges in the positions from which they were removed. Insert each gauge into its correct hole and twist clockwise about 1/8 turn, until seated.

7. Snap the Driver Message Center bezel into place, using the four small tabs on the sides of the bezel.

NOTE: Mechanical (air) gauges do not make a sweep.

8. Turn on the ignition and test the operation of the gauges. All the electronic gauges (except the voltmeter) should make one complete sweep and return to their normal indicating positions; the warning and indicator lights should turn on, then off.

9. Reconfigure the ICU to its original factory settings. For instructions, see Section 54.03, **Subject 160**.

Ignition Sequence Screen Parameter Changing, Level III ICU

IMPORTANT: The level III ICU is also known (on ServiceLink) as the ICU2M.

The parameters in this subject are used to control the display of screens that appear during the ignition sequence.

To change ignition sequence screen parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

Ignition Sequence Screen Parameters *			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
1 *	Sec	0–15	**Freightliner Screen:** Controls the length of time that the "Freightliner" screen shows on the dash driver display during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		7–15	Enter any number between "7" and "15." The screen displays for that number of seconds.
2 *	Sec	0–15	**Monitored Systems OK Screen:** Controls the enabling of this screen and the length of time that it shows on the dash driver display during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–15	Enter any number between "1" and "15." The screen displays for that number of seconds.
3 †	Sec	0–15	**Service Interval, Miles:** Controls the enabling of this screen and the length of time that it shows on the dash driver display during the ignition sequence.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–15	Enter any number between "1" and "15." The screen displays for that number of seconds.
4 †	Sec	0–15	**Service Interval, Hours:** Controls the enabling of this screen and the length of time that it shows on the dash driver display during the ignition sequence.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–15	Enter any number between "1" and "15." The screen displays for that number of seconds.
5	None	0 or 1	**Idle Hours and Gallons Screen:** Controls the enabling of this screen in the ignition sequence and in stationary access (accessed from the keypad).
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display on the ignition sequence or when requested).
		1=On	Enter "1." The screen display is enabled (it displays on the ignition sequence or when requested).
6 †	None	1 or 2	**MPG Display Screen:** Controls the enabling of this screen. This is the basic display screen, showing the mpg bar graph (dynamic display), current mpg value and the odometer reading.
		1	Enter "1." The screen displays with bargraph.
		2	Enter "2." The screen displays without bargraph.

* No access by users to parms #1 and #2

† Authorization required

Table 1, Ignition Sequence Screen Parameters (parms #1-6)

Ignition Sequence Screen Parameter Changing, Level III ICU

Ignition Sequence Screen Parameters *			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
7	Sec	0–63	**Incoming Message Screen:** Controls the length of time that the "Incoming Message" screen shows on the dash driver display whenever the ICU receives a message from the data link.
		0=Off	Enter "0" (zero). The screen never displays at all.
		1–62	Enter any number between "1" and "62." The screen displays for that number of seconds.
		63	Enter "63." The screen displays until the operator dismisses it by pressing any key.

* All parameters in this table are accessible to users

Table 2, Ignition Sequence Screen Parameters (parm #7)

Stationary Access Screen Parameter Changing, Level III ICU

IMPORTANT: The level III ICU is also known (on ServiceLink) as the ICU2M.

The parameters in this subject are used to control the display of stationary access screens.

To change stationary access screen parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

Stationary Access Screen Parameters *			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
101	None	0 or 1	**Trip Information Screen:** Controls the enabling of this title screen (accessed from the keypad).
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display when requested).
		1=On	Enter "1." The screen display is enabled (it does display when requested).
102	None	0 or 1	**Trip Miles and Trip Hours Screen:** Controls the enabling of this data screen (accessed from the keypad). For programming instructions, see parm #101.
103	None	0 or 1	**Idle Hours and Average MPG Screen:** Controls the enabling of this screen (accessed from the keypad). For programming instructions, see parm #101.
104	None	0 or 1	**Leg Miles and Leg Hours Screen:** Controls the enabling of this data screen (accessed from the keypad). For programming instructions, see parm #101.
105	None	0 or 1	**Fuel Information Screen:** Controls the enabling of this title screen (accessed from the keypad). For programming instructions, see parm #101.
106	None	0 or 1	**Fuel Used and Average MPG Screen:** Controls the enabling of this data screen (accessed from the keypad). For programming instructions, see parm #101.
107	None	0 or 1	**Idle Gallons and PTO Gallons Screen:** Controls the enabling of this screen (accessed from the keypad). For programming instructions, see parm #101.

		1=On	Enter "1." The screen display is enabled (it does display when requested).
124	None	0 or 1	**Data Link Active Screen:** Controls the enabling of this dynamic display screen. For programming instructions, see parm #123.
125	None	0 or 1	**Data Link Status Screen:** Controls the enabling of this dynamic display screen. For programming instructions, see parm #123.
126 *	Sec	0–254	**No Data Link Activity Alert Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the ICU cannot detect any response from the J1587 databus through the data link.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1	Enter "1." The screen displays one time only for seven seconds.
		2	Enter "2." The screen displays for seven seconds, dismisses itself, and returns every 254 seconds until the fault is corrected.
		3–253	Enter any number between "3" and "253." The screen display repeats after that number of seconds. It continues its repeat cycle until the fault is corrected. Each time, it can be dismissed by the driver pushing any key.
		254	Enter "254." The screen displays continuously until the condition returns to normal. It can not be dismissed.
127 *	None	0 or 1	**Part No. and Software Screen:** Controls the enabling of this screen (accessed from the keypad). This screen displays the ICU part number (see parm #400) and software version number (see parm #402). For programming instructions, see parm #123.
128 †	None	0 or 1	**Vehicle ID Number Screen:** Controls the enabling of this screen (accessed from the keypad). This screen displays vehicle ID number (see parm #401). For programming instructions, see parm #123.
129 †	Miles	0–254	**Reset Faults Screen:** Controls the enabling of this screen, whose purpose is to delete all the accumulated historical faults.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display when requested).
		1–254	Enter any number between "1" and "254." The screen function is enabled for from 1 to 254 odometer miles. NOTE: This function is used by the production plants only.

* No access by users to parms #126 or #127

† Authorization required

Table 3, Stationary Access Screen Parameters (parms #123-129)

Stationary Access Screen Parameters *			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
130 *	Sec	0–15	**Reset Key Valid Time:** When the "Reset Confirmation" screen is enabled (see parm #131), controls the number of seconds allowed to confirm a reset (prevents accidental resets).
		0=Off	Enter "0" (zero). This function is disabled (resets are not confirmed).

Stationary Access Screen Parameter Changing, Level III ICU

Stationary Access Screen Parameters *			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
		1-15	Enter any number between "1" and "15." The reset is confirmed if the reset key is pressed within that number of seconds. If the reset key is not pressed within the allotted time, the screen being reset continues to report its old values.
131 *	None	0 or 1	**Reset Confirmation Screen:** Controls the enabling of this screen, which appears when the reset button on the keypad is pressed.
		0=Off	Enter "0" (zero). The screen is disabled (it does not display when the reset button is pressed).
		1=On	Enter "1." The screen display is enabled (it displays when the reset button is pressed).
			NOTE: See parm #130, which sets the number of seconds required for confirmation.

* No access by users to parms #130 or #131

Table 4, Stationary Access Screen Parameters (parms #130-131)

Direct Access Screen Parameter Changing, Level III ICU

IMPORTANT: The level III ICU is also known (on ServiceLink) as the ICU2M.

The parameters in this subject are used to control the display of direct access screens.

To change direct access screen parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

Direct Access Screen Parameters *			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
200	Sec	0–254	**Trip Miles and Trip Hours Screen Display Time:** Controls the enabling of this direct access screen and the length of time that it shows on the dash driver display after pressing the TRIP key.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1–253	Enter any number between "1" and "253." The screen displays for that number of seconds.
		254	Enter "254." The screen displays continuously until dismissed. It can be dismissed by pressing any key.
201	Sec	0–254	**Fuel Used and Average MPG Screen Display Time:** Controls the enabling of this direct access screen and the length of time that it shows on the dash driver display after pressing the FUEL key.
			For programming instructions, see parm #200.
202	Sec	0–254	**Leg Miles and Leg Hours Screen Display Time:** Controls the enabling of this direct access screen and the length of time that it shows on the dash driver display after pressing the LEG key.
			For programming instructions, see parm #200.
203 †	Sec	0–254	**Outside Temperature Screen:** Controls the enabling of this screen, and how long it remains on. This screen is accessed by pressing the TEMP key.
			For programming instructions, see parm #200.

* All parameters in this table are accessible to users

† Authorization required

Table 1, Direct Access Screen Parameters (parms #200-203)

Alert Screen and Alarm Parameter Changing, Level III ICU

IMPORTANT: The level III ICU is also known (on ServiceLink) as the ICU2M.

The parameters in this subject are used to control the display of alert screens and the sounding of the audible alarm.

To change alert screen and/or alarm parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

Alert Screen and Alarm Parameters *			
Parm	**Units**	**Range**	**Description**
300 *	Sec	0–254	**Low Coolant Level Warning Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the engine ECU reports a low coolant level fault.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1	Enter "1." The screen displays one time only for seven seconds.
		2	Enter "2." The screen displays for seven seconds, dismisses itself, and returns every 254 seconds until the fault is corrected.
		3–253	Enter any number between "3" and "253." The screen display repeats after that number of seconds. It continues its repeat cycle until the fault is corrected. Each time, it can be dismissed by the driver pushing any key.
		254	Enter "254." The screen displays continuously until the condition returns to normal. It can not be dismissed.
301 †	None	0–3	**Low Coolant Level Alarm:** Controls the enabling of this alarm, and the type of sound. This alarm sounds when the coolant level is too low.
		0=Off	Enter "0" (zero). The alarm function is disabled (it does not sound).
		1	Enter "1." The alarm sounds continuously until the problem is corrected.
		2	Enter "2." The alarm pulses steadily until the problem is corrected.
		3	Enter "3." The alarm pulses according to a programmed pattern until the problem is corrected. NOTE: To change the programmable pulsing function, see parm #325.
302 †	Sec	0–254	**Low Voltage Warning Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. See parm #300 for programming instructions.
303 †	None	0–3	**Low Voltage Alarm:** Controls the enabling of this alarm, and the type of sound. This is an optional alarm function. See parm #301 for programming instructions.
304 †	Sec	0–254	**Low Oil Pressure Warning Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. See parm #300 for programming instructions.

* No access by users to parm #300

† Authorization required

Table 1, Alert Screen and Alarm Parameters (parms #300-304)

Alert Screen and Alarm Parameter Changing, Level III ICU

Alert Screen and Alarm Parameters *			
Parm	**Units**	**Range**	**Description**
305 †	None	0–3	**Low Oil Pressure Alarm:** Controls the enabling of this alarm, and the type of sound. This alarm sounds when the oil pressure is too low.
		0=Off	Enter "0" (zero). The alarm function is disabled (it does not sound).
		1	Enter "1." The alarm sounds continuously until the problem is corrected.
		2	Enter "2." The alarm pulses steadily until the problem is corrected.
		3	Enter "3." The alarm pulses according to a programmed pattern until the problem is corrected. NOTE: To change the programmable pulsing function, see parm #325.
306 †	Sec	0–254	**High Coolant Temperature Warning Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1	Enter "1." The screen displays one time only for seven seconds.
		2	Enter "2." The screen displays for seven seconds, dismisses itself, and returns every 254 seconds until the fault is corrected.
		3–253	Enter any number between "3" and "253." The screen display repeats after that number of seconds. It continues its repeat cycle until the fault is corrected. Each time, it can be dismissed by the driver pushing any key.
		254	Enter "254." The screen displays continuously until the condition returns to normal. It can not be dismissed.
307 †	None	0–3	**High Coolant Temperature Alarm:** Controls the enabling of this alarm, and the type of sound. This alarm sounds when the coolant temperature is too high. See parm #305 for programming instructions.
308 †	Mph	1–15	**Parking Brake Warning Screen (Vehicle MPH):** Controls the vehicle speed required to activate this alert screen (vehicle moving, parking brake on). Enter any number between "1" and "15." The alert screen displays when the vehicle is traveling at one-half that speed. For example, if the vehicle mph value is set to "5," the screen displays when the vehicle is traveling at a speed of 2.5 mph with the parking brake on.
309 †	Sec	60–254	**Parking Brake Warning Screen (Time On):** Controls the number of seconds this alert screen displays (vehicle moving, parking brake on). Enter any number between "60" and "254." The alert screen displays for that number of seconds, then turns itself off.
310 †	None	0–3	**Parking Brake On and Vehicle Moving Alarm:** Controls the enabling of this alarm, and the type of sound. This alarm sounds when the vehicle is moving and the parking brake is on. For programming instructions, see parm #305.
311 †	Sec	60–254	**Parking Brake Warning Alarm (Time On):** Controls the number of seconds this alarm sounds (vehicle moving, parking brake on). Enter any number between "60" and "254." The alarm sounds for that number of seconds, then turns itself off.

* All parameters in this table are accessible to users

† Authorization required

Table 2, Alert Screen and Alarm Parameters (parms #305-311)

Alert Screen and Alarm Parameter Changing, Level III ICU

Alert Screen and Alarm Parameters *			
Parm	**Units**	**Range**	**Description**
312 †	None	60-254	**Door Open and Parking Brake Off Alert Screen:** Controls the enabling of this alert screen, which comes on when the parking brake is off and the door open and/or the ignition keyswitch turned on. Enter any number between "60" and "254." The alert screen displays for that number of seconds, then turns itself off.
313 *	None	0–3	**Door Open and Parking Brake Off Alarm:** Controls the enabling of this alarm, and the type of sound. This alarm sounds when the door is open and the parking brake is off.
		0=Off	Enter "0" (zero). The alarm function is disabled (it does not sound).
		1	Enter "1." The alarm sounds continuously until the problem is corrected.
		2	Enter "2." The alarm pulses steadily until the problem is corrected.
		3	Enter "3." The alarm pulses according to a programmed pattern until the problem is corrected. NOTE: To change the programmable pulsing function, see parm #325.
314	None	0 or 1	**Turn Signal Warning Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the turn signals have been left on.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1	Enter "1." The screen displays one time only for seven seconds.
		2	Enter "2." The screen displays for seven seconds, dismisses itself, and returns every 254 seconds until the fault is corrected.
		3–253	Enter any number between "3" and "253." The screen display repeats after that number of seconds. It continues its repeat cycle until the fault is corrected. Each time, it can be dismissed by the driver pushing any key.
		254	Enter "254." The screen displays continuously until the condition returns to normal. It can not be dismissed. NOTE: See parm #443, which controls the number of seconds the turn signals have to remain on before the alert screen activates, and parm #444, which controls the distance in miles the vehicle has to travel.
315	None	0–3	**Turn Signal ON Alarm:** Controls the enabling of this alarm, and the type of sound: continuous buzzing (type 1), steady pulsing (type 2), or programmable pulsing (type 3). This alarm sounds when the turn signals are left on too long, as defined by time (see parm #443), distance (see parm #444), or both. For programming instructions, see parm #313.
316 *	None	0–254	**Low Windshield Wiper Water Level Screen:** Controls the enabling of this alert screen, which appears when the water level in the washer reservoir gets low.
		0=Off	Enter "0" (zero). The screen is disabled (it does not display at all).
		1=On	Enter "1." The screen display is enabled (it displays when the turn signals have been left on).

* No access by users to parms #313 or #316

† Authorization required

Table 3, Alert Screen and Alarm Parameters (parms #312-316)

Alert Screen and Alarm Parameter Changing, Level III ICU

Alert Screen and Alarm Parameters *			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
317 *	None	0–3	**Low Windshield Wiper Water Level Alarm:** Controls the enabling of this alarm, and the type of sound. This alarm comes on when the windshield washer water level gets too low.
		0=Off	Enter "0" (zero). The alarm function is disabled (it does not sound).
		1	Enter "1." The alarm sounds continuously until the problem is corrected.
		2	Enter "2." The alarm pulses steadily until the problem is corrected.
		3	Enter "3." The alarm pulses according to a programmed pattern until the problem is corrected. NOTE: To change the programmable pulsing function, see parm #325.
318 †	None	0–254	**Recirc Mode Engaged Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the HVAC unit has been switched to recirculated air.
		0=Off	Enter "0" (zero). The screen display is disabled (it does not display at all).
		1	Enter "1." The screen displays one time only for seven seconds.
		2	Enter "2." The screen displays for seven seconds, dismisses itself, and returns every 254 seconds until the fault is corrected.
		3–253	Enter any number between "3" and "253." The screen display repeats after that number of seconds. It continues its repeat cycle until the fault is corrected. Each time, it can be dismissed by the driver pushing any key.
		254	Enter "254." The screen displays continuously until the condition returns to normal. It can not be dismissed.
319 *	None	0–254	**Provide Fresh Air Screen:** Controls the enabling of this alert screen, how often the display repeats, and whether the screen can be dismissed by the driver. This screen appears when the HVAC unit has been operating for 20 minutes on recirculated air. See parm #318 for programming instructions. NOTE: To change the alarm function, see parm #320.
320 *	None	0–3	**HVAC Input Alarm:** Controls the enabling of this alarm, and the type of sound. This alarm sounds when either the Recirc Mode Engaged (parm #318) or Provide Fresh Air (parm #319) alert screens come on. For programming instructions, see parm #317.
321 *	None	0–3	**Door Open, Headlights On, Ignition Off Alarm:** Controls the enabling of this alarm, and the type of sound: continuous buzzing (type 1), steady pulsing (type 2), or programmable pulsing (type 3). This alarm sounds when the door is open or the headlights are on, but the ignition keyswitch is turned OFF. See parm #320 for programming instructions.
322 †	None	0–3	**Engine Protection Alarm:** Controls the enabling of this alarm, and the type of sound. This alarm sounds when the engine protection light comes on. For programming instructions, see parm #317.

* No access by users to parms #317, 319, #320, or #321

† Authorization required

Table 4, Alert Screen and Alarm Parameters (parms #317-322)

Alert Screen and Alarm Parameter Changing, Level III ICU

Alert Screen and Alarm Parameters *			
Parm	**Units**	**Range**	**Description and Explanation of Screen**
323 *	None	0–3	**Low Air Alarm:** Controls the enabling of this alarm, and the type of sound. This alarm sounds when the air pressure drops below the minimum.
		0=Off	Enter "0" (zero). The alarm function is disabled (it does not sound).
		1	Enter "1." The alarm sounds continuously until the problem is corrected.
		2	Enter "2." The alarm pulses steadily until the problem is corrected.
		3	Enter "3." The alarm pulses according to a programmed pattern until the problem is corrected. NOTE: To change the programmable pulsing function, see parm #325.
324	None	0–3	**Alarm Enable:** Controls the enabling of this alarm, and the type of sound: continuous buzzing (type 1), steady pulsing (type 2), or programmable pulsing (type 3). This is an optional alarm function. For programming instructions, see parm #323.
325	Sec	0–15	**Alarm Pulsing:** Controls the number of seconds each alarm pulse lasts when the type 3 alarm is selected.
		0=Off	Enter "0" (zero). The type 3 (programmable) alarm function is disabled (this does not affect the other two types of alarm function).
		1–15	Enter any number between "1" and "15." The alarm remains ON for that number of seconds during each pulse.
326 *	Sec	0–15	**Set Screen Blinking Time:** Controls the blinking rate of screen displays.
		0=Off	Enter "0" (zero). Blinking is disabled (no screen displays blink).
		1–15	Enter any number between "1" and "15." The screen displays for one-half that number of seconds. For example, if the blinking time is set to "3," blinking displays will blink every 1.5 seconds.

* No access by users to parm #323 or #326

Table 5, Alert Screen and Alarm Parameters (parms #323-326)

Configuration Parameter Changing, Level III ICU

IMPORTANT: The level III ICU is also known (on ServiceLink) as the ICU2M.

The parameters in this subject are used to control the configuration of the screens as they are displayed by the level III ICU.

To change configuration parameters (parms), display the parameter table in ServiceLink. Using one of the tables listed below, enter the desired range setting in the "Value" column in the parameter table.

NOTE: Not all parameters can be changed by every user. Some cannot be changed by users at all. Others require authorization. These files display in different colors on the ServiceLink screen and are designated by footnotes in the text.

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
400 *	None	12 bits	**Input Software Version Number:** Allows the input of the software version number installed in the ICU. This is a data input parameter. Enter the software version number.
401 †	None	17 bits	**Input Vehicle ID Number:** Allows the input of the vehicle identification number. This is a data input parameter. Enter the vehicle identification number.
402 *	None	21 bits	**Input Century Class ICU Part Number:** Allows the input of the ICU part number. This is a data input parameter. Enter the ICU part number.
403 *	None	64 bits	**Input ICU Password:** Allows the input of the ICU password. This is a data input parameter. Enter the ICU password.
404	None	0 or 128 *0=Off* *128*	**Engine:** Enables the ICU to look for an electronic engine control module (ECM) installed on the vehicle and responding to the data link. Enter "0" (zero) if no ECM is installed. Enter "128" if an ECM is installed.
405	None	0 or 232 *0=Off* *232*	**SPACE:** Enables the ICU to look for a seat-belt pre-tensioning system (SPACE) installed on the vehicle and responding to the data link. Enter "0" (zero) if no SPACE system is installed. Enter "232" if a SPACE system is installed.
406	None	0 or 219 *0=Off* *219*	**VORAD®:** Enables the ICU to look for an Eaton® VORAD collision avoidance system installed on the vehicle and responding to the data link. Enter "0" (zero) if no collision avoidance system is installed. Enter "219" if a collision avoidance system is installed.
407	None	0 or 136 *0=Off* *136*	**ABS:** Enables the ICU to look for an antilock brake system installed on the vehicle and responding to the data link. Enter "0" (zero) if no antilock brake system is installed. Enter "136" if an antilock brake system is installed.
408	None	0 or 150 *0=Off*	**ECAS:** Enables the ICU to look for an electronic suspension installed on the vehicle and responding to the data link. Enter "0" (zero) if no electronic suspension is installed.

Configuration Parameter Changing, Level III ICU

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
		150	Enter "150" if an electronic suspension is installed.

* No access by users to parms #400, #402, or #403

† Authorization required

Table 1, Configuration Parameters (parms #400-408)

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
409	None	0 or 190	**ACPU:** Enables the ICU to look for an air conditioning protection unit installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no air conditioning protection unit is installed.
		190	Enter "190" if an air conditioning protection unit is installed.
410	None	0 or 130	**Transmission:** Enables the ICU to look for an electronic transmission installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no electronic transmission is installed.
		130	Enter "130" if an electronic transmission is installed.
411	None	0,181 or 231	**Communications:** Enables the ICU to look for a communications system installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no communications system is installed.
		181	Enter "181" if a Qualcomm® satellite communications system is installed.
		231	Enter "231" if a HighwayMaster® communications system is installed.
413	None	0 or 179	**Data Logging Unit:** Enables the ICU to look for a data logging unit installed on the vehicle and responding to the data link.
		0=Off	Enter "0" (zero) if no data logging unit is installed.
		179	Enter "179" if a data logging unit is installed.
415 †	None	0–866	**Gauge Function DR001:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR001.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the engine oil pressure gauge is installed here, enter "852."
416 †	None	0–866	**Gauge Function DR002:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR002.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the coolant temperature gauge is installed here, enter "856."
417 †	None	0–866	**Gauge Function DR003:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR003.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the engine oil temperature gauge is installed here, enter "854."
418 †	None	0–866	**Gauge Function DR004:** Specifies a gauge function at this location.

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR004.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the voltmeter is installed here, enter "836."

* All parameters in this table are accessible to users

† Authorization required

Table 2, Configuration Parameters (parms #409-418)

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
419 †	None	0–866	**Gauge Function DR005:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR005.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the turbo air pressure gauge is installed here, enter "842."
420 †	None	0–866	**Gauge Function DR006:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR006.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the pyrometer is installed here, enter "858."
421 †	None	0–866	**Gauge Function DR007:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR007.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the tachometer is installed here, enter "812."
422 †	None	0–866	**Gauge Function DR008:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR008.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the speedometer is installed here, enter "810."
423 †	None	0–866	**Gauge Function DR009:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR009.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the primary air system pressure gauge is installed here, enter "840."
424 †	None	0–866	**Gauge Function DR010:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR010.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the secondary air system pressure gauge is installed here, enter "840."
425 †	None	0–866	**Gauge Function DR011:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR011.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the fuel level gauge is installed here, enter "844."

Configuration Parameter Changing, Level III ICU

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
426 †	None	0–866	**Gauge Function DR012:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR012.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the transmission fluid temperature gauge is installed here, enter "864."

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
427 †	None	0–866	**Gauge Function DR013:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR013.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the forward (or rear) axle temperature gauge is installed here, enter "866."
428 †	None	0–866	**Gauge Function DR014:** Specifies a gauge function at this location.
		0=Off	Enter "0" (zero) if no gauge is installed at gauge location DR014.
		810–866	Enter any number between "810" and "866" that corresponds to the assignment number of the gauge installed at this location. For example, if the rear (or forward) axle temperature gauge is installed here, enter "866."
429 †	rpm	0–999	**Starter Lockout Rpm:** Specifies the engine speed in revolutions per minute (rpm) required to lock out the starter.
		0=Off	Enter "0" (zero) if no starter lock-out is desired.
		1–999	Enter any number between "1" and "999" that corresponds to the engine rpm required to lock out the starter. For example, if the starter is to be locked out at 500 rpm, enter "500."
430 †	sec	0–254	**Starter Lockout Time:** Specifies the number of seconds that engine speed must remain above the rpm value specified in parm #429 before the starter is locked out.
		0=Off	Enter "0" (zero) if no starter lock-out is desired.
		1–254	Enter any number between "1" and "254" that corresponds to the number of seconds that the engine rpm must remain above the value required to lock out the starter. For example, if the starter is to be locked out five seconds after engine rpm has remained above the specified value, say 500 rpm, enter "5."
431 †	sec	0–180	**Ignition Keyswitch Illumination:** Specifies the length of time the ignition keyswitch remains lit after the driver's door is opened or the switch is turned OFF.
		0=Off	Enter "0" (zero) if no ignition keyswitch illumination is desired.
		1–180	Enter any number between "1" and "180" that corresponds to the number of seconds that the ignition keyswitch remains lit. For example, if the switch is to be remain lit for 30 seconds, enter "30."
432 *	Sec	0–15	**Bulb Check Time On:** Controls the number of seconds that the bulbs illuminate during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). This function is disabled (the bulbs do not illuminate).

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
		1-15	Enter any number between "1" and "15." The bulbs illuminate for that number of seconds.
433 *	Min	0–254	**Dash Active After Ignition Off:** Controls the number of minutes that the dash continues to remain active after the ignition keyswitch is turned OFF.
		0	Enter "0" (zero). When the ignition keyswitch is turned off, the dash turns inactive immediately.
		1–254	Enter any number between "1" and "254." After the ignition keyswitch has been turned off, the dash continues to remain active for that number of minutes.
			NOTE: The dash will appear to be turned off, even though the microprocessor remains active to perform these functions: door open, parking brake off (as enabled by parm #211); alarm (as enabled by various parms).

* No access by users to parms #432 or #433

† Authorization required

Table 4, Configuration Parameters (parms #427-433)

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
434 *	Sec	0–7	**Alarm Check On Time:** Controls the number of seconds that the alarm sounds during the "Ignition ON" sequence.
		0=Off	Enter "0" (zero). The alarm does not sound at all.
		1–7	Enter any number between "1" and "7." The alarm sounds for that number of seconds.
435 †	Volts	5–135	**Low Voltage Warning Threshold:** Controls the voltage required to trigger the display of the "Warning–Low Voltage" screen.
			Enter any number between "5" and "135." The low voltage warning comes on when the voltage equals one-tenth that amount. For example, if this parameter is set to "115," the warning comes on at 11.5 volts.
436 †	Miles	0–254	**Maintenance Interval, Miles:** Controls the spacing of service intervals, in units of 50 miles, for tracking by the ICU in the event that the service interval screens are activated.
		0=Off	Enter "0" (zero). This function is disabled (the service intervals are not tracked by the ICU).
		1-254	Enter any number between "1" and "254." The service intervals are tracked at a spacing of 50 times that number of miles.
437 †	Miles	0–254	**Maintenance Screen Activation, Miles:** Controls the distance in miles from the next service at which the service information screens activate.
		0=Off	Enter "0" (zero). This function is disabled (the service information screens do not activate).
		1-254	Enter any number between "1" and "254." The service information screens activate at that number of miles. For example, to activate the service information screens 100 miles before the next service, enter "100."
438 †	Hours	0–254	**Maintenance Interval, Hours:** Controls the spacing of service intervals, in units of 150 hours, for tracking by the ICU in the event that the service interval screens are activated.
		0=Off	Enter "0" (zero). This function is disabled (the service intervals are not tracked by the ICU).
		1-254	Enter any number between "1" and "254." The service intervals are tracked at a spacing of 10 times that number of hours.
439 †	Hours	0–254	**Maintenance Screen Activation, Hours:** Controls the time in hours from the next service at which the service information screens activate.

Configuration Parameter Changing, Level III ICU

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
		0=Off	Enter "0" (zero). This function is disabled (the service information screens do not activate).
		1-254	Enter any number between "1" and "254." The service information screens activate at that number of hours. For example, to activate the service information screens 20 hours before the next service, enter "20."
440 *	None	1–254	**Short Term Fuel Economy Average Coefficient:** On the mpg bar graph display (see parm #6), controls the amount of filtering done to the fuel economy data. Enter any number between "1" and "254." A lower number provides more filtering (a less responsive, slower to change graph). A higher number provides less filtering (a more responsive, faster to change graph).

* No access by users to parms #434 or #440

† Authorization required

Table 5, Configuration Parameters (parms #434-440)

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
441 *	None	1–254	**Fuel Economy Rate of Change Coefficient:** On the mpg bar graph display (see parm #6), controls the amount of filtering done to the rate of change calculated by comparing current fuel usage to previous usage. Enter any number between "1" and "254." A lower number provides more filtering (a less responsive, slower moving graph). A higher number provides less filtering (a more responsive, faster moving graph).
442 *	Mpg	1–254	**Target Miles Per Gallon (Mpg):** On the mpg bar graph display (see parm #6), controls the value used for the target mpg. Enter any number between "1" and "254." The target mpg equals one-tenth (0.1) of that number. For example, to set the target mpg at 10.5, enter "105."
443 †	Min	0–15	**Turn Signal Warning Activation Time:** Controls how long the turn signals have to remain ON before the buzzer warning activates and the dash driver display shows the "Warning–Turn Signal ON" screen.
		0=Off	Enter "0" (zero). The warning does not activate (it does not come on at all).
		1–15	Enter any number between "1" and "15." The warning activates, but only after that number of minutes has elapsed. NOTE: If both parm #113, turn signal activation time, and parm #114, turn signal activation distance, are turned on, the turn signal warning is activated by whichever condition becomes active first.
444 †	Miles	0–15	**Turn Signal Warning Activation Distance:** Controls how far the vehicle has to travel with the turn signals ON before the buzzer warning activates and the dash driver display shows the "Warning–Turn Signal ON" screen.
		0=Off	Enter "0" (zero). The warning does not activate (it does not come on at all).

Configuration Parameters *			
Parm	**Units**	**Range**	**Description**
		1–15	Enter any number between "1" and "15." The warning activates, but only after the vehicle has traveled one-tenth that number of miles. For example, if "5" is entered, the turn signal warning activates after the vehicle has traveled 0.5 (one-half) mile. NOTE: If both parm #113, turn signal activation time, and parm #114, turn signal activation distance, are turned on, the turn signal warning is activated by whichever condition becomes active first.

* No access by users to parms #441 or #442

† Authorization required

Table 6, Configuration Parameters (parms #441-444)

Gauge Assignment Numbers		
Value	**Function**	**Default Location**
0	Gauge Off	—
810	Speedometer	DR008
812	Tachometer	DR007
836	Voltmeter	DR004
838	Application Air Pressure	None
840	Primary Air System Pressure	DR009
	Secondary Air System Pressure	DR010
842	Turbo Air Pressure	DR005
843	Fuel Pressure	None
844	Fuel Level	DR011
	Second Fuel Level	None
852	Engine Oil Pressure	DR001
854	Engine Oil Temperature	DR003
856	Engine Coolant Temperature	DR002
858	Pyrometer	DR006
864	Transmission Fluid Temperature	DR012
866	Forward-Rear Axle Temperature	DR013
	Rearmost Axle Temperature	DR014

Table 7, Gauge Assignment Numbers

Troubleshooting

The instrumentation control unit (ICU) receives messages and faults transmitted by other ECUs on the J1587 datalink.

NOTE: There are also some warnings that are controlled by sensor inputs to the ICU.

The ICU presents this information to the operator or service technician in the form of alert screens (when the vehicle is moving), diagnostic information data screens (when the vehicle is not moving), or active fault screens.

Ignition Sequence

When the ignition switch is turned ON, the ICU performs an ignition sequence. The electronically driven gauges sweep from zero to full scale and then back to zero. The parking brake and low air pressure warning/indicator lights also activate for a certain number of seconds (the number of seconds can be programmed).

NOTE: The battery voltage, primary air, and secondary air gauges are not electronically driven and do not sweep.

During the ignition sequence, the ICU monitors and records any active vehicle electronic system fault codes transmitted on the datalink by other Electronic Control Units (ECUs). The ICU stores a maximum of 16 active fault codes (eight each for the ICU and for other vehicle systems). The ICU will store these active faults in memory until one of the following happens:

- The ignition switch is turned OFF or;
- The ICU receives a "DIAGNOSTIC CLEAR" message and the ECU stops transmitting the fault code.

The ICU can store eight ICU system historic, or inactive, fault codes. Clear ICU system historic fault codes with the SET/RESET keypad key or with ServiceLink.

System Fault Analysis

When displaying fault codes, the ICU uses four kinds of code groups:

- Module Identifiers (MIDs)
- Parameter Identifiers (PIDs)
- Sub-System Identifiers (SIDs)
- Failure Mode Identifiers (FMIs)

For lists of MIDs, PIDs, SIDs, and FMIs, see Section 54.03, **Specifications 400**. For more information on these code groups and how to read them, see "Fault Codes" in this subject.

To correct an active fault, see the following sources:

- Engine ECM (MID 128)—use the engine manufacturer's literature.
- ABS ECU (MID 136)—see **Section 42.08** or use the antilock brake system manufacturer's literature.
- ICU (MIDs 140, 142, and 234)—see this section.
- DLU (MID 179)—see **Section 54.06**.
- ACPU (MID 190)—see **Section 83.02**.

IMPORTANT: To begin troubleshooting active fault codes, do not turn the ignition switch OFF and then ON. It is not uncommon for a fault to disappear when ignition power is removed, only to return again when the vehicle has left the shop.

1. Correct the active fault.
2. To verify that the problem is corrected and that the fault code is no longer displayed as active, turn the ignition switch OFF and then ON.
3. Start the vehicle.

NOTE: In some cases, it may be necessary to drive the vehicle to confirm that a fault has been repaired.

Datalink Activity

1. If the alert message "NO DATALINK ACTIVITY" is displayed, check the J1587 datalink wiring (twisted pairs).
2. Verify that all ECUs are connected.
3. Verify that the ECU J1587+ is connected to the datalink J1587+ and that ECU J1587– is connected to datalink J1587–.

Gauges

Gauge Does Not Sweep

NOTE: This section applies only to electronic gauges; the air gauges and voltmeter do not sweep.

If a particular gauge does not sweep during the ignition sequence, there is a problem either with the gauge or the ICU.

1. Turn the gauge counterclockwise and remove it from the ICU housing.
2. Install a gauge known to be good and repeat the ignition sequence.
3. If the test gauge sweeps full scale and back to zero, replace the original gauge with a new one. For replacement instructions, see Section 54.03, **Subject 110**.
4. If the test gauge does not sweep, replace the ICU. For replacement instructions, see **Subject 100**.

NOTE: If the ICU has failed, replace the complete ICU housing. Remove all gauges, the message center bezel, and the wood grain panel. Install these parts in the new ICU housing.

Gauge Does Sweep

If a gauge malfunctions but sweeps during the ignition sequence, the ICU is not at fault.

1. Check the circuits that supply input signals to the ICU.
2. Check the engine ECM programming.

NOTE: Use the technician diagnostic routine (TDR), provided with ServicePro, to help determine the cause of the problem.

Warning Incicator Lights

Light Does Not Illuminate

The parking brake and low air pressure warning/indicator lights should illuminate during the ignition sequence.

IMPORTANT: The following lights do not illuminate during the ignition sequence:

A. ENG PROT indicator light input WL002

B. CHK ENG indicator light input WL003

C. STOP ENG indicator light input WL007 (used on Cummins engines only)

D. TRAC ABS indicator light input WL011

If a warning/indicator light other than those listed above does not illuminate during the ignition sequence, either the light bulb is bad or the ICU is malfunctioning. Replace the light bulb with a test bulb known to be good and repeat the ignition sequence.

1. Remove the message center bezel and replace the bulb with a test bulb. Use the bulb replacement tool provided.
2. If the test bulb lights, replace the original bulb with a new one. For replacement instructions, see Section 54.03, **Subject 120**.

   If the test bulb does not light, replace the ICU. For replacement instructions, see **Subject 100**.

Light Illuminates

If a warning/indicator light malfunctions but illuminates during the ignition sequence, the ICU is not at fault.

1. Check the circuits that supply input signals to the ICU. These lights are activated by either a 12V power input or a ground input.
2. Check the ECU programming corresponding to the light.

NOTE: Use the technician diagnostic routine (TDR), provided with ServicePro, to help determine the cause of the problem.

Buzzer

Buzzer Does Not Operate

If the buzzer does not activate during the ignition sequence, either the buzzer or the ICU is malfunctioning. The buzzer is mounted behind the tachometer.

1. Install a buzzer known to be good and repeat the ignition sequence.
2. If the test buzzer functions, replace the original buzzer with a new one. For replacement instructions, see Section 54.03, **Subject 130**.

If the test buzzer does not function, replace the ICU. For replacement instructions, see **Subject 100**.

Buzzer Does Operate

If the buzzer operates during the ignition sequence but does not work properly for another function, there is a problem with the ICU configuration or with ICU input circuits.

1. Check the ICU parameter (buzzer functions) configuration with ServiceLink. For more information, see Section 54.03, **Subject 180**.
2. Check the circuits that supply input signals to the ICU.
3. Check the ECU programming corresponding to the buzzer function.

Dash Driver Display Screen

Screen Does Not Activate

If the dash driver display screen does not activate during the ignition sequence, either the display screen itself or the ICU is malfunctioning. The dash driver display screen is mounted behind the message center bezel.

1. Install a dash driver display screen known to be good and repeat the ignition sequence.
2. If the test screen functions, replace the original dash driver display screen with a new one. For replacement instructions, see Section 54.03, **Subject 140**.

   If the test screen does not function, replace the ICU. For replacement instructions, see **Subject 100**.

Screen Does Activate

If the dash driver display screen operates during the ignition sequence, but does not work properly for another function, then there is a problem in the ICU configuration or the keypad, or the ICU is faulty.

1. Check the ICU parameter configuration (screen display functions) with ServiceLink.
2. Verify that the ICU parameter that controls the screen function which is having the problem is configured correctly.
3. If the parameter value is incorrect, change the parameter value and enable the screen function.

   For more information, see Section 54.03, **Subject 170** or **Subject 200**. For screen functions controlled by the right-hand ICU microprocessor, see Section 54.03, **Subject 220**.
4. Check the keypad connection to the wiring harness and repair the circuit if necessary.
5. If the keypad to wiring harness connection is good, replace the keypad. For replacement instructions, see Section 54.03, **Subject 150**.

ICU Small Gauges

The oil pressure, coolant temperature, oil temperature, and turbo air pressure gauges are driven electronically by the ICU using data inputs from the engine ECM. The ICU receives digital data from the engine ECM via the J1587 datalink.

1. To determine whether the fault lies in the ICU or the gauge input circuits, use the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be elsewhere, use ServiceLink, or the engine manufacturer's diagnostic software tool, and determine if there is an active engine ECM fault code related to the problem.
3. If an active fault code is displayed, follow the engine manufacturer's instructions to correct the problem.

   If no active fault code is displayed, check the datalink connection from the engine ECM to the ICU.
4. Check the datalink for cross-wired connections from all ECUs.

Voltmeter

The voltmeter is driven by the voltage input to the ICU. The voltmeter should function with the ignition switch in the ON position.

1. Replace a problem gauge with a test gauge known to be good and turn the ignition ON.
2. If the test gauge indicates 11 to 14V, replace the original gauge with a new one.

If the test gauge indicates lower than 11V or higher than 14V, check input voltages to the ICU connector as follows:

2.1 Check the 12V battery circuit: pin D14 and wire 437.

2.2 Check the 12V ignition circuit: pin D15 and wire 437A.

2.3 Check the ground circuit: pin D13 and wire GND1.

3. Troubleshoot and repair any of the above circuits that shows a malfunction.

   If all the circuits above are functioning, replace the ICU. For replacement instructions, see **Subject 100**.

Pyrometer

The pyrometer is electronically driven by the ICU. The pyrometer input circuit to the ICU contains a thermocouple mounted on the turbocharger exhaust port and a thermocouple amplifier module (TAM). The thermocouple senses the exhaust temperature and sends a small voltage signal to the TAM. The TAM amplifies this voltage signal by a factor of 100 (typically 0 to 8 VDC) and sends it on to the ICU. The ICU receives the analog voltage signal from the TAM and converts it to the digital signal that drives the pyrometer.

1. To determine whether the fault lies in the ICU or the gauge input circuits, use the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be in the gauge input circuits, check for 12 VDC of ignition power at the vehicle side connector to the TAM (circuit 218). The TAM is located just above the right-hand wheel well. Repair a malfunctioning circuit if necessary.
3. Warm up the engine fully so that the thermocouple reaches operating temperature. Then shut down the engine and turn the ignition back on.

NOTE: Do not measure voltage using chassis ground as a reference.

4. Check the voltage output signal of the TAM.

   Example: At 300°F (150°C) = 5.14 VDC (acceptable); at 480°F (250°C) = 9.16 VDC (unacceptable).

   NOTE: To measure TAM output voltage, gain access the circuits at the right-hand wheel well or at the ICU connector pin C6 (218A+) and pin D6 (218A–).

   4.1 Check between circuits 218A+ (positive lead) and 218A– (negative lead). Voltage should be 4 to 8 VDC, depending on temperature.

   4.2 If this measurement is not within the tolerances, then either the TAM or the thermocouple is malfunctioning.

NOTE: The TAM's output should be 100 times greater than the thermocouple output (TAM output = 5.14 VDC, thermocouple output = .0514 VDC).

NOTE: Do not measure voltage using chassis ground as a reference.

5. Check the voltage output signal of the thermocouple.

   Example: At 300°F (150°C) = 0.0514 VDC (acceptable); at 480°F (250°C) = 0.0916 VDC (unacceptable).

   NOTE: To measure thermocouple output voltage, gain access to the circuits at the right-hand wheel well.

   5.1 Check the voltage between circuits. The voltage should be between 0.04 and 0.08 VDC.

   5.2 If this measurement is out of tolerance, the thermocouple is malfunctioning. Replace a malfunctioning thermocouple as required.

   If this measurement is within tolerance, but the measurement in the previous step was out of tolerance, the TAM is malfunctioning. Replace a malfunctioning TAM as required.
6. Check the circuits from the TAM to the ICU.

   6.1 Check for continuity between circuit 218A+ and ICU left-hand connector pin C6.

6.2 Check for continuity between circuit 218A– and pin D6.

6.3 Repair a malfunctioning circuit if necessary.

Transmission Temperature Gauge

The transmission temperature gauge is electronically driven by the ICU. The ICU input circuit contains a temperature sensor (thermistor) mounted in the transmission housing. The sensor causes a voltage drop across its leads corresponding to the transmission temperature. The ICU measures the voltage drop and converts it to a digital signal, which drives the electronic transmission temperature gauge.

1. To determine whether the fault lies in the ICU or the gauge input circuits, use the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be in the gauge input circuits, check the resistance of the temperature sensor at the transmission. The resistance between the two sensor pins is typically 5250 ohms to 172 ohms. Replace the sensor if necessary.

   Examples: At 32°F (0°C) = 5250 ohms; at 77°F (25°C) = 5000 ohms.
3. Check the continuity of the sensor-to-ICU circuits on the ICU connector. Repair a malfunctioning circuit if necessary.

   3.1 Check for continuity between wire 30 and pin C12.

   3.2 Check for continuity between wire 30G and pin C13.

Drive Axle Temperature Gauge

The temperature gauges for the forward-rear and rearmost drive axles are electronically driven by the ICU. The input circuits to the ICU contain temperature sensors (thermistors) mounted in the drive axle housings. The sensor causes a voltage drop across its leads corresponding to the axle temperature. The ICU measures the voltage drop and converts it to a digital signal, which drives the electronic gauges.

1. To determine whether the fault lies in the ICU or the gauge input circuits, use the "Gauges" procedure above.
2. If the problem is found to be in the ICU, replace the ICU. For replacement instructions, see **Subject 100**.

   If the problem is found to be in the gauge input circuits, check the resistance of the rear axle temperature sensors. The resistance between the two sensor pins is typically 5250 ohms to 172 ohms. Replace the sensor if necessary.

   Examples: At 32°F (0°C) = 5250 ohms; at 77°F (25°C) = 5000 ohms.
3. Check the continuity of the circuits from the forward-rear drive axle sensors to the ICU connector. Repair a malfunctioning circuit if necessary.

   3.1 Check for continuity between wire 42 and pin A10.

   3.2 Check for continuity between wire 42G and pin A11.
4. Check the continuity of the circuits from the rearmost drive axle sensors to the ICU connector. Repair a malfunctioning circuit if necessary.

   4.1 Check for continuity between wire 43 and pin B2.

   4.2 Check for continuity between wire 43G and pin B4.

Outside Ambient Air Temperature Circuit

A temperature sensor (thermistor) is mounted under the front bumper step. The sensor sends a resistance value corresponding to the outside air temperature to the ICU, which converts it to a digital signal. The ICU uses this digital signal to display the outside ambient air temperature on the dash driver display, when the TEMP key is pressed on the keypad.

1. Turn the ignition switch to the ON position and push the TEMP key on the keypad to troubleshoot the outside ambient air temperature circuit.
2. If there is an open circuit, the display will read +00. Verify that the sensor is connected.

3. Check the continuity of circuit 299 (Air Temp+) from the front bumper step to the chassis connector, and from there to the ICU connector. Repair a malfunctioning circuit if necessary.

   3.1 Check for continuity between the front bumper step and chassis connector pin D7.

   3.2 Check for continuity between chassis connector pin D7 and ICU pin C7.

4. Check the continuity of circuit 299A (Air Temp GND) from the front bumper step to the chassis connector, and from there to the ICU connector. Repair a malfunctioning circuit if necessary.

   4.1 Check for continuity between the front bumper step and chassis connector pin D9.

   4.2 Check for continuity between chassis connector pin D9 and ICU pin D7.

5. If the temperature displayed does not correspond to the air temperature, check the resistance of the temperature sensor. The resistance between the two sensor pins is typically 0.25 to 34 kilo ohms. Replace the sensor if necessary.

   Examples: At 59°F (15°C) = 1.5 to 1.6 kilo ohms; at 68°F (20°C) = 1.2 to 1.3 kilo ohms; and at 77°F (25°C) = 0.9 to 1.1 kilo ohms.

Fuel Level Gauge Diagnosis

The fuel level gauge is controlled by the ICU using a variable resistance input from the fuel level sending unit that is located in the fuel tank. The fuel level sending unit resistance varies linearly from 31±2Ω with a full tank to 247±3Ω when empty.

If the ICU3 is measuring a resistance greater than 284Ω between circuit 47 and ground, a fault will be set for fuel level circuit open. If the ICU3 is measuring less than 23.5Ω between circuit 47 and ground, a fault will be set for fuel level circuit shorted low. ServiceLink may be used to monitor for these faults. The gauge will read empty until the measurement from the sensor is between 284Ω and 23.5Ω. Refer to **Table 1** for the fuel level diagnostic procedure.

NOTE: If the fuel level sensor is below the minimum resistance (short to ground) or above the maximum (open), the fuel gauge will read empty. Shorting the fuel sensor wires will not drive the gauge to full scale.

Fuel Level Gauge Diagnosis

Step	Test Procedure	Test Result	Action
1	If a 100 ohm resistor is available, disconnect the fuel level sender connector and place the resistor across circuit 47 and ground in the wiring harness connector to simulate the fuel level sending unit. Turn the ignition to the ON position and observe the fuel gauge. If, after gauge initialization, the gauge points very closely to the half tank mark, then the wiring and ICU are all operating correctly. Jump to Step 4 if there is no problem with the wiring and ICU. Does the fuel level gauge stay at empty even though there is fuel in the tank or is the complaint an inaccurate and intermittent reading? Note - turn the ignition to OFF and disconnect the batteries before continuing.	Stays at Empty	Go to Step 2.
		Inaccurate or Intermittent	Go to Step 4.

Fuel Level Gauge Diagnosis			
Step	**Test Procedure**	**Test Result**	**Action**
2	Disconnect the connector at the fuel level sender and measure the resistance of the sender. What is the resistance of the sender?	Greater than 284Ω or Less than 23.5Ω	Go to Step 4.
		Between 284Ω and 23.5Ω	Go to Step 3.
3	Connect the fuel level sender and disconnect the connectors on the back of the ICU. Measure the resistance in the vehicle wiring between circuit 47 in connector pin D1 and the ground circuit in connector pin D2. What is the resistance of the circuit?	Greater than 284Ω	Troubleshoot and repair an open circuit on either circuit 47 or the ground between the ICU connector and the fuel level sender.
		Between 284Ω and 23.5Ω	This is the valid resistance range. If the fuel tank is full and the resistance is close to 31Ω, replace the ICU. Otherwise no problem is indicated.
		Less than 23.5Ω	Troubleshoot and repair a short to ground on circuit 47 between the ICU connector and the fuel level sender.
4	Remove the fuel sending unit from the fuel tank. Connect an ohm meter to the pins at the fuel level sender connector. Slowly move the level of the float arm from full to empty. See **Fig. 1**. Does the resistance vary linearly from 31±2Ω to 247±3Ω?	Yes	Troubleshoot and repair for corrosion or an intermittent connection in the circuitry between the ICU and the fuel level sender.
		No	Replace the fuel level sending unit.

Table 1, Fuel Level Gauge Diagnosis

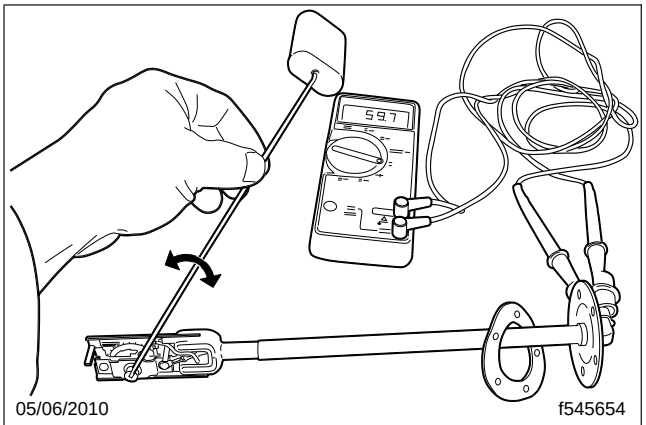

Fig. 1, Testing the Fuel Level Sending Unit

Fault Codes

The ICU displays four kinds of numerical code groups for reporting faults, accompanied by a text message which describes both the failed component and the failure mode, or cause of failure.

Each fault code displayed consists of three code groups. The first code group identifies the fault transmitter. It is referred to as the module identifier (MID). For a complete list of MIDs, see Section 54.03, **Specifications 400**.

The next code group consists of three digits also. This code identifies the system in which the fault was detected. It is either the parameter identifier (PID), or the sub-system identifier (SID). For lists of PIDs and SIDs, see Section 54.03, **Specifications 400**.

Since the ICU gathers information via the J1587 datalink, any error message or warning displayed by the ICU can indicate one of two things: a fault in the vehicle system or a fault in the data. If the fault lies in a particular vehicle system, see the troubleshooting subject in the appropriate section of the workshop manual.

To help identify faults in the data, the ICU displays a two-digit code at the end of each fault message called the Failure Mode Identifier (FMI). The FMI

gives information about where the fault lies. Is the circuit shorted, or open? Is the vehicle low on coolant, or is the coolant level sensor bad? For a complete list of FMIs, see Section 54.03, **Specifications 400**.

See **Table 2** for a list of Level III (ICU2M) fault codes.

Level III (ICU2M) Fault Codes			
Parameter	**Additional Information**	**J 1587 Spec.**	**MID (transmitter)**
Diagnostic Faults	Broadcast Every 15 sec. (Active)	PID 194	140
Software ID	On Request (PID 0 and 128)	PID 234	140
Component ID	On Request (PID 0 and 128)	PID 243	140
Park Brake Status	Broadcast 1.0 per sec.	PID 70	140
Brake Switch Status	Broadcast 1.0 per sec.	PID 65	140
Low Air Pressure	Broadcast 1.0 per sec.	PID 254	142
Fuel Level	Broadcast every 10 sec.	PID 96	140
Battery Voltage	Broadcast 1.0 per sec.	PID 168	140
Transmission Oil Temperature	Broadcast 1.0 per sec. *	PID 177	140
FWD Rear Axle Temperature	Broadcast 1.0 per sec. *	PID 77	140
RR Rear Axle Temperature	Broadcast 1.0 per sec. *	PID 78	140
Exhaust Gas Temperature	Broadcast 1.0 per sec. *	PID 173	140
Ambient Air Temperature	Broadcast 10.0 per sec.	PID 171	140
Odometer	Broadcast Every 10 sec.	PID 245	140
VIN	On Request (PID 0 and 128)	PID 237	140
Requests, Specific	Broadcast 1.0 per sec.	PID 128	140

* Fault messages should not be transmitted if the parameter for the gauge is not enabled.

Table 2, Level III (ICU2M) Fault Codes

Fault Code Screens

Fault code screens provide troubleshooting information in a brief, easy-to-read format. See the example in **Table 3**.

NOTE: The second code group in the fault code can be either a PID or a SID. To tell them apart, all SIDs are preceded by an "s" in the space between the first code group (the MID) and the second code group. If the second code group is a PID, the space is blank.

Screen Contents
ENG Coolant TEMP
Low 128x110 01 *

* x is blank for a PID, "s" for a SID.

Table 3, Level III (ICU 2M) Fault Code Screen

Specifications

IMPORTANT: The level III ICU is also known (on ServiceLink) as the ICU2M.

The instrumentation control unit, level III (level III ICU) has only one microprocessor, on the left. The two connectors are pink. Connector #1 has 24 pins, numbered A1 through A12, and B1 through B12. Connector #2 has 32 pins, numbered C1 through C16, and D1 through D16.

See **Fig. 1** for a schematic of the wiring and pinout connections for the level III ICU (ICU2M).

The original version of the ICU (ICU1) was installed on vehicles built before May, 1998. The level III ICU (ICU2M) is installed on vehicles built later than May, 1998.

To fully identify fault codes, see Section 54.03, **Specifications, 400**, for a complete list of parameter identifiers (PIDs), sub-system identifiers (SIDs), and failure mode identifiers (FMIs).

16. Wheel Spin Indicator
17. Optional Indicator 6
18. Low Voltage Warning (optional)
19. Optional Indicator 8

Fig. 2, Driver Message Center, Level III ICU (ICU2M)

General Description

This section covers the instrumentation control unit model 3 (ICU3). It is optional on both the Argosy COE and the Century Class Conventional.

ICU3

The ICU3 is a basic electronic dashboard that accepts input from the fuel level sensor, the transmission temperature sensor (if installed), and the J1587 datalink. The information is processed by a microcomputer and displayed on electronic gauges driven by stepper motors. Only air gauges operate mechanically.

The following gauges are standard:

- Speedometer
- Tachometer
- Engine Oil Pressure Gauge
- Coolant Temperature Gauge
- Fuel Level Gauge
- Primary Air System Pressure Gauge
- Secondary Air System Pressure Gauge

The transmission fluid temperature gauge is optional, but it is required on vehicles with automatic transmissions.

The speedometer and tachometer are large-faced electronic gauges located below the driver information center. See **Fig. 1**.

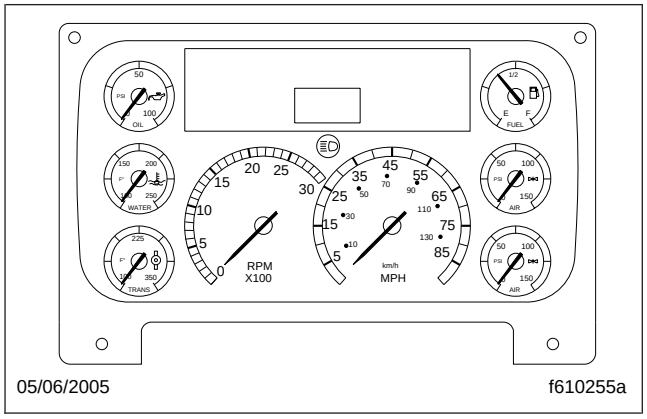

Fig. 1, ICU3

The other gauges are small-faced gauges on the driver's instrument panel, to either side of the speedometer and tachometer. The engine oil pressure, coolant temperature, transmission fluid temperature, and fuel level gauges are electronic; the two system air gauges, primary and secondary, are mechanical.

Only the air pressure gauges are replaceable in the field. The ICU3 can not drive gauges located on the auxiliary instrument panel.

Dash Message Center

The heart of the ICU3 is the dash message center. It has two parts: a set of 26 warning and indicator lights similar to those found on a conventional lightbar, and a dash driver display screen. The dash driver display screen is a 1-line by 7-character liquid crystal display (LCD) which is normally used to display the odometer reading. In addition, there is a separate voltmeter display underneath the odometer display.

The information that can be provided by the message center includes:

- odometer readings
- a listing of active faults

Mode/Reset Switch

The mode/reset switch is located on the right-hand side of the instrument cluster, if installed. See **Fig. 2**.

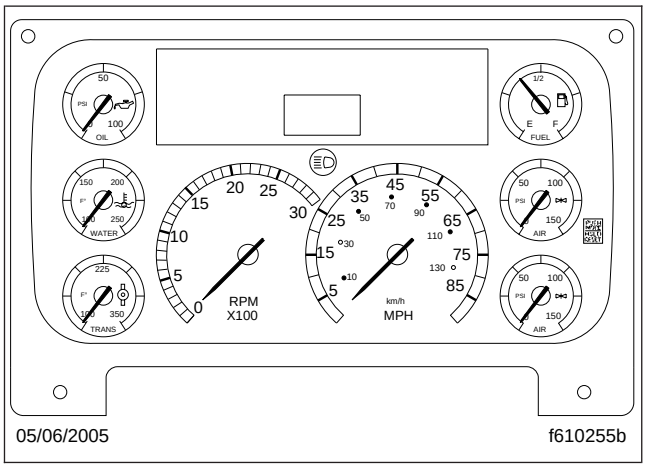

Fig. 2, ICU3 with Mode/Reset Switch

General Information

The mode/reset switch is used to scroll through the displays on the driver display screen, and to reset the trip distance and trip hours values to zero.

When the odometer reading is displayed and the parking brake is applied:

- Press the mode/reset switch once to display trip distance.
- Press the mode/reset switch a second time to display trip hours (engine hours).
- Press the mode/reset switch a third time and the SELECT screen and the current units, MI or KM, will display.
- Release the parking brake to return to the diagnostic screen.

To reset trip miles and/or trip hours to zero, press and hold the mode/reset switch for 1 second or longer. To toggle between MI (miles) or KM (kilometers), press and hold the mode/reset switch while in the SELECT screen.

The mode/reset switch can also be used to display complete fault codes for diagnostic purposes. For more information, see **Specifications, 410**.

Warning and Indicator Lights

There are spaces on the ICU3 for 26 warning and indicator lights. See **Fig. 3** for a typical installation.

There are four rows of lights. The lights in the top row are all optional and may be installed in any order, except for two lights which are typically installed at a fixed position.

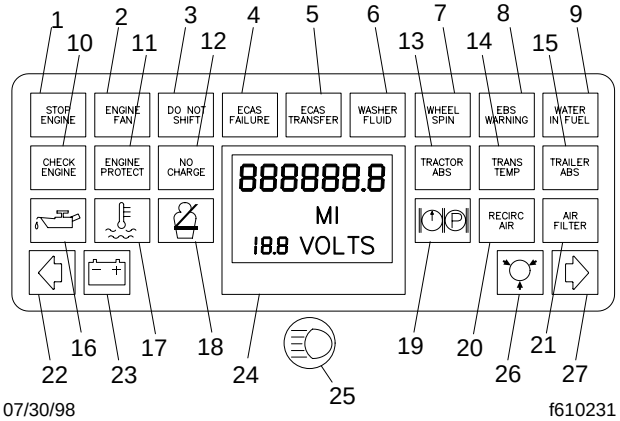
- Position 1: Stop Engine Warning (Red)—installed on vehicles with Cummins engines only
- Position 7: Wheel Spin Indicator (Amber)

NOTE: Positions 1 through 8 are ground-activated circuits; position 9 is power-activated.

On the other three rows, the lights are installed at fixed positions that do not vary. Some lights are optional; if an optional light is not requested, the position is blank (does not light up).

The following fixed-position lights are standard:

- Check Engine Indicator (Amber)
- Low Engine Oil Pressure Warning (Red)
- High Coolant Temperature Warning (Red)



07/30/98 f610231

Typical installation shown. Location of legends installed in the top row may vary, and other legends may be specified.

1. Stop Engine Warning (Cummins engine only)
2. Engine Fan On Indicator (optional)
3. Do Not Shift Indicator (optional)
4. ECAS Failure Warning (optional)
5. ECAS Transfer Indicator (optional)
6. Low Washer Fluid Indicator (optional)
7. Wheel Spin Indicator (optional)
8. EBS Warning (optional)
9. Water In Fuel Indicator (optional)
10. Check Engine Indicator
11. Engine Protection Warning (optional)
12. Alternator No Charge Indicator (optional)
13. Tractor ABS Warning
14. Transmission Temperature Warning (optional)
15. Trailer ABS Warning (optional)
16. Low Engine Oil Pressure Warning
17. High Coolant Temperature Warning
18. Fasten Seat Belt Warning
19. Parking Brake On Warning
20. Recirculated Air Indicator
21. Air Restriction Indicator
22. Left Turn Signal
23. Low Battery Voltage Warning
24. Dash Driver Display Screen
25. High Beams On Indicator
26. Low Air Pressure Warning
27. Right Turn Signal

Fig. 3, Dash Message Center, ICU3

- Fasten Seat Belt Warning (Red)
- Left Turn Signal (Green)
- Low Battery Voltage Warning (Red)
- Tractor ABS Indicator (Amber)
- Parking Brake On Warning (Red)

- Recirculated Air Indicator (Amber)
- Low Air Pressure Warning (Red)
- Right Turn Signal (Green)
- High Beams On Indicator (Blue)

The following fixed-position lights are optional:

- Engine Protection Warning (Red)
- Alternator No Charge Indicator (Amber)
- High Transmission Temperature Indicator (Amber)—installed on vehicles with automatic transmissions
- Trailer ABS Indicator (Amber)—installed on vehicles designed to be used with a trailer
- Air Restriction Indicator (Amber)

The following lights are optional and their installed location may vary anywhere in the top row:

- Engine Fan On Indicator (Amber)
- Do Not Shift Indicator (Amber)
- ECAS Failure Warning (Red)
- ECAS Transfer Indicator (Amber)
- Low Washer Fluid Indicator (Amber)
- EBS (Electronic Braking System) Warning (Red)
- Water In Fuel Indicator (Amber)

All light bulbs are replaceable in the field, including gauge light bulbs and warning/indicator light bulbs.

Principles of Operation

Ignition Sequence

When the ignition keyswitch is turned on, the ICU3 runs through the ignition sequence. See **Fig. 4**. If the headlights are turned on, the screen displays the odometer and waits for the ignition to be turned on.

IMPORTANT: When the ignition keyswitch is first turned on, all the electronic gauges complete a full sweep of their dials, the warning and indicator lights light up, and the buzzer sounds for three seconds.

The following warning and indicator lights go on during the ignition sequence:

- Low Engine Oil Pressure Warning
- High Coolant Temperature Warning
- Low Air Pressure Warning
- Parking Brake On Warning
- Low Battery Voltage Indicator
- Fasten Seat Belt Warning
- All engine warning lights, including Engine Protection, Check Engine, and Stop Engine (on Cummins only)
- All ABS warning lights, including Wheel Spin, Tractor ABS, and Trailer ABS (if installed)

NOTE: Even though the engine and ABS warning lights go on during the ignition sequence, they are not controlled by the ICU3, but by their own system ECU (electronic control unit).

Once the ignition keyswitch has been turned on, the ICU performs a self-test, looking for active faults. During the first half of the self-test, all segments of the display illuminate as follows: "888888.8." During the second half of the self-test, the software revision level is displayed.

If there are no active faults, the screen displays the odometer.

If, however, the ICU3 has received active fault codes from other devices, it displays them, one after the other, until the parking brake is released or the ignition keyswitch is turned off.

The screen displays a code, called the message identifier (MID), indicating the ECU or system that is not functioning properly.

Example: If the engine or engine control unit is not functioning properly, the screen displays "ECU 128." For a complete list of possible screen displays, see **Specifications, 400**.

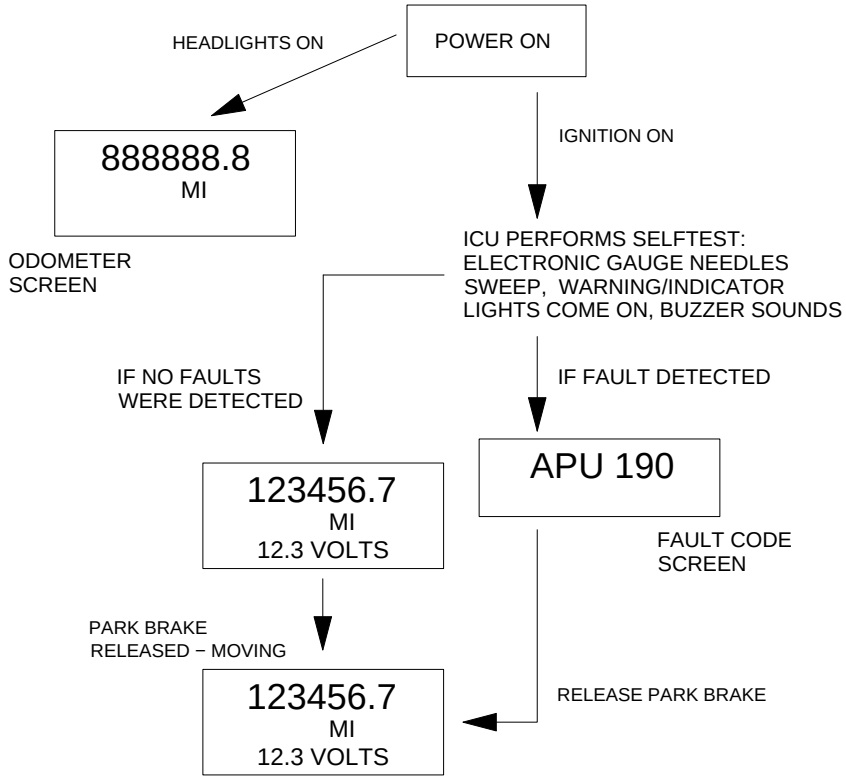
NOTE: If the ICU3 receives a message from an ECU that has not been pre-programmed into the ICU's memory, it displays "SYS MID" instead.

Once the parking brake is released, the ICU3 displays the odometer again.

Odometer

The odometer is set to display in either miles or kilometers, depending on the primary scale of the speedometer. The legend, either "MI" or "KM," illumi-

General Information



During the first half of the self-test, all segments of the display illuminate. During the second half of the self-test, the software revision level is displayed.

NOTE: If there is more than one fault, the ICU3 displays them, one after another, changing every three seconds, until the park brake is released.

Fig. 4, ICU3 Ignition Sequence

nates between the odometer and the volts display when the engine is running or the headlights are turned on.

The odometer is a seven-digit display with a decimal point, until the vehicle has traveled 999,999.9 miles or kilometers (km). At one million miles (km), the odometer resets itself to "1000000," without the decimal point, and can continue up to 9,999,999. The odometer only displays significant figures (no leading zeros).

IMPORTANT: Although the odometer uses data supplied by the engine ECU to update its count, it keeps its own mileage starting from the zero point, which marks where it was first installed.

Buzzer

The buzzer sounds during the ignition sequence and whenever one of the following conditions exists:

- The engine oil pressure falls below the preset level, which is 5 to 9 psi (35 to 60 kPa) on most engines.
- The coolant temperature rises above the preset level, which is 215°F (101°C) on Caterpillar and Detroit Diesel engines; 221°F (105°C) on Mercedes-Benz engines; and 220°F (104°C) on Cummins engines.
- The air pressure falls below the preset level, which is 44 psi (300 kPa).

- The parking brake is set with the vehicle moving at a speed greater than 2 miles per hour (3 km/h).

An optional ground-activated buzzer can be controlled by another ECU on the vehicle.

Replacement

The instrumentation control unit model 3 (ICU3) is a self-contained one-piece unit, including housing, gauges, and the dash message center. It is attached to wing panels that are fastened to the dash. See **Fig. 1**.

Air pressure gauges and light bulbs are the only components that are replaceable in the field. For air pressure gauge replacement, see **Subject 110**. For light bulb replacement, see **Subject 120**.

To replace individual switches or flipper valves, see **Section 54.03, Subject 110**.

NOTE: To remove the auxiliary instrument panel, see **Section 54.03, Subject 100**.

IMPORTANT: Before draining the air, it can be helpful to move the adjustable steering column to the lowest possible position.

1. Drain both air systems, primary and secondary.

CAUTION

Electronic components of the ICU3 are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU3 circuitry.

2. Remove the four fasteners from the corners of the bezel attached to the front of the ICU housing. See **Fig. 2**. Fasteners used on the ICU3 are Torx® T25 dog-point screws. See **Fig. 3**.

CAUTION

Do not forcibly pull the driver's panel from the dash. This may dislodge wires from the harness electrical connectors on the back of the ICU housing and damage the wires, the ICU, or the dash.

3. Pull the old ICU away from the dash. When removing the old ICU from an Argosy COE, carefully work the ICU housing free of the wing panels. Do not remove the wing panels unless they are damaged. Pull the top of the unit towards you until the back of the housing is free, then pull up to remove the rest of the unit.
4. Remove the connectors from the back of the housing.

   4.1 From behind the ICU housing, disconnect the two electrical connectors in the center of the housing.

   IMPORTANT: Bleed off all air before trying to remove the air hoses.

   4.2 Disconnect all air hoses. Using a paint pen, mark the hoses for ease of installation.
5. Remove the old ICU from the vehicle. See **Fig. 2**.
6. Install the new ICU3 on the dash. See **Fig. 2**.

   6.1 Connect the air hoses to the air gauges as marked during removal.

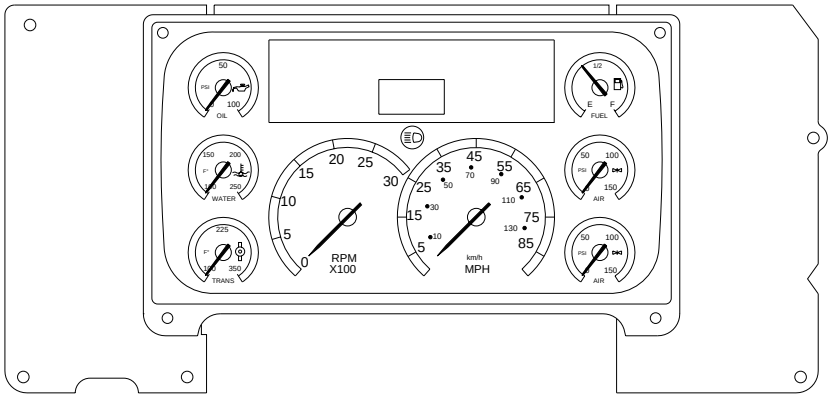
   6.2 Connect the two electrical connectors, as removed.

   6.3 Install the wing panels, if removed.

   6.4 Place the ICU3 in the dash and install the fasteners.
7. Turn on the ignition and test the operation of the new ICU3. All the electronic gauges should make one complete sweep and return to their normal indicating positions; the warning and indicator lights should turn on, then off. Mechanical (air) gauges do not make a sweep.

   If any gauges are not working properly, the ICU3 will need to be serviced or replaced.

Instrumentation Control Unit 3 Replacement



05/05/2005 f610216

Fig. 1, ICU3 With Wing Panels

1. Dog Point
2. Torx Head

Fig. 3, Dog-Point Screw

Replacement

IMPORTANT: Before draining the air, it can be helpful to move the adjustable steering column to the lowest possible position. This makes it easier to remove the ICU.

1. Drain both air systems, primary and secondary.

CAUTION

To avoid damaging the ICU, please read and follow the cautions in Subject 100 regarding grounding the ICU and forcibly pulling it from the dash.

2. Remove the ICU3. See **Fig. 1**. For detailed instructions, see **Subject 100**.

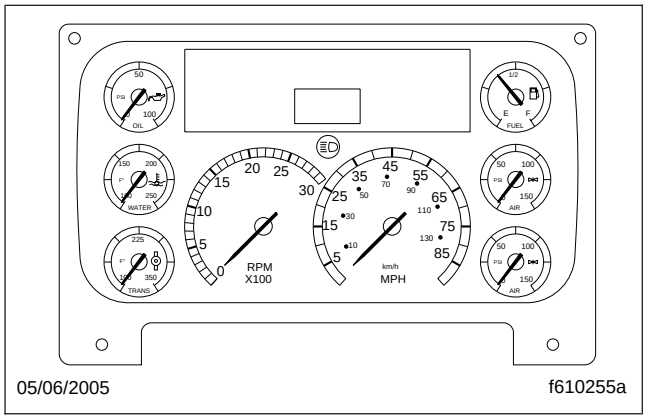

Fig. 1, ICU3

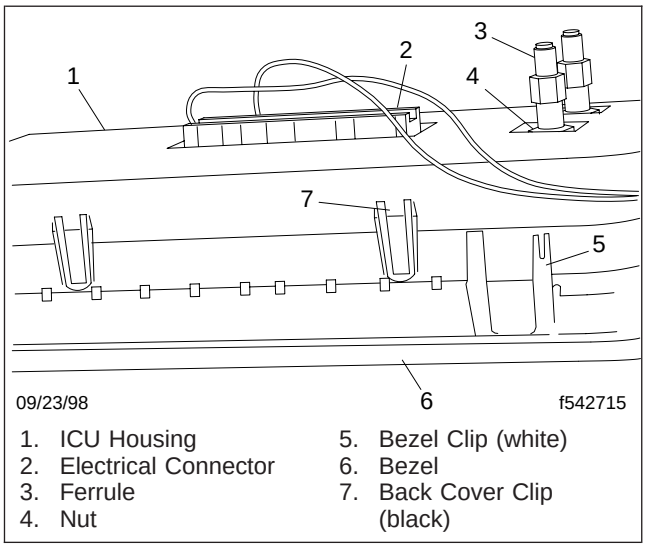
3. Remove the reset button from the front of the ICU housing, if installed.

CAUTION

Use extreme care to avoid breaking the clips when prying them off the ICU housing. The clips are under tension and are easy to damage.

4. Using a thin-bladed screwdriver, very carefully pry off the nine large white clips from the sides of the ICU housing. Remove the bezel from the ICU housing. See **Fig. 2**.

   4.1 From the back of the ICU housing, remove the ferrule from the threaded tube coming out the back of the air gauge.



1. ICU Housing
2. Electrical Connector
3. Ferrule
4. Nut
5. Bezel Clip (white)
6. Bezel
7. Back Cover Clip (black)

Fig. 2, Air Pressure Gauge Installation

   4.2 Remove the nut from the threaded air tube.

5. Remove the old air gauge from the ICU.

6. Install the new air gauge.

   6.1 Insert the new gauge into the hole in the ICU housing.

   6.2 Tighten the nut on the threaded tube.

   6.3 Install the ferrule.

7. Position the bezel on the ICU housing. Fasten the nine white clips to the sides of the ICU housing.

8. Install the reset button on the ICU housing, if removed.

9. Install the ICU3. For detailed instructions, see **Subject 100**.

10. Start the engine and wait for the air pressure to build up. When it has, test the operation of the new gauge.

Replacement

IMPORTANT: Before draining the air, it can be helpful to move the adjustable steering column to the lowest possible position. This makes it easier to remove the ICU.

1. Drain both air systems, primary and secondary.

CAUTION

To avoid damaging the ICU, please read and follow the cautions in Subject 100 regarding grounding the ICU and forcibly pulling it from the dash.

2. Remove the ICU3. See **Fig. 1**. For detailed instructions, see **Subject 100**.

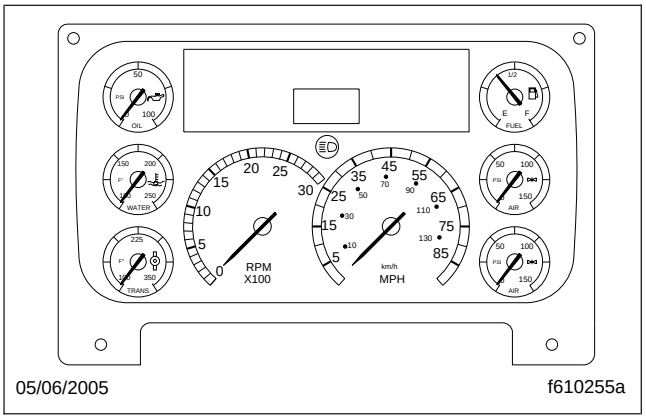


Fig. 1, ICU3

CAUTION

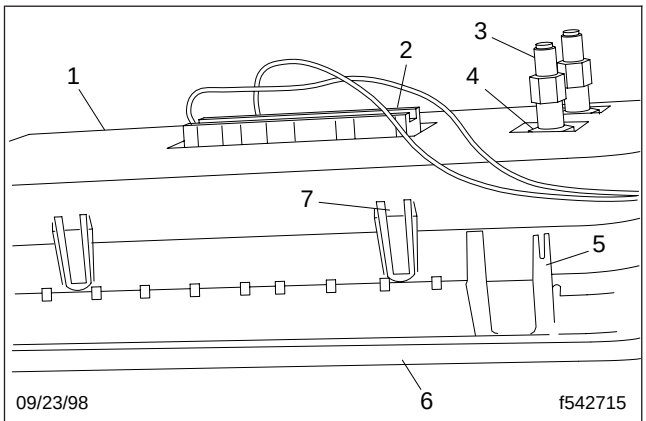
Use extreme care to avoid breaking the clips when prying them off the ICU housing. The clips are under tension and are easy to damage.

3. Pry off the five small black clips from the sides of the ICU housing. Remove the back cover from the ICU housing. See **Fig. 2**.

4. Remove the burnt-out light bulb(s). See **Fig. 3**.

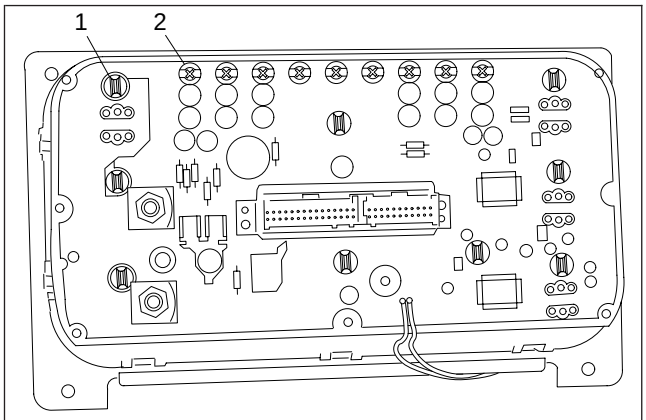
   4.1 To remove gauge light bulbs, twist the bulb holder behind the affected gauge until the bulb comes out.

   4.2 To remove warning/indicator light bulbs, use a small screwdriver to twist out the bulb base behind the affected light.



1. ICU Housing
2. Electrical Connector
3. Ferrule
4. Nut
5. Bezel Clip (white)
6. Bezel
7. Back Cover Clip (black)

Fig. 2, Back Cover Installation



1. Gauge Light Bulb Holder
2. Warning and Indicator Light Bulb Base

Fig. 3, Light Bulb Installation

5. Install the new light bulb(s).

   5.1 To install gauge light bulbs, twist the bulb holder into the slot from which the old one was removed.

   5.2 To install warning/indicator light bulbs, insert the new bulb base into the proper slot and use a small screwdriver to tighten it.

6. Position the back cover on the ICU housing. Fasten the five black clips to the sides of the ICU housing.

Light Bulb Replacement

7. Install the ICU3. For detailed instructions, see **Subject 100**.
8. Turn on the ignition keyswitch. Check all bulbs for correct operation.

Fuel Level Gauge Diagnosis

The fuel level gauge is controlled by the ICU using a variable resistance input from the fuel level sending unit that is located in the fuel tank. The fuel level sending unit resistance varies linearly from 31±2Ω with a full tank to 247±3Ω when empty.

If the ICU3 is measuring a resistance greater than 284Ω between circuit 47 and ground, a fault will be set for fuel level circuit open. If the ICU3 is measuring less than 23.5Ω between circuit 47 and ground, a fault will be set for fuel level circuit shorted low. ServiceLink may be used to monitor for these faults. The gauge will read empty until the measurement from the sensor is between 284Ω and 23.5Ω. Refer to **Table 1** for the fuel level diagnostic procedure.

NOTE: If the fuel level sensor is below the minimum resistance (short to ground) or above the maximum (open), the fuel gauge will read empty. Shorting the fuel sensor wires will not drive the gauge to full scale.

Fuel Level Gauge Diagnosis

Step	Test Procedure	Test Result	Action
1	If a 100 ohm resistor is available, disconnect the fuel level sender connector and place the resistor across circuit 47 and ground in the wiring harness connector to simulate the fuel level sending unit. Turn the ignition to the ON position and observe the fuel gauge. If, after gauge initialization, the gauge points closely to the half tank mark, then the wiring and ICU are all operating correctly. Jump to Step 4 if there is no problem with the wiring and ICU. Does the fuel level gauge stay at empty even though there is fuel in the tank or is the complaint an inaccurate and intermittent reading? Note - turn the ignition to OFF and disconnect the batteries before continuing.	Stays at Empty	Go to Step 2.
		Inaccurate or Intermittent	Go to Step 4.
2	Disconnect the connector at the fuel level sender and measure the resistance of the sender. What is the resistance of the sender?	Greater than 284Ω or Less than 23.5Ω	Go to Step 4.
		Between 284Ω and 23.5Ω	Go to Step 3.
3	Connect the fuel level sender and disconnect the connectors on the back of the ICU. Measure the resistance in the vehicle wiring between circuit 47 in connector pin D1 and the ground circuit in connector pin D2. What is the resistance of the circuit?	Greater than 284Ω	Troubleshoot and repair an open circuit on either circuit 47 or the ground between the ICU connector and the fuel level sender.
		Between 284Ω and 23.5Ω	This is the valid resistance range. If the fuel tank is full and the resistance is close to 31Ω, replace the ICU. Otherwise no problem is indicated.
		Less than 23.5Ω	Troubleshoot and repair a short to ground on circuit 47 between the ICU connector and the fuel level sender.

Troubleshooting

Fuel Level Gauge Diagnosis			
Step	**Test Procedure**	**Test Result**	**Action**
4	Remove the fuel sending unit from the fuel tank. Connect an ohm meter to the pins at the fuel level sender connector. Slowly move the level of the float arm from full to empty. See **Fig. 1**. Does the resistance vary linearly from 31±2Ω to 247±3Ω?	Yes	Troubleshoot and repair for corrosion or an intermittent connection in the circuitry between the ICU and the fuel level sender.
		No	Replace the fuel level sending unit.

Table 1, Fuel Level Gauge Diagnosis

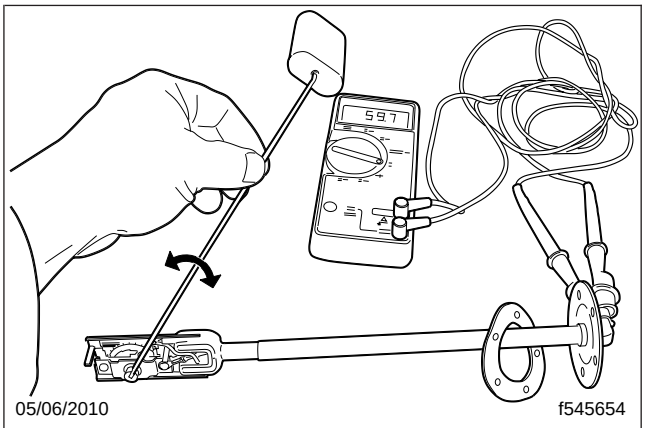


Fig. 1, Testing the Fuel Level Sending Unit

The instrumentation control unit model 3 (ICU3) has two pink connectors that plug into pins located in the center of the unit, on the back. Connector #1 has 24 cavities, numbered A1 through A12, and B1 through B12. Connector #2 has 32 cavities, numbered C1 through C16, and D1 through D16.

See **Fig. 1** for a schematic of the wiring and pinout connections for the ICU3.

To fully identify fault codes, see **Section 54.03, Specifications 400**, for a complete list of parameter identifiers (PIDs), sub-system identifiers (SIDs), and failure mode identifiers (FMIs).

Wire numbers for optional indicators depend on the option installed. The wire number given applies only to the option listed and will change if a different option is installed at that location. Optional indicator #9 is 12V power-activated; all other optional indicators are ground-activated.

NOTE: Do not use reserved pins for testing or programming.

General Description

IMPORTANT NOTIFICATION: Servicing of the Eaton VORAD EVT–300 Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

⚠ CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables, and the CWS Central Processing Unit (CPU) 32-pin connector and ground cables. See Subject 150 for instructions. Electric currents produced during electric welding can damage various electronic components on the vehicle.

The Eaton VORAD EVT–300 is a computerized collision warning system (CWS) that uses front-mounted and side-mounted (optional) radar to continuously monitor vehicles ahead and alongside the vehicle. Additional warning time, to prevent potential rear-ending of other vehicles, is provided by alerting the driver to stationary or slow moving objects in front of the vehicle or to objects toward which the vehicle is creeping. The system provides three levels of alerts to indicate the interval to a vehicle ahead travelling at normal speeds.

The system warns of potentially dangerous situations by means of visual and audible alerts. The system performs in fog, rain, snow, dust, smoke, and darkness. To be detected, objects must be within the radar beam's field of view and provide a surface area that can reflect back the radar beam.

Components consist of one, two, or three in-cab display units, the front-mounted antenna assembly, side sensor(s), the central processing unit (CPU), antenna mounting plate, and associated wiring harnesses.

Forward-Looking Antenna Assembly

The forward-looking antenna assembly transmits radar signals to, and receives them back from, vehicles and objects ahead. This allows the determination of the distance to, relative speed of, and angle to the target of vehicles and objects ahead. The system uses this information to warn the driver of potentially dangerous situations.

The forward-looking antenna assembly will simultaneously monitor up to 20 vehicles within a 350-foot (107-meter) range. Much information processing is done by the antenna itself. A four-wire twisted pair attaches via a Deutsch connector to the rear of the antenna. The antenna wires are built into the 32-pin connector going to the CPU.

The forward-looking azimuth measurement system (monopulse technology) provides a 12 degree beam. It is able to track targets in a curve (up to 20 targets at one time) but reports only those within the vehicle's lane. Road curvature information is provided by the CPU's yaw rate sensor, which shapes the radar detection zone to the curve.

The detection range is reduced during a sharp turn.

Optional Side Sensors

An optional side sensor(s), mounted on the side of the vehicle, also transmits and receives radar signals for a distance of 2 to 10 feet (0.5 to 3 meters), alongside the vehicle. It has a 15 degree beam angle. The side sensor can detect unseen vehicles and objects, moving and stationary, adjacent to the vehicle.

CPU Internal Gyroscope

The B-pillar door must be closed and secured when the vehicle is in operation. Unintended motion of the B-pillar door will affect the CPU's internal gyroscope. The system may provide an incorrect or unnecessary warning or no warning when one is required.

The CPU's internal gyroscope is sensitive to orientation. The CPU must be mounted with the uppermost surface within ±3 degrees of true horizontal and vertical planes. Ensure that the directional arrow on the CPU points up. A separate power ground, as well as a ground strap, is provided on the CPU.

Driver Display Unit

The driver display unit (DDU) contains the controls and indicators relating to system operation. See Fig. 1. A slot is provided at the front lower edge to insert an optional driver's identification card. An optional, configurable light and audible alarm indicate

General Information

whether or not the driver's identification card has been inserted. At startup, a power-on LED test takes place and all of the lights illuminate.

The "first alert detection range" is adjusted by rotating the range knob. See **Fig. 1**, Ref. 5.

NOTE: The system may be configured so that range control is not adjustable by the driver.

Accident reconstruction data can be saved by pushing and holding the range knob for five seconds. This will save the most recent data in half of the allocated memory.

A green SC indicator light (see **Fig. 1**, Ref. 6) will flash eight times when the range knob is depressed for five seconds to store accident reconstruction information. It will also flash eight times after the power-on LED test is finished if accident reconstruction data was previously stored.

A yellow alert light (see **Fig. 1**, Ref. 11) will illuminate when an object is detected within the 350-foot (107-meter) maximum detection range. The yellow light also illuminates when the proximity alarm threshold is crossed.

NOTE: The maximum detection range on straight roads is 350 feet (107 meters). On curved roads, the range is reduced by the road's turn radius.

An orange alert light (see **Fig. 1**, Ref. 10) illuminates along with the yellow alert light when the vehicle is within a three-second following interval behind another vehicle in the same lane. If within a 2-second following interval, and closing on the vehicle ahead, a warning tone will also sound.

A red alert light (see **Fig. 1**, Ref. 9) illuminates along with the yellow and orange alert lights when the vehicle is less than one second behind another vehicle. If the vehicle ahead is opening the interval, no tone will sound. If the interval is closing, double tones will sound. Within a 1/2-second or less following interval, opening or closing, the tones will repeat twice per second.

If a stationary vehicle or object, or an object moving at least 20 percent slower than the CWS-equipped vehicle, is detected within 220 feet (67 meters), and within three seconds, all three alert lights will illuminate and the double tones will sound. This warning overrides all others and is not affected by the range control knob setting.

If the CWS-equipped vehicle is traveling less than 5 mph (8 km/h) and an object is detected less than 15 feet (4.5 meters) in front of the vehicle, and the closing rate is less than 2 mph (3 km/h) but more than 1/2 mph (1 km/h), the yellow alert light will illuminate and a low-frequency double tone will sound.

All warnings apply only to objects within the maximum detection range and in the CWS-equipped vehicle's lane. Proximity alert tones and 2-second following interval tones are configured items. All tones are disabled in sharp turns or when the brakes are applied. If the configuration permits, the 3-second alert level may be adjusted with the range control knob.

A low-frequency tone sounds when a system failure is detected. A medium-frequency tone sounds when the volume control level is changed. Only if the system is configured to require a driver's identification card (optional) does the following information apply. A high-frequency tone sounds when the driver's identification card has been successfully read. A low-frequency tone sounds when the driver's card has been unsuccessfully read. The system can be configured so that if the system is on and the requested driver's card has not been inserted: no alert is given, or a visual alert only is given, or both a visual and an audible alert are given.

The side sensor is an optional part of the system. One side sensor may be mounted on one side of the vehicle, or one may be mounted on each side of the vehicle, or two may be mounted on one side to increase the monitored area on that side. The red side sensor light will illuminate and stay on if a failure is detected. If objects are temporarily unable to be detected during heavy rain, both the red and yellow lights will illuminate.

The optional accident reconstruction capability provides two segments of system data, one of which can be stored in system memory. Pushing and holding the DDU range knob for about 5 seconds will store the first segment. Within 6 seconds, the green SC indicator light will blink rapidly eight times, confirming that the data has been saved. If the range knob is pushed again, a fail tone will sound. After the first segment is saved, the second segment runs continuously, but only contains the last 10 minutes (approximately) of system data.

If the first memory segment has been frozen, then the other segment cannot be frozen. Only by disconnecting the main CPU connector can the second memory segment be preserved. The CPU must be

10. Orange, Alert Light
11. Yellow, Alert Light
12. Distance/Danger Alert Lights

Fig. 1, Driver Display Unit (DDU)

returned to Eaton VORAD for downloading and interpretation of accident reconstruction data.

Pressing and holding the DDU volume knob (see **Fig. 1**, Ref. 3) for at least five seconds will activate the failure display mode. The system may turn off if the knob is released before five seconds. After five seconds, the DDU FAIL light will begin blinking out fault codes. After an eight-second interval additional fault codes, if present, will be blinked out. A code 10 will be displayed if either no faults are found or when all fault codes have been displayed.

NOTE: Vehicles equipped with an instrument cluster with a message center (ICU–2M only), will automatically display MID, SID, and FMI codes when a CWS fault is detected. An abbreviated text description of the fault, in English, will also display. The Eaton VORAD assigned fault code numbers (10 through 94) will not display.

Fault codes are cleared by pushing and holding the range knob, but only when the system is in failure display mode, otherwise one segment of accident reconstruction data will be frozen.

Principles of Operation

The collision warning system (CWS) operates by transmitting and receiving low power, high frequency, radar (microwave) signals between the vehicle and objects in front of and to the side(s) of it. These signals determine changes in distance and speed between the vehicle and the object. This information is then used to inform the driver of a potential collision by visual and auditory alerts. To be detected, an object must be within the field of view of the antenna's radar beam. It must also provide a surface that can reflect the radar beam back to the antenna assembly. The side sensor(s) detects objects alongside the vehicle.

The antenna assembly compares the frequencies between the transmitted and received signals. It converts the information to a digital format and outputs it to the central processing unit (CPU) for processing. The CPU in turn sends signals to activate the appropriate lights and alarms. The antenna is mounted to aim directly in front of the vehicle. It has a range of up to 350 feet (107 meters) for moving objects and 220 feet (67 meters) for stationary and slow-moving objects.

General Information

The side sensor range is set to detect vehicles in the adjacent lane. It also provides information to the CPU for processing.

The CPU processes the information it receives from the antenna assembly, J1587 (vehicle speed), side sensor(s), brake circuit, and turn signal circuit. It sends signals to the driver display unit and the side sensor display to illuminate lights. It also signals the driver display unit to sound alerts over the speaker.

The driver display unit (DDU), if so configured, controls power to the system, speaker volume, and the range threshold of alerts to objects in the road. It also controls the storage of the first 10-minute segment of accident reconstruction data onto the driver's card.

The side sensor display (SSD) contains red and yellow alert lights, indicating if an object is detected or not. The red light indicates a detected object. The yellow light indicates no object detected. Both the side sensor display and the driver display unit have a light-intensity adjusting light sensor.

SmartCruise

System Overview

SmartCruise is an optional Adaptive Cruise Control (ACC) system that uses the EVT-300 hardware and SmartCruise software to maintain the vehicle's headway by interacting with the engine and requesting that the engine either de-fuel, or de-fuel and apply the engine brake. Since SmartCruise does not apply the service brake or steer the vehicle, the driver needs to be in control of the vehicle at all times. Also, because of the limitations of the EVT-300 system in distinguishing real targets from false targets when these targets are stationary and present in or near the vehicle's path (road signs in a curve or near the lane of travel, overpasses, parked vehicles on the side of the road, center dividers, retaining walls, etc.), SmartCruise ignores stationary targets when maintaining the headway, but the EVT-300 Collision Warning System (CWS) does not alert the driver of a target in the vehicles path.

SmartCruise works in conjunction with the engine cruise control functions so that all functions of the cruise control (called Conventional Cruise Control, which is contained in the engine ECU) operate as usual when no targets are present in front of the vehicle. When a valid target is present and SmartCruise determines that the headway is less than the driver's set headway, it will request the engine to de-fuel, or to de-fuel and apply the engine brake. Once the correct headway is achieved, SmartCruise maintains the headway until the the speed of the target exceeds the driver's set speed. At that moment, SmartCruise allows the engine to continue with Conventional Cruise Control functions.

System Requirements

Using the data gathered by the forward looking antenna assembly, SmartCruise is capable of controlling the headway of the vehicle. SmartCruise interacts with the Engine Control Module (ECM) over the SAE J1939 data bus. When the driver activates the Conventional Cruise Control (CCC), vehicle speed is controlled by the engine cruise control system (CCC) until SmartCruise determines that a target is being approached. If a target is approaching, SmartCruise sends a message over the J1939 data bus to the engine to reduce power or also apply the engine brake. Once the correct headway is achieved, SmartCruise will maintain that headway until the speed of the target exceeds the driver's set speed. SmartCruise then allows the engine to resume Conventional Cruise Control functions.

Operating Parameters

The operating parameters of the SmartCruise system are as follows:

- The minimum operating speed of the vehicle is the same as the minimum operating Conventional Cruise Control speed.
- The minimum set speed of the vehicle is 30 MPH.
- The minimum following headway is no less than 2.0 seconds when the range of adjustment is enabled.
- The maximum range of adjustment is at least 2.75 seconds when the range of adjustment is enabled.
- If the system loses its target in a curve, the system will not accelerate or resume to set speed while in a curve with a radius less than 2200 feet.

System Heartbeat on SAE J1939

The Adaptive Cruise Control Heartbeat is enabled when specific components are installed on the vehicle, and when specific requirements are met by the EVT-300.

Vehicle Requirements

SmartCruise is available on heavy-duty trucks with an engine brake, a Vehicle Cruise Control system, and an electronically controlled engine. Engine speed and engine brake application is controllable over the SAE J1939 data bus. The current operating state of the Vehicle Cruise Control is available over either the J1939 or the SAE J1587 data bus. Although not mandatory, for optimal performance the truck should have an electronically controllable transmission that allows the selection of the transmission gear over the J1939 bus.

The vehicle equipped with EVT-300 CWS and SmartCruise will only offer SmartCruise as a standard Cruise Control feature. Conventional Cruise Control can only be enabled by toggling the Headway Control (HDWY CNTL) On/Off switch twice within 10 seconds.

Eaton VORAD Requirements

The EVT-300 CWS with SmartCruise will send a J1939 “heartbeat” message (ACC1 message every 100 ms) continuously from Power On to Power Off to indicate to the engine that the EVT-300 is operating properly. If the "SmartCruise Enable" configuration option is "NO," no ACC1 messages will be transmitted.

The EVT-300 system will be powered when the ignition is switched ON. After the self-check the system will start transmitting the heartbeat. Fifteen seconds after the engine has been started and reached a steady state (idle), if the heartbeat is not on the data bus, the engine should disable SmartCruise mode and return to throttle mode. If the Ignition is ON, but the engine was not started, the engine will disregard the presence or absence of the ‘heartbeat’ (ACC1) on the J1939 data bus.

SmartCruise will always be in one of the following eight states and will transmit its current state in the ACC1 message:

- "000—Off (stand by, enabled, ready for activation)" - Indicates SmartCruise is enabled in the EVT-300 configuration setup and there are no EVT-300 faults that prevent SmartCruise from operating and the Conventional Cruise Control is not active.
- "001—Speed control active" - SmartCruise is on, but not currently sending control messages. In other words, no target is ahead and the Conventional Cruise Control is controlling road speed to the driver’s set speed.
- "010—Distance control active" - SmartCruise is on, the target is ahead, and SmartCruise actively sending control messages to maintain following interval.
- "011—Overtake mode" - SmartCruise is on, but temporarily disabled because the driver is manually overriding cruise control by using either the throttle pedal or the cruise control "accel" switch.
- "100—Not defined" - Not used.
- "101—Finish mode" - SmartCruise is on, no target is ahead, and SmartCruise is sending control messages to return to the driver’s set speed. This occurs when the target SmartCruise is tracking moves out of the way and SmartCruise returns the vehicle to the driver’s set speed.
- "110—Disabled or error" - SmartCruise is in an error state and cannot operate.
- "111—Not available" The operator has pressed the EVT-300 OFF switch.

Engine Requirements

The Adaptive Cruise Control (SmartCruise) system will continuously send a heartbeat message (ACC1) on the J1939 data bus. If there is no heartbeat present on the J1939 data bus, the engine should assume that the ACC system is no longer functioning properly and should disable Cruise Control functions and return to throttle control. The engine will have one memory flag that will be programmed at the vehicle manufacturing plant to indicate that an ACC system will be installed on the vehicle. The memory flag in the engine ECM shall be set to ‘1’ by a programming tool if the vehicle has ACC or it should be left unchanged, defaulted to ‘0’ (by the engine manufacturer) for no ACC.

The EVT-300 system will be powered when the ignition is switched ON. The system will start transmit-

General Information

ting the heartbeat in less than 15 seconds after the engine has been started and reached a steady state (idle). If the heartbeat is not on the data bus after 15 seconds, the engine should disable ACC mode and return to throttle mode. If the Ignition is ON, but the engine was not started, the engine disregards the presence or absence of the 'heartbeat' (ACC1) on the J1939 data bus.

When ACC has failed, Conventional Cruise Control can be enabled by toggling the Headway Control On/Off switch twice within 10 seconds.

If the ACC heartbeat comes back on the data bus, the engine ECM shall again allow ACC operation, but only at the next engine ignition key-on cycle. This is to avoid the possibility of the engine being in Conventional Cruise Control and SmartCruise taking over without driver notification and acknowledgement, in the event of intermittent data bus message or wiring connections.

If the SmartCruise is disabled on a vehicle, the memory flag in the engine ECM needs to be set to 0 by a programming tool to allow normal operation of Conventional Cruise Control functions.

Faults

SmartCruise should report faults if SmartCruise operation is not allowed. The fault will remain active until the ignition power is cycled (Off/On) or the fault is cleared using a service tool (ProLink or ServiceLink). An active fault will cause the "110 -Disabled or error" state to be sent in the ACC1 message, and the HDWY FAIL light will illuminate. It will also send a fault message via J1587 to the ICU for the driver display.

If the EVT-300 has a fault that prevents it from operating SmartCruise properly, it will discontinue sending the heartbeat or will send an ACC1 message of "110" to indicate that the engine should change from cruise control to throttle control.

For certain faults reported by the CWS, SmartCruise operation will not be allowed. If a SmartCruise fault occurs, the ignition power must be recycled to re-enable SmartCruise operation. Faults for which SmartCruise operation will *not* be allowed, and faults for which SmartCruise operation is allowed are shown in **Table 1**.

SmartCruise Response to CWS Faults

Accident Reconstruction

The EVT-300 has the capability to store data that can be used for accident reconstruction purposes.

The Accident Recorder can store two segments of system data in the system's non-volatile memory. The Central Processing Unit must be returned to Eaton VORAD Corporation to download and interpret the recorded data in the non-volatile memory. This must be done before 30 days have elapsed, or the event will be removed from the system memory.

Replacement

IMPORTANT NOTIFICATION: Servicing of the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: Removal of the driver display unit (DDU) requires gaining access to the inside of the auxiliary instrument panel. See **Group 60** for specific procedures for removal and installation of the dash panels. See **Subject 170** for DDU test procedures.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Remove the instrument center-panel trim, the HVAC/radio trimplate, and the right-hand dash trimcap.
3. Remove the four Torx®-head screws securing the auxiliary instrument panel to the dash assembly.
4. Gain access to the rear (forward side) of the auxiliary panel by pulling the panel toward you.
5. Remove the two Torx-head screws which attach the DDU mounting bracket to the auxiliary panel. See **Fig. 1** .
6. Withdraw the DDU, with its mounting bracket attached, and disconnect the electrical harness.

NOTE: If replacing the DDU or the bracket, carefully separate the unit from the bracket. It is attached with a two-sided adhesive. Remove all of the old adhesive. Install new adhesive and attach the DDU to the bracket.

7. To install the DDU, first connect the electrical harness.
8. Place the DDU, with bracket attached, behind the auxiliary panel and insert it into the panel.
9. Install and tighten the two bracket mounting Torx-head screws.
10. Carefully push the auxiliary panel into position, against the dashboard assembly.

4. Torx-head Screw
5. J-Clip
6. DDU Mounting Bracket

Fig. 1, Driver Display Unit (DDU)

11. Install the four Torx-head screws which secure the panel to the dashboard assembly and tighten them securely.
12. Install the right-hand trimcap, the HVAC/radio trimplate, and the instrument center-panel trim.
13. Remove the chocks from the tires and connect the batteries.

Replacement

IMPORTANT NOTIFICATION: Servicing of the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: See **Subject 170** for side sensor display (SSD) test procedures.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Remove the two Torx®-head screws securing the passenger grab handle to the passenger side A-pillar. Remove the handle.
3. Pull the door trim edging back to expose the edge of the inner A-pillar trim cover. Remove the cover. See **Fig. 1** .
4. Release the plastic retaining clip securing the SSD to the A-pillar cover. Remove the SSD.
5. Disconnect the electrical harness.
6. To install, connect the harness to the SSD.
7. Insert the SSD into the A-pillar cover and ensure it is secured with the plastic retaining clip.
8. Put the A-pillar cover in position on the A-pillar.
9. Press the door trim edging into place.
10. Place the grab handle in position. Install and securely tighten the mounting screws.
11. Remove the chocks from the tires and connect the batteries.

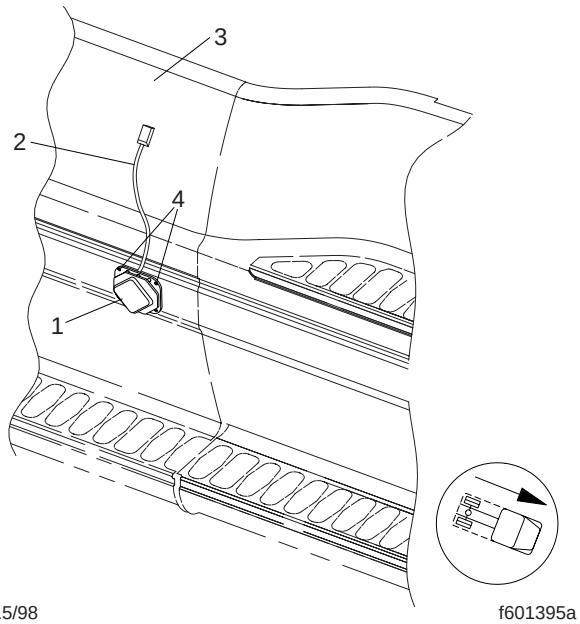
Replacement

IMPORTANT NOTIFICATION: Servicing of the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: See **Subject 170** for side sensor test procedures.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Remove the four fasteners and nuts securing the side sensor to the center air-fairing panel. See **Fig. 1** .



1. Side Sensor
2. Side Sensor Harness
3. Center Air-Fairing Panel
4. Mounting Fastener

Fig. 1, Side Sensor

3. Pull the sensor away from the panel.
4. Reach through the fuel access door, or up between the side-fairing and fuel tank, and locate the sensor harness. Cut any tie straps securing the sensor harness and pull the mated connectors out through the sensor mounting hole and disconnect them.
5. To install, locate the two side sensor harness connector ends and join them together.
6. From the outside, feed the harness through the hole in the fairing panel.
7. Secure the assembly to the fairing panel with the four fasteners and nuts.
8. Reach up between the side-fairing and the fuel tank and make a service loop in the excess side sensor harness. Secure the service loop to the aluminum side-fairing mounting rail with tie straps.
9. Remove the chocks from the tires and connect the batteries.

Replacement

IMPORTANT NOTIFICATION: Servicing of the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: See **Subject 170** for antenna assembly test procedures, **Subject 160** for initial adjustments, and **Subject 180** for on-road checks and final adjustments.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Remove the four fasteners which secure the antenna assembly mounting brackets to the antenna mounting plate. See **Fig. 1** or **Fig. 2** .
3. Pull the antenna assembly forward to gain access to the four-wire twisted pair and the Deutsch connector.
4. Disconnect the Deutsch connector from the rear of the antenna assembly.
5. To install the antenna assembly, connect the Deutsch connector to the rear of the antenna assembly.
6. Attach the antenna assembly to the mounting plate with the four fasteners and tighten them securely.
7. Realign the antenna.
8. Remove the chocks from the tires and connect the batteries.

Replacement

IMPORTANT NOTIFICATION: Servicing of the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. On both Conventionals and Argosy COEs, remove the antenna assembly.

NOTE: See **Subject 130** for instructions on replacement of the antenna assembly.

3. With the antenna assembly removed, disconnect the Deutsch connector from the rear of the antenna assembly.
4. On Conventionals, hold the heads of the four mounting plate/radiator support fasteners from above and remove the nuts below the mounting plate. See **Fig. 1** .
5. Remove the mounting plate from the vehicle.
6. To install, place the mounting plate in position with the four fasteners extending through the holes in the radiator support/mounting plate.
7. Install the four nuts and torque them 28 lbf·ft (38 N·m).

NOTE: Push the plate back against the mounting fasteners while tightening the nuts. This ensures that the plate is perpendicular to the vehicle's longitudinal axis.

8. On Argosy COEs, remove the two mounting plate/crossmember fasteners and remove the mounting plate from the vehicle. See **Fig. 2** .
9. To install, place the mounting plate in position behind the crossmember, install the two fasteners, and tighten them 8 lbf·ft (11 N·m).
10. On both Conventionals and Argosy COEs, connect the Deutsch connector to the rear of the antenna assembly, and install the antenna assembly onto the mounting plate.

NOTE: If the antenna assembly is removed from the mounting plate, even with the mounting brackets left attached, it will be necessary to realign the antenna.

11. Remove the chocks from the tires and connect the batteries.

Replacement

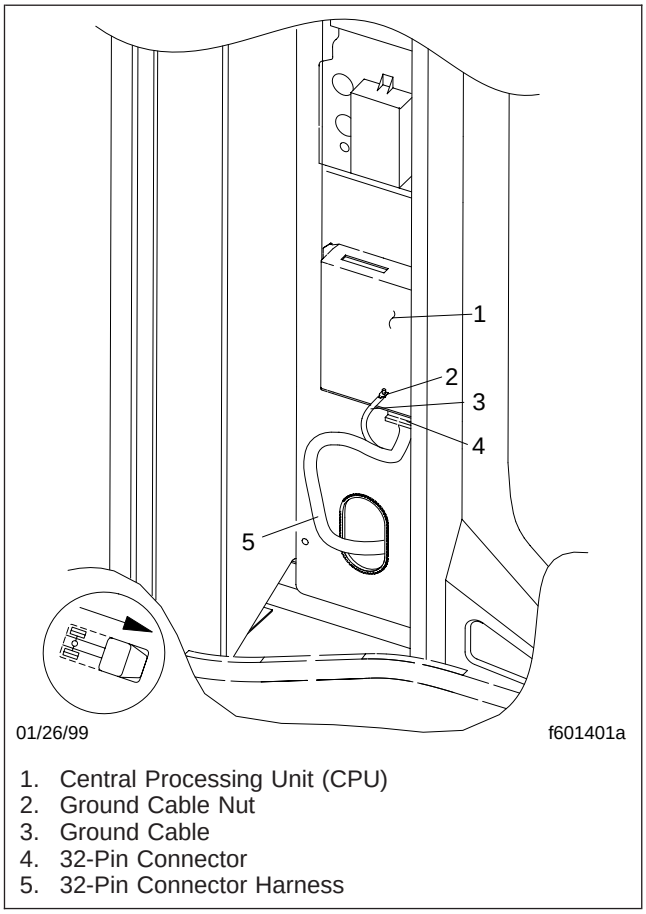
IMPORTANT NOTIFICATION: Servicing of the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: Before replacing a central processing unit (CPU), confirm that there is a problem. Visually inspect the CPU and confirm that all connections, power and grounds, are good. Check for a blown fuse or tripped circuit breaker. Check the condition of the pins in all connectors and cavities. Examine the wiring and look for physical damage to the insulation, corrosion, or the effects of heat. See **Subject 300** for CPU fault codes and troubleshooting procedures.

IMPORTANT: If possible, view the configuration parameters of the old CPU with ProLink and record them before removing the old CPU from the system.

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.
2. Inside the cab, turn the two camlock fasteners on the B-pillar door with a flat-bladed screwdriver and open the B-pillar door. See **Fig. 1** .
3. Remove the four locknuts attaching the CPU to the mounting studs on the inside of the B-pillar door. Remove the CPU from the door. See **Fig. 2** .
4. Disengage the push lock connector and carefully withdraw the 32-pin harness connector from the CPU.
5. At the bottom of the CPU, remove the nut from the ground stud and remove the ground wire from the stud.

IMPORTANT: The CPU's internal gyroscope is sensitive to orientation. The CPU must be mounted with the uppermost surface within ±3° of true horizontal and vertical planes. Also, ensure that the directional arrow on the CPU points up.



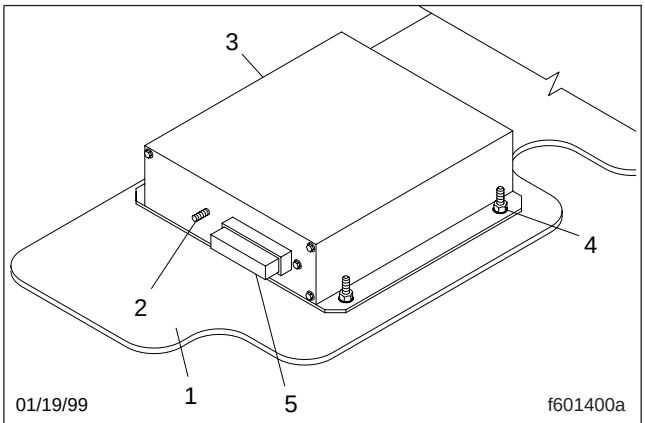
1. Central Processing Unit (CPU)
2. Ground Cable Nut
3. Ground Cable
4. 32-Pin Connector
5. 32-Pin Connector Harness

Fig. 1, B-Pillar Cavity (showing CPU)

6. To install, place the new CPU in position against the mounting studs, inside the B-pillar door.
7. Install the four locknuts and tighten them securely.
8. Place the ground wire ring terminal over the ground stud on the bottom of the CPU. Install and tighten the nut securely.
9. Carefully connect the 32-pin harness connector to the CPU.
10. Close the B-pillar door and secure it by turning the two camlock fasteners.

NOTE: When replacing a CPU with a new unit, it is necessary to verify the system's configuration using ProLink. Follow the steps below to verify that a new CPU is configured identically to the one it is replacing.

Central Processing Unit (CPU) Replacement



1. B-Pillar Door
2. Ground Stud
3. Central Processing Unit (CPU)
4. Mounting Stud and Locknut
5. 32-Pin Harness Connector

Fig. 2, Central Processing Unit (CPU)

11. Access the ProLink SET UP menu.
12. Verify that the vehicle ID number and the odometer reading are correct.
13. Select H/W (hardware) CONFIGURATION from the SETUP menu and confirm that the current parameters of the new CPU are identical to those of the CPU it is replacing.
14. Select S/W (software) CONFIGURATION from the SETUP menu and confirm that the current parameters of the new CPU are identical to those of the CPU it is replacing.
15. Select TRIP PARAMETERS from the S/W (software) CONFIGURATION menu and confirm that the current parameters of the new CPU are identical to those of the CPU it is replacing.
16. Select PERFORMANCE OPTIONS from the S/W (software) CONFIGURATION menu and confirm that the current parameters of the new CPU are identical to those of the CPU it is replacing.
17. Select PRODUCT OPTIONS from the S/W (software) CONFIGURATION menu and confirm that the current parameters of the new CPU are identical to those of the CPU it is replacing.
18. After you have ensured that the new CPU is configured identically to the old one, press FUNC to return to the SETUP menu and clear all fault codes.
19. Remove the chocks from the tires and connect the batteries.

General Information

IMPORTANT NOTIFICATION: Service on the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

The only component requiring an initial adjustment, after removal and installation, is the antenna assembly.

For initial adjustments to the antenna assembly, a good quality digital level is recommended.

NOTE: Perform these initial adjustments when the antenna assembly, antenna assembly mounting brackets, or antenna mounting plate are removed or replaced. Perform the initial adjustments before performing the on-road checks and final adjustments.

Initial Antenna Assembly Adjustment

1. Park the vehicle on a level surface. Set the parking brake, chock the tires, and disconnect the batteries.

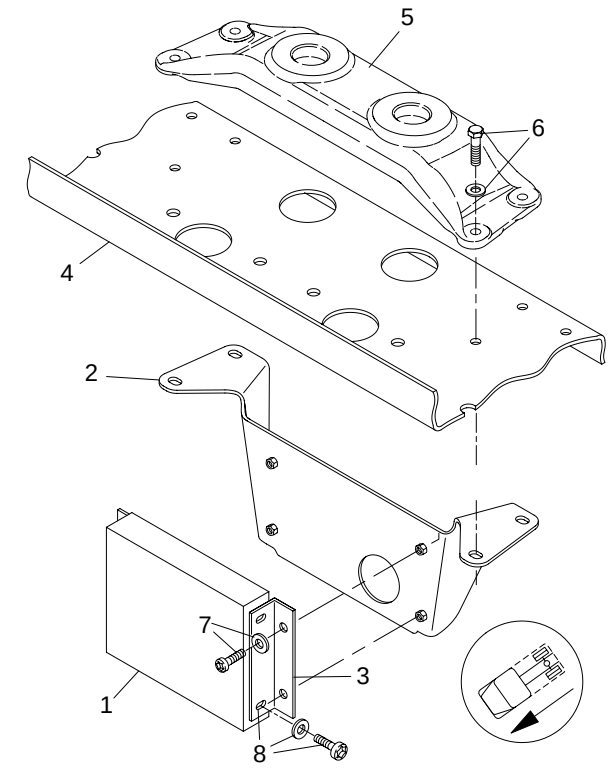
IMPORTANT: The vehicle must be parked on a level surface, with the suspension aired up to the normal ride height and ride attitude, to properly perform the initial antenna assembly adjustment procedure.

2. Place the digital level on the frame rail, behind the cab. The vehicle as well as the ground surface needs to be approximately level.

NOTE: Take note of the angle of the vehicle and/or ground surface. You must compensate for any deviation from absolute level.

3. Loosen the four adjusting setscrews (two on each antenna mounting bracket) with a 5/32-inch Allen wrench. See **Fig. 1** or **Fig. 2**.

4. Push the antenna assembly all the way back in the mounting bracket adjustment slots, so that the antenna is flush with the antenna mounting plate, and only snug the setscrews.



05/05/99 f601748

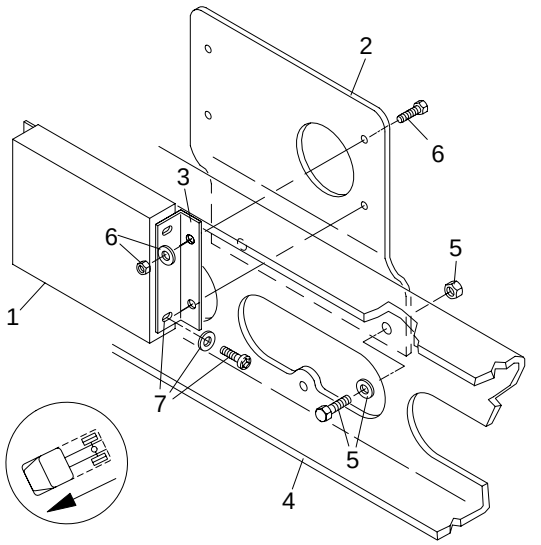
1. Antenna Assembly
2. Antenna Mounting Plate
3. Antenna Bracket
4. Front Closing Crossmember
5. Lower Radiator Support
6. Fastener (mounting plate/radiator support)
7. Fastener (mounting plate/antenna bracket)
8. Adjusting Slot/Fastener

Fig. 1, Antenna Assembly (Conventional)

NOTE: Push the antenna assembly back, flush with the antenna mounting plate, to accomplish the initial antenna assembly left-to-right adjustment. This adjustment is also dependent upon the proper installation of the mounting plate. When installing the mounting plate on Conventional vehicles, be sure to push the mounting plate back and hold it against the four mounting plate/radiator support fasteners as the nuts are being tightened.

5. Place the digital level vertically against the face of the antenna. The initial vertical antenna setting is one degree down. Look for a reading of 89

Initial Adjustments



05/05/99 f601749

1. Antenna Assembly
2. Antenna Mounting Plate
3. Antenna Bracket
4. Front Crossmember
5. Fastener (mounting plate/crossmember)
6. Fastener (mounting plate/antenna bracket)
7. Adjusting Slot/Fastener

Fig. 2, Antenna Assembly (Argosy)

degrees (or 91 degrees), depending on level readout. Ensure that the top of the antenna is tilted toward the front by one degree.

NOTE: If the vehicle is angled down because it is parked on an unlevel surface, add the number of degrees off from level to the one degree down. If the vehicle is angled up, subtract the number of degrees off from level to the one degree down. For example, if the vehicle is angled down 2.7 degrees the antenna angle must be 3.7 degrees down which will produce a reading of 86.3 degrees (or 93.7 degrees), depending on level readout.

6. Adjust the antenna out from either the top or bottom to obtain the required degree reading on the level.
7. Tighten the setscrews securely.
8. Check the vertical setting to be sure it is still set at the required degree angle.
9. If the vertical setting has changed, repeat the procedure.
10. Proceed to **Subject 180** for instructions on performing the on-road checks and final adjustments.
11. Connect the batteries and remove the chocks from the tires.

Component Checks

IMPORTANT NOTIFICATION: Servicing of the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

MPSI PROLINK® 9000

To properly test and diagnose problems with the Eaton VORAD EVT–300 collision warning system, an MPSI ProLink 9000 diagnostic tool equipped with an Eaton VORAD cartridge, or a multi-protocol cartridge with the Eaton applications PCMCIA card, is required. The initial or default EVT–300 diagnostic menu consists of three sub menus: setup, checkout, and error log. Verify system configuration of the central processing unit (CPU) with the setup menu. Use the checkout menu to test the functions of the various components. Display fault codes using the error log menu.

NOTE: Use only a digital ohmmeter when performing tests to avoid damaging electronic components.

COMPONENT CHECKS USING THE CHECKOUT MENU

NOTE: Before selecting CHECKOUT, select SETUP and verify system configuration. This ensures proper operation of the CHECKOUT menu during component function tests.

The various components of the collision warning system can be activated using this menu. Some checks require assistance from the technician. The technician will be asked, via the ProLink, if the expected event occurred. Use the UP and DOWN arrow keys to scroll the selection arrow. Select the CHECKOUT menu from the initial EVT–300 diagnostic menu by placing the selection arrow next to CHECKOUT and pressing ENTER.

NOTE: The following component checks are performed with the vehicle stationary.

Side Sensor Display (SSD) Test

1. Select SSD TEST from the CHECKOUT menu.
2. Place the selection arrow next to the side sensor display.

NOTE: If the vehicle has only one side sensor, there will be an N/A value displayed for the other side sensor.

3. Press ENTER to toggle the state of the side sensor display light.
4. The indicator light on the side sensor display will match the RED or YELLOW message shown on the ProLink.
5. Press FUNC to exit the SSD TEST and return to the CHECKOUT menu.

Side Sensor (SS) Test

1. Select SS TEST from the CHECKOUT menu.
2. Place the selection arrow next to the side sensor you are testing.

NOTE: If the vehicle has only one side sensor, there will be an N/A value displayed for the other side sensor.

3. Wave your hand in front of the side sensor.
4. As you wave your hand, the message displayed on the ProLink will change from NO to YES.

NOTE: The message OPEN/SHORT will appear if the side sensor power source is disconnected.

5. Press FUNC to exit the SS TEST and return to the CHECKOUT menu.

Driver Display Unit (DDU) Test

1. Select DDU TEST from the CHECKOUT menu.

NOTE: At the lamp test line, the RED, YELLOW, and ORANGE range control alert lights will toggle automatically. Each will illuminate individually on the display as the ProLink indicates their color.

2. On the DDU, rotate the left knob (volume control) left to right fully through its range. The percentage value for the LEFT KNOB on the ProLink display will change from 0 to 100 percent.
3. Then, rotate the right knob (range control) left to right fully through its range. The percentage value for the RIGHT KNOB on the ProLink display will change from 0 to 100 percent.

Component Checks

4. Push in the right knob (range control). The display will indicate PUSH.
5. Press FUNC to exit the DDU TEST and return to the CHECKOUT menu.

Speaker Test

1. Select the SPEAKER TEST from the CHECKOUT menu.
2. Place the selection arrow next to the particular sound to be tested and press ENTER.

NOTE: When performing this test, sound volume is always at maximum. Adjusting the volume knob (left knob) on the DDU will have no effect.

3. Listen for the specific sound from the DDU speaker.
4. Repeat the procedure to test each of the six different sounds.
5. Press FUNC to exit the SPEAKER TEST and return to the CHECKOUT menu.

Antenna Test

1. Select ANTENNA TEST from the CHECKOUT menu.
2. Have an assistant walk toward the front of the antenna.

NOTE: The antenna will only detect a moving object.

3. Note the RANGE reading on the ProLink.
4. Ensure that the RANGE reading is approximately correct.
5. Press FUNC to exit the ANTENNA TEST and return to the CHECKOUT menu.

Turn Signal Test

1. Select TURN SIGNAL TEST from the CHECKOUT menu.
2. Place the selection arrow next to the right-side turn signal.

NOTE: There will be an N/A value displayed for the turn signal on the left-hand side.

3. Move the turn signal lever into position to activate the turn signal for the right-hand side.
4. The ProLink display for that turn signal position will change from OFF to ON.
5. Press FUNC to exit the TURN SIGNAL TEST and return to the CHECKOUT menu.

Brake Test

1. Select BRAKE TEST from the CHECKOUT menu.
2. Depress the brake pedal when the ProLink display indicates PRESS BRAKE PEDAL.

NOTE: If the system is not configured for a brake signal BIT test, there will be an N/A value displayed.

3. The BRAKE message on the display will change from OFF to ON when the brake pedal is depressed.
4. Press FUNC to exit the BRAKE TEST and return to the CHECKOUT menu.

Antenna Assembly

IMPORTANT NOTIFICATION: Service on the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

NOTE: These procedures are intended to be performed only on an interstate highway, freeway, or similar roadway where at least two lanes in your direction are available for use. Perform these procedures only after performing the initial adjustments when an antenna assembly, antenna assembly mounting brackets, or antenna mounting plate have been removed or replaced. See **Subject 160** for instructions.

1. Drive the vehicle straight ahead at normal highway speeds of 50 to 55 mph (80 to 88 km/h).

⚠ WARNING

Only attempt these procedures where at least two lanes are available for use and traffic is light. Improperly performing these procedures could result in loss of control of the vehicle and possible physical injury and property damage.

2. Confirm that the system is monitoring only the vehicle traveling immediately ahead of your vehicle.
3. Using ProLink, select the CHECKOUT menu, then scroll to and select ANTENNA.

NOTE: The driver display unit (DDU) should display following distance information only for the vehicle traveling immediately ahead, by illuminating the number 1 or number 2 alert light. The DDU should not display following distance information for vehicles in the left or right lanes, ahead of the your vehicle, while your vehicle is traveling in a straight line.

4. Monitor the azimuth reading on ProLink. Look for a 0.0 reading.

NOTE: The vehicle you are tracking must be traveling directly ahead in your lane, in the same position (center) of the lane as your vehicle, and both vehicles must be traveling on a straight roadway.

When the above conditions are met and a negative value is indicated, the antenna is "seeing" the target in its own left field of view (antenna facing to the right too much). When a positive value is indicated, the antenna is "seeing" the target in its own right field of view (antenna facing to the left too much). Look for a reading that will "bounce around" 0.0 in equal values, positive to negative (equal values produced left to right).

5. To adjust the antenna assembly, first pull the vehicle off the road in a safe location and shut off the engine.
6. Loosen the two adjusting setscrews in the antenna mounting bracket only on the side you wish to adjust.
7. If negative values were read, point the antenna to the left by pulling out the passenger's side of the antenna.
8. If positive values were read, point the antenna to the right by pulling out the driver's side of the antenna.
9. Tighten the antenna-adjusting setscrews securely.
10. Drive the vehicle again and monitor the azimuth reading on ProLink. Look for a 0.0 reading.
11. If necessary, repeat the procedure from the beginning until the reading "bounces around" 0.0 in equal values, positive to negative (equal values produced left to right).

Troubleshooting

IMPORTANT NOTIFICATION: Servicing of the Eaton VORAD Collision Warning System should be undertaken only by qualified technicians. Special skills and equipment are required to perform these procedures. For assistance, contact Eaton VORAD at (800) 840–7970.

COMPONENT TROUBLESHOOTING

When an active fault is detected by the system, the red failure light on the driver display unit (DDU) illuminates until the cause of the condition is corrected. It is possible to read fault codes either on the DDU, by placing it in failure display mode, or with a ProLink® 9000 diagnostic tool.

NOTE: Vehicles equipped with an instrument cluster with a message center (ICU-2M only), will automatically display MID, SID, and FMI codes when a CWS fault is detected. An abbreviated text description of the fault, in English, will also display. The Eaton-VORAD assigned fault code numbers (10 through 94) will not display.

Active and inactive fault codes may be blinked out over the DDU when the system is placed in failure display mode. Press and hold the DDU volume knob for at least 5 seconds. The system may turn off if you release the knob before 5 seconds. After 5 seconds, the DDU red failure light will begin blinking out fault codes. After an 8-second interval additional fault codes, if present, will be blinked out. A code 10 will be displayed if either no faults are found or when all fault codes have been displayed. Display active codes by turning the range knob to the left of center.

Display inactive codes by turning the knob to the right of center. The failure light will blink as many times as the first digit of the fault code number, pause approximately 3/4 of a second, and then blink as many times as the second digit. After all of the active or inactive fault codes have been displayed, the sequence repeats. This process continues until the system is turned off. To clear all fault codes from system memory while in failure display mode, press and hold the range knob for approximately 30 seconds.

Make the various basic checks below before proceeding to the more detailed troubleshooting procedures in the following tables.

NOTE: Certain tests, as noted in the following table require the use of a ProLink 9000 diagnostic tool, equipped with an Eaton VORAD cartridge or a multi-protocol cartridge with the Eaton applications PCMCIA card.

1. Confirm that there is a problem.
2. Before replacing any component, make continuity checks with a DVOM (digital volt/ohm meter).
3. Confirm that all connections, power and grounds, to either the vehicle or components, are good.
4. Check for a blown fuse or tripped circuit breaker.
5. Check the condition of pins in all connectors and cavities.
6. Examine the wiring of the suspect component. Look for physical damage to the insulation, corrosion, and the effects of heat.
7. Examine the external components (antenna assembly, wire harness, side sensor) for damage or corrosion.

Component Troubleshooting		
Symptom	**Cause/Source**	**Remedy**
DDU green ON light blinks continuously.	Driver ID card not inserted/driver ID card.	1. — Verify that the card alarm is correctly configured in the CPU. * 2. — Insert a new driver identification card.
DDU green SC light blinks eight times at power up.	An event is stored in the CPU's memory.	NOTE: When the system is turned on, the SC light will blink eight times after the self-test has been completed, if an event has been saved. Return the CPU to the factory to have the event uploaded and/or cleared.

Troubleshooting

Component Troubleshooting		
Symptom	**Cause/Source**	**Remedy**
Red FAIL light on side sensor display illuminates continuously.	CPU not receiving side sensor information/side sensor.	1. — Confirm that the vehicle has a side sensor. If not, verify in the H/W configuration menu that the RSS, LSS, and 2SS 1SSD setting is NO. * 2. — Check the connection and for damage to the side sensor wiring harness to the CPU. 3. — While performing the SS test, wave your hand in front of the side sensor and verify that the correct signal is received. * 4. — Verify a 5-volt output at the side sensor signal wire at the side sensor connector, using a DVOM (digital volt/ohm meter) with a target present. 5. — Disconnect the three-pin side sensor, pigtail, and CPU connectors. Check for corrosion or a recessed pin. 6. — Replace the side sensor.
No warning tones audible.	Speaker not functioning, incorrect brake signal, gyro malfunction, speed input signal inoperative/ DDU, brake input or configuration setting, CPU, speed input or source.	1. — Verify that the volume control knob is turned all the way to the right. 2. — Turn the system off and back on. Turn the volume control knob and listen for a tone. 3. — Verify that the DDU connection is good. 4. — Perform the speaker test and verify that an audible tone is heard from the DDU speaker. 5. — Verify that the CPU is oriented and mounted correctly for its type. 6. — Verify speed input. 7. — Perform the brake test and verify that the correct signal is received when the brake pedal is depressed. *
Warning tones audible when brakes applied.	Incorrect input signal/ brake input.	NOTE: The forward following distance warning tones are disabled when the brake pedal is depressed. Creep (proximity) and side sensor alerts are not disabled when the brake pedal is depressed. 1. — Perform the brake test and confirm receipt of the correct signal when the brake pedal is depressed. * 2. — Verify that the brake mode setting is correctly configured in the CPU. * 3. — Verify that the brake logic is correctly configured in the CPU. *
Side sensor warning tone audible when brakes are applied.	Incorrect input signal/ turn signal input.	1. — Verify that a tone is not audible when you wave your hand in front of the side sensor, with only the brake pedal depressed (turn signal not activated). 2. — Verify that the turn signal setting is correctly configured in the CPU. * 3. — Perform the turn signal test and confirm receipt of the correct signal when the turn signal is applied. *
No system ON/OFF capability.	Software/system configuration.	NOTE: System parameters may be configured to enable or disable the on/off capability. This requires use of a ProLink 9000 diagnostic tool.

Component Troubleshooting		
Symptom	**Cause/Source**	**Remedy**
The volume knob does not reduce the volume.	System configuration/ DDU.	NOTE: System parameters can be configured to limit volume to a minimum level, but only with a ProLink diagnostic tool. If the owner or fleet manager allows full adjustment of the volume level, follow the procedure below. 1. — Verify that the MIN VOL setting is zero. * 2. — Perform the DDU test and confirm proper operation of the volume knob. * 3. — Check that the DDU is properly connected and not damaged. 4. — Check that the main harness to the CPU is properly connected and not damaged.
The range knob does not change the alert levels.	Software configuration/ DDU.	NOTE: System parameters do not always allow the operator to reduce the range threshold level. This configuration can only be changed with a ProLink diagnostic tool. If the owner or fleet manager allows adjustment of the range level, follow the procedure below. 1. — Verify that the RANGE ENABLE configuration is ON. * 2. — Perform the DDU test and confirm proper operation of the range knob. * 3. — Check that the DDU is properly connected and not damaged. 4. — Check that the main harness to the CPU is properly connected and not damaged.
Front antenna detects vehicles in an adjacent lane with no vehicle in front of your vehicle.	Antenna misaligned/ antenna assembly.	1. — Walk a measured path in front of the vehicle and cross from side to side in front of the antenna. Verify that the reported target distance and azimuth angle are correct. * 2. — Confirm that the antenna face angle is properly adjusted to 1 degree down. 3. — Adjust the antenna in the direction opposite the detected side lane. Then, confirm that the antenna azimuth angle is correct left to right.
Front antenna detects vehicles in both left and right adjacent lanes, with no vehicle in front of your vehicle.	Radar side lobes extended/antenna assembly.	1. — Confirm that the antenna assembly is mounted at the minimum height, or above. 2. — Confirm that the antenna assembly is mounted securely. 3. — Confirm that the antenna beam's path is unobstructed and that no movement of surrounding body panels is being detected. 4. — Walk a measured path in front of the vehicle and cross from side to side in front of the antenna. Verify that the reported target distance and azimuth angle are correct. * 5. — Confirm that the antenna face angle is properly adjusted to 1 degree down. NOTE: Contact Eaton VORAD at (800) 840–7970 for additional assistance.

Troubleshooting

Component Troubleshooting		
Symptom	**Cause/Source**	**Remedy**
Front antenna loses or ignores detected vehicles within 100 feet (30 meters) in front of your vehicle.	Tracking module error/ antenna assembly.	1. — Confirm that the antenna assembly is correctly aligned. 2. — Check the antenna harness connection to the CPU and the antenna assembly. 3. — Inspect the antenna assembly, the harness, and the CPU for corrosion or damage. 4. — Confirm that the antenna assembly is mounted at the minimum height or above. 5. — Confirm that the antenna assembly is securely mounted. 6. — Confirm that the antenna beam's path is unobstructed and that no movement of surrounding body panels is being detected. 7. — Walk a measured path in front of the vehicle and cross from side to side in front of the antenna. Verify that the reported target distance and azimuth angle are correct. * 8. — Confirm that the antenna face angle is properly adjusted to 1 degree down. NOTE: If the component listed in the Cause/Source column has been replaced, perform a road test afterward to confirm that the condition has been resolved.
Side sensor display does not indicate power, or a detected object.	Side sensor display, wiring, CPU/side sensor display, wire harness, CPU.	1. — Check the side sensor display with ProLink and verify its operation. * 2. — Check that the side sensor display wire harness is properly connected and not damaged. 3. — Check for correct continuity and supplied voltage readings at the connector. 4. — Replace the side sensor display, then check its operation. 5. — Replace the CPU, reconfigure settings, then check its operation. *

* A ProLink 9000 diagnostic tool, equipped with an Eaton VORAD cartridge or a multi-protocol cartridge with the Eaton applications PCMCIA card, is required to perform checkout and configuration procedures.

Table 1, Component Troubleshooting

FAULT CODE TROUBLESHOOTING USING THE ERROR LOG MENU

1. Select ERROR LOG from the initial EVT–300 diagnostic menu.

NOTE: ERROR LOG provides a list of all the fault codes detected by the system. A BIT (Built-In Test) is performed every 15 seconds by the system to determine the condition of the components and internal processes. Faults that occur are logged as fault codes in the system's memory. The first line of the ERROR LOG menu displays the code number and the code status, either active or inactive.

2. Place the selection arrow next to the first line of the ERROR LOG menu. The first fault code in the error log is displayed.

NOTE: The second line of the ERROR LOG menu displays the name of the current fault. The third line (CLR CT/MIN) displays the number of occurrences of the current fault and the

total number of minutes it has been continuously occurring. The fourth and fifth lines of the menu indicate the date and time of the first and last occurrences, respectively, of the fault.

3. Return the display arrow to the active or inactive code line.
4. Press ENTER and the next fault code with its information is displayed.
5. Continue to press ENTER to display all logged fault codes with their information.

NOTE: It may be helpful in diagnosing or solving a problem to know if some action will remove a fault. Clear the count on a particular fault by following the steps below.

6. Select the fault code for which the count is to be cleared as in steps 2 and 3 above.
7. Place the display arrow on the CLR CT/MIN line.
8. Press ENTER to clear the fault's count.

NOTE: To get to the Eaton VORAD main menu, press FUNC in the initial EVT–300 diagnostic menu. The EVT–300 diagnostic menu is the default menu and comes on initially. Once at the Eaton VORAD main menu screen, you may select active or inactive faults. The name, FMI code, and count for active and inactive faults are displayed here. Failure Mode Identifiers (FMI) numbers describe a specific type of failure detected in a specific system.

9. Press the left or up arrow key to display the previous active or inactive fault.
10. Press the right or down arrow key to display the next active or inactive fault.
11. Press FUNC to return to the Eaton VORAD main menu.

NOTE: At the CLEAR FAULT CODES line, accessed from the Eaton VORAD main menu, you can clear all fault codes from system memory. Be sure this is what you want to do as all BIT data will be reinitialized when all fault codes are cleared.

12. Press ENTER if you want to clear all fault codes and then select DIAGNOSTICS from the Eaton VORAD main menu to return to the EVT–300 diagnostic menu.

Fault Code Troubleshooting

Fault Code *	Cause/Source	SID	FMI	Remedy
11/CONTROLLER	Controller/CPU.	254	12	CPU cruise control input error. Cannot be repaired in the field. †
12/CONTROLLER	Controller/CPU.	254	4	CPU NVRAM memory error. Cannot be repaired in the field. †
13/CONTROLLER	Controller/CPU.	254	4	CPU NVRAM internal battery voltage low. Cannot be repaired in the field. †
14/CONTROLLER	Controller/CPU.	254	12	CPU EEPROM error. Unable to write to memory storage device. Cannot be repaired in the field. †
15/CONTROLLER	Controller/ CyberCard.	254	12	1. — The system is unable to read the CyberCard or the card slot is damaged. Ensure that the card slot is clean and that no dirt, dust, or debris is present. 2. — CPU internal component failure. Cannot be repaired in the field. †

Troubleshooting

Fault Code Troubleshooting				
Fault Code *	**Cause/Source**	**SID**	**FMI**	**Remedy**
21/BRAKE	Vehicle brake input connection not detected/brake input.	3	2	1. — Confirm that the brake source is correctly configured in the CPU. ‡ 2. — Confirm that the exterior brake light bulbs are good. 3. — Confirm that the brake switch operates correctly. 4. — Perform the brake test and confirm that the correct signal is received when the pedal is depressed. ‡ 5. — Confirm that the brake logic is correctly configured in the CPU. ‡ 6. — Confirm that the brake input wire is connected to the proper source. 7. — Ensure that the main harness to CPU connection is good and that the harness is not damaged. 8. — Verify that pin number 9, on the top row of the main harness connector, receives 12 volts when the brake is applied.
22/SPEED MONITOR	Speed input is not detected/speed input, configuration setting.	6	2	1. — Confirm that the SPEEDO BIT setting is correctly configured in the CPU. ‡ 2. — Confirm that the speed mode is correctly configured. ‡ 3. — Perform the speedometer test to confirm the speedometer's accuracy against the vehicle speed. ‡ 4. — Check the main harness to the CPU connection and for damage to the main harness.
23/RIGHT TURN SIGNAL	Right turn signal input not detected/ turn signal input, configuration setting.	7	2	1. — Confirm that the vehicle has a right side sensor. If not, confirm that the right turn signal setting, in the H/W configuration menu, is NO. ‡ 2. — Confirm that the exterior turn signal bulbs are good. 3. — Confirm that the turn signal switch operates properly. 4. — Confirm that the right turn signal input is connected to the right turn signal lead. 5. — Perform the turn signal test to confirm that the correct input is received when the right turn signal is activated. ‡ 6. — Verify that pin number 15, on the top row of the main harness connector, receives 12 volts when the right turn signal is activated. 7. — Check the main harness to the CPU connection and for damage to the main harness.

Fault Code Troubleshooting				
Fault Code *	**Cause/Source**	**SID**	**FMI**	**Remedy**
24/RIGHT SIDE SENSOR	Right side sensor not communicating with CPU/right side sensor.	10	2	1. — Confirm that the vehicle has a right side sensor. If not, verify in the H/W configuration menu that the RSS setting is NO. ‡ 2. — Check the connection and for damage to the right side sensor wiring harness to the CPU. 3. — While performing the SS test, wave your hand in front of the right side sensor and verify that the correct signal is received. ‡ 4. — Disconnect the three-pin right side sensor, CPU pigtail, and CPU connectors. Check for corrosion or a recessed pin.
25/LEFT TURN SIGNAL	Left turn signal input not detected/ turn signal input, configuration setting.	8	2	1. — Confirm that the vehicle has a left side sensor. If not, confirm that the left turn signal setting is NO. ‡ 2. — Confirm that the exterior turn signal bulbs are good. 3. — Confirm that the turn signal switch operates properly. 4. — Confirm that the left turn signal input is connected to the left turn signal lead. 5. — Perform the turn signal test to confirm that the correct input is received when the left turn signal is activated. ‡ 6. — Verify that pin number 15, on the bottom row of the main harness connector, receives 12 volts when the left turn signal is activated. 7. — Check the main harness to the CPU connection and for damage to the main harness.
26/LEFT SIDE SENSOR	Left side sensor not communicating with CPU/left side sensor.	11	2	1. — Confirm that the vehicle has a left side sensor. If not, verify in the H/W configuration menu that the LSS setting is NO. ‡ 2. — Check the connection and for damage to the left side sensor wiring harness to the CPU. 3. — While performing the SS test, wave your hand in front of the left side sensor and verify that the correct signal is received. ‡ 4. — Disconnect the three-pin left side sensor, CPU pigtail, and CPU connectors. Check for corrosion or a recessed pin.
31/CONTROLLER	Controller/CPU.	254	12	CPU real time clock error. Cannot be repaired in the field. †
32/CONTROLLER	CPU gyroscope error/CPU.	254	12	1. — Confirm that the CPU is oriented and mounted correctly for its type. 2. — While performing the GYRO test, confirm that the voltage is stable when the vehicle is stationary, but begins to vary when a turn is simulated by tilting the CPU left to right. ‡ 3. — CPU internal component failure. Cannot be repaired in the field. †

Troubleshooting

Fault Code Troubleshooting

General Information

A "datalink" is an electrical network that connects two or more computers to exchange data. The simplest datalink is a pair of wires between two computers. Freightliner uses datalinks to connect the Electronic Control Units (ECUs) for the electronically controlled vehicle systems with each other and with the Instrumentation Control Unit (ICU). A personal computer using Freightliner's ServiceLink diagnostic software can also be connected to the network via a datalink.

Datalink Systems

Different types of datalinks are used to connect certain ECUs. The vehicle may have any of the following datalinks:

J1587/J1708

J1587/J1708 is a low speed vehicle datalink that communications information between the ECUs on the vehicle. The J1587 datalink is also referred to as J1708. See **Fig. 1**. J1708 refers to the SAE standard for the physical part of the datalink, such as the wiring and the electronic components. J1587 refers to the SAE standard for the messaging protocol that communicates on the J1708 network. In the context of vehicle repair, the terms J1708 and J1587 are used interchangeably.

The J1587 datalink uses a twisted pair of wires to reduce interference from digital messages being sent on the wires. Wire colors for the J1587 datalink are:

- Orange **J1587 Low**
- Green **J1587 High**

J1922

J1922 is a special-purpose, low-speed datalink for engine, ABS, and transmission ECU communication. See **Fig. 2**. Most vehicles with automated shift transmissions and/or traction control use J1922 datalink, until it was replaced by J1939 datalink. ServiceLink and other diagnostic tools cannot be connected to a J1922 datalink. However, faults are still reported by the ECU on the J1922 datalink through the warning lights in the ICU or fault codes reported on the J1587 datalink or both.

The J1922 datalink uses a twisted pair of wires to reduce interference from digital messages being sent on the wires. Wire colors for the J1922 datalink are:

- Pink **J1922 High**
- Blue **J1922 Low**

J1939

J1939 is a high-speed vehicle datalink that communicates information between ECUs on the vehicle. The J1939 datalink replaced the J1922 datalink. See **Fig. 3**.

Unlike the J1587 datalink, J1939 datalink allows an ECU to broadcast requests as well as information. Examples of information that can be communicated on the J1939 datalink are:

- engine rotational speed;
- road speed;
- transmission tailshaft speed;
- engine retarder deactivation request;
- engine torque reduction request.

The J1939 datalink uses a twisted pair of wires to reduce interference from digital messages being sent on the wires. Wire colors for the J1939 datalink are:

- Yellow **J1939 High**
- Green **J1939 Low**

The back bone of the J1939 datalink is the section of the datalink that is between two terminating resistors. An ECU can be connected anywhere along the length of the backbone in between the terminating resistors. The wiring between the ECU and the J1939 backbone is called a circuit. The maximum distance of the terminating resistor is 3 feet from the last ECU or diagnostic connector.

The purpose of the terminating resistors is to minimize the reflection of data on the datalink which can cause J1939 messages to become partially or completely lost. Terminating resistors prevent this from occurring. Each terminating resistor is 120 Ohms, but the equivalent of two 120 Ohms resistors in parallel is 60 Ohms. With both resistors installed in the circuit, there should be 60 Ohms measured at any two points between **J1939 High** and **J1939 Low** in the circuit.

Each ECU is generally connected to the J1939 backbone using a tee connector or splice. See **Fig. 4**.

For more information, see **Section 54.03, Specifications 400**, Tables 3 through 9.

General Information

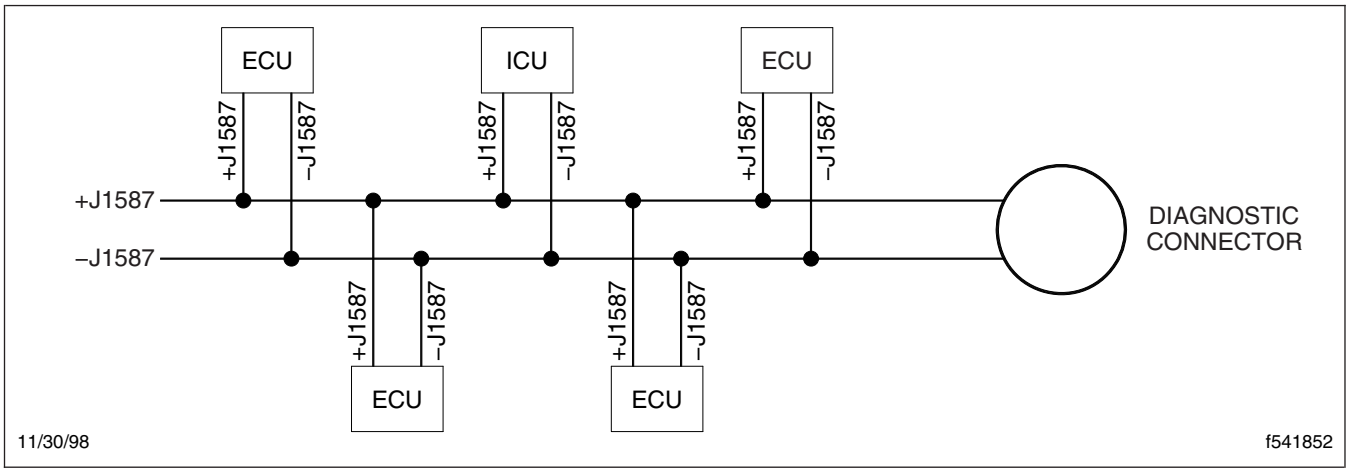

Fig. 1, J1587 Datalink

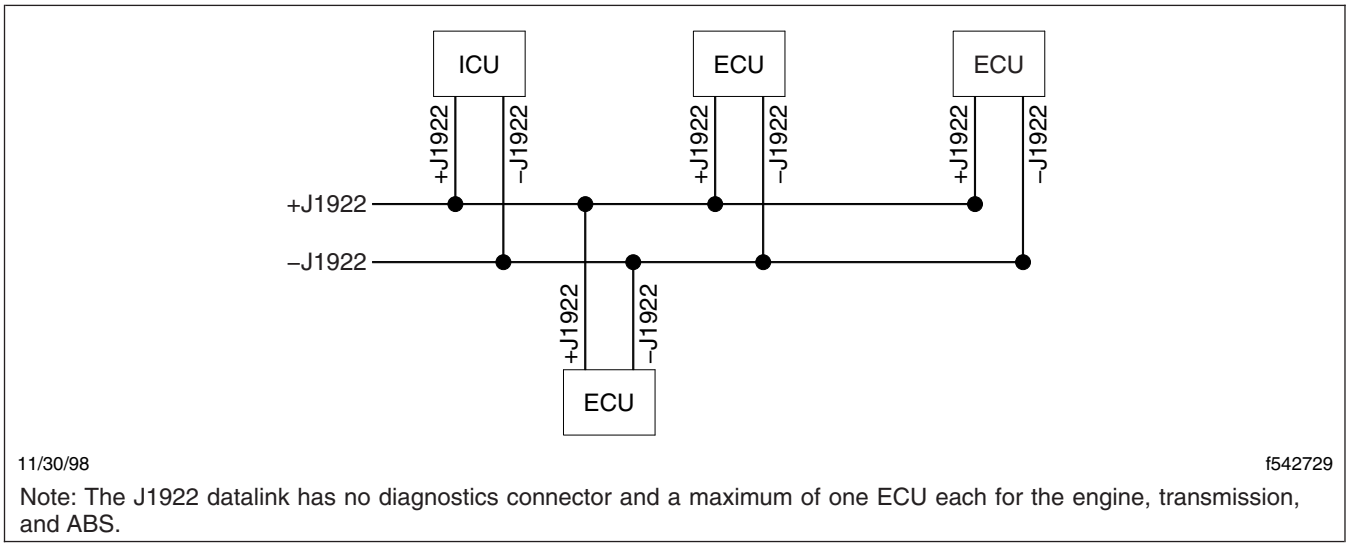

Note: The J1922 datalink has no diagnostics connector and a maximum of one ECU each for the engine, transmission, and ABS.

Fig. 2, J1922 Datalink

The typically factory-installed ECUs shown in **Table 1** connect to the datalink.

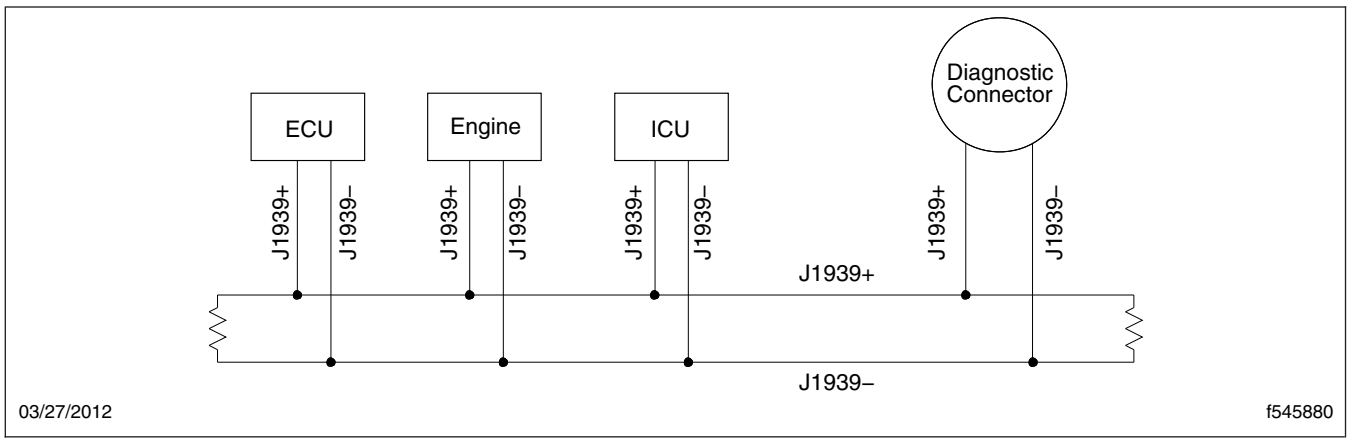

Fig. 3, J1939 Datalink

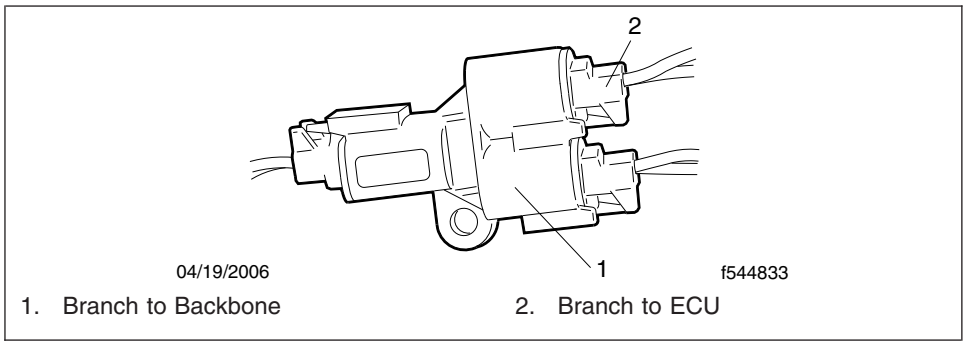

Fig. 4, J1939 Tee Connector

ECUs Connected to the Datalink	
ECU	**Status**
Engine	Always connected
Instrumentation Control Unit	Always connected
Electronic Transmission	Optional
Antilock Brakes (ABS)	Standard
Electronic Suspension	Optional
Data Logging Unit	Optional
Qualcomm® Communications System Control Unit	Optional
Air Conditioning Protection Unit (ACPU)	Standard*
HighwayMaster® Communications System Control Unit	Optional

* Not available on vehicles built after April 1999.

Table 1, ECUs Connected to the Datalink

Making the Pinout Measurements Easier to See

The pins on the diagnostic connector may be difficult to see when testing. If the pins are difficult to see, use a Y-cable as an extension to the diagnostic connector to make test measurements easier. See **Fig. 5** for a drawing of the connector at the end of the Y-cable and the corresponding 9-pin diagnostic connector pins.

NOTE: Be sure to attach a meter with a proper jumper kit to prevent unintentional shorting to other pins and possible damage to ECUs.

2. Pin E
3. Pin B
4. Pin F
5. Pin G
6. Pin C (J1939 High)
7. Pin D (J1939 Low)

Fig. 5, Y-Cable Pinouts

The Roll Call

To check the readiness of the ECUs on the datalink, the ICU sends a signal to other ECUs and expects a response from each. This "Roll Call" procedure tells the ICU which ECUs are functioning correctly. When the list of functioning ECUs is compared against the parameter list of factory-installed ECUs that are supposed to respond, the technician can determine which ECUs or datalinks are bad.

The roll call procedure was not included in the software of the ICU2L, and is not found in some early versions of ICU1. The list of ECUs that are polled can be changed using Freightliner ServiceLink software for ICU1 and ICU2M only. The following ICUs will conduct a roll call when the ignition is first turned on:

- ICU1 with software versions 8.4.0 and greater (any ECU, subject to parameter settings)
- ICU2M (any ECU, subject to parameter settings)
- ICU3 (limited to engine ECU and ABS ECU)
- ICU2L (limited to engine ECU and ABS ECU) after March 1999 release

See **Table 2** for the ICU parameters.

If the ICU does not receive a signal on the datalink from one or more of the active ECUs, it displays a roll call fault. The roll call fault is displayed *only* on the dash driver display screen. It is not broadcast on the datalink; therefore, it cannot be read by ServiceLink. However, Servicelink can be used to determine if an ECU is not responding because it polls all ECUs on the datalink when it first connects to the vehicle datalink.

Datalink Junction Blocks

For datalink wiring diagrams, see **Specifications 400**. For the J1587 datalink, the wires routed through the vehicle cab have the following junction block connectors:

- The vehicles built through August 1996 have one datalink junction block. The ICU connector serves as the dash junction block.
- The vehicles built from August 1996 to June 1997 have two datalink junction blocks but only one datalink connection to the ICU, with an internal jumper to the right-hand side.
- The vehicles built from June 1997 have two datalink junction blocks and two datalink connections (one to each ICU microprocessor). Vehicles with an ICU2M, ICU2L, or ICU3 use only one connection to the ICU.

ServiceLink Roll Call Parameters				
ECU	ICU Parameter No.		Roll Call	
	ICU1	ICU2M	ON	OFF
Engine ECU	N/A*	404	128	0
Electronic Transmission ECU	193	410	130	0
Antilock Brakes (ABS) ECU	190	407	136	0
Electronic Suspension ECU	191	408	150	0
Data Logging Unit	195	413	179	0
Qualcomm® Communications System Control Unit	194	411	181†	0
Air Conditioning Protection Unit (ACPU)	192	409	190	0
HighwayMaster® Communications System Control Unit	194	411	231†	0
VORAD ECU	189	406	219	0

* Always enabled

† Do not use this parameter.

Table 2, ServiceLink Roll Call Parameters

Century Class vehicles have at least one datalink junction block located under the B-pillar base cover. See **Fig. 6**. Those built since August, 1996, have a second datalink junction block located behind the waste bin on the wall of the driver's console support. The location of the junction block at the dash is shown in **Fig. 7**.

Locating J1939 Wiring Diagrams

The J1939 wiring diagram can be found in module 160. Other modules may also contain datalink wiring information. See **Table 3**.

Use PartsPro® to obtain drawing numbers for installation drawings, harness assembly drawings, and wiring diagrams applicable to the vehicle being worked on.

ABS harness and installation drawings	330, 332, and 333

Table 3, Component Module Locations

Datalink Repair

J1587 and J1922 Repairs

Use the same methods of repair for the twisted-pair datalink wiring as are used for the other wires on the vehicle. However, the datalink wires must be twisted at a rate of a minimum one turn per inch (25 mm) of length.

J1939 Repairs

A special cable must be used for repairs to the J1939 datalink wiring. The two types of J1939 cable ("heavy" and "lite") can be spliced together as long as the pass-through connectors are the "heavy" type. The "lite" cable (because of its lower cost) is recommended for repairs on both types of J1939 cable. Refer to Appendix C of SAE J1939-11 for the special procedures for repairing the "heavy" J1939 datalink.

Parts

Twisted-pair datalink wires may be spliced using a mating connector set. See **Table 1** for a typical set of datalink connector parts.

Procedure

1. Cut out any damaged section of datalink wire, keeping the lengths of the two wires equal. See **Fig. 1** for an example of a damaged section of datalink wire that has been removed and the datalink prepared for repair.
2. Crimp the terminals onto the wires using the proper crimp tool.
3. Pull test the terminals by hand to ensure the crimp is mechanically solid.
4. Insert the terminated wires into the connector body and install the terminal lock. The protocol for J1939 is for the yellow wire to be in cavity 1 and the green wire to be in cavity 2. Note that the lock is installed while holding the wires in position. Test the installation. If the wires slipped back during the lock installation, they will pull out of the connector.
5. Make certain the wires are twisted as close to the entry point of the connector as possible. Plug the two connector halves together. See **Fig. 2**.

Table 1, Datalink Connector Parts

General Information

This Troubleshooting subject has three main parts:

- Troubleshooting Tables

  Use the Troubleshooting Tables to get ideas on what could be causing the problem and the possible remedies to that problem.

- Troubleshooting Procedures

  Follow the Troubleshooting Procedures section to isolate the areas that have faults and to know which tests to perform.

- Testing Procedures

  The Testing Procedures section has the individual tests and specifications needed to determine whether a part must be repaired or replaced.

NOTE: Be sure to attach a meter with a proper jumper kit to prevent unintentional shorting to other pins and possible damage to ECUs.

Troubleshooting Tables

Use the following troubleshooting tables to find remedies to possible causes of datalink problems.

Problem—Power-On Roll Call Reports Fault

Problem—Power-On Roll Call Reports Fault	
Possible Cause	**Remedy**
ECU does not support roll call function (ICU1/2M only).	Reset ECU parameter to disable roll call.
Datalink wiring has fault.	Repair or replace.
Wrong power supply voltage or ground to ECU.	Replace fuse or circuit breaker, charge battery, check connections.
Connector has fault - (Pass-through, Branch, Diagnostic)	Repair or replace wiring.
ECU has fault.	Replace ECU.
ICU has fault.	Replace ICU.
Terminating resistor for J1939 datalink is missing or has a fault.	Replace terminating resistor.
Branch length is too long on J1939 datalink.	Shorten "lite" branch to less than 10 feet (3 m).
Battery is discharged or is bad.	Charge or replace battery.

Problem—ServiceLink Will Not Connect

Problem—ServiceLink Will Not Connect	
Possible Cause	**Remedy**
ICU is older series that does not support roll call.	Use ICU for display of active fault codes only.
One or more ECUs has a fault.	Remove suspected ECUs one at a time until ServiceLink can be connected.
ServiceLink computer is not configured or connected correctly.	Check the computer settings, communication adaptor and cabling between the computer, communication adaptor, and diagnostic connector.
Connector types are different.	The J1939 datalink and new J1587 datalinks have 9-pin connectors. Connect an adapter or use the ICU for the diagnostics information display.
J1922 datalink is installed.	Use ICU for diagnostics information display.

Troubleshooting

Problem—ServiceLink Will Not Connect	
Possible Cause	**Remedy**
Battery is discharged, has a bad connection, or has a fault.	Charge, clean terminals, or replace battery.

Problem—Missing Data on Datalink-Driven Gauges

Problem—Missing Data on Datalink-Driven Gauges *	
Possible Cause	**Remedy**
ICU or engine ECU is not communicating on datalink.	Test wiring and ICU or engine ECU.
Datalink wiring has a fault.	Test and repair wiring.
Connector or junction block has a fault.	Repair or replace connector.
Incorrect voltage to ECUs	Test datalink and vehicle wiring.

* Datalink-driven gauges include: engine oil pressure, coolant temperature, engine oil temperature, turbo air pressure, tachometer, speedometer

Troubleshooting Procedures

To find the part of the datalink system that is causing a problem, follow the Troubleshooting Procedures and refer to the appropriate Troubleshooting Tests for the test points and specifications. Perform the steps of the Troubleshooting Procedures in sequence until you locate the fault.

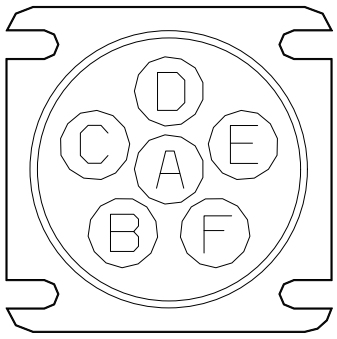
The seven steps to diagnosing a datalink problem are:

1. Determine which types of datalink are installed on the vehicle.

   1.1 Check the diagnostic connector. A 6-pin connector (or a 9-pin connector without pins C and D installed) is used for J1587 datalinks. See **Fig. 1** and **Fig. 2**. J1939 datalinks have pins C and D installed in the 9-pin diagnostics connector. The J1922 datalink wiring is used only for the engine, ABS and automatic transmission ECUs and has no diagnostic connector.

   1.2 Check the wires. J1939 cable has a heavy jacket. Note that some non-Freightliner ECUs have their J1587 wires inside a jacket as well. If all the wiring has a jacket, the datalink is a J1939 datalink.

   If the J1939 cable has a drain wire inside the shielding, it is a "heavy" cable. The J1939 "lite" cable (with no drain wire) can be spliced into a section of "heavy" cable.



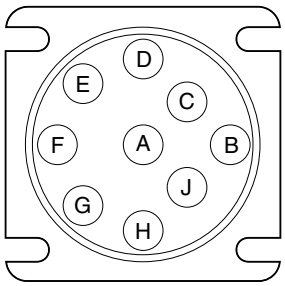
11/30/98 f542751

1. Pin A (J1587 High)
2. Pin B (J1587 Low)
3. Pin C (12V+)
4. Pin D (Reserved)
5. Pin E (Ground)
6. Pin F (Reserved)

Fig. 1, J1587 6-Pin Diagnostics Connector

   1.3 Determine whether a Cummins IS Series, Caterpillar CFE, or a Mercedes-Benz engine is installed with an ABS system that has traction control. These systems use a J1939 datalink.

   1.4 A J1939 datalink is used when an Eaton® Fuller® AutoShift transmission is installed. The WABCO EBS (brake-by-wire) system and certain Eaton VORAD EVT-300 systems also require J1939 datalinks. Certain other ECUs may require a J1939 datalink.



05/01/2006 f151036b

NOTE: Pins C and D are not installed in the J1587 diagnostics connector.

1. Pin A Battery (Low)
2. Pin B Battery (High)
3. Pin C (J1939 High)
4. Pin D (J1939 Low)
5. Pin E (Shield)
6. Pin F (J1587 High)
7. Pin G (J1587 Low)
8. Pin H (Reserved)
9. Pin J (Reserved)

Fig. 2, J1939/J1587 9-Pin Diagnostics Connector

2. Determine which ECUs are not communicating with ServiceLink.
   - 2.1 Connect to the vehicle with ServiceLink
   - 2.2 Compare the ICU (late ICU1, ICU2M, ICU2L after March 1999, and ICU3) roll call list with ServiceLink ECU list.

     Note: Some ECUs cannot communicate with the ICU, but will appear on the ServiceLink parameter list. The ICU2L and ICU3 rollcall function is limited to the engine ECU and the ABS ECU.
   - 2.3 If an ECU is not communicating on the datalink, disconnect all the generic ECUs, one at a time, until no faults are displayed on the ICU screen or until ServiceLink connects to the system. The last ECU to be disconnected before the successful ServiceLink connection is the one causing the problem.
3. Check the suspected ECU.
   - 3.1 Check the resistance and voltage at the ECU connectors. See **Testing the ECUs** in the DATALINK TESTING PROCEDURES section of this subject.
   - 3.2 Temporarily replace the ECU with an ECU known to be good. If the ICU (or ServiceLink) now lists that ECU, install a new ECU.
4. Check the wires and connectors from the ICU at the connector for the suspected faulty ECU. See **Testing the J1587 Datalink**, **Testing the J1922 Datalink**, or **Testing the J1939 Datalink** in the DATALINK TESTING PROCEDURES section of this subject.
   - 4.1 Check the power supply voltage.
   - 4.2 Check the data signal voltage.
   - 4.3 Check the continuity and resistance to ground. If the readings are outside the acceptable range and are found at several test points, suspect that the datalink has a fault.
5. Determine which branch includes the suspected faulty ECU. Find the connectors and junction blocks that are in series with the suspected faulty ECU.
6. Check the wiring between the branch connector and the ECU and the wiring from the ICU to the branch connector. See **Testing the J1587 Datalink**, **Testing the J1922 Datalink**, or **Testing the J1939 Datalink** in the DATALINK TESTING PROCEDURES section of this subject.
   - 6.1 Check power supply voltage.
   - 6.2 Check the data signal voltage.
   - 6.3 Check the continuity and resistance to ground.
7. Check the ICU. See **Testing the ICU** in the DATALINK TESTING PROCEDURES section of this subject.
   - 7.1 Check the voltages at the junction block to the ICU.
   - 7.2 Replace the ICU with an ICU known to be good.

Datalink Testing Procedures

The following procedures give the test points and specifications for checking the various types of datalinks, connectors, ECUs and ICUs. Refer to the DATALINK TROUBLESHOOTING TABLES and the DATALINK TROUBLESHOOTING PROCEDURES, above, for information on when to test the particular parts of the datalink system.

Troubleshooting

Testing at the ECUs

1. Make sure that the vehicle battery is charged and the fuses and circuit breakers are good before testing the ECU connectors.
2. The keyswitch must be in the OFF position. Disconnect the ECU datalink circuit at the connector closest to the ECU. Turn the keyswitch to the ON position and check the voltage at the ECU harness connector. See **Table 1** for the acceptable results.
3. Connect the ECU to the datalink connector when the keyswitch is in the OFF position. Turn the keyswitch to the ON position for this test. Touch the probes of the digital multimeter (on the DC voltmeter scale) to the metal terminals of the ECU connector as shown in **Table 1** to test the ECU. Use the AC scale for the voltage tests if the multimeter will not display the rapidly changing DC voltage using the DC scale. If the test results are not within the range shown, replace the ECU and test again.

NOTE: Voltages in **Table 1** will be varying.

ECU Harness Voltage Tests		
J1587 and J1922 Datalinks		
Meter (High) Probe	**Meter (Low) Probe**	**Acceptable Meter Reading (VDC)**
ECU Datalink High Terminal	ECU Datalink Low Terminal	1 to 4 VDC (1 to 3V on the AC Scale)
Battery Positive Post	ECU Datalink High Terminal	6 to 11 VDC *
	ECU Datalink – Terminal	9 to 13.5 VDC *
J1939 Datalink		
Diagnostics Pin C (J1939 High)	Diagnostics Pin D (J1939 Low)	.2 to 5 VDC (.1 to 4V on the AC Scale)
Diagnostics Pin B (BAT High)	Diagnostics Pin C	6 to 11 VDC*
	Diagnostics Pin D	9 to 13.5 VDC*

* If datalink wire connections are reversed, the results are reversed.

Table 1, ECU Harness Voltage Tests

Testing the J1922 Twisted-Pair Datalink

1. Make sure that all fuses and circuit breakers are in good condition before testing the J1922 datalink.

NOTE: A fault on the J1922 datalink should be reported on the vehicle's J1587 datalink by one or more of the ECUs. However, the report may not give a true indication of the actual fault.

2. Turn the keyswitch to the OFF position before disconnecting or connecting any part of the datalink system. Disconnect the J1922 connector for the datalink section you are testing.

IMPORTANT: Do NOT disconnect the datalink by disconnecting the engine, frontwall or chassis electrical connectors.

IMPORTANT: The batteries **MUST** be disconnected and the ignition must be **OFF** prior to any J1922 resistance tests. Failure to do so may result in inconclusive resistance measurements. The J1939 datalink is not completely inactive with only the ignition off. It may be active even if there appears to be no voltage on the the datalink.

3. Turn the keyswitch to the OFF position. Test the continuity of a J1922 twisted-wire pair by touching the red (positive) probe of a digital multimeter (set to the ohmmeter mode) to the **J1922 High** wire. Connect the black (negative) probe to the J1922– wire. See **Table 2** for the results.

   Check the datalink isolation to the vehicle ground by holding one ohmmeter probe on the J1922– wire and the other probe to a good ground. Perform this test again with the ohmmeter leads reversed.

4. Test the signal voltage on the J1922 twisted pair as shown in **Table 1**. The keyswitch must be in the ON position for the voltage tests. Use the AC scale for the voltage tests if your multimeter will not display the rapidly changing DC voltage using the DC scale.

J1922 and J1587 Resistance Tests		
Meter (High) Probe	**Meter (Low) Probe**	**Acceptable Meter Reading (Ohms)**
High	Low	1k to 30k Ohms
High	Vehicle Ground	More than 1k Ohms
Low	Vehicle Ground	More than 1k Ohms

Table 2, J1922 and J1587 Resistance Tests

NOTE: If any voltage reading is a steady 0 VDC or a steady 12 VDC, the ECU or datalink wiring has a fault.

Testing the J1587 Twisted-Pair Datalink

1. Make sure that all fuses and circuit breakers are in good condition.
2. Turn the keyswitch to the OFF position before disconnecting or connecting any part of the datalink system. Disconnect the J1587 connector for the datalink section you are testing.

IMPORTANT: Do NOT disconnect the datalink by disconnecting the engine, frontwall or chassis electrical connectors.

IMPORTANT: The batteries **MUST** be disconnected and the ignition must be **OFF** prior to any J1587 resistance tests. Failure to do so may result in inconclusive resistance measurements. The J1939 datalink is not completely inactive with only the ignition off. It may be active even if there appears to be no voltage on the the datalink.

3. Turn the keyswitch to the OFF position. Test the continuity of a J1587 twisted-wire pair by touching the red (positive) probe of a digital multimeter (set to the ohmmeter mode) to the **J1587 High** terminal of the connector. Connect the black (negative) probe to the J1587– wire terminal. See **Table 2** for the results.

   Check the datalink isolation to the vehicle ground by holding one ohmmeter probe on the **J1587 Low** wire and the other probe to a good ground. Perform this test again with the ohmmeter leads reversed. **Table 2** shows the acceptable resistances for these tests.
4. Test the signal voltage on the J1587 twisted pair as shown in **Table 1**. The keyswitch must be in the ON position for the voltage tests. Use the AC scale for the voltage tests if your multimeter will not display the rapidly changing DC voltage using the DC scale.

NOTE: If any voltage reading is a steady 0 VDC or a steady 12 VDC, the ECU or datalink wiring has a fault.

Testing the J1939 Datalink

Use the following five basic steps in the order given to successfully locate J1939 datalink problems. Do not skip steps or tests unless directed to do so.

J1939 Resistance Test

This test checks whether or not both terminating resistors are installed, and ensures that there is a complete circuit from the diagnostic connector through the backbone loop. It does not ensure that branch circuits to each ECU are OK.

Tests in this subject are performed using a digital multimeter set to read ohms.

IMPORTANT: The batteries **MUST** be disconnected and the ignition must be **OFF** prior to

any J1939 resistance tests. Failure to do so may result in inconclusive resistance measurements. The J1939 datalink is not completely inactive with only the ignition off. It may be active even if there appears to be no voltage on the the datalink.

1. Turn the ignition OFF and disconnect the batteries.
2. Connect the meter leads of a digital multimeter set to read ohms to pins C and D of the 9-pin diagnostic connector and measure the resistance.
3. Reconnect the batteries after the test is completed.

See **Table 3** for test results and possible causes.

J1939 Resistance Test	
Result	**Possible Cause**
60Ω ± 6Ω	The J1939 datalink backbone is intact and both terminating resistors are installed. Go to step 2.
120Ω ± 12Ω	Any of the following: • One of the terminating resistors is missing. • One of the terminating resistors is open. • The circuit may be open anywhere between the terminating resistors.
40Ω ± 4Ω	Three terminating resistors have been installed; one must be removed. There must be one terminating resistor at each end of the backbone for a total of two.
0Ω to 5Ω	**J1939 High** and **J1939 Low** have shorted together somewhere in the system.
Greater than 1000Ω	The most likely cause is an open circuit between the diagnostic connector and the J1939 backbone. It may also be that both terminating resistors are missing or open.
Any other readings	Any of the following: • Incorrect terminating resistor resistance. • Poor or corroded connections. • Short circuit to ground or an open circuit somewhere on the datalink. Go to step 2 to pinpoint the problem.

Table 3, J1939 Resistance Test

ECU Communication Test

The following series of tests check for communication with each ECU connected to the J1939 datalink. If one fails to communicate, pinpoint whether the problem is wiring or an ECU. If all ECUs communicate as they should, J1939 is probably not the problem.

1. **Check whether each ECU connected to the J1939 datalink responds.**

   1.1 Connect the computer to the diagnostic connector.

   1.2 Start the J1939 Datalink Monitor template.

   NOTE: The template contains instructions on its use.

   1.3 Check whether each ECU that is supposed to be connected to the datalink responds. See **Table 4** for test results and possible causes.

Check whether each ECU connected to the J1939 datalink responds	
Result	**Possible Cause**
All ECUs respond	The J1939 datalink is probably not the problem.
One ECU fails to respond.	Go to step 2.
No ECUs respond	Possible explanations are: • The **J1939 High** and **J1939 Low** pinouts may be reversed at the diagnostic connector, or at any other connector in the system. Check their polarity. • There may be a problem with the PC to vehicle interface. • The entire datalink may be down due to a short to power or short to ground. Go to Step 3 to pinpoint the problem.

Table 4, Check Whether Each ECU Connected to the J1939 Datalink Responds

2. **Check the J1939 datalink wiring to the ECU that does not respond.**

   IMPORTANT: The batteries **MUST** be disconnected and the ignition must be **OFF** prior to any J1939 resistance tests.

   2.1 Turn the ignition OFF and disconnect the batteries.

   2.2 Locate the connector at the ECU in Step 2, Test 1 that did not respond and disconnect it.

   2.3 Locate the pins for **J1939 High** and **J1939 Low**. Refer to Freightliner or component supplier literature or wiring diagrams for the specific component.

   2.4 Check to make sure that **J1939 High** and **J1939 Low** polarity is correct at the component before proceeding. If not, this is the most likely problem.

   2.5 Using a digital multimeter set to read ohms, measure the resistance across the two J1939 datalink pins at the connector to the suspect ECU.

   2.6 Reconnect the batteries after the test is completed. See **Table 5** for test results and possible causes.

Check the J1939 datalink wiring to the ECU that does not respond	
Result	**Possible Cause**
60Ω ± 6Ω	The datalink itself is probably not the problem. Make sure that any changeable J1939 parameters for this ECU are set correctly before proceeding. Also, make sure that there is power and ground to the suspect ECU. Go to **step 3** once the following have been confirmed: • J1939 parameters for the ECU (if they can be changed) are correct. • There is power and ground to the suspect ECU.
Not 60Ω ± 6Ω	There is a problem with the J1939 wiring between the ECU connector and its connection to the J1939 backbone. Repair as necessary.

Table 5, Check the J1939 Datalink Wiring to the ECU That Does Not Respond

3. **Install a test ECU to confirm the problem.**

   3.1 Install a test ECU and make sure that all J1939 parameters (if changeable) are set correctly.

3.2 Using the J1939 Datalink Monitor template, check to see if every ECU that is supposed to be connected to the datalink responds. See **Table 6** for test results and possible causes.

Install a test ECU to confirm the problem	
Result	**Possible Cause**
All ECUs respond	The ECU was faulty and the test ECU confirmed this. Replace the ECU.
The ECU still does not respond.	The problem has not been confirmed. Carefully repeat all the diagnostics. If the ECU still does not respond, contact your District Service Manager or the ECU supplier directly for assistance.

Table 6, Install a Test ECU to Confirm the Problem

Test J1939 Voltage for Circuit Faults (Shorts to Power and Ground)

These tests check for shorts to power and shorts to ground on the J1939 datalink.

NOTE: All tests are performed using a digital multimeter set to read voltage.

NOTE: Before proceeding, verify that battery voltage (approximately +12 VDC) is available at pin B of the diagnostic connector. With the ignition ON, use a digital multimeter to test for voltage at pin B by placing the red (+) lead on pin B and the black (-) lead on a good chassis ground.

1. **Test J1939 High for shorts to power and ground.**

   1.1 Turn the ignition ON.

   1.2 Touch the red (+) lead to pin B (+12 VDC) and the black (-) lead to pin C (**J1939 High**) of the diagnostic connector. See **Table 7** for test results and possible causes.

Shorts to Power and Ground (J1939 High)	
Result	**Possible Cause**
0 VDC	**J1939 High** is shorted to power. Continue to the next test, "Pinpointing Short Circuits on the J1939 Datalink."
12 VDC (battery voltage)	**J1939 High** is shorted to ground. Continue to the next test, "Pinpointing Short Circuits on the J1939 Datalink."
Any other reading	**J1939 High** is not shorted to power or ground. Go to step 2.

Table 7, Shorts to Power and Ground (J1939 High)

2. **Test J1939 Low for shorts to power and ground.**

   2.1 Turn the ignition ON.

   2.2 Touch the red (+) lead to pin B (+12 VDC) and the black (-) lead to pin D (**J1939 Low**) of the diagnostic connector. See **Table 8** for test results and possible causes.

Shorts to Power and Ground (J1939 Low)	
Result	**Possible Cause**
0 VDC	**J1939 Low** is shorted to power. Continue to the next test, "Pinpointing Short Circuits on the J1939 Datalink."

Shorts to Power and Ground (J1939 Low)	
Result	**Possible Cause**
12 VDC (battery voltage)	**J1939 Low** is shorted to ground. Continue to the next test, "Pinpointing Short Circuits on the J1939 Datalink."
Any other reading	**J1939 Low** is not shorted to power or ground. There may be a problem with the vehicle to computer interface. The datalink itself appears to be OK.

Table 8, Shorts to Power and Ground (J1939 Low)

Databus Quick Test

NOTE: All voltages in **Table 1**, except for BAT+ and BAT– will be varying.

Databus Quick Test				
No.	**Test**	**Red Lead/Black Lead**	**Specification**	**Result**
Battery Connected – Ignition ON				
1	Bat+ to Bat-	Pin B to Pin A	Source Voltage (> 12.4)	
2	J1587+ to J1587–	Pin F to Pin G	1 – 5 VDC (0 – 4 VAC)	
3	Bat+ to J1587+	Pin B to Pin F	6 – 11 VDC	
4	Bat+ to J1587–	Pin B to Pin G	9 – 13.5 VDC	
5	J1939+ to J1939–	Pin C to Pin D	.2 – 5 VDC (.1 – 4 VAC)	
6	Bat+ to J1939+	Pin B to Pin C	6 – 11 VDC	
7	Bat+ to J1939–	Pin B to Pin D	9 – 13.5 VDC	
Ignition OFF – Battery Disconnected at Batteries – NOT Cab Load Disconnect Switch				
8	J1587+ to J1587–	Pin F to Pin G	1k – 30k Ohms	
9	J1587+ to Bat–	Pin F to Pin A	> 1k Ohms

Table 1, Databus Quick Tests

Datalink Wiring Diagrams

For vehicles built with the ICU1 through August 1996, see **Fig. 1**.

For vehicles built with the ICU1 from August 1996 to June 1997, see **Fig. 2**.

For vehicles built with the ICU1 from June 1997, see **Fig. 3**.

Vehicles with an ICU2M, ICU2L, or ICU3 use the layout shown in **Fig. 4**.

Figure 5 shows the communication relationships between the ECUs and other components on a vehicle with a J1939 datalink.

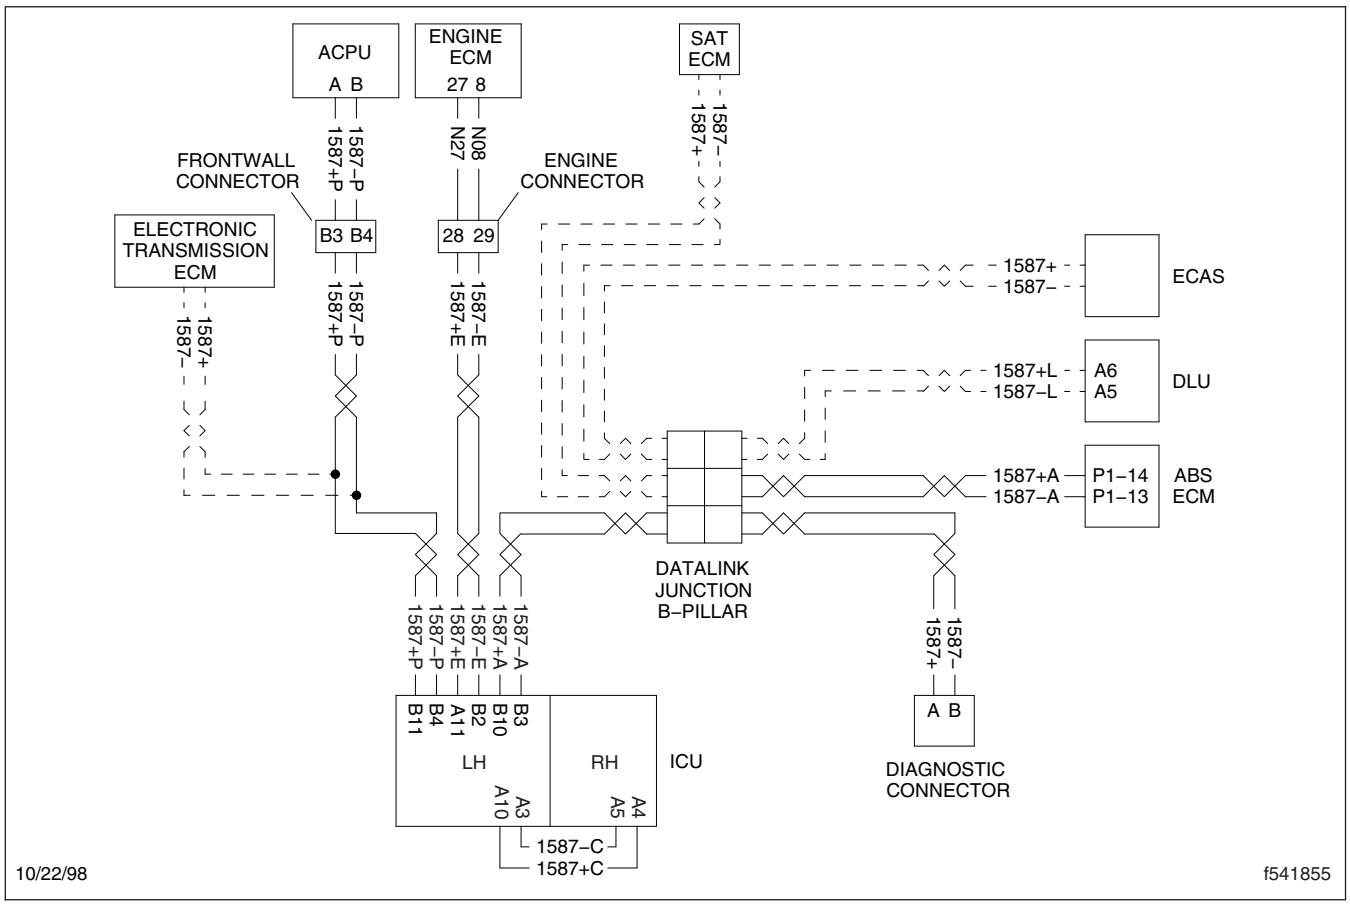

Fig. 1, J1587 Datalink Wiring-ICU1 (vehicles built through August 1996)

Specifications

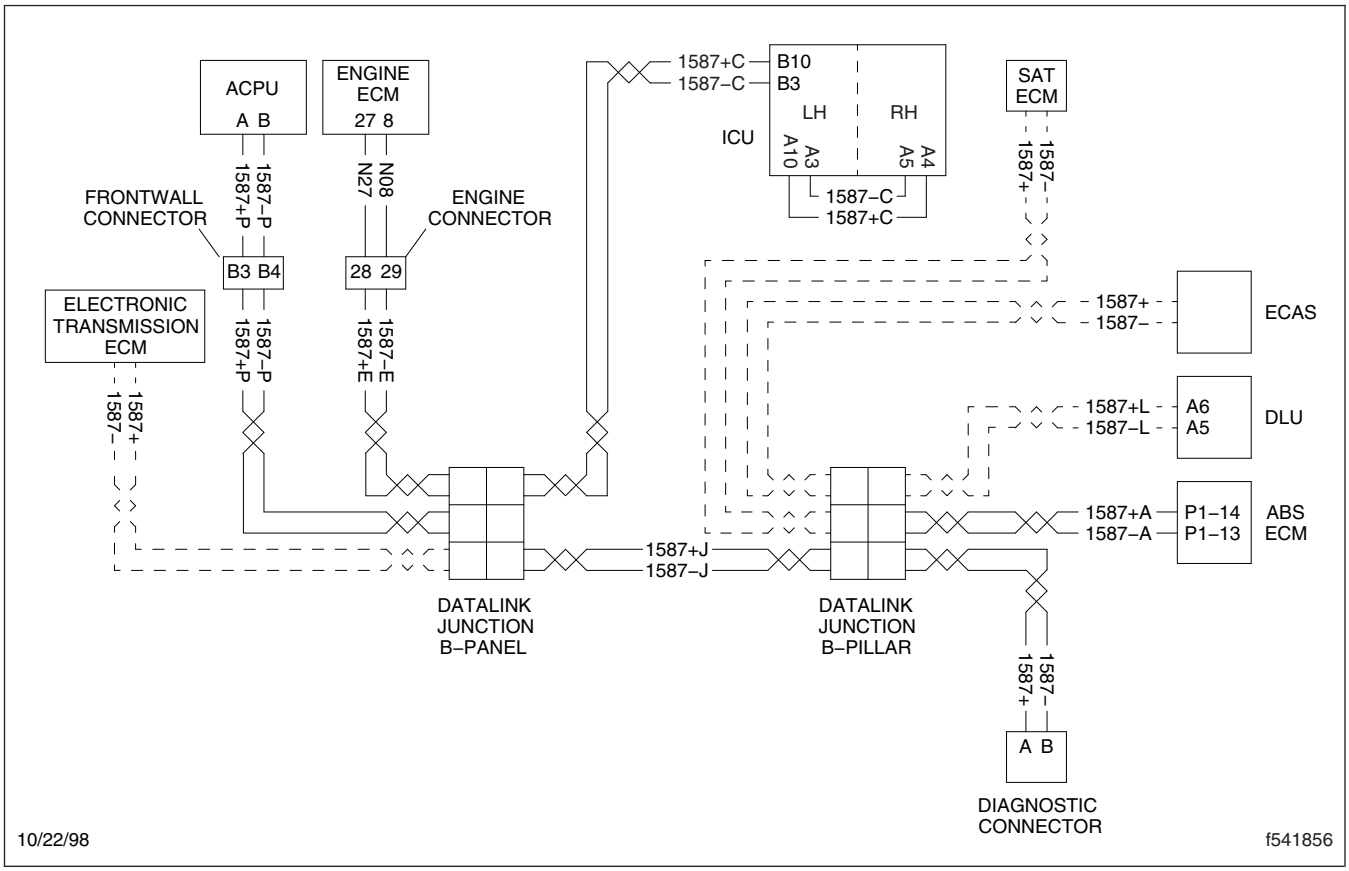

Fig. 2, J1587 Datalink Wiring-ICU1 (vehicles built from August 1996 through June 1997)

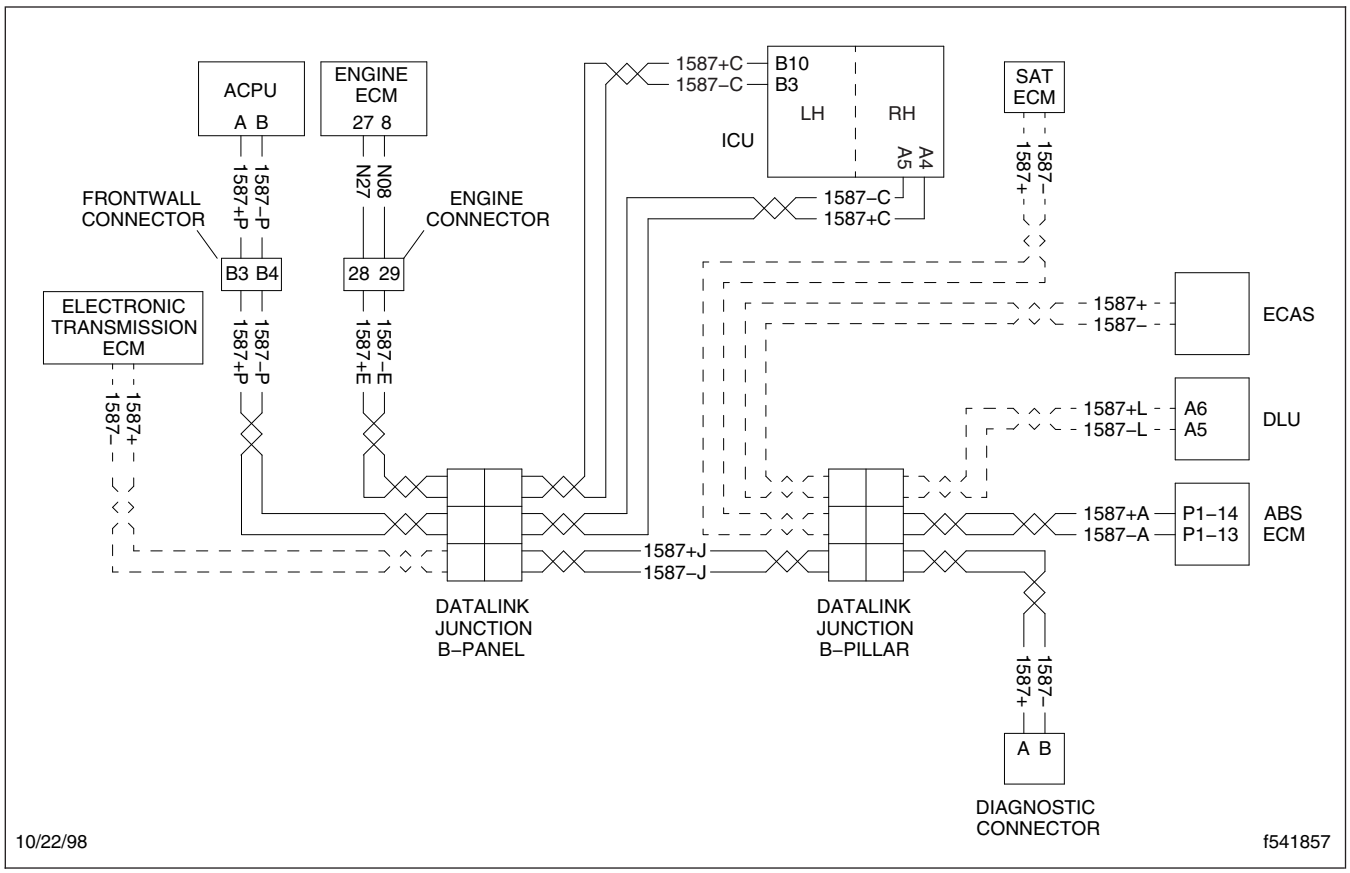

Fig. 3, J1587 Datalink Wiring-ICU1 (vehicles built from June 1997)

Specifications

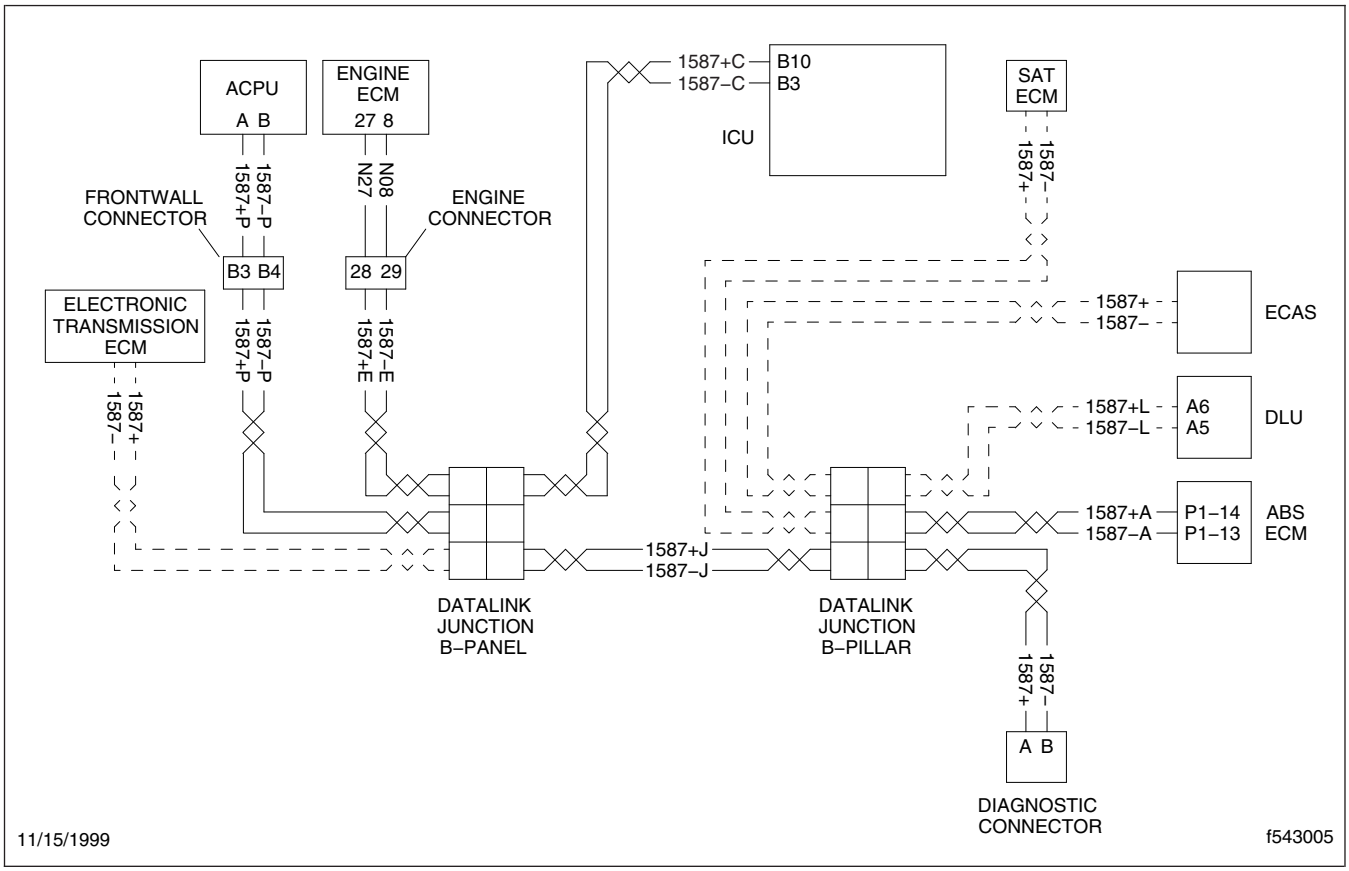

Fig. 4, J1587 Datalink Wiring-ICU2L, ICU2M, ICU3

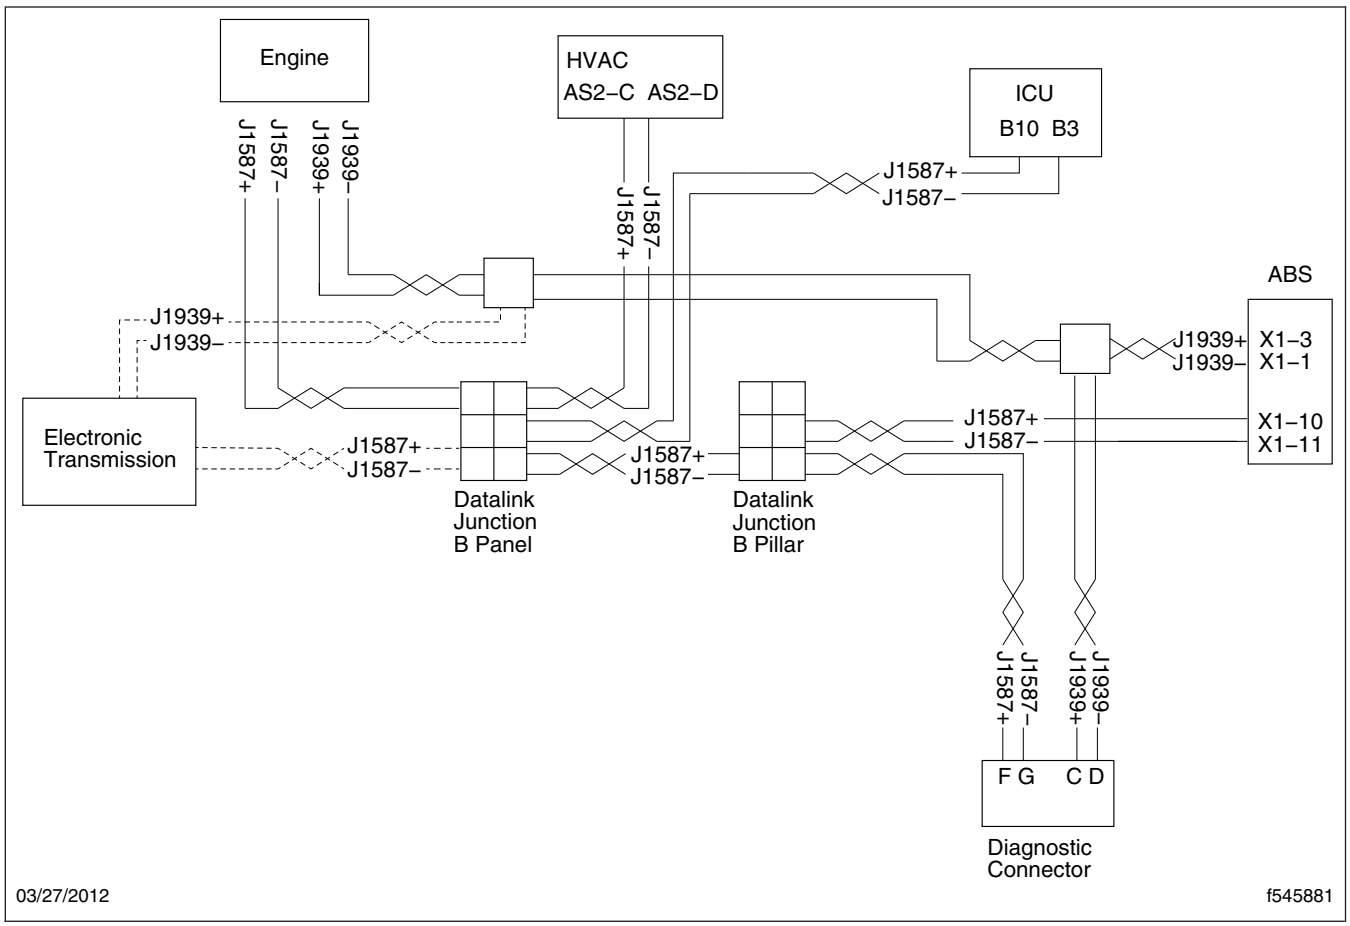

Fig. 5, Datalink Communication, ICU3/ICU4

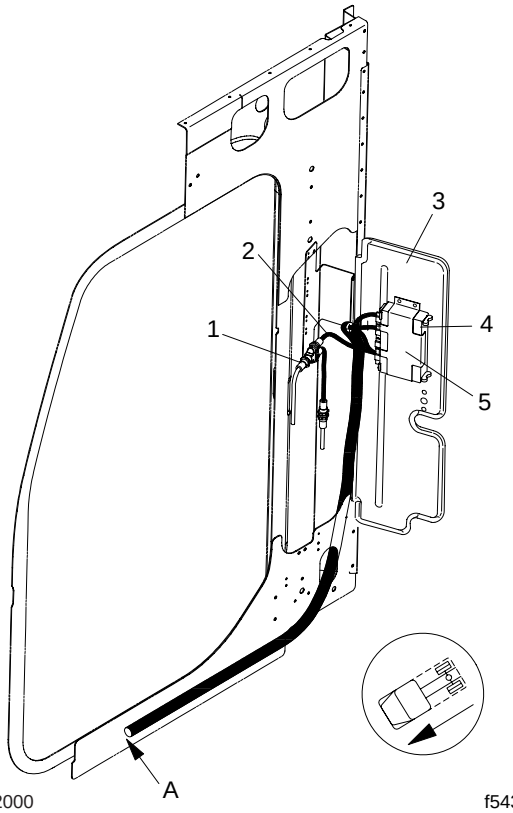
Removal

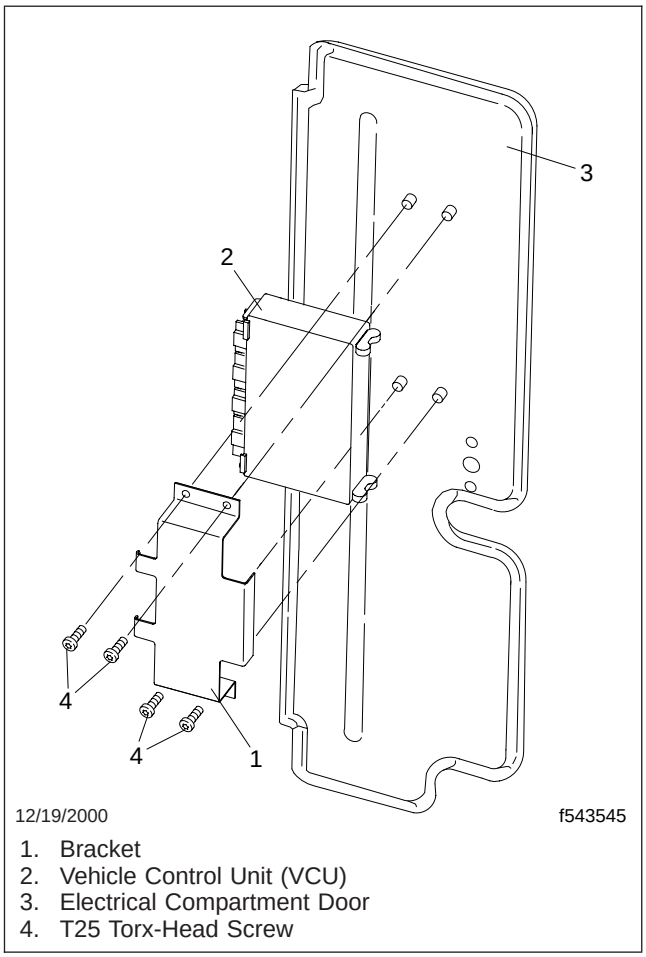
1. Open the electrical compartment door on the right-hand B-pillar, behind the seat. See **Fig. 1**.



A. To Dash Harness
1. J1939 Tee with Jumper
2. J1939 Diagnostic Harness
3. Electrical Compartment Door
4. Vehicle Control Unit (VCU)
5. Bracket

Fig. 1, VCU and J1939 Harness

2. Disconnect the three electrical connectors (violet, gray, and brown) by pressing the release at the bottom of each connector.
3. Using a T25 Torx®-head screwdriver, remove the four mounting screws attaching the bracket to the electrical compartment door. See **Fig. 2**.
4. Remove the bracket and the VCU from the vehicle.



1. Bracket
2. Vehicle Control Unit (VCU)
3. Electrical Compartment Door
4. T25 Torx-Head Screw

Fig. 2, VCU Removal and Installation

Installation

1. Place the VCU inside the bracket and position the holes in the bracket over the nutserts in the electrical compartment door, as removed.
2. Tighten the T25 Torx-head screws until firm in the nutserts.
3. Connect the violet, gray, and brown electrical connectors to the VCU, as removed.

IMPORTANT: The connectors cannot be installed on the wrong plug location on the VCU, because they each have different numbers of pins. Connector VC2 is not used at this time.

- Connector VC1 (brown) has 21 pins.

Vehicle Control Unit Removal and Installation

- Connector VC3 (gray) has 18 pins.
- Connector VC4 (violet) has 15 pins.

4. Close the electrical compartment door.

Harness Routing Diagrams

For a routing diagram showing the engine wiring harnesses, see **Fig. 1** for a view from the left-hand side, **Fig. 2** for a top view, and **Fig. 3** for a front view.

For a routing diagram showing the dash harness, see **Fig. 4**.

Harness Wiring

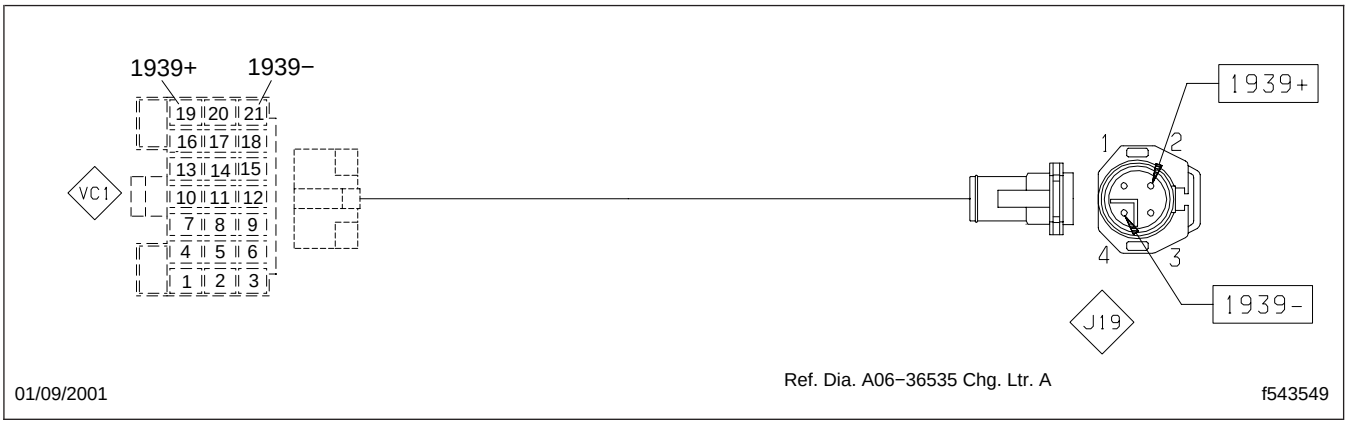

Fig. 3, MBE4000 Engine J1939 Diagnostic Harness

General Description

The Ametek instrumentation control unit model 4M (ICU4M) replaced the Pollak ICU2M in production in December 2004. See **Fig. 1**. The ICU4M is an individual-gauge cluster with an intelligent light bar (ILB) and a 10-key keypad on the auxiliary instrument panel. It is very similar to the ICU2M except for these differences:

- ICU4M gauges sweep 270 degrees and have pointers lit by an LED (light-emitting diode)
- Service intervals are programmable from the keypad
- A warning chime and alert message display warns the driver if the door is opened without first setting the parking brake
- If low oil pressure or high coolant temperature is detected, a red warning light at the bottom of the gauge illuminates, a warning buzzer sounds, and a flashing alert message appears on the display, along with a text message giving additional information.

The light bar is the heart of the ICU4M. It has three parts:

- a set of 24 warning and indicator lights
- a dash message center
- the printed circuit boards necessary to drive the other components

The message center display screen is a two-line by twenty-character liquid crystal display (LCD). See **Fig. 2**.

Gauges

There can be up to 14 removable gauges on the driver's instrument panel. The ICU4M can also drive gauges located on the auxiliary instrument panel. Gauges cannot be removed from the front of the panel.

The standard gauges are:

- speedometer
- engine coolant temperature
- engine oil pressure
- battery voltmeter
- fuel level

Other available gauges include:

- tachometer
- engine oil temperature
- transmission fluid temperature
- rear axle temperature; on vehicles with tandem or tridem axles, forward-rear, axle #3, and rearmost-rear
- ammeter
- system air pressure; primary, secondary, application, and suspension
- pyrometer
- turbo boost air pressure

Some gauges have a red warning light integrated into the gauge. These are listed below, with an indication of how the warning light is activated:

- engine coolant temperature—see **Table 1**

Maximum Coolant Temperature	
Engine Manufacturer	**°F (°C)**
Caterpillar	215 (101)
Cummins	220 (104)
Detroit Diesel	215 (101)
Mercedes-Benz	221 (105)

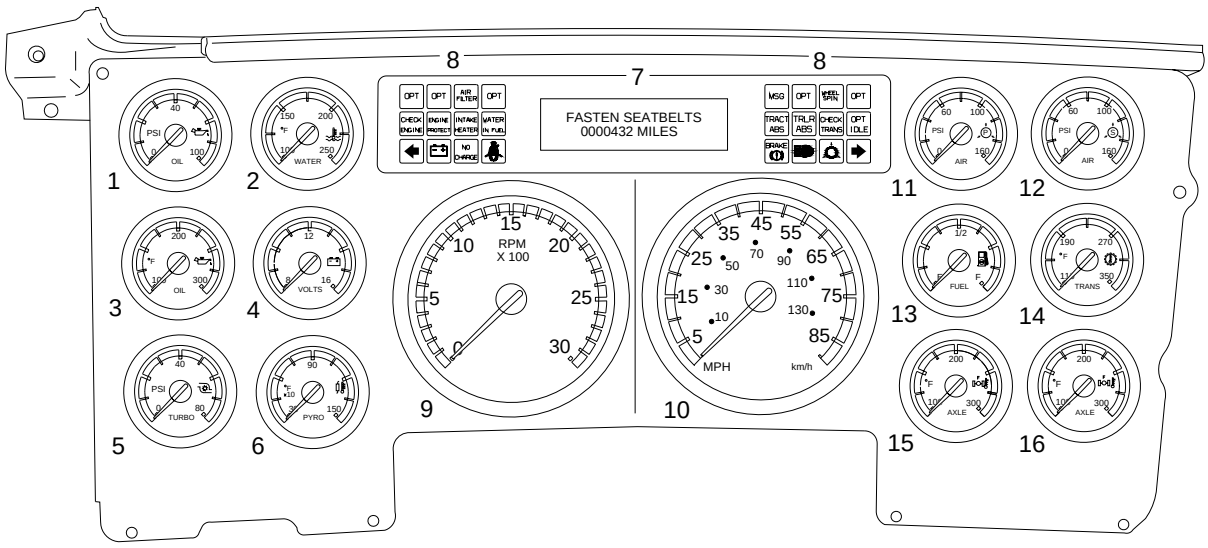
Table 1, Maximum Coolant Temperature

- engine oil pressure—5 to 9 psi (35 to 60 kPa) on most engines
- fuel level—less than 1/8 tank
- transmission temperature—356°F (180°C)

Warning and Shutdown Process

If the engine coolant temperature, the coolant level, or the engine oil pressure (on some engines, the engine oil temperature or the intake air temperature also) reach preset levels, the engine will begin a warning and shutdown process.

1. The red engine protection (ENGINE PROTECT) warning light comes on to indicate that the protection system available for the engine has been activated.
2. The engine ECU begins to reduce the maximum engine torque and speed.



12/01/2004 f610706a

14. Transmission Fluid Temperature Gauge
15. Tandem Rear Axle Temperature Gauge, Forward
16. Tandem Rear Axle Temperature Gauge, Rear

Fig. 1, ICU4M Gauge Layout (typical)

3. If the condition does not improve, the engine will shut down within 30 seconds.

The driver must safely bring the vehicle to a stop on the side of the road and shut down the engine as soon as the red light is seen. If the engine shuts down while the vehicle is in a hazardous location, the engine can be restarted after turning the key to the OFF position for a few seconds.

NOTE: Some engines can be programmed to derate rather than shut down.

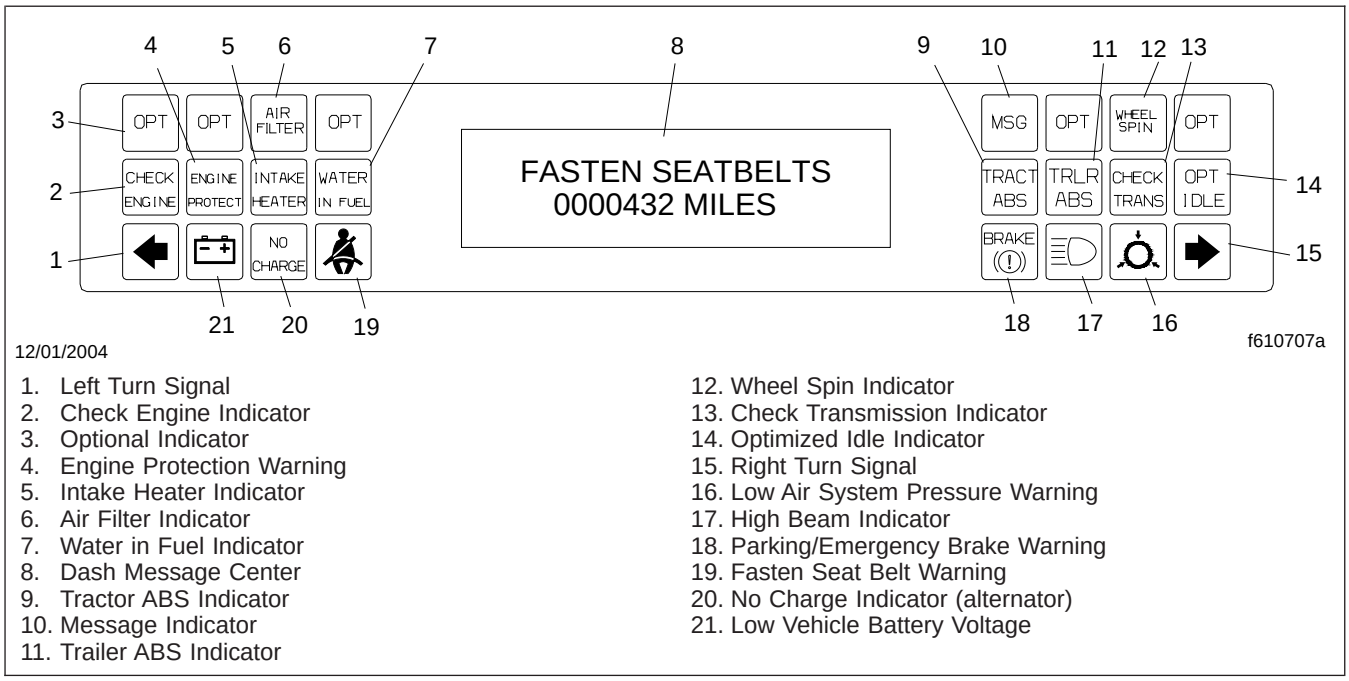
Warning and Indicator Lights

Up to 24 warning and indicator lights (telltales) can be installed in the ICU4M; the 16 positions in the bottom two rows are fixed, and the eight positions in the top row are optional. In addition, there may also be up to four gauges with a warning light integrated on the gauge.

In-Gauge Lights

Four gauges have a small warning or indicator light integrated into the gauge. The in-gauge light is located at the bottom of the gauge in the six-o'clock position.

- The red high coolant temperature warning (located on the engine coolant temperature gauge) and buzzer activate whenever the message center receives a high coolant fault message from the engine (MID 128, PID 110, and FMI 00). See **Table 1** for maximum coolant temperatures for each engine.
- The red low engine oil pressure warning (located on the engine oil pressure gauge) and buzzer activate whenever the message center receives a low oil pressure fault message from the engine (MID 128, PID 100, and FMI 01).



1. Left Turn Signal
2. Check Engine Indicator
3. Optional Indicator
4. Engine Protection Warning
5. Intake Heater Indicator
6. Air Filter Indicator
7. Water in Fuel Indicator
8. Dash Message Center
9. Tractor ABS Indicator
10. Message Indicator
11. Trailer ABS Indicator
12. Wheel Spin Indicator
13. Check Transmission Indicator
14. Optimized Idle Indicator
15. Right Turn Signal
16. Low Air System Pressure Warning
17. High Beam Indicator
18. Parking/Emergency Brake Warning
19. Fasten Seat Belt Warning
20. No Charge Indicator (alternator)
21. Low Vehicle Battery Voltage

Fig. 2, ICU4M Light-Bar Display (typical)

- The yellow high transmission temperature indicator (located on the optional transmission oil temperature gauge) activates when the transmission fluid temperature goes above 365°F (185°C). This light is directly controlled by the transmission via hard wire input to the message center.
- The yellow low fuel indicator (located on the fuel gauge) activates when the fuel tank is less than 1/8 full.

Standard Lights

The standard warning and indicator lights operate as follows:

- The green right-turn and left-turn signal indicators flash on and off whenever the outside turn signal lights are flashing.
- The blue high-beam indicator comes on when the headlights are on high beam.
- The yellow CHECK ENGINE indicator comes on when an engine fault is detected or recorded. The check engine light is controlled by the engine ECU. See the engine manufacturer's manuals for troubleshooting.
- The red low air pressure warning (pressure circle icon) and buzzer activate whenever air pressure in the primary or secondary air reservoir falls below 64 to 76 psi (440 to 525 kPa).
- The red parking/emergency brake (BRAKE! legend) warning light activates whenever the parking brake is set. A buzzer also activates when the vehicle is moving at least 2 mph (3 km/h) with the parking brake set.
- The red fasten seat belt warning (seat belt icon) illuminates for 15 seconds when the ignition key is turned to the ON position.
- The yellow INTAKE HEATER indicator illuminates to indicate that the intake air heater is active. This telltale is directly controlled by the engine via hard wire input to the message center.
- The yellow WATER IN FUEL indicator illuminates to indicate that the fuel could contain water. This telltale is directly controlled by the engine via hard wire input to the message center.
- The yellow tractor ABS (TRACT ABS) indicator illuminates when a problem with the ABS system is detected. This telltale is directly con-

trolled by the ABS via hard wire input to the message center.

- The yellow check transmission (CHECK TRANS) indicator illuminates when a problem with the electronic transmission is detected. This telltale is directly controlled by the transmission via hard wire input to the message center.
- Installed only on vehicles equipped with the Detroit Diesel optimized idle system, the yellow optimized idle (OPT IDLE) indicator illuminates when the vehicle is stopped, the parking brake is on, and optimized idle system is running. This telltale is directly controlled by the engine via hard wire input to the message center.
- The red low vehicle battery voltage warning (battery icon) illuminates when the battery voltage is 11.9 volts or less. This telltale is controlled by the message center by monitoring the voltage message from the engine.
- The yellow alternator NO CHARGE indicator illuminates to indicate an alternator charge output failure. This telltale is directly controlled by the alternator via hard wire input to the message center.

The yellow trailer ABS (TRLR ABS) indicator operates as follows when a compatible trailer is properly connected to a tractor before the engine is started (PLC trailers only):

- With the ignition key in the ON position, the trailer ABS telltale illuminates momentarily, then turns off.
- If the telltale comes on momentarily during vehicle operation, then shuts off, a fault was detected and corrected.
- If the telltale comes on and stays on during vehicle operation, there is a fault with the trailer ABS. Repair the trailer ABS system immediately to ensure full antilock braking capability.

The trailer ABS indicator will not illuminate unless a compatible trailer is connected to the tractor.

NOTE: When connected to a PLC-equipped trailer, this telltale is directly controlled by the **tractor** ABS ECU via hard wire input to the message center.

On non-PLC-equipped trailers, this telltale is directly controlled by the **trailer** ABS ECU via hard wire input to the message center.

Optional Lights

The eight warning and indicator light positions on the top row of the message center are optional. The positions are numbered from #1 to #8, with #1 on the far left and #8 on the far right. Available optional indicator lights include: low washer fluid, automatic transmission overheat warning, wheel spin warning, impaired air filter warning, ECAS (electronic suspension) transfer indicator, and ECAS failure warning.

Keypad

The ICU4M is controlled by a keypad located on the auxiliary dash panel. See **Fig. 3**. This keypad, which has 10 keys, can be used to do the following things:

- Call up information onto direct access screens while the vehicle is moving, using the dedicated keys (temp, fuel, trip, and leg).
- Move from screen to screen while the vehicle is stationary using the general keys (left, right, and down arrow keys).
- Program on-screen service intervals, screen brightness, language, units of measurement, and other display functions, using the set function of the set/reset key.
- Clear unused or obsolete data, reset fault code screens after the faults have been cleared, or reset the counters for trip or fuel information, using the reset function of the set/reset key.
- Record significant data using the event key (optional—if a data logging unit is installed).

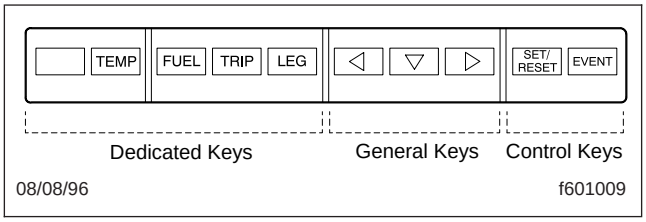


Fig. 3, 10-Key Keypad

NOTE: One key is blank and is not usable at this time.

See **Fig. 4** for information on how to use the set/reset key.

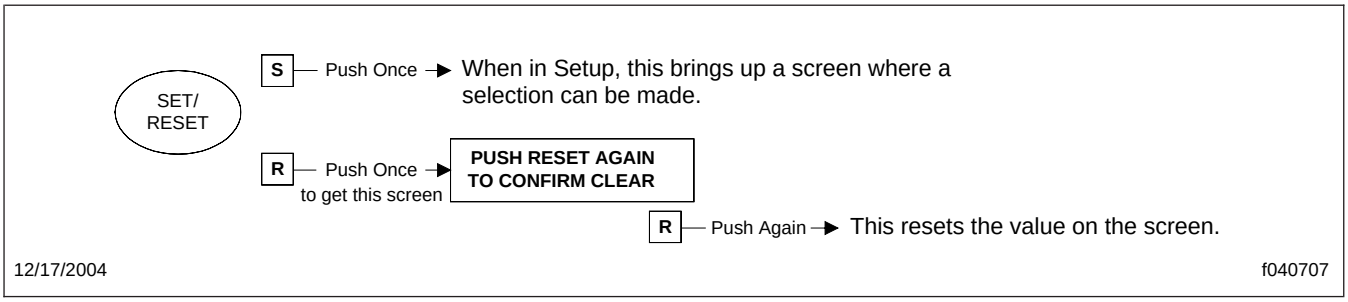

Fig. 4, Set/Reset Key Functions

Buzzer and Chime

The buzzer sounds for 3 seconds during the self-test at start-up, and when the following conditions exist:

- the engine oil pressure falls below the preset level of 5 to 9 psi (35 to 60 kPa) on most engines
- the coolant temperature rises above the preset level as given in **Table 1**
- the air pressure falls below the preset level of 64 to 76 psi (440 to 525 kPa)
- the parking brake is set and the vehicle is moving at a speed of at least 2 mph (3 km/h)

A friendly chime sounds when the parking brake is off and the door is open, or when the headlights are on and the door is open.

Principles of Operation

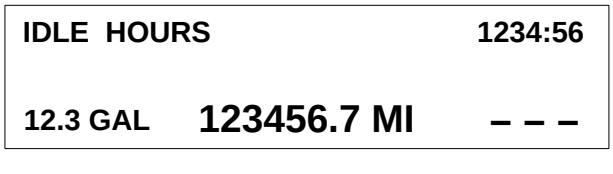
Ignition Sequence

When the ignition key is turned on, the ICU4M begins a self-test. During the first half of this process, the following events occur. Observing these events is a good way to make sure the ICU4M is functioning properly:

- all gauges controlled by the message center sweep to full scale and return
- all display segments of the message center turn on and then turn off
- the buzzer sounds for three seconds
- the battery voltage, low air pressure, and parking brake warning lights come on and then go off
- the fasten seat belt warning light illuminates for 15 seconds

In the second half of the self-test, the software revision level of the ICU4M displays on the message center, followed by the active faults, if any.

When the self-test is complete, the fasten seat belt screen displays if the engine is not running. If the engine is running, the idle hours screen displays. See **Fig. 5** for the idle hours screen (odometer display).



NOTE: On vehicles with automated manual transmission, the three digits on the lower right are reserved for current gear information.

Fig. 5, Idle Hours Screen

Alert Screens

Alert screens can display whenever a condition occurs that requires the driver's attention, whether the vehicle is in motion or parked. They warn, caution, or provide other messages, some critical to the operation of the vehicle.

On an alert screen, the top line contains a flashing message, such as "Warning" or "Alert." The lower line contains information about the content of the alert. See **Fig. 6**.

Some examples of alert messages:

- Park Brake On
- Park Brake Off

General Information

Fig. 6, Alert Message

- Low Oil Pressure
- High Coolant Temperature
- Low Voltage
- Turn Signal On
- No Datalink Activity

Automated Manual Transmissions

The ICU4M can display current gear information for vehicles with automated manual transmissions (AMT). The last three digits at the far right on the lower line are reserved for this information. On the diagrams for the stationary access screens, this is indicated by the legend "AMT."

If there is a need to shift, one digit displays an arrow, either up or down depending on the shift direction. The other two digits display the current gear.

On vehicles with conventional manual or automatic transmissions, these three digits do not display.

Stationary Access Screens

The stationary access screens provide a wealth of information. Using the general keys (arrow keys) to scroll up, down, and to the left or right, you control the following functions:

- trip information
- fuel information
- engine information
- diagnostic information including complete J1587 fault codes
- service information including mileage or time to next service
- setup information of various kinds
- vehicle information

With the parking brake released, only the odometer and alert screens can be displayed. Park the vehicle and set the parking brake to display additional screen functions.

Trip Information

Trip information allows you to view trip mileage and time, time spent idling, average miles per hour, and leg mileage and time. See **Fig. 7**.

Fuel Information

Fuel information allows you to view total fuel usage since the last reset, fuel mileage, and fuel consumed while idling or running the PTO. See **Fig. 8**.

Engine Information

Engine information allows you to view total engine mileage and hours, fuel consumption for the engine and PTO, and engine oil level (where installed). See **Fig. 9**.

NOTE: Engine oil level is an optional function available on vehicles with Mercedes-Benz engines.

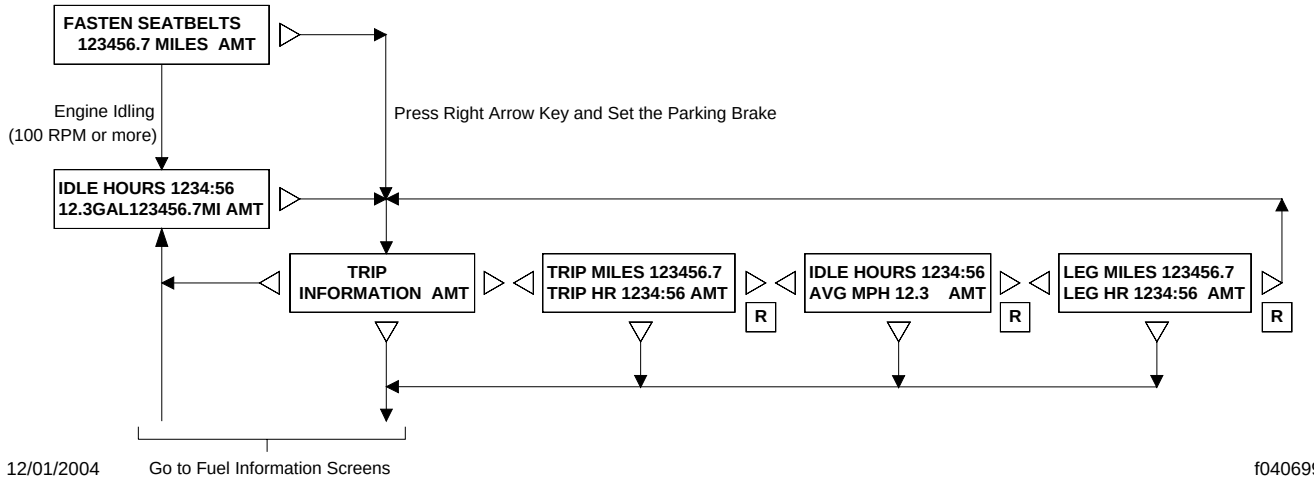
Diagnostic Information

Diagnostic information allows you to view any J1587 fault codes transmitted on the vehicle datalink. The complete fault code is displayed both as a text message and in numbers. Specific fault code information can be displayed only with the vehicle stopped and the parking brake set.

During vehicle start-up, with the parking brake set, the ICU4M displays active fault codes, if any, until the parking brake is released. With an active fault code on display, push the left arrow key to go to the active faults screen (gives the total number of active faults), and again to go to the diagnostic information screen. From here, any of the diagnostic information can be obtained, including information about any fault, active or historical.

NOTE: Historical faults are dash faults only.

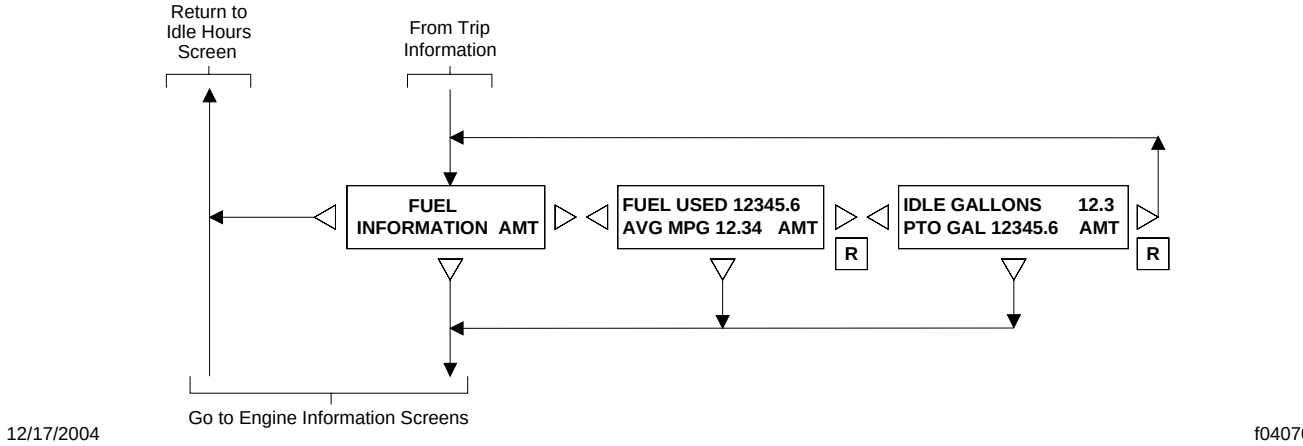
Diagnostic information can also be obtained at any time. From the odometer screen, press the right arrow key once and the down arrow key three times to display the diagnostic information screen. See **Fig. 10**.



AMT= Current gear information for automated manual transmissions.

NOTE: Metric unit screens are similar.

Fig. 7, Trip Information Screens



AMT= Current gear information for automated manual transmissions.

NOTE: Metric unit screens are similar.

Fig. 8, Fuel Information Screens

Active Faults

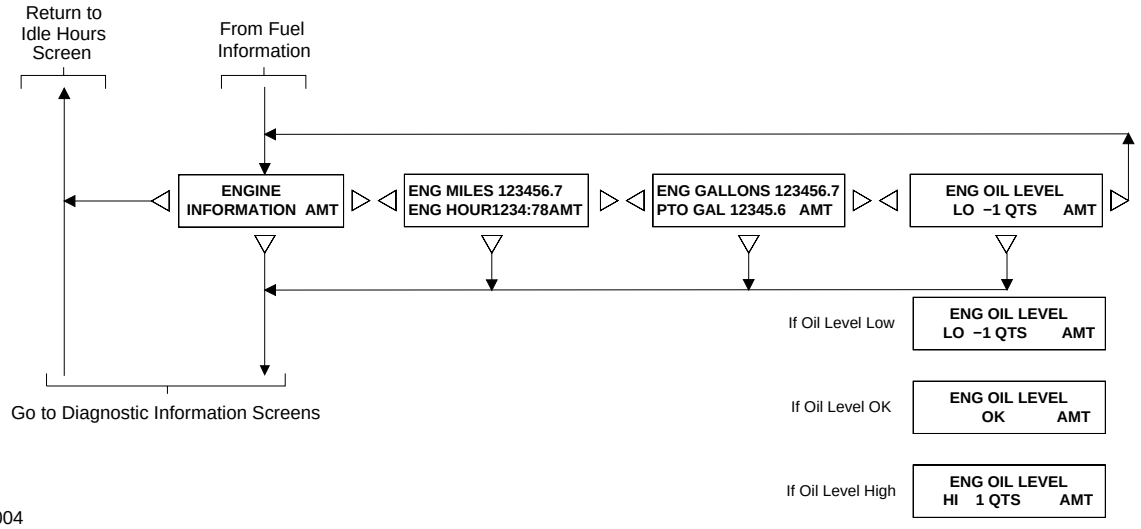
Active faults are communicated on the J1587 datalink. If active fault codes display during start-up or at any other time, make a note of the fault code and text message.

Historical Faults

Historical faults (dash faults only) are kept in the ICU4M's memory after the active fault has been cleared. The data are useful for situations where the same fault recurs over time, to indicate an underlying problem that may otherwise escape attention.

It is possible to clear historical fault data from the ICU4M's memory when the information is no longer

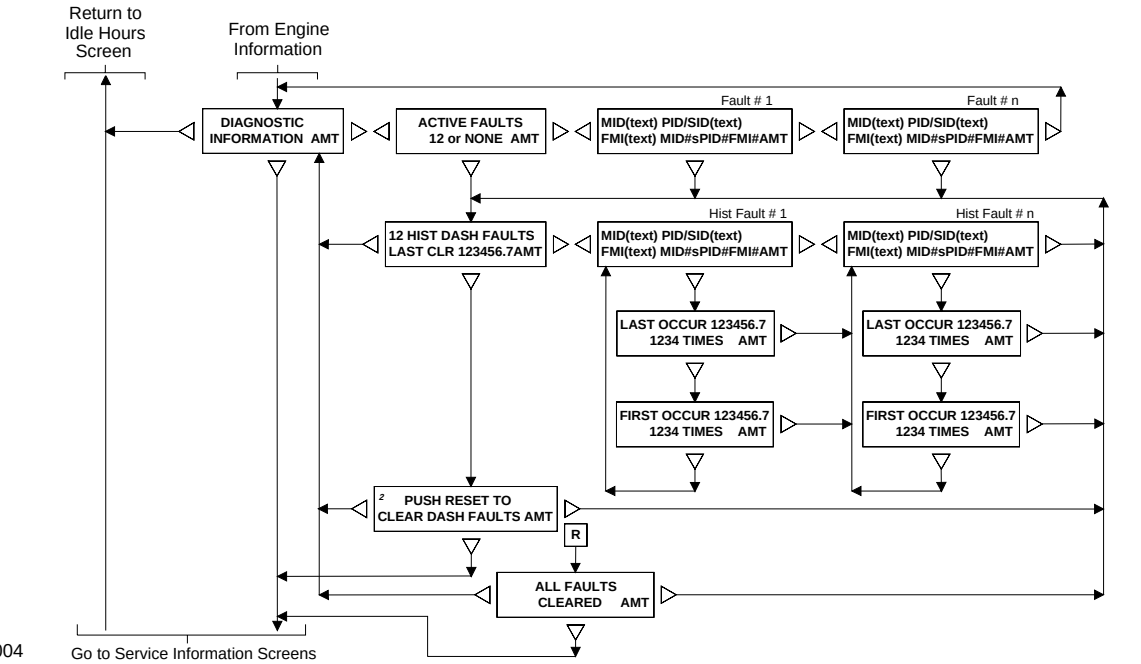
General Information



AMT= Current gear information for automated manual transmissions.

NOTE: Metric unit screens are similar.

Fig. 9, Engine Information Screens



AMT= Current gear information for automated manual transmissions.

NOTE: With less than 254 miles on the odometer, clearing historical faults also clears the memory of the electronic unit reporting the fault.

Fig. 10, Diagnostic Information Screens

needed. When there are less than 254 miles on the odometer, clearing historical faults also clears the memory of the electronic unit reporting the fault.

IMPORTANT: Do not reset historical faults unless you are sure that the data will not be needed in the future. It is not possible to clear individual historical faults: either all the data are cleared, or none.

To clear historical faults, press the set/reset key. When the message "all faults cleared" appears, all the historical fault data have been cleared. From this message, press the left arrow key to return to the diagnostic information screen, the right arrow key to return to the historical faults information screen, or the down arrow key to go on to service information.

Service Information

Service information allows you to view the next recurring service interval. Service intervals can be expressed in either miles or hours. See **Fig. 11**. They can also be inactivated, so they do not display at all. For programming service intervals, look under the heading "Setup Information."

NOTE: If the service information screen is not activated, the ICU4M will instead display the setup information screen, which can be used to activate service information.

If the vehicle has gone past the service interval, the "miles/hours remaining" screen is replaced by the "service was due" screen, followed by the number of miles/hours since the service fell due.

Setup Information

Setup information allows you to program various features of the ICU4M environment. These are the programmable features:

- service intervals
- target miles per gallon
- LCD lighting
- display brightness
- language
- units of measurement
- parameters

From the service information screen, press the down arrow key to display the setup information screen. See **Fig. 12**.

To set any feature, press the set/reset key when prompted. A decision screen appears, displaying the decision choices with the current selection flashing. To change the selection, move the left or right arrow key as many times as required until the desired selection is flashing. Then press the down arrow key to leave the decision screen and go to the next setup feature screen. See **Fig. 13**.

Service Interval Programming

For service intervals only, there is an extra programming step. From the service interval feature screen, press the set/reset key to display a decision screen for setting service interval units (the choices are miles, hours, or off).

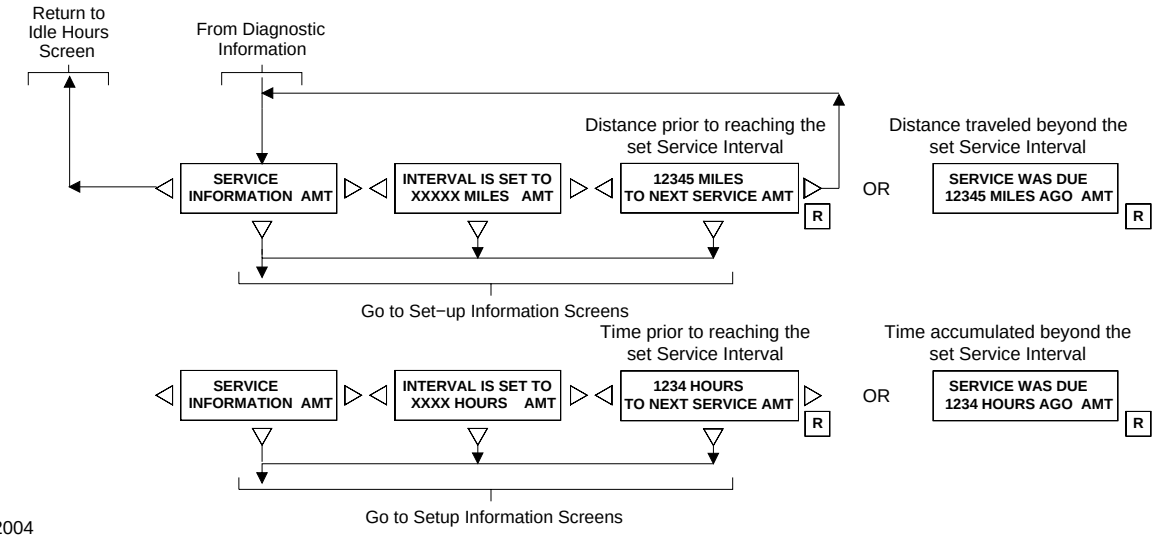
If you select miles or hours on this decision screen, press the down arrow key to go to a second decision screen. This decision screen allows you to select the length of the interval in the units you have chosen (either miles or hours). Once you have selected the interval length, press the down arrow key again to go to the next setup feature screen (target mpg).

If, on the other hand, you select "off" at the selection screen for service interval units (meaning you have turned off service interval information), you go directly to the next setup feature screen (target mpg).

Vehicle Information

Vehicle information allows you to view datalink activity in a dynamic graph format, datalink usage and error rate (datalink status), and ICU4M data, including ICU4M serial number and software revision level. See **Fig. 14**.

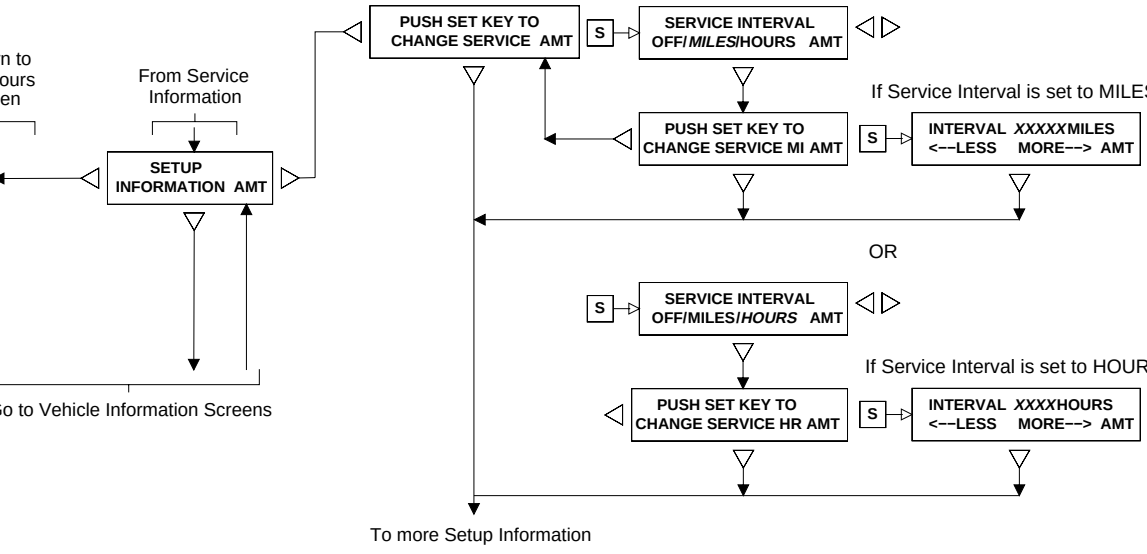
General Information



AMT= Current gear information for automated manual transmissions.

NOTE: Service information screens only appear if the service interval is set to MILES or HOURS in Setup Information. Metric unit screens are similar.

Fig. 11, Service Information Screens



AMT= Current gear information for automated manual transmissions.
The current selection flashes. Press the left and/or right arrow key(s) to change the selection. To store the changes and exit the screen, press the down arrow key.

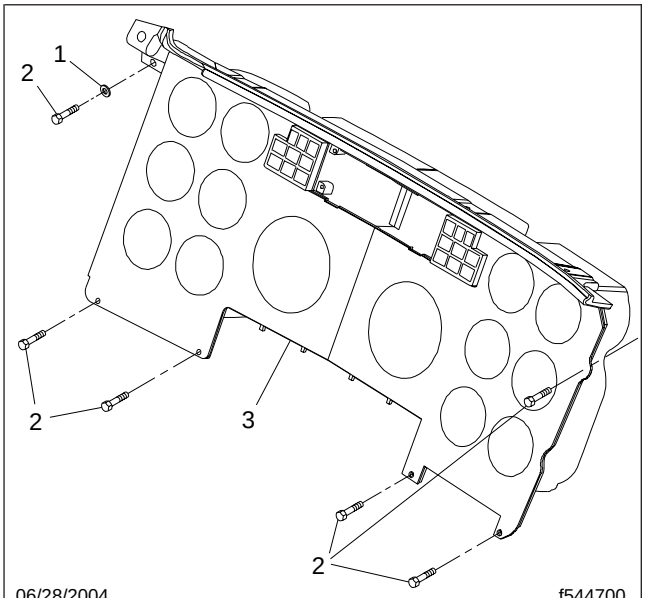
Fig. 14, Vehicle Information Screens

Replacement

To replace the individual components, see the subject listed below for procedures.

- Individual gauges, see **Subject 110**
- Light bar, see **Subject 120**
- Light bulbs or telltale lenses, see **Subject 130**

1. Remove the left-hand dash panels. Be sure the screws that attach the dash panel trimtop to the upper dash assembly have been removed. For instructions, see **Section 60.08, Subject 100**.
2. Remove the screw that attaches the dash panel trimtop to the lower dash panel. This screw is located on the far left of the trimtop.
3. Remove the fasteners that secure the ICU4M housing to the dash. Fasteners used on the ICU4M are 7/8" Torx pan-head dog-point screws. See **Fig. 1**.



1. #10 Stainless Steel Flatwasher, 1/2" OD
2. 7/8" Dog-Point Torx Screw
3. ICU4M Housing

Fig. 1, ICU4M Dash Panel Installation

CAUTION

Electronic components of the ICU are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU circuitry.

4. Disconnect the electrical harness connectors from the back of the light bar. These include the 32-pin light bar connector, the 24-pin light bar connector, and the two 6-pin gauge databus connectors. Also disconnect the 3-pin auxiliary input connector, if so equipped. See **Fig. 2**.

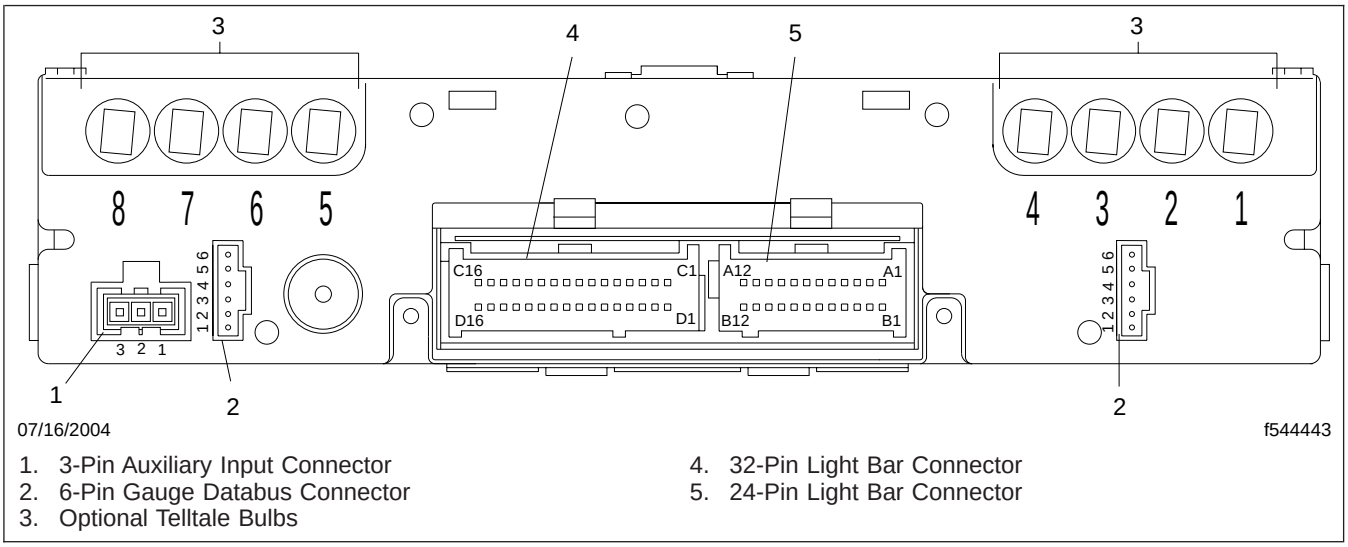
IMPORTANT: Bleed off all air before trying to remove the air hoses.

5. Using a paint pen, mark the air hoses for ease in installation. After bleeding all air from the system, disconnect all air gauge hoses.
6. Remove the light bar faceplate. Place a small flat blade under each end near the center and carefully pry it forward to release the locking tabs.
7. When all fasteners and connections between the ICU housing and the dash have been disconnected, remove the old ICU from the dash. See **Fig. 3**.
8. Remove the light bar from the back by removing its four Torx screws from the front of the ICU4M housing. The top two screws also secure the trimtop to the ICU4M housing.
9. Disconnect each gauge from the others by disconnecting the daisy chain harness connectors.

NOTE: Record the location of each gauge before removing it, if the same configuration is desired for reinstallation. Gauges must be installed in the appropriate size panel opening, and they must all be connected to each other in daisy-chain fashion in order to work, but a specific location for each gauge is not necessary.

10. Remove all gauges. See **Fig. 4**. For procedures, see **Subject 110**.
11. Remove the remaining screw that attaches the dash panel trimtop to the old ICU.

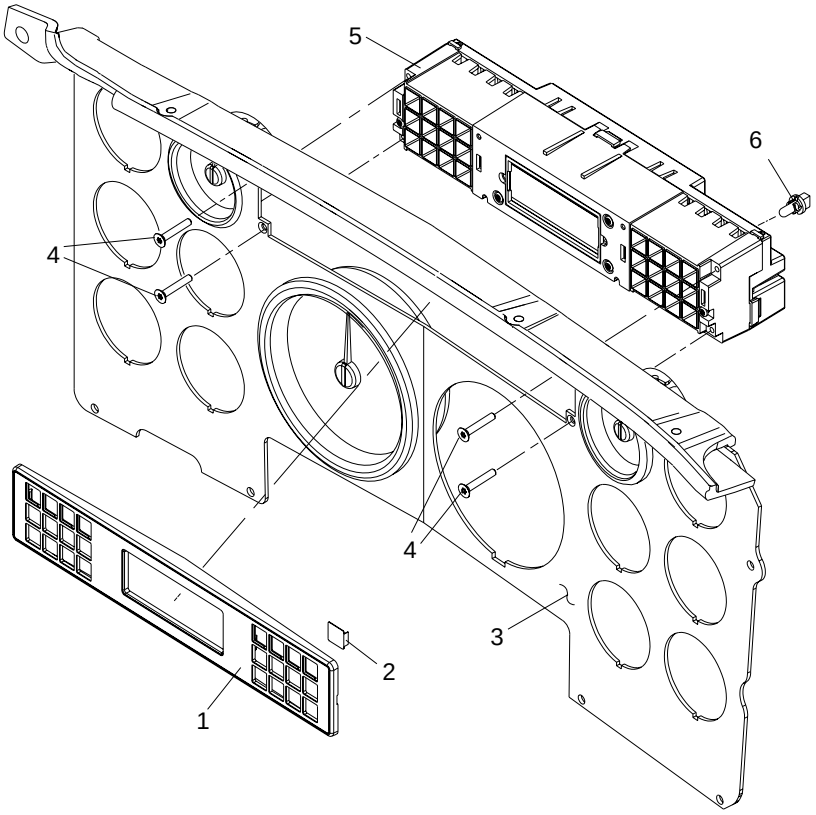
ICU4M Replacement



1. 3-Pin Auxiliary Input Connector
2. 6-Pin Gauge Databus Connector
3. Optional Telltale Bulbs
4. 32-Pin Light Bar Connector
5. 24-Pin Light Bar Connector

Fig. 2, Light Bar Connector Pin Locations (rear view)

12. Attach the dash panel trimtop to the replacement ICU4M housing.
13. Locate each replacement gauge in the correct gauge opening. See **Fig. 4**. For procedures, see **Subject 110**.
14. Install the light bar. Place it into the opening from the back and install its four Torx screws from the front of the ICU4M. The top two screws also secure the trimtop to the ICU4M housing. Hold the trimtop so its mounting tabs are flush with the ICU4M housing, then secure the light bar. See **Fig. 3**.
15. Install the light bar faceplate. Place it over the front of the light bar, then carefully press it on until its end tabs lock in place.
16. Connect each gauge to the others on each side of the ICU4M housing. Connect the harnesses in daisy-chain fashion.
    - 16.1 Start by connecting the inside harness of one of the two large gauges to the closest 6-pin connector on the light bar. Then connect the harness on the outside of the gauge to the nearest plug at the top of the column of small gauges next to it. Connect the other harness from the small gauge to the one below it. Continue working down, then across the bottom to the column of gauges next to it, then up the column. The final gauge in the chain will connect only to the gauge immediately below it.
    - 16.2 Connect the gauges on the other side of the ICU4M in similar fashion. Start with the other large gauge, connect it to the nearest 6-pin connector on the light bar, then connect the other harness from the large gauge to the small gauge nearest on the top inside column and work similarly down the inside column and up the outside column around so all gauges are connected in the chain.
17. Place the ICU4M close to its installed position and connect the air hoses to the air gauges as marked during removal.
18. Connect all remaining electrical harnesses to the back of the light bar. These include the 32-pin light bar harness connector, the 24-pin light bar harness connector, and the 3-pin auxiliary input harness connector, if so equipped. See **Fig. 2**.
19. Install the fasteners that secure the ICU4M housing to the dash. Fasteners used on the ICU4M are 7/8" Torx pan-head dog-point screws. See **Fig. 1**.
20. Install all remaining dash panels. Be sure to install the fasteners that attach the dash panel trimtop to the upper dash assembly and lower



05/24/2005 f610769

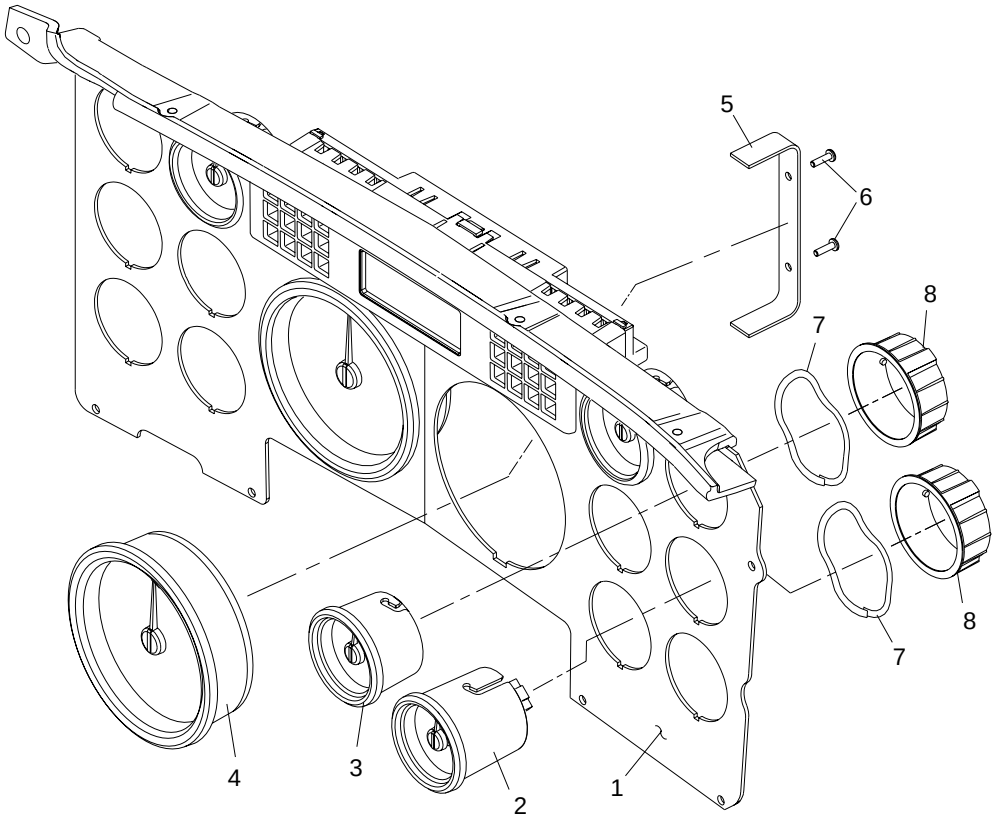
dash panel. For instructions, see **Section 60.08, Subject 100**.

21. Turn on the ignition and test the operation of the ICU4M:
    - all gauges controlled by the ICU4M sweep to full scale and return
    - the buzzer sounds for 3 seconds
    - the fasten seat belt warning light illuminates for 15 seconds
    - the battery voltage, low air pressure, and parking brake warning lights illuminate, and then turn off.
22. Repair or replace any gauges that are not working properly.

ICU4M Replacement



05/24/2005 f610770

1. ICU4M Housing
2. Air Pressure Gauge
3. Small Gauge
4. Large Gauge (Speedometer or Tachometer)
5. Large Gauge Mounting Bracket
6. Large Gauge Mounting Screws
7. Wave Ring
8. Small Gauge Mounting Collar

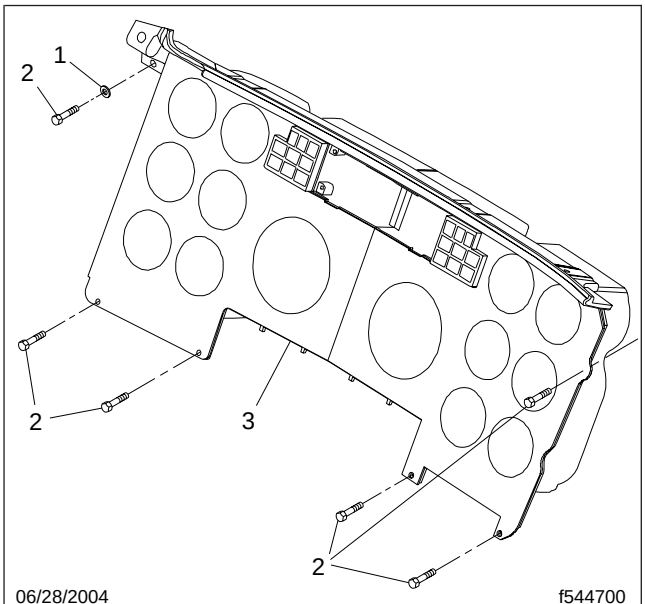
Fig. 4, ICU4M Gauge Installation

How to use these procedures:

1. Start with the instructions under the heading "Removing the Dash Panels."
2. Go to the instructions under the correct heading, as necessary to replace each type of gauge.
3. Finish with the instructions under the heading "Installing the Dash Panels." This will restore the ICU4M to service.

Removing the Dash Panels

1. Remove the left-hand dash panels. Be sure the screws that attach the dash panel trimtop to the upper dash assembly have been removed. For instructions, see **Section 60.08, Subject 100**.
2. Remove the screw that attaches the dash panel trimtop to the lower dash panel. This screw is located on the far left of the trimtop.
3. Remove the fasteners that secure the ICU4M housing to the dash. Fasteners used on the ICU4M are 7/8" Torx pan-head dog-point screws. See **Fig. 1**.



1. #10 Stainless Steel Flatwasher, 1/2" OD
2. 7/8" Dog-Point Torx Screw
3. ICU4M Housing

Fig. 1, ICU4M Dash Panel Installation

CAUTION

Electronic components of the ICU are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU circuitry.

4. Carefully pull the dash panel forward to gain access to the gauges from behind the panel.

Speedometer and Tachometer

1. Disconnect the electrical harness connectors from the back of the gauge.
2. Remove the two Torx screws that secure the mounting bracket and the gauge to the ICU4M housing. See **Fig. 2**.
3. Orient the replacement gauge and place it through the opening from the front. Then place the mounting bracket on the back of the gauge and install the two Torx screws.
4. Connect both wire harnesses to the back of the gauge.
5. See the instructions below under the heading "Installing the Dash Panels."

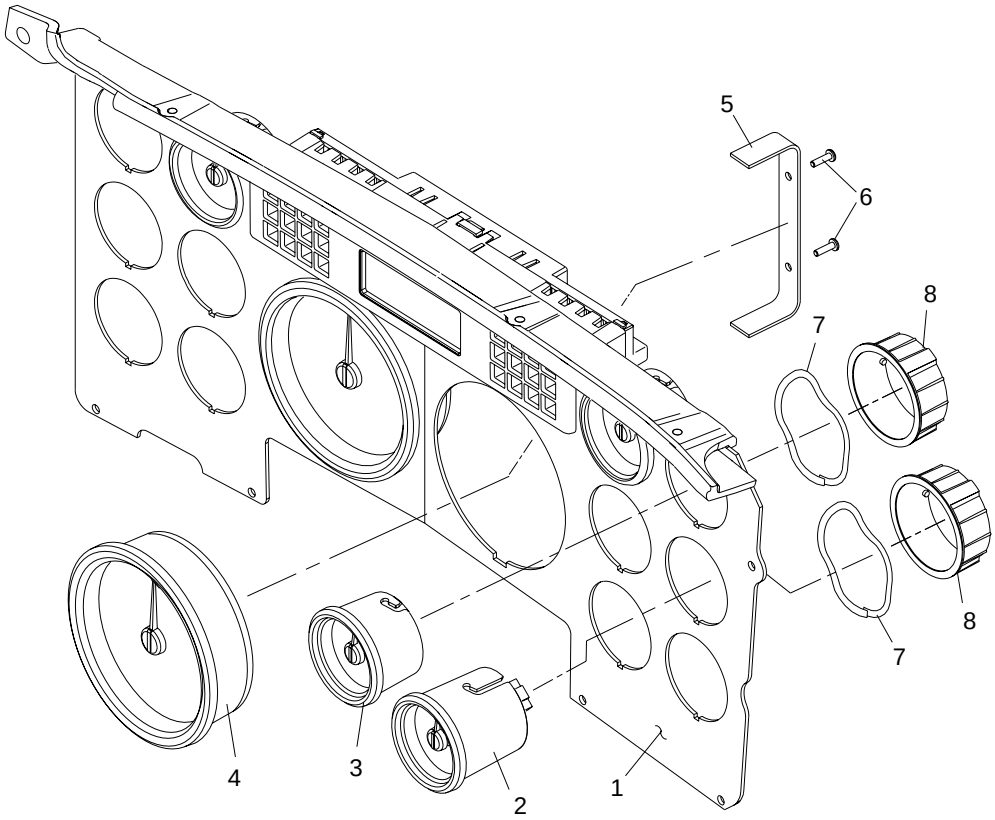
Air Pressure Gauges

IMPORTANT: Bleed off all air before trying to remove the air hoses.

1. Using a paint pen, mark the air hoses for ease in installation. After bleeding all air from the system, disconnect the air gauge hoses.
2. Unplug both wire harnesses from the back of the gauge.
3. Remove the ICU4M from the dash and place it on a bench with the gauge lens protected. See **Subject 100**.

NOTE: If multiple gauges are being replaced, note the location of each gauge before removal.

Gauge Replacement



05/24/2005 f610770

1. ICU4M Housing
2. Air Pressure Gauge
3. Small Gauge
4. Large Gauge (speedometer or tachometer)
5. Large Gauge Mounting Bracket
6. Large Gauge Mounting Screws
7. Wave Ring
8. Small Gauge Mounting Collar

Fig. 2, ICU4M Gauge Installation

4. Remove the old gauge from the ICU4M housing. See **Fig. 2**.
   - 4.1 Push in and give the gauge mounting collar (made of black plastic) a slight counterclockwise twist until the collar unlocks from the gauge.

   NOTE: The gauge collar may be difficult to remove, but it can be done without tools.

   - 4.2 Remove the collar and wave ring from the back of the ICU housing.
   - 4.3 Lift up the ICU housing and remove the gauge through the front of the ICU housing.
5. Install the new gauge in the ICU4M housing.
   - 5.1 Locate the replacement gauge in the correct gauge opening.
   - 5.2 Insert the tab on the gauge into the slot in the ICU4M housing until the gauge is flat against the front of the housing.
   - 5.3 Place the collar and wave ring on the back of the gauge. Push the gauge mounting collar against the wave ring and twist the collar clockwise until the collar locks in place.
6. Install the ICU4M in the dash. See **Subject 100**.
7. Connect both wire harnesses to the back of the gauge.
8. Connect the air gauge hoses.

9. See the instructions below under the heading "Installing the Dash Panels."

All Other Gauges

1. Unplug both wire harnesses from the back of the gauge.
2. Remove the ICU4M from the dash and place it on a bench with the gauge lens protected. See **Subject 100**.

NOTE: If multiple gauges are being replaced, note the location of each gauge before removal.

3. Remove the old gauge from the ICU4M housing. See **Fig. 2**.
   - 3.1 Push in and give the gauge mounting collar (made of black plastic) a slight counterclockwise twist until the collar unlocks from the gauge.

   NOTE: The gauge collar may be difficult to remove, but it can be done without tools.

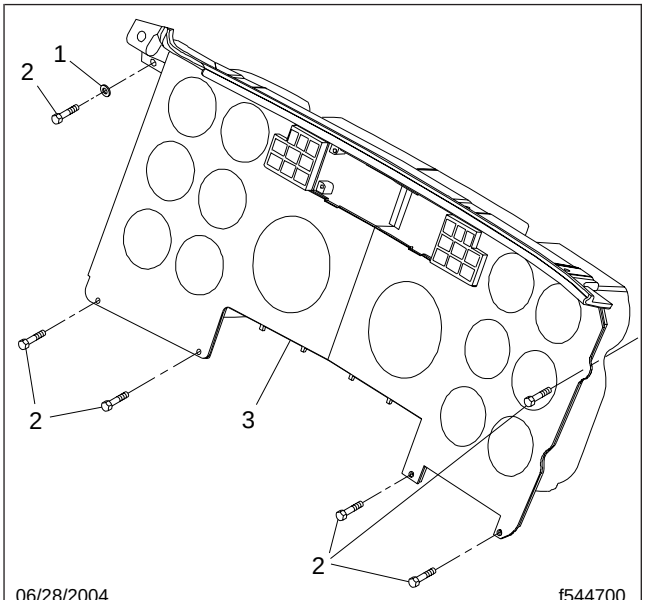
   - 3.2 Remove the collar and wave ring from the back of the ICU housing.
   - 3.3 Lift up the ICU housing and remove the gauge through the front of the ICU housing.
4. Install the new gauge in the ICU4M housing.
   - 4.1 Locate the replacement gauge in the correct gauge opening.
   - 4.2 Insert the tab on the gauge into the slot in the ICU4M housing until the gauge is flat against the front of the housing.
   - 4.3 Place the collar and wave ring on the back of the gauge. Push the gauge mounting collar against the wave ring and twist the collar clockwise until the collar locks in place.
5. Install the ICU4M in the dash. See **Subject 100**.
6. Connect both wire harnesses to the back of the gauge.
7. See the instructions below under the heading "Installing the Dash Panels."

Installing the Dash Panels

1. Install the fasteners that secure the ICU4M housing to the dash. Fasteners used on the ICU4M are 7/8" Torx pan-head dog-point screws. See **Fig. 1**.
2. Install all remaining dash panels. Be sure to install the fasteners that attach the dash panel trimtop to the upper dash assembly and lower dash panel. For instructions, see **Section 60.08, Subject 100**.
3. Turn on the ignition and test the operation of the ICU4M:
   - all gauges controlled by the ICU4M sweep to full scale and return
   - the buzzer sounds for 3 seconds
   - the fasten seat belt warning light illuminates for 15 seconds
   - the battery voltage, low air pressure, and parking brake warning lights illuminate, and then turn off.
4. Repair or replace any gauges that are not working properly.

Light Bar Replacement

1. Remove the left-hand dash panels. Be sure the screws that attach the dash panel trimtop to the upper dash assembly have been removed. For instructions, see **Section 60.08, Subject 100**.
2. Remove the screw that attaches the dash panel trimtop to the lower dash panel. This screw is located on the far left of the trimtop.
3. Remove the fasteners that secure the ICU4M housing to the dash. Fasteners used on the ICU4M are 7/8" Torx pan-head dog-point screws. See **Fig. 1**.



1. #10 Stainless Steel Flatwasher, 1/2" OD
2. 7/8" Dog-Point Torx Screw
3. ICU4M Housing

Fig. 1, ICU4M Dash Panel Installation

CAUTION

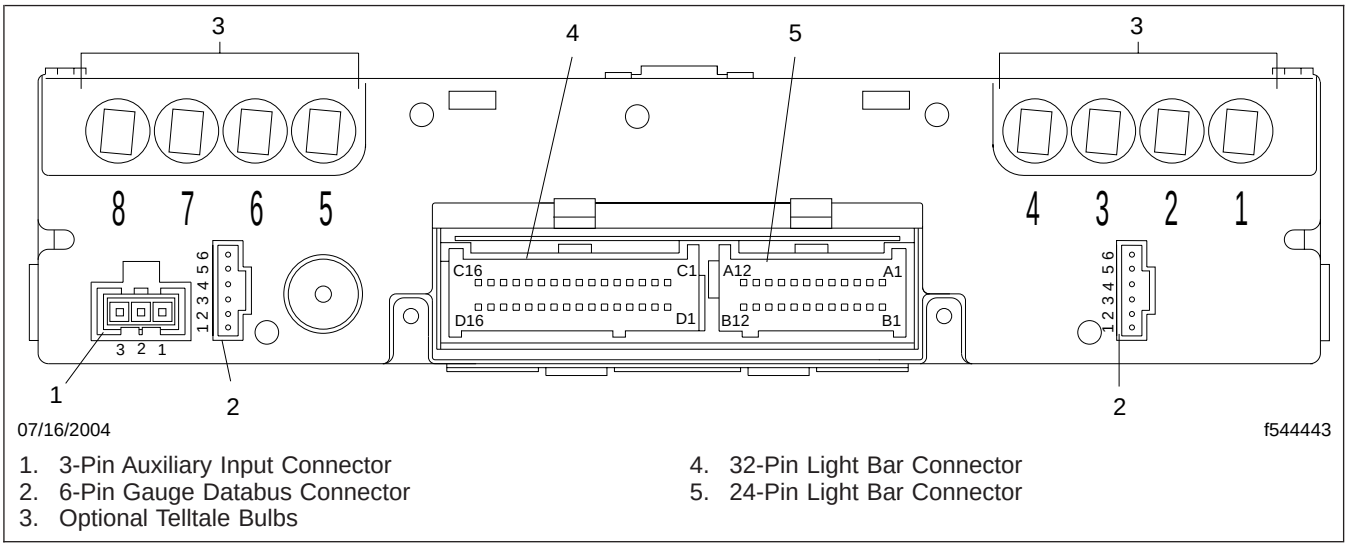
Electronic components of the ICU are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU circuitry.

4. Disconnect the electrical harness connectors from the back of the light bar. These include the 32-pin light bar connector, the 24-pin light bar connector, and the two 6-pin gauge databus connectors. Also disconnect the 3-pin auxiliary input connector, if so equipped. See **Fig. 2**.
5. Remove the light bar faceplate. Place a small flat blade under each end near the center and carefully pry it forward to release the locking tabs.
6. Remove the light bar from the back by removing its four Torx screws from the front of the ICU4M housing. The top two screws also secure the trimtop to the ICU4M housing. See **Fig. 3**.
7. Install the replacement light bar. See **Fig. 3**.
   - 7.1 From the back of the ICU4M housing, insert the light bar into the opening in the ICU4M housing.
   - 7.2 From the front, install four Torx screws, as removed.

   NOTE: The top two screws also secure the dash panel trimtop to the ICU4M housing.

   - 7.3 Hold the trimtop so its mounting tabs are flush to the ICU4M housing, then secure the light bar.
8. Install the light bar faceplate. Place it over the front of the light bar, then carefully press it on until its end tabs lock in place.
9. Connect the electrical harnesses to the back of the light bar; the 32-pin harness connector, the 24-pin harness connector, the two 6-pin databus harness connectors from the speedometer and tachometer, and the 3-pin auxiliary input harness connector, if so equipped. See **Fig. 2**.
10. Install the fasteners that secure the ICU4M housing to the dash. Fasteners used on the ICU4M are 7/8" Torx pan-head dog-point screws. See **Fig. 1**.
11. Install all remaining dash panels. Be sure to install the fasteners that attach the dash panel trimtop to the upper dash assembly and lower dash panel. For instructions, see **Section 60.08, Subject 100**.
12. Turn on the ignition and test the operation of the ICU4M:

Light Bar Replacement



1. 3-Pin Auxiliary Input Connector
2. 6-Pin Gauge Databus Connector
3. Optional Telltale Bulbs
4. 32-Pin Light Bar Connector
5. 24-Pin Light Bar Connector

Fig. 2, Light Bar Connector Pin Locations (rear view)

- all gauges controlled by the ICU4M sweep to full scale and return
- the buzzer sounds for 3 seconds
- the fasten seat belt warning light illuminates for 15 seconds
- the battery voltage, low air pressure, and parking brake warning lights illuminate, and then turn off.

13. Repair or replace any gauges that are not working properly.

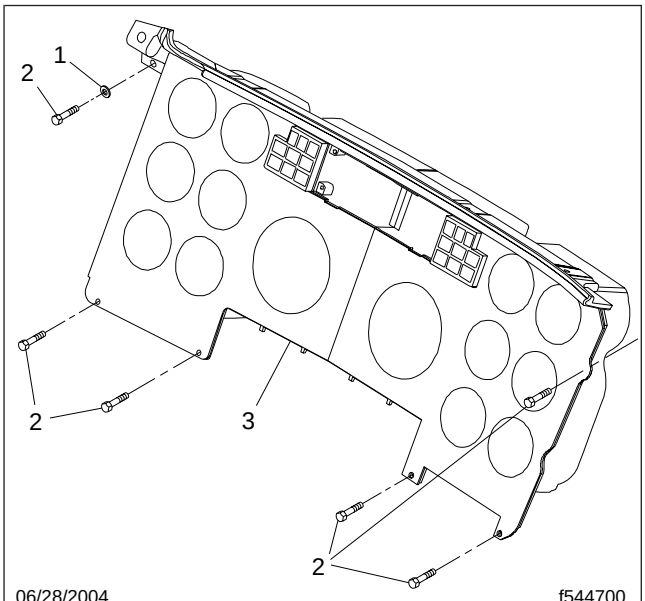
2. Telltale Lens
3. ICU4M Housing
4. Light Bar Screws
5. Light Bar
6. Light Bulb

Fig. 3, ICU4M Light Bar Replacement

Light Bulb Replacement

NOTE: Only the top row of warning and indicator lights have replaceable bulbs. The replaceable bulbs are incandescent. All lights in this row are optional, so not all positions may be in use.

1. Remove the left-hand dash panels. Be sure the screws that attach the dash panel trimtop to the upper dash assembly have been removed. For instructions, see **Section 60.08, Subject 100**.
2. Remove the screw that attaches the dash panel trimtop to the lower dash panel. This screw is located on the far left of the trimtop.
3. Remove the fasteners that secure the ICU4M housing to the dash. Fasteners used on the ICU4M are 7/8" Torx pan-head dog-point screws. See **Fig. 1**.



1. #10 Stainless Steel Flatwasher, 1/2" OD
2. 7/8" Dog-Point Torx Screw
3. ICU4M Housing

Fig. 1, ICU4M Dash Panel Installation

CAUTION

Electronic components of the ICU are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU circuitry.

4. Carefully pull the dash panel forward to gain access to the light bar from behind the panel.
5. Twist the burned-out bulb about 1/8-turn counterclockwise and pull it out from the back of the light bar. See **Fig. 2**.
6. Insert a new bulb into the opening on the back of the light bar and twist it about 1/8-turn clockwise until it is securely in place.
7. Install the fasteners that secure the ICU4M housing to the dash. Fasteners used on the ICU4M are 7/8" Torx pan-head dog-point screws. See **Fig. 1**.
8. Install all remaining dash panels. Be sure to install the fasteners that attach the dash panel trimtop to the upper dash assembly and lower dash panel. For instructions, see **Section 60.08, Subject 100**.
9. Turn on the ignition and test the operation of the ICU4M:
   - all gauges controlled by the ICU4M sweep to full scale and return
   - the buzzer sounds for 3 seconds
   - the fasten seat belt warning light illuminates for 15 seconds
   - the battery voltage, low air pressure, and parking brake warning lights illuminate, and then turn off.
10. Repair or replace any gauges that are not working properly.

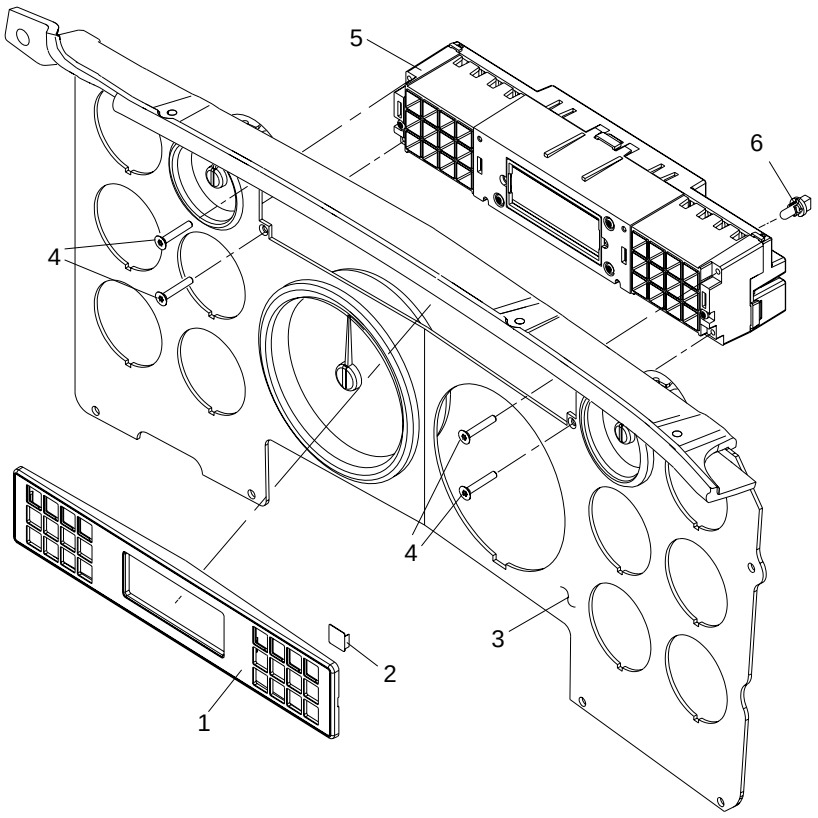
Telltale Lens Replacement

The term "telltale lens" refers to the small plastic inserts in the top row of the light bar with legends printed on them. These can be replaced.

CAUTION

Electronic components of the ICU are vulnerable to damage from static electricity. If available,

Light Bulb/Telltale Lens Replacement



05/24/2005 f610769

1. Light Bar Faceplate
2. Telltale Lens
3. ICU4M Housing
4. Light Bar Screws
5. Light Bar
6. Light Bulb

Fig. 2, ICU4M Light Bar

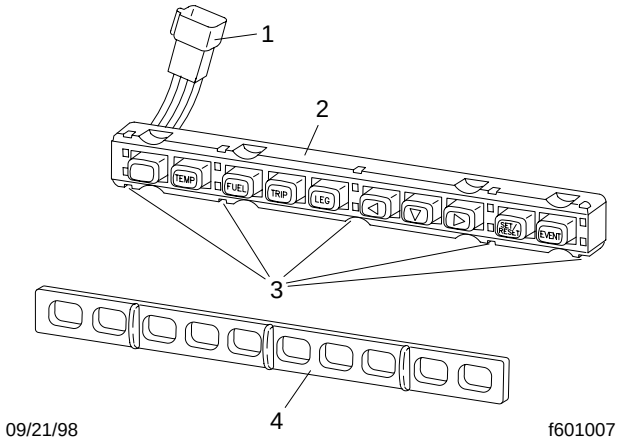
wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU circuitry.

1. Place a flat blade under each end of the light bar faceplate and carefully pry it off the light bar.
2. Using a pair of needlenose pliers or a similar tool, grab the exposed tab along the side of the telltale slot and carefully slide the telltale lens out from the slot.
3. Place the replacement telltale lens in its correct slot, as removed. Properly orient the telltale lens so the legend is readable from the front, then slide the telltale lens into its slot.

Turn on the ignition keyswitch. Check all bulbs and telltales for correct operation.

Replacement

1. Remove the auxiliary instrument panel. For instructions, see **Subject 100**.
2. Remove the keypad bezel. See **Fig. 1**.



1. Electrical Connector
2. Keypad Housing
3. Access Holes
4. Keypad Bezel

Fig. 1, Keypad Replacement

IMPORTANT: Proceed carefully with the keypad bezel removal. The locking tabs break easily when too much force is applied.

2.1 Beginning at one end, insert a small screwdriver into one of the access holes on the bottom edge of the keypad housing to release a tab.

2.2 Roll the bottom edge of the bezel outward and upward to disengage the locking tab. Insert a small screwdriver or blade under the bezel to prevent the bezel from snapping back into place.

2.3 Continue this process until all five locking tabs are released.

2.4 Carefully lift the edge of the keypad bezel over the keys to release the bezel from the keypad.

NOTE: It may be helpful to press each of the keys to help the bezel clear the tops of the keys.

3. Remove the keypad housing.

3.1 Pull the keypad housing away from the panel.

3.2 Unplug the electrical connector.

3.3 Remove the keypad housing from the vehicle.

4. Install the keypad housing.

4.1 Snap the electrical connector into the wiring harness.

4.2 Align the four tabs on the keypad housing with the four slots on the auxiliary instrument panel.

5. Install the keypad bezel.

5.1 Insert the five lower retainer hooks into the notches in the panel.

5.2 While holding the keypad housing from the back, roll the top edge of the bezel into the housing until the upper hooks snap into place and hold the housing against the panel.

6. Install the auxiliary instrument panel. For instructions, see **Subject 100**.
7. Turn on the ignition and check the new keypad for proper operation.

General Information

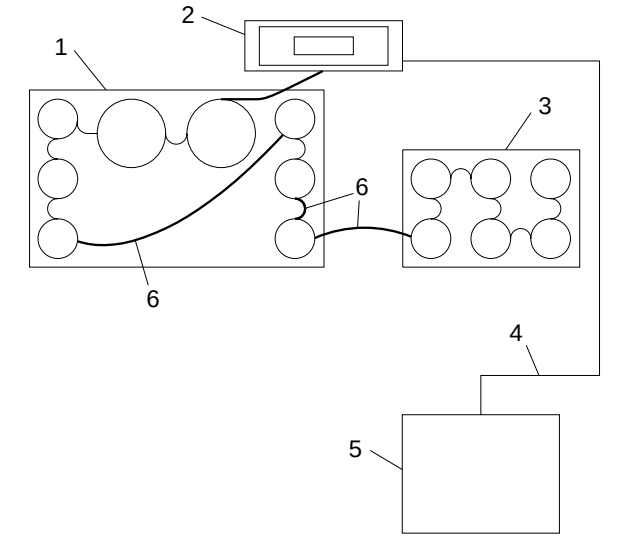
The Ametek ICU4M replaced the Pollak ICU2M in production Century Class vehicles on December 20, 2004. The ICU4M is not used on Argosy vehicles.

The ICU4M contains up to 14 individual gauges, a light bar control unit, and a daisy-chain databus. See **Fig. 1**. The light bar is the brain of the system. It includes a message center with 2x20-character liquid crystal display (LCD) screen, and up to 24 warning and indicator lights.

The light bar controls all of the individual gauges. The light bar has two input types to drive the gauges: J1587 data from the engine ECM to control the databus driven gauges, and direct wired sensor input to control the other gauges. Each gauge has a unique address that the light bar communicates with.

The following gauges are driven by the J1587 databus inputs to the lightbar:

- speedometer
- tachometer
- oil pressure gauge
- coolant temperature gauge
- oil temperature gauge
- turbo boost pressure gauge



1. A-Panel Gauges
2. Message Center
3. B-Panel Gauges
4. J1587 Databus
5. Engine
6. Cluster Databus (jumper wires or daisy chain)

Fig. 1, Light Bar Control Unit Block Diagram

- voltmeter

The following gauges are driven by sensor inputs to the lightbar:

- fuel level gauge
- transmission temperature gauge
- forward tandem axle temperature gauge
- rear tandem axle temperature gauge
- pyrometer
- ammeter

The following air gauges are directly driven by air pressure; they are not controlled by the message center:

- primary air pressure gauge
- secondary air pressure gauge
- application air pressure gauge
- suspension air pressure gauge

General Troubleshooting Procedures

1. Check fault codes:

   Check for ICU fault codes (MID 140) and fault codes that are only displayed by the instrument cluster. Address these first. See *Fault Code Troubleshooting*, and **Table 1** and **Table 2** for MID 140 fault code definitions as well as roll call faults that are only displayed on the instrument cluster display and not in Servicelink. If this solves the problem, no further action is necessary. If the problem is still present, go to the next step.

2. For gauge problems do the following:

   2.1 For single gauge not working, see **Table 3** for diagnosis.

   2.2 For multiple gauges not working, see **Table 4** for diagnosis.

   2.3 For gauges that are not accurate, see **Table 5** for diagnosis.

   2.4 For air pressure gauge(s) not working, see **Table 6** for diagnosis.

3. For warning lamp problems, do the following:

   3.1 For light bar warning lamp problems, see **Table 8** for diagnosis.

   3.2 For in-gauge warning lamp problems, see **Table 9** for diagnosis.

4. For backlighting problems, see **Table 10** for diagnosis.

5. For keypad problems, see **Table 11** for diagnosis.

Fault Code Troubleshooting

The tables referenced under this heading provide provides fault codes that originate from the ICU4M message center (MID 140). Use **Table 1** to diagnose all MID 140 fault codes. Use **Table 2** to diagnose other J1587 fault codes only displayed by the ICU4M.

J1587 Fault Code Troubleshooting—ICU4M Specific Fault Codes				
MID	**PID/SID**	**FMI**	**Fault Code Description**	**Action**
140	p077	5	Forward rear axle temperature sensor—open	Check sensor and wiring for fault. Repair as necessary. Refer to **Specifications 400** for sensor resistance values.
		6	Forward rear axle temperature sensor—shorted	
140	p078	5	Rear rear axle temperature sensor—open	
		6	Rear rear axle temperature sensor—shorted	
140	p096	5	Fuel level sensor—open	Refer to **Table 7** for troubleshooting the fuel level system.
		6	Fuel level sensor—shorted	
140	p168	1	Light bar voltage too low (less than 10.5 volts)	Check voltage supply to light bar. Repair as necessary.
140	p171	5	Ambient air temperature sensor—open	Check sensor and wiring for fault. Repair as necessary.
		6	Ambient air temperature sensor—shorted	
140	p173	5	Pyrometer sensor—open	Check sensor and wiring for fault. Repair as necessary. Refer to **Specifications 400** for sensor resistance values.
		6	Pyrometer sensor—shorted	
140	p177	5	Transmission oil temperature sensor—open	Check sensor and wiring for fault. Repair as necessary. Refer to **Specifications 400** for sensor resistance values.
		6	Transmission oil temperature sensor—shorted	
140	s240	12	Light bar program memory failure	Replace the light bar.
140	s254	12	Light bar controller failure	Replace the light bar.

Table 1, J1587 Fault Code Troubleshooting--ICU4M Specific Fault Codes

Troubleshooting

J1587 Fault Code Troubleshooting—Other Fault Codes That Are Only Displayed by the ICU4M, Not in Servicelink				
MID	**SID**	**FMI**	**Fault Code Description**	**Action**
128	254	7	Engine ECM not responding	Check J1587 databus, power, and ground connections to the electronic unit that is not responding. Repair as necessary. NOTE: Once the ICU4M cluster sees an ECU on the databus for the first time, it will “learn” it, and will expect to see that ECU on roll call for the remainder of its life, or until it is reset (see below.) If the ICU4M does not see an ECU it expects to see on roll call, it will display one of the faults listed in this table on the message center. IMPORTANT: If the cluster is used as a test cluster in another vehicle, it must be reset (see below) before placing it back into the original vehicle. If the other vehicle contains an ECU that the original truck does not, the cluster will learn this ECU and will expect to see it on the databus when the cluster is placed back in the original vehicle. This will cause one of these faults in this table to be active, unless the cluster is reset. TO RESET THE LEARNED ROLL CALL ECUs: Use the keypad to display the "Setup Information" screen. Press the right key then use the down arrow on the keypad to scroll to the "Push Set Key to Change Parameters" message. Press the set key on the keypad. A message will be displayed that says, "Reset Parameters YES NO". Press the left arrow key on the keypad to select YES. When selected, YES will be flashing. Press the down arrow key on the keypad to reset the parameters. In addition to resetting the ICU4M parameters, the display will also transition to the Vehicle Information screen. This will clear the instrument cluster’s previously learned ECUs for roll call. The cluster will now relearn what ECUs to expect on roll call.
130	254	7	Transmission ECU not responding	
136	254	7	ABS ECU not responding	
146	254	7	Front HVAC controller not responding	
150	254	7	Electronically Controlled Air Suspension (ECAS) not responding	
164	254	7	Bulkhead Module not responding*	
181	254	7	Qualcomm not responding	
190	254	7	Air Conditioning Protection Unit (ACPU) not responding*	
200	254	7	Rear HVAC controller not responding	
219	254	7	VORAD not responding	
223	254	7	Transmission shift unit not responding	
231	254	7	Cellular communications not responding	
232	254	7	SPACE and/or airbag system not responding	
236	254	7	Step Deployment Unit #1 not responding (Argosy only)*	
237	254	7	Step Deployment Unit #2 not responding (Argosy only)*	
249	254	7	Chassis Module not responding*	

* This component is not used on the Century Class, but may show up in a roll call. If so, perform the reset procedure.

Table 2, J1587 Fault Code Troubleshooting--Other Fault Codes That Are Only Displayed by the ICU4M, Not in Servicelink

Gauge Troubleshooting

The tables referenced under this heading detail specific troubleshooting procedures for gauge problems. For a single gauge that does not work, use **Table 3** for diagnosis. For multiple gauges not working, use **Table 4** for diagnosis. For inaccurate gauges, use **Table 5** for diagnosis. For air pressure gauge problems, use **Table 6**.

Diagnosis for a Single Gauge Not Working			
Test No.	**Test Description**	**Test Result**	**Action**
1	Does the gauge that is malfunctioning sweep when the ignition is turned on?	Yes	Go to test 4.
		No	Go to test 2.
2	Is the malfunctioning gauge the last one in the chain from the light bar? (This will be one of the gauges that only has one jumper wire connected to it.)	Yes	Go to test 3.
		No	Replace gauge.
3	Remove the jumper wire to this gauge and install a known good wire. Does the gauge now work?	Yes	Replace jumper wire.
		No	Replace gauge.
4	Is the malfunctioning gauge driven by direct sensor input to the light bar? See **Table 13** for gauge control strategy.	Yes	If the gauge is just inaccurate, the sensor may be defective. See **Table 5** for diagnosis. If the gauge is not working, check the sensor and sensor wiring to the light bar. See **Table 7** for fuel level diagnostic procedure. Refer to **Specifications 400** for sensor resistance values. If no problem is found with the sensor or sensor wiring, the light bar may be defective.
		No	Go to test 5.
5	Connect Servicelink to vehicle and open the ICU4 Datalink Monitor template. Does the malfunctioning gauge work on the template?	Yes	Replace the light bar.
		No	Check sensor that drives gauge. It will usually be an input to the engine ECM. Repair as necessary.

Table 3, Diagnosis for a Single Gauge Not Working

Diagnosis for Multiple Gauges Not Working (databus-driven gauges)			
Test No.	**Test Description**	**Test Result**	**Action**
1	Do the gauges that are malfunctioning sweep when the ignition is turned on?	Yes	Go to Test 2.
		No	Go to Test 8.
2	Are all the gauges that are malfunctioning sensor driven by direct input to the light bar (gauges are not J1587 databus driven)? Refer to **Table 13** for gauge control strategy.	Yes	If the affected gauges are one or more of the following: transmission temp, ammeter, and axle temp #3, then check the common sensor ground that connects to pin C12 in the 32-pin connector. If OK, the light bar is probably faulty. If the gauges above are not affected, then the light bar is probably faulty. Repair as necessary.
		No	Go to Test 3.
3	Are all the malfunctioning gauges J1587 driven? Refer to **Table 13** for gauge control strategy.	Yes	Go to Test 4.
		No	Replace the light bar.
4	Connect PC to vehicle and start Servicelink. Will Servicelink connect?	Yes	Go to Test 5.
		No	Assuming Servicelink and the vehicle adapter are working correctly, the most likely cause is something taking the entire J1587 databus down (short, etc.). Repair as necessary.

Troubleshooting

Diagnosis for Multiple Gauges Not Working (databus-driven gauges)			
Test No.	**Test Description**	**Test Result**	**Action**
5	In Servicelink, does the ICU4 show up in the ECU list (MID 140)?	Yes	Go to Test 6.
		No	Check the J1587 databus to the ICU. If OK, the light bar is probably faulty. Repair as necessary.
6	In Servicelink, does the engine ECM show up in the ECU list (MID 128)?	Yes	Go to Test 7.
		No	Check the J1587 databus to the engine ECM. If OK, the engine ECM is probably faulty. Repair as necessary.
7	In Servicelink, open the ICU4 Datalink Monitor template. Do the affected gauges work on the template?	Yes	Replace the light bar.
		No	The engine ECM sensor wiring or the engine ECM itself is probably faulty. Repair as necessary.
8	Do any of the malfunctioning gauges sweep when the ignition is turned on?	Yes	Go to Test 9.
		No	Check power and ground to the light bar. If OK, the light bar is probably faulty. Repair as necessary.
9	Are all of the malfunctioning gauges in sequence with one another on the daisy chain?	Yes	Go to Test 10.
		No	Replace the light bar.
10	Locate the faulty gauge that is closest to the light bar in the daisy chain. Replace the jumper wire between this gauge and the next gauge closest to the light bar that works (or the light bar itself). Do the gauges now work?	Yes	Replace the jumper wire.
		No	Replace the light bar.

Table 4, Diagnosis for Multiple Gauges Not Working (databus-driven gauges)

Diagnosis for Inaccurate Gauges			
Test No.	**Test Description**	**Test Result**	**Action**
1	Is the gauge J1587 databus controlled? Refer to **Table 13** to determine gauge control strategy.	Yes	Go to Test 2.
		No	Go to Test 3.
2	Connect Servicelink to vehicle. Open the ICU4 Datalink Monitor template. Check if the template gauge reads the same as the cluster gauge. Does the template gauge read the same as the cluster gauge?	Yes	The gauge is OK. The sensor connected to the engine ECM may be faulty. Refer to engine manufacturer's literature for troubleshooting information.
		No	Try a known good gauge. If this does not correct the problem, replace the light bar.
3	For sensor driven gauges, check if gauge sensor resistance matches the specified values. Refer to **Specifications 400** for sensor resistance values. NOTE: An accurate thermometer will have to be used to determine appropriate sensor values for temperature gauges. Does the sensor resistance match the published values?	Yes	Go to Test 4.
		No	Replace the sensor.

Diagnosis for Inaccurate Gauges			
Test No.	**Test Description**	**Test Result**	**Action**
4	Repeat Test 3, except take the readings at the light bar connector (disconnect the connector). See **Fig. 6**, and **Table 16** for 24-pin connector, and **Table 17** for 32-pin connector. See **Table 7** for fuel level diagnostic procedure. Refer to **Specifications 400** for sensor resistance values. Does the sensor resistance match the published values?	Yes	Try a known good gauge. If this does not correct the problem, replace the light bar.
		No	Repair sensor wiring as necessary.

Table 5, Diagnosis for Inaccurate Gauges

Air Pressure Gauge Diagnosis			
Test No.	**Test Description**	**Test Result**	**Action**
1	Which air pressure gauge is not functioning correctly?	Primary or secondary	Go to Test 2.
		Application	Go to Test 3.
		Suspension	Go to Test 4.
2	Drain the air tanks. Connect an accurate pressure gauge to the primary or secondary air tank (whichever one corresponds with the problem gauge). Start the engine and build air pressure until the compressor cuts out. Is the air pressure gauge in the cluster within 6 psi (41 kPa) of the test gauge?	Yes	No problem found.
		No	Check for kinked air lines to the gauge. If OK, replace the gauge.
3	Connect an accurate pressure gauge to a delivery port on the foot valve. Make a 90 psi (620 kPa) brake application while observing the application air pressure gauge in the cluster and the test gauge. Is the air pressure gauge in the cluster within 3 psi (21 kPa) of the test gauge?	Yes	No problem found.
		No	Check for kinked air lines to the gauge. If OK, replace the gauge.
4	Connect an accurate pressure gauge to the air suspension. Is the air pressure gauge in the cluster within 3 psi (21 kPa) of the test gauge?	Yes	No problem found.
		No	Check for kinked air lines to the gauge.. If OK, replace the gauge.

Table 6, Air Pressure Gauge Diagnosis

Fuel Level Gauge Diagnosis

The fuel level gauge is controlled by the ICU using a variable resistance input from the fuel level sending unit that is located in the fuel tank. The fuel level sending unit resistance varies linearly from 31±2Ω with a full tank to 247±3Ω when empty.

Troubleshooting

If the ICU3 is measuring a resistance greater than 284Ω between circuit 47 and ground, a fault will be set for fuel level circuit open. If the ICU3 is measuring less than 23.5Ω between circuit 47 and ground, a fault will be set for fuel level circuit shorted low. ServiceLink may be used to monitor for these faults. The gauge will read empty until the measurement from the sensor is between 284Ω and 23.5Ω. Refer to **Table 7** for the fuel level diagnostic procedure.

NOTE: If the fuel level sensor is below the minimum resistance (short to ground) or above the maximum (open), the fuel gauge will read empty. Shorting the fuel sensor wires will not drive the gauge to full scale.

Fuel Level Gauge Diagnosis			
Step	**Test Procedure**	**Test Result**	**Action**
1	If a 100 ohm resistor is available, disconnect the fuel level sender connector and place the resistor across circuit 47 and ground in the wiring harness connector to simulate the fuel level sending unit. Turn the ignition to the ON position and observe the fuel gauge. If, after gauge initialization, the gauge points closely to the half tank mark, then the wiring and ICU are all operating correctly. Jump to Step 4 if there is no problem with the wiring and ICU. Does the fuel level gauge stay at empty even though there is fuel in the tank or is the complaint an inaccurate and intermittent reading? Note - turn the ignition to OFF and disconnect the batteries before continuing.	Stays at Empty	Go to Step 2.
		Inaccurate or Intermittent	Go to Step 4.
2	Disconnect the connector at the fuel level sender and measure the resistance of the sender. What is the resistance of the sender?	Greater than 284Ω or Less than 23.5Ω	Go to Step 4.
		Between 284Ω and 23.5Ω	Go to Step 3.
3	Connect the fuel level sender and disconnect the connectors on the back of the ICU. Measure the resistance in the vehicle wiring between circuit 47 in connector pin D1 and the ground circuit in connector pin D2. What is the resistance of the circuit?	Greater than 284Ω	Troubleshoot and repair an open circuit on either circuit 47 or the ground between the ICU connector and the fuel level sender.
		Between 284Ω and 23.5Ω	This is the valid resistance range. If the fuel tank is full and the resistance is close to 31Ω, replace the ICU. Otherwise no problem is indicated.
		Less than 23.5Ω	Troubleshoot and repair a short to ground on circuit 47 between the ICU connector and the fuel level sender.
4	Remove the fuel sending unit from the fuel tank. Connect an ohm meter to the pins at the fuel level sender connector. Slowly move the level of the float arm from full to empty. See **Fig. 2**. Does the resistance vary linearly from 31±2Ω to 247±3Ω?	Yes	Troubleshoot and repair for corrosion or an intermittent connection in the circuitry between the ICU and the fuel level sender.
		No	Replace the fuel level sending unit.

Table 7, Fuel Level Gauge Diagnosis

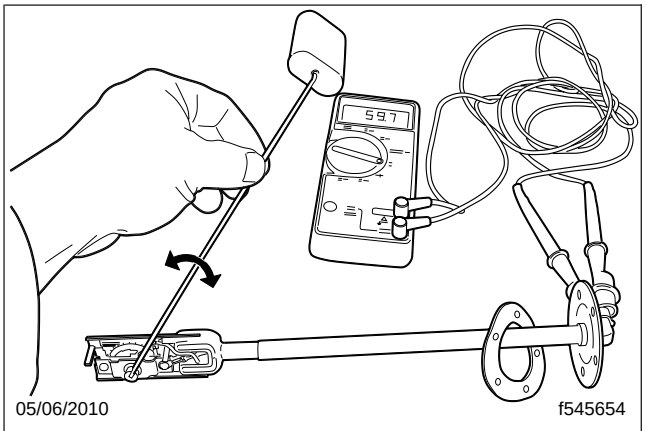


Fig. 2, Testing the Fuel Level Sending Unit

Warning Lamp Troubleshooting

Use the tables referenced under this heading to diagnose warning lamp problems. See **Table 8** to diagnose problems with warning lamps in the light bar and **Table 9** to diagnose problems with in-gauge warning lamps.

Diagnosis for Warning Lamps in the Light Bar			
Test No.	**Test Description**	**Test Result**	**Action**
1	What is the problem with the warning lamp?	Stays on	Go to Test 8.
		Does not turn on	Go to Test 2.
2	Is the warning lamp one of the following? • Park Brake/Brake Warning • Low Air Pressure • Low Battery Voltage • Fasten Seatbelt	Yes	Go to Test 3.
		No	Go to Test 4.
3	Does the warning lamp turn on when the ignition is turned on?	Yes	No problem found.
		No	Replace the light bar.
4	Is the warning lamp activated by a ground input or +12V input? See **Table 14**.	12V activated	Go to Test 5.
		Ground activated	Go to Test 6.

Troubleshooting

Diagnosis for Warning Lamps in the Light Bar			
Test No.	**Test Description**	**Test Result**	**Action**
5	Disconnect the light bar connector that contains the circuit for the warning lamp that is not working (see **Fig. 6**, and **Table 16** and **Table 17**). Turn the ignition on and activate the circuit that controls the warning lamp (for example, turn on the left turn signal for the left turn warning lamp). See **Fig. 6**, and **Table 16** and **Table 17**. Check for voltage at the light bar connector pin that corresponds to that warning lamp. What is the voltage? NOTE: For turn signal circuits, the voltage will alternate between 12V and 0V.	12V	Replace the light bar.
		0V	Check circuit that controls warning lamp and repair as necessary.
6	Is the warning lamp one of the optional warning lamps (top row of light bar)?	Yes	Check the bulb and replace if necessary. If the bulb is okay, go to Test 7.
		No	Go to Test 7.
7	Locate the light bar connector and circuit that controls the warning lamp (see **Fig. 6**, and **Table 16** and **Table 17**). Using a jumper to ground, backprobe the pin that corresponds to the problem warning lamp. Does the warning lamp turn on?	Yes	Problem is in the circuit that controls the warning lamp, repair as necessary.
		No	Replace the light bar.
8	Is the warning lamp that stays on the Low Air Pressure warning lamp?	Yes	Go to Test 11.
		No	Go to Test 9.
9	Is the problem with the Low Battery Voltage warning lamp?	Yes	Within Servicelink, open the ICU4 Datalink Monitor template and start the engine. Check the voltmeter voltage on the template. If the voltage is below 11.9V, check and repair the vehicle charging system or power and ground circuits to the engine ECM. If the voltage is above 11.9V, replace the light bar.
		No	Go to Test 10.
10	Is the problem with the Fasten Seatbelt warning lamp?	Yes	If the Fasten Seatbelt warning lamp does not turn off approximately 15 seconds after the ignition is turned ON, then replace the light bar.
		No	Go to Test 12.
11	Turn the ignition ON. Using a jumper to ground, backprobe pin A3 of the 24-pin light bar connector. Does the Low Air Pressure warning lamp turn off?	Yes	Either the air brake system pressure is too low or the problem is in the low air pressure warning circuit that controls the warning lamp. Repair as necessary.
		No	Replace the light bar.

Diagnosis for Warning Lamps in the Light Bar			
Test No.	**Test Description**	**Test Result**	**Action**
12	Is the warning lamp activated by a ground input or +12V input? See **Table 14**.	12V activated	Go to Test 13.
		Ground activated	Go to Test 14.
13	Disconnect the connector that contains the circuit for the warning lamp that stays on (see **Fig. 6**, and **Table 16** and **Table 17**). Turn the ignition ON. Check for voltage at the light bar connector pin that corresponds to the warning lamp. What is the voltage?	12V	The problem is not with the light bar. Check the system that controls the warning lamp for faults (the light may be on for a reason other than a faulty warning lamp circuit). Otherwise, check warning lamp circuit for short to power and repair as necessary.
		0V	Replace the light bar.
14	Disconnect the connector that contains the circuit for the warning lamp that stays on (see **Fig. 6**, and **Table 16** and **Table 17**). Turn the ignition ON. Check for voltage at the light bar connector pin that corresponds to the warning lamp by connecting the positive meter lead to battery (+) and the negative lead to the connector pin that corresponds to the warning lamp. What is the voltage?	12V	The problem is not with the light bar. Check the system that controls the warning lamp for faults (the light may be on for a reason other than a faulty warning lamp circuit). Otherwise, check warning lamp circuit for short to ground and repair as necessary.
		0V	Replace the light bar.

Table 8, Diagnosis for Warning Lamps in the Light Bar

Diagnosis for In-Gauge Warning Lamps			
Test No.	**Test Description**	**Test Result**	**Action**
1	Does the warning lamp illuminate during the ignition on gauge sweep?	Yes	Go to Test 2.
		No	Replace the gauge.
2	Is the problem with either one of the following gauge warning lamps? • Low Oil Pressure • High Coolant Temperature	Yes	Go to Test 3.
		No	Go to Test 5.

Troubleshooting

Diagnosis for In-Gauge Warning Lamps			
Test No.	**Test Description**	**Test Result**	**Action**
3	Is the problem that the warning lamp stays on?	Yes	Go to Test 4.
		No	The warning lamp is probably not illuminating because it is not receiving an active fault code from the engine ECM: • 128 p100 01 (oil pressure too low) • 128 p110 00 (coolant temp too high) If the appropriate code is active and the warning lamp does not work, then the light bar is probably faulty.
4	Check for either of the following engine fault codes: • 128 p100 01 (oil pressure too low) • 128 p110 00 (coolant temp too high) Are either of these faults active?	Yes	Check for a problem in the engine's lubrication or cooling system. Repair as necessary.
		No	Replace the light bar.
5	Is the problem with the High Transmission Temperature warning lamp?	Yes	Go to Test 6.
		No	Go to Test 9.
6	Is the problem that the warning lamp stays on?	Yes	Go to Test 8.
		No	Go to Test 7.
7	Using a jumper to ground, backprobe pin A4 of the 24-pin connector. Does the High Transmission Temperature warning lamp turn on?	Yes	The problem is in the circuit that controls the warning lamp. Repair as necessary.
		No	Replace the light bar.
8	Disconnect the 24-pin light bar connector. Turn the ignition ON. Check for voltage at the 24-pin light bar connector pin A4 by connecting the positive meter lead to battery (+) and the negative lead to pin A4.	12V	The problem is not with the light bar. Check the transmission for faults (the light may be on for a reason other than a faulty warning lamp circuit). Otherwise, check warning lamp circuit for short to ground and repair as necessary.
		0V	Replace the light bar.
9	Is the problem that the Low Fuel Level warning lamp stays on?	Yes	Go to Test 10.
		No	Go to Test 11.
10	Does the fuel gauge read below 1/8?	Yes	Normal condition; no further action is necessary.
		No	Replace the light bar.
11	Does the fuel gauge read below 1/8?	Yes	Replace the light bar.
		No	The warning lamp should not turn on until the fuel level is 1/8 or less for at least 60 seconds. No problem found.

Table 9, Diagnosis for In-Gauge Warning Lamps

Backlighting Troubleshooting

The backlighting signal to the light bar is a pulse-width-modulated (PWM) signal at approximately 320 Hz. See **Table 10** for diagnosis.

Backlighting Troubleshooting (gauges and light bar)			
Test No.	**Test Description**	**Test Result**	**Action**
1	Does any of the backlighting work (i.e., panel switches, etc.)?	Yes	Go to Test 2.
		No	Check the panel lamp dimmer switch, and panel lighting circuit. Repair as necessary.
2	Is all the cluster backlighting dead (light bar LCD and all gauges)?	Yes	Go to Test 3.
		No	Go to Test 5.
3	Disconnect the light bar 24-pin connector (see **Fig. 6**). Turn the headlamps ON, and the panel lamp dimmer switch to full bright. Measure the voltage at connector pin A1; it should be approximately +12V. What is the voltage?	12V	Go to Test 4.
		0V	Check backlighting circuit 29A for open between the instrument cluster and splice to other dash components. Repair as necessary.
4	Disconnect both the light bar 24-pin and 32-pin connectors (see **Fig. 6**). Turn the headlamps ON, and the panel lamp dimmer switch to full bright. Measure the voltage between pin A1 (24-pin connector) and pin D3 (32-pin connector). What is the voltage?	12V	Replace the light bar.
		0V	Check panel lamp ground circuit. Repair as necessary.
5	Is the light bar LCD backlighting the only thing with dead backlighting?	Yes	Replace the light bar.
		No	Go to Test 6.
6	Is only one gauge backlight dead?	Yes	Go to Test 7.
		No	Go to Test 8.
7	Is the gauge with dead backlighting the last gauge in the daisy chain (farthest from the light bar)?	Yes	Try a known good jumper wire to the gauge. If backlight now works on this gauge, this solved the problem. If the backlighting still does not work, replace the gauge.
		No	Replace the gauge.
8	Are all the gauges with dead backlighting in sequence with one another in the daisy-chain?	Yes	Try a known good jumper wire between the gauge with dead backlighting that is closest to the light bar and the next good gauge (one closer to light bar). If all backlighting now works, the jumper solved the problem. If not, replace all gauges with dead backlighting.
		No	Go to Test 9.

Troubleshooting

Backlighting Troubleshooting (gauges and light bar)			
Test No.	**Test Description**	**Test Result**	**Action**
9	Is one of the dead gauges the last gauge in the daisy-chain (farthest from the light bar)?	Yes	Try a known good jumper to the last gauge. If the last gauge now works, the jumper solved the problem to this gauge. Replace all other gauges with dead backlighting. If the jumper did not correct the backlighting to the last gauge in the daisy-chain, replace all gauges with dead backlighting.
		No	Replace all gauges with dead backlighting.

Table 10, Backlighting Troubleshooting (gauges and light bar)

Keypad Troubleshooting

Use **Table 11** to troubleshoot the keypad. Refer to **Fig. 3** for keypad layout, **Fig. 4** for keypad connector pin positions, and **Fig. 5** for keypad wiring diagram. See **Table 12** for keypad connector pin descriptions.

Keypad Diagnosis		
To test the keypad: Use a digital multimeter to measure resistance across each set of pins below, while pressing the appropriate keypad keys as noted in the table below. If any resistance measurement falls outside the acceptable resistance range, replace the keypad.		
Pins	Key to Press While Measuring Resistance	Acceptable Resistance Range
A and H	No keys pressed	361 to 369 Ohms
	DIAMOND* key	170 to 174 Ohms
	TEMP key	105 to 108 Ohms
B and H	No keys pressed	361 to 369 Ohms
	FUEL key	170 to 174 Ohms
	TRIP key	105 to 108 Ohms
C and H	No keys pressed	361 to 369 Ohms
	LEG key	170 to 174 Ohms
	LEFT ARROW key	105 to 108 Ohms
D and H	No keys pressed	361 to 369 Ohms
	DOWN ARROW key	170 to 174 Ohms
	RIGHT ARROW key	105 to 108 Ohms
E and H	No keys pressed	361 to 369 Ohms
	SET/RESET key	170 to 174 Ohms
	EVENT* key	105 to 108 Ohms

* These keys are not included on all keypads.

Table 11, Keypad Diagnosis

Keypad Pigtail Connector Pin Descriptions			
Pin	**Description**	**Pin**	**Description**
A	Diamond* and TEMP keys	E	SET/RESET and EVENT* keys
B	FUEL and TRIP keys	F	Backlight (+)
C	LEG and Left arrow keys	G	Backlight (-)
D	Down arrow and Right arrow keys	H	Keypad ground return

* These keys are not included on all keypads.

Table 12, Keypad Pigtail Connector Pin Descriptions

Gauge Control Strategy

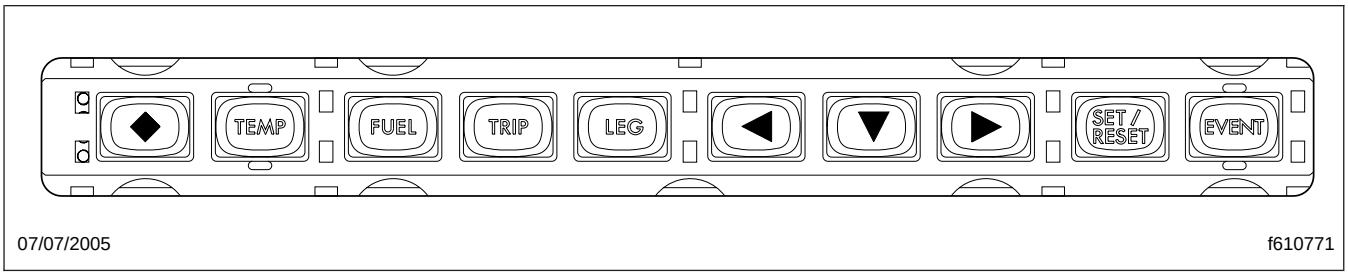

Fig. 3, Keypad

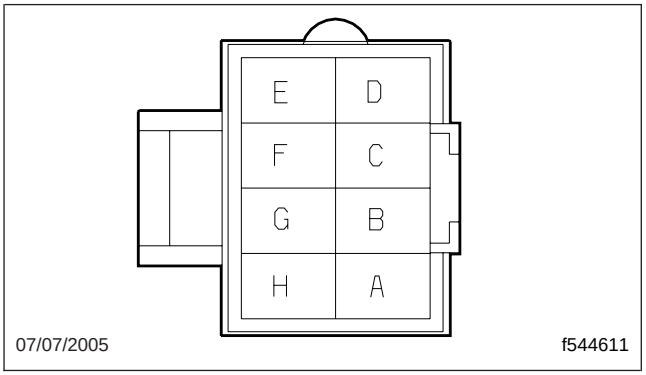

Fig. 4, Keypad Connector (viewed toward connector)

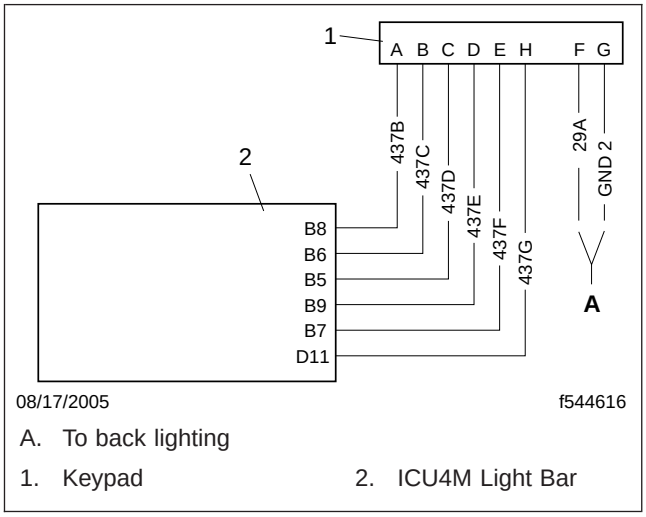

Fig. 5, Keypad Wiring Diagram

The information under this heading defines how each individual gauge, standard or optional, is controlled. Some gauges are J1587 databus driven, meaning the information is sent to the instrument cluster from the engine ECM. Other gauges are controlled by a sensor wired directly to the instrument cluster light bar. **Table 13** identifies each standard and optional gauge, and its method of control.

Standard and Optional Gauges Control Strategy—Input Types		
Gauge	**Input Type to Light Bar to Drive Gauge**	**Standard/ Optional**
Speedometer	J1587 databus—from engine (MID 128)	Standard
Engine Coolant Temperature	J1587 databus—from engine (MID 128)	Standard
Engine Oil Pressure	J1587 databus—from engine (MID 128)	Standard
Fuel Level	Sensor input	Standard
Tachometer	J1587 databus—from engine (MID 128)	Standard
Battery Voltage	J1587 databus—from engine (MID 128)	Standard
Transmission Oil Temperature	Sensor input	Optional
Primary Air System Pressure	NA—air line is connected directly to gauge	Standard
Secondary Air System Pressure	NA—air line is connected directly to gauge	Standard
Forward Rear Axle Temp	Sensor input	Optional
Rear Rear Axle Temp	Sensor input	Optional
Engine Oil Temperature	J1587 databus—from engine (MID 128)	Optional
Turbo Boost Pressure	J1587 databus—from engine (MID 128)	Optional
Pyrometer	Sensor input	Optional
Application Air Pressure	NA—air line is connected directly to gauge	Optional
Suspension Air Pressure	NA—air line is connected directly to gauge	Optional
Ammeter	Sensor input*	Optional

* Ammeters used are stand alone gauges that are not connected to the light bar.

Table 13, Standard and Optional Gauges Control Strategy--Input Types

Warning Lamp Control Strategy

The information under this heading defines how each individual warning lamp is controlled. Not all warning lamps are standard. Some in-gauge warning lamps are J1587 databus driven, meaning the information is sent to the instrument cluster from the engine ECM (see **Table 15**). The light bar warning lamps are controlled directly by a hardwire to the instrument cluster light bar (see **Table 14**). Other warning lamps are controlled by decisions made by the light bar (see **Table 14** and **Table 15**).

NOTE: In **Table 14**, the warning lamps that are indicated as having a bulb check after the ignition is turned on are controlled by the light bar. Other direct wired warning lamps may have a bulb check that is controlled by the device they are connected to (e.g. the engine ECM.) These externally controlled bulb checks are not indicated in **Table 14**.

Light Bar Warning Lamp Control						
Warning Lamp	**Legend**	**Bulb Check**	**Buzzer Operation**	**Power Source**	**Warning Lamp Operation/ Control**	**Control Pin**
Left Turn Signal		—	—	12V external	12V (activates)	C8

Light Bar Warning Lamp Control						
Warning Lamp	**Legend**	**Bulb Check**	**Buzzer Operation**	**Power Source**	**Warning Lamp Operation/ Control**	**Control Pin**
Right Turn Signal		—	—	12V external	12V (activates)	D8
Highbeam		—	—	12V external	12V (activates)	A12
Park Brake/ Brake System Warning		Yes	When vehicle is moving over 2 mph with brake set.	12V Ign (internal)	Ground (activates)	C5
Low Air Pressure		Yes	Coincides with operation of this warning lamp	12V Ign (internal)	Ground (deactivates)	A3
Low Battery Voltage		Yes	—	Internal	Controlled by light bar. If light bar receives battery voltage message from the engine less than 11.9V, the warning lamp will illuminate.	NA
Fasten Seat Belt		Yes	—	Internal	Controlled by light bar. On for approximately 15 sec after ignition is turned on.	NA
Check Engine		No*	—	12V Ign (internal)	Ground (activates)	C15
Engine Protection		No*	—	12V Ign (internal)	Ground (activates)	C16
Tractor ABS		No*	—	12V Ign (internal)	Ground (activates)	B11
Trailer ABS		No*	—	12V Ign (internal)	Ground (activates)	D12
Check Trans		No*	—	12V Ign (internal)	Ground (activates)	D10
Water in Fuel		No*	—	12V Ign (internal)	Ground (activates)	C10
Intake Heater		No*	—	12V Ign (internal)	Ground (activates)	A5
No Charge		No	—	12V Ign (internal)	Ground (activates)	A9
Optimized Idle		No	—	12V Ign (internal)	Ground (activates)	C1

Troubleshooting

Light Bar Warning Lamp Control						
Warning Lamp	**Legend**	**Bulb Check**	**Buzzer Operation**	**Power Source**	**Warning Lamp Operation/ Control**	**Control Pin**
Opt. #1 (Stop Engine)		No*	—	12V Ign (internal)	Ground (activates)	C14
Opt. #2	—	No	—	12V Batt (internal)	Ground (activates)	A6

Opt. #8	—	No	—	12V (external)	12V (activates)	D4

* Bulb check is not controlled by the lightbar. The controlling device (engine, ABS, transmission, etc.) may perform a bulb check.

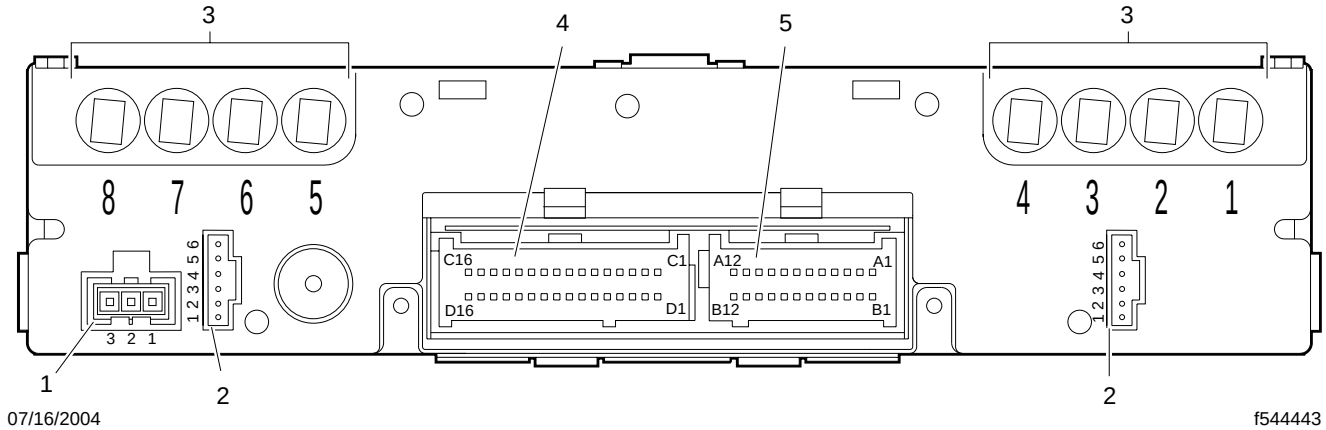
Table 14, Light Bar Warning Lamp Control

Gauge Warning Lamp Control (warning lamps in gauge)				
Gauge Warning Lamp	**Gauge**	**Bulb Check**	**Warning Lamp/Buzzer Operation**	**Warning Lamp/Buzzer Control**
Low Oil Pressure	Oil Pressure	Yes	Warning lamp and buzzer will remain on for a minimum of 30 seconds and will stay on as long as the fault remains active.	Light bar controls this gauge warning lamp when the engine sends low oil pressure fault MID 128, PID 100, FMI 01.
High Coolant Temperature	Engine Coolant Temperature	Yes	Warning lamp and buzzer will remain on for a minimum of 30 seconds and will stay on as long as the fault remains active.	Light bar controls this gauge warning lamp when the engine sends high coolant temperature fault MID 128, PID 110, FMI 00.
High Transmission Temperature	Transmission Temperature	Yes	On when input to light bar is grounded.	Ground activated from hard wire input to light bar pin A4.
Low Fuel Level	Fuel Level	Yes	The light bar turns this warning lamp on if the fuel level is less than 1/8 of a tank for at least 60 seconds.	Light bar compares fuel level sensor input to programmed resistance values to determine when to illuminate this warning lamp.

Table 15, Gauge Warning Lamp Control (warning lamps in gauge)

Pin and Circuit Descriptions

See **Fig. 6** for a rear view of the light bar, showing connector pin locations. See **Table 16** for 24-pin light-bar connector pin descriptions, **Table 17** for 32-pin light-bar connector pin descriptions, **Table 18** for 6-pin gauge databus connector pin descriptions, and **Table 19** for 3-pin auxiliary input connector pin descriptions.



1. 3-Pin Auxiliary Input Connector

Sensor Specifications

See **Table 5** for Stewart-Warner fuel level sensor resistance values.

NOTE: If the fuel level sensor is below the minimum resistance (short to ground) or above the maximum (open), the fuel gauge will read

empty. Shorting the fuel sensor wires will not test the gauge circuit.

Fuel Level Sensor Resistance (Stewart-Warner)		
Gauge Reading	Sensor Resistance (Ohms)	
	Acceptable Range	Nominal Value
Empty Stop	244.0 to 249.0	246.5
Empty	232.0 to 239.2	235.6
1/8	190.8 to 196.9	193.8
1/4	149.6 to 154.5	152.1
3/8	126.1 to 129.0	127.5
1/2	102.5 to 103.5	103.0
5/8	84.4 to 85.7	85.0
3/4	66.2 to 67.8	67.0
7/8	47.8 to 49.2	48.5
Full	29.4 to 30.6	30.0

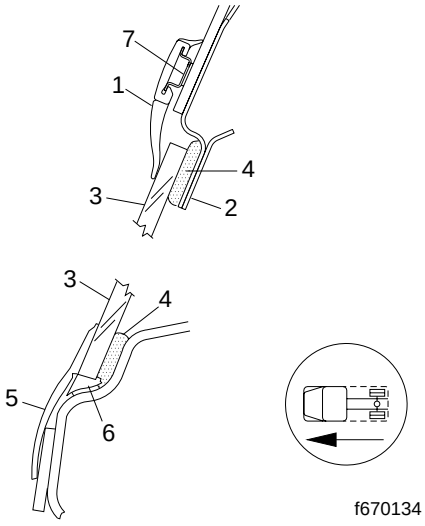
General Information

The windshield is either a one-piece or a two-piece installation. The windshield glass is held in place on the windshield mask by a bead of urethane adhesive/sealant. Rubber molding strips are installed at the top and bottom edges of the glass. Two-piece windshields have an additional molding strip on the center post, between the right and left glass panes.

The windshield is installed in a manner similar to automobile windshields, in that the urethane sealant holds the windshield in place and seals out moisture; see **Fig. 1**. The molding strips are installed mainly for appearance.



NOTE: Installation with top molding retainer strip is shown.

1. Top Molding Strip
2. Windshield Mask
3. Windshield Glass
4. Urethane Adhesive/Sealant
5. Bottom Molding Strip
6. Positioning Block
7. Retainer Strip

Fig. 1, Windshield Installation, Cross-Sectional View

See **Specifications 400** for special tools and materials needed to replace a windshield.

One-Piece Windshield Replacement, Century Class Conventional and Coronado

Replacement

NOTE: Freightliner recommends Sika Ultrafast, Dow U-400HV, or Bostik® 70-08A adhesive for windshield replacement.

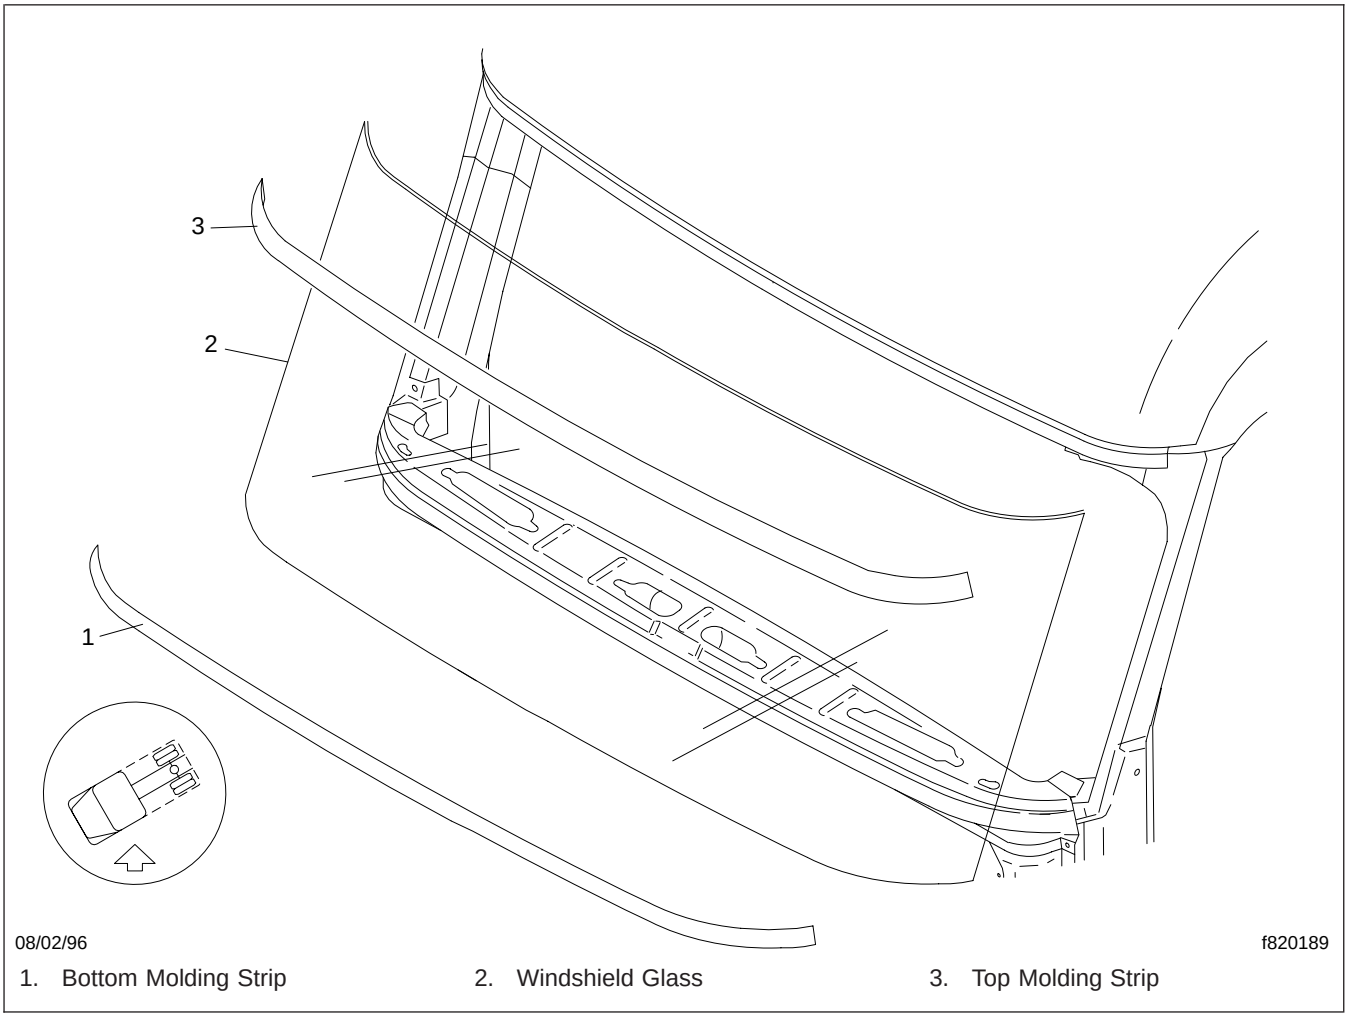
The procedure below specifies Dow adhesives and primers, though other manufacturers' systems can be used. Regardless of the system used, adhere to the adhesive manufacturer's instructions, and use that manufacturer's recommended primers and glass prep solutions for the entire procedure.

See **Fig. 1** for a one-piece windshield installation.

If the windshield is cracked, carefully inspect the glass, urethane sealant, and the windshield mask to determine the cause. Correct the problem before installing a new windshield. If the underlying cause for the crack is not corrected, the replacement windshield may crack when exposed to high winds, pressure, temperature extremes, or vehicle motion.

NOTE: At least two people are needed to replace a windshield.

1. Apply the parking brakes and chock the tires.
2. Open the windows. Shutting the doors with the windows closed could pressurize the cab and create gaps in the uncured adhesive.

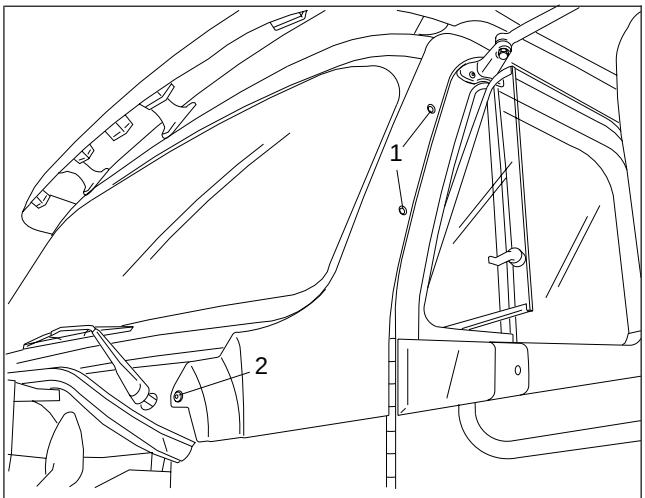


1. Bottom Molding Strip
2. Windshield Glass
3. Top Molding Strip

Fig. 1, One-Piece Windshield Installation

One-Piece Windshield Replacement, Century Class Conventional and Coronado

3. Open the hood.
4. Remove the windshield wiper arms; see **Group 82**.
5. Protect the paint finish and instrument panel by taping paper around the inside and outside of the windshield opening.
6. Remove the lower capscrew from the exterior A-pillar panel; see **Fig. 2**.



1. Middle A-Pillar Fasteners (Coronado only)
2. Lower A-Pillar Fastener

Fig. 2, A-Pillar Exterior Panel Fasteners

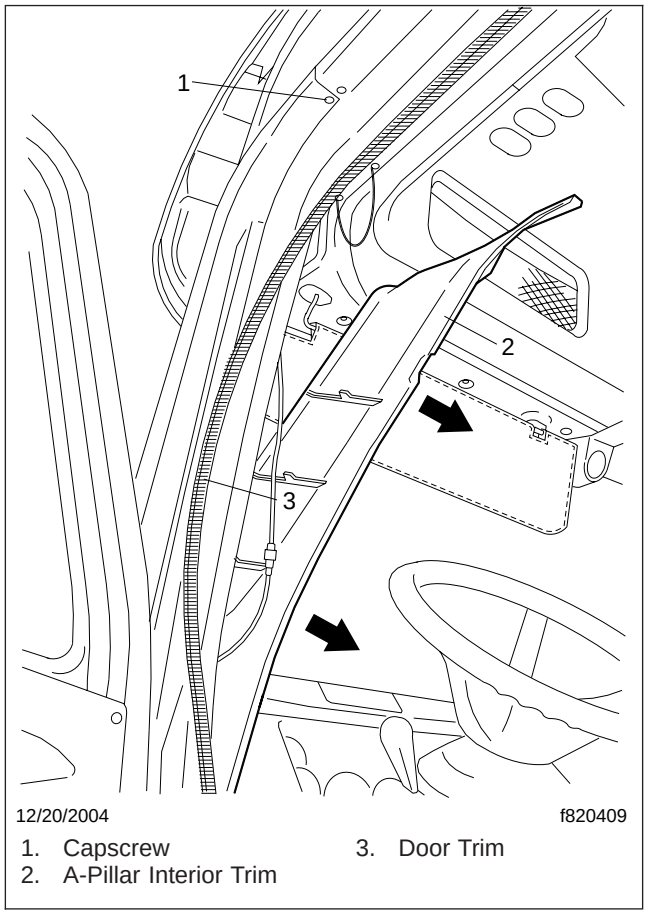
7. If the vehicle is a Coronado, remove the two fasteners that attach the middle span of the panel to the A-pillar.

   If the vehicle is a Century Class Conventional, the exterior panel mounting is concealed under the A-pillar interior trim. Remove the mounting nuts, as follows.

   7.1 Remove the grab handle from the right-hand A-pillar.

   7.2 On both sides of the vehicle, loosen the door trim, then remove the A-pillar interior trim; see **Fig. 3**.

   7.3 If the vehicle is equipped with an Eaton® VORAD® collision warning system, disconnect the sensor located on the inside of the right-hand A-pillar.



1. Capscrew
2. A-Pillar Interior Trim
3. Door Trim

Fig. 3, Removing A-Pillar Interior Trim

   7.4 Through the access holes on each A-pillar, remove the three nuts that attach the exterior panel to the A-pillar; see **Fig. 4**.

8. Remove the capscrew that attaches the exterior A-pillar panel to the top of the door frame; see **Fig. 3**. Remove the panel.
9. Remove the Torx® screw and bushing at each end of the top molding strip; see **Fig. 5**.
10. Slide the top molding strip off the retainer strip.

NOTE: Vehicles built before July 21, 2000 are not equipped with a retainer strip; remove the top molding strip by pulling it loose from the gap between the windshield glass and the windshield mask.

11. Remove the bottom molding strip.

One-Piece Windshield Replacement, Century Class Conventional and Coronado

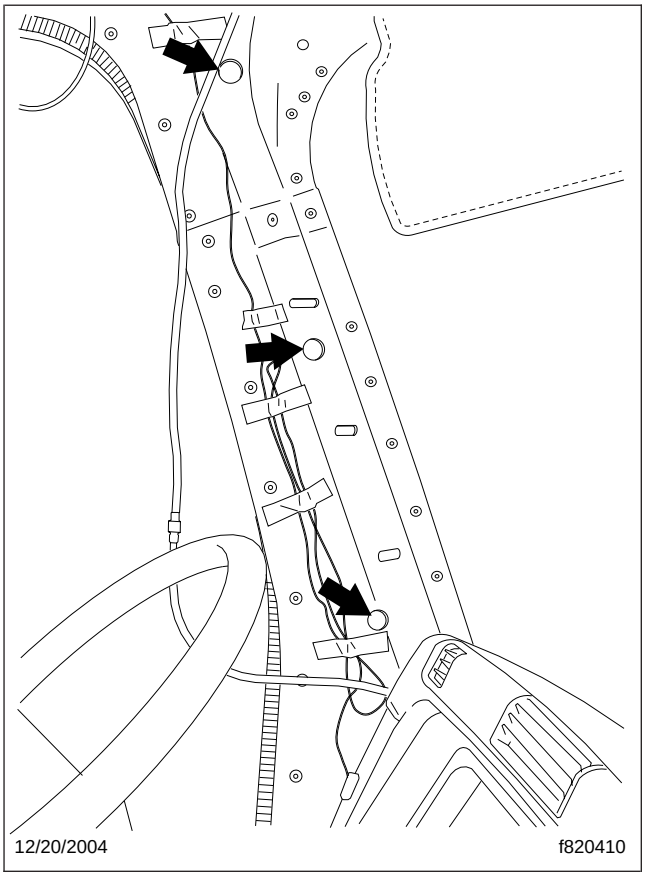


Fig. 4, A-Pillar Fastener Access Holes

12. Using a pneumatic cutting tool (**Fig. 6**), a piano wire (**Fig. 7**), or a pull knife (**Fig. 8**), cut through the urethane sealant all around the edges of the windshield glass.

NOTE: To order a BTB pneumatic cutting tool, see **Specifications 400**.

⚠ WARNING

Wear protective gloves and safety glasses when replacing windshield glass. Gloves will protect your hands from sharp edges, and allow a better grip. Failure to wear gloves and safety glasses when handling glass could result in injury to hands or eyes.

13. Carefully remove the damaged windshield glass.
14. Remove the four rubber positioning blocks from the lower windshield mask; see **Fig. 9**. Discard them.

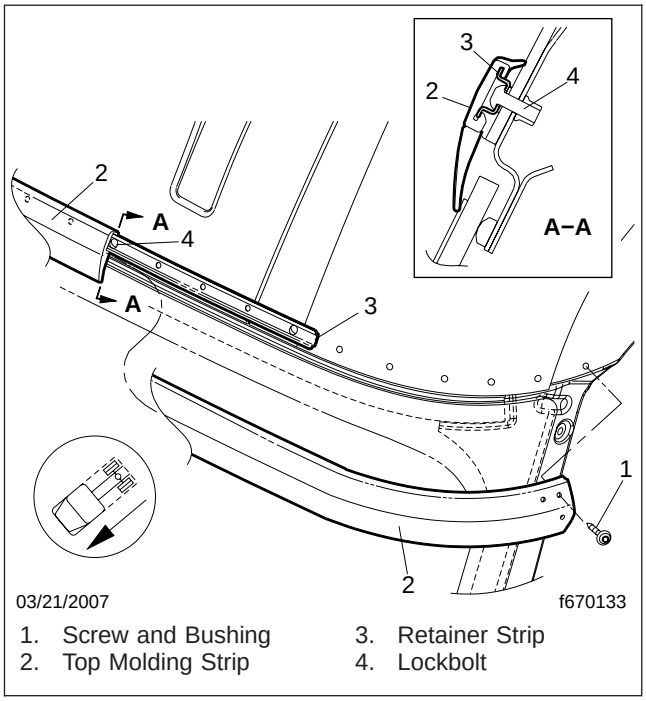

Fig. 5, Top Molding Strip Installation

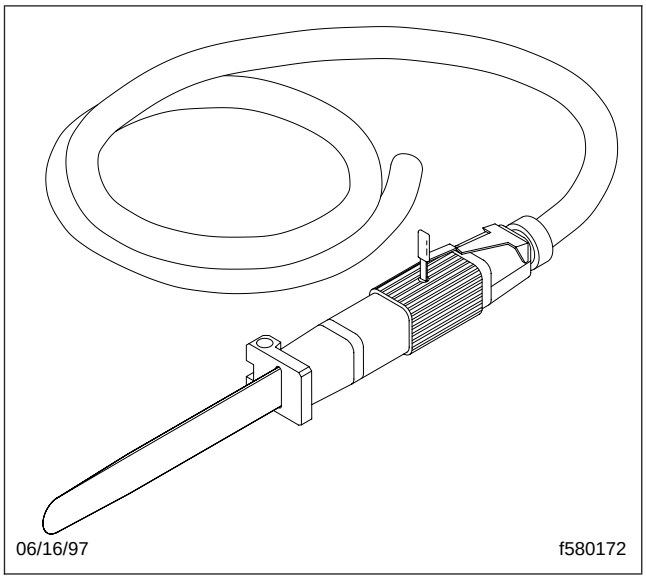

Fig. 6, BTB Pneumatic Cutting Tool

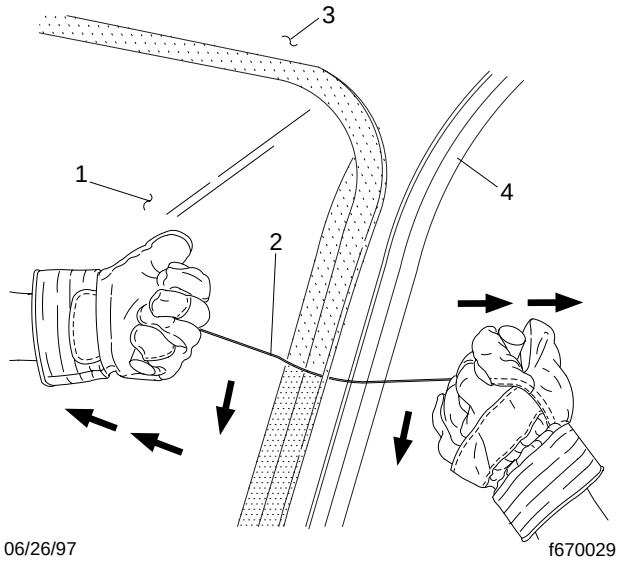
15. Using a BTB pneumatic cutting tool or a sharp knife, trim down the old urethane sealant to a thickness of about 1/16 inch (1 to 2 mm). Make sure any remaining adhesive has a smooth and even surface.

One-Piece Windshield Replacement, Century Class Conventional and Coronado



1. Windshield Glass
2. Piano Wire
3. Roof
4. Door Frame

Fig. 7, Windshield Glass Removal with Piano Wire

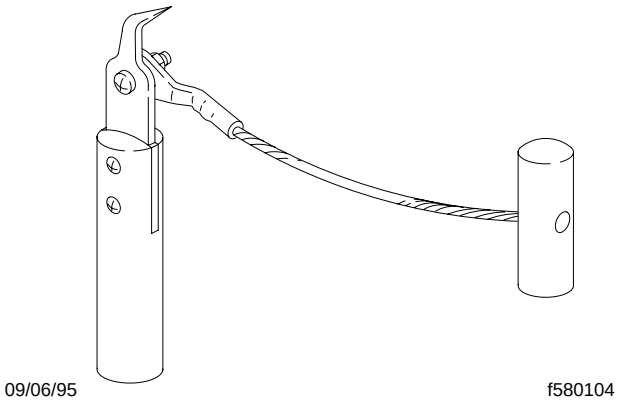


Fig. 8, Typical Pull Knife

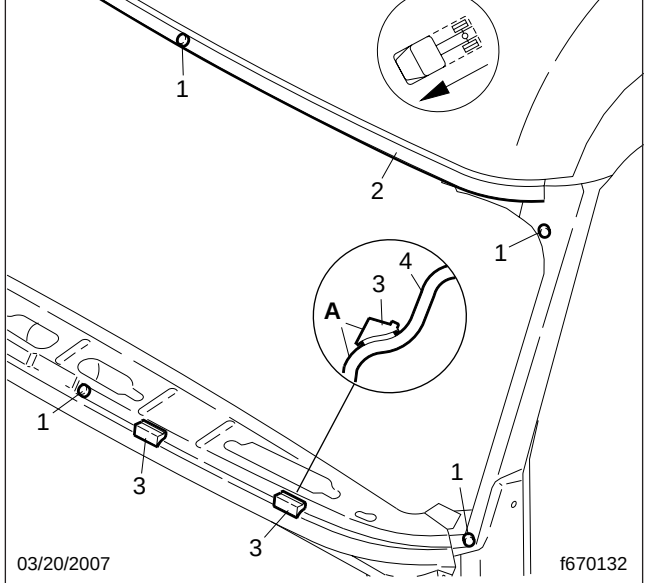
16. Brush the remaining adhesive and debris from the windshield-seating cavity.
17. Check the windshield mask. Apply Betaprime® 5404A Pinchweld and Encapsulation Primer to any bare metal. Allow to dry for a minimum of 6 minutes.



A. These two surfaces are to be flush.

1. Spacer Button
2. Windshield Mask (upper)
3. Positioning Block
4. Windshield Mask (lower)

Fig. 9, Cab Area for Windshield Installation

NOTE: Exposed bare metal areas larger than 1/2 inch x 1/2 inch (13 mm x 13 mm) require the use of Betaprime 5201TF Bare Metal Etch Primer.

18. Install eight spacer buttons on the windshield mask; see **Fig. 9**.
19. Install four new rubber positioning blocks in the cavity; see **Fig. 9**.
20. Put the new windshield glass on a suitable stand or fixture, with the inside surface of the glass facing up.
21. Clean the bonding surface of the glass with Betaclean GC-800.
22. Apply Betaprime 5500 1-Step Glass/Frit Primer all the way around the edge of the glass to a width of about 1 inch (25 mm). *Do not get any of the primer on the black dot pattern of the glass.* Allow a minimum of six minutes for the primer to dry.
23. Holding the sealant applicator at a 90-degree angle to the windshield mask on the cab, apply a

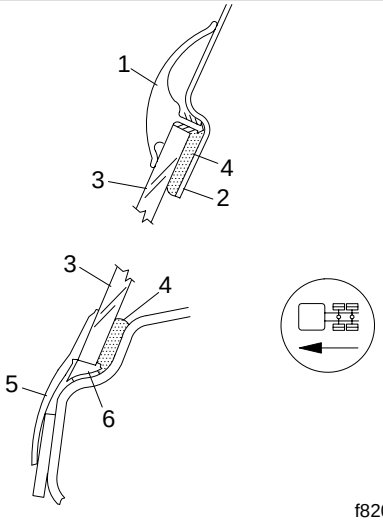
One-Piece Windshield Replacement, Century Class Conventional and Coronado

uniform and continuous bead of Betaseal U-400HV Adhesive all the way around the edges of the windshield mask. The bead should be a minimum of 3/8 inch (10 mm) thick.

Keep the spiked edge of the applicator tip against the edge of the mask, and overlap the bead slightly.

IMPORTANT: Do not apply the urethane adhesive/sealant to the windshield glass. Aligning a windshield with adhesive on the glass is very difficult to do without getting the adhesive/sealant on the painted cab surface outside the windshield mask.

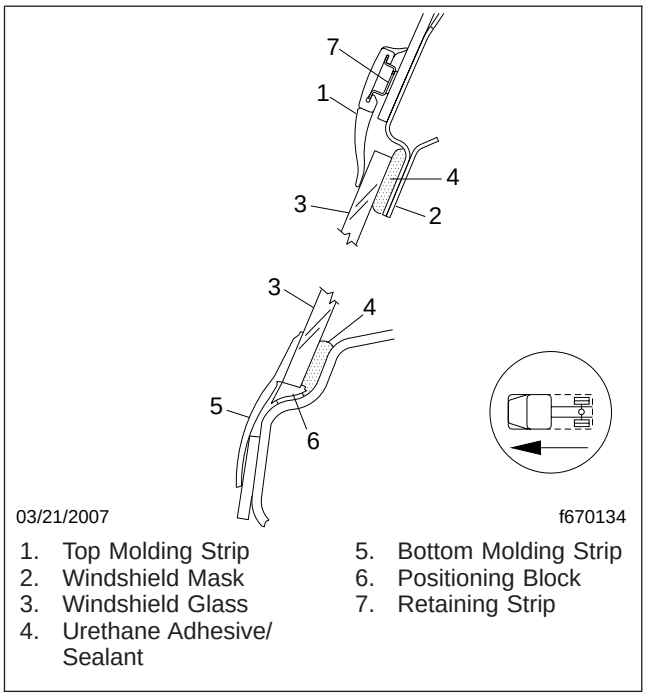
24. Attach a suction device to the outside of the windshield. Lift and install the windshield. Make sure the glass is centered on the windshield mask, and that the bottom edge of the glass seats onto the positioning blocks correctly; see **Fig. 10** or **Fig. 11**.



1. Top Molding Strip
2. Windshield Mask
3. Windshield Glass
4. Urethane Sealant
5. Bottom Molding Strip
6. Positioning Block

Fig. 10, Cross-Section View (vehicles built before July 21, 2000)

25. Gently press down on the glass all the way around the bead line to firmly seat the windshield.
26. With a spatula or a paddle, smooth the adhesive flat along the edge of the windshield.



1. Top Molding Strip
2. Windshield Mask
3. Windshield Glass
4. Urethane Adhesive/ Sealant
5. Bottom Molding Strip
6. Positioning Block
7. Retaining Strip

Fig. 11, Cross-Section View (vehicles built from July 21, 2000)

27. Install the bottom rubber molding strip, using Betaseal U-418 primerless auto glass urethane adhesive. Do not use a silicone hot glue.
28. Slide the top molding strip onto the retainer strip, if so equipped. Fasten each end of the strip to the A-pillar with a Torx screw and bushing; see **Fig. 5**.

NOTE: Vehicles built before July 21, 2000 are not equipped with a retainer strip. Attach the molding strip using Betaseal U-418 primerless auto glass urethane adhesive.

29. Attach each A-pillar exterior panel to the top of the door frame with a capscrew; see **Fig. 3**.
30. If the vehicle is a Coronado, install the two fasteners that attach the middle span of the panel to the A-pillar; see **Fig. 2**.

    If the vehicle is a Century Class Conventional, install the A-pillar exterior panel mounting nuts and interior trim, as follows.

    30.1 Through the access holes on each A-pillar, install the three nuts that attach the exterior panel to the A-pillar; see **Fig. 4**.

One-Piece Windshield Replacement, Century Class Conventional and Coronado

30.2 If the vehicle is equipped with an Eaton® VORAD® collision warning system, connect the sensor located on the inside of the right-hand A-pillar.

30.3 On both sides of the vehicle, install the A-pillar interior trim, then secure the door trim; see **Fig. 3**.

30.4 Attach the grab handle to the right-hand A-pillar.

31. Secure the lower end of the A-pillar exterior panel with a capscrew; see **Fig. 2**.
32. Install the wiper arms; see **Group 82**.
33. Clean both sides of the new windshield glass.
34. Remove the protective coverings from the dash.
35. Close the hood.
36. See the adhesive manufacturer's documentation for cure and drive-away times.

Two-Piece Windshield Replacement, Century Class Conventional and Coronado

Replacement

NOTE: Freightliner recommends Sika Ultrafast, Dow U-400HV, or Bostik® 70-08A adhesive for windshield replacement.

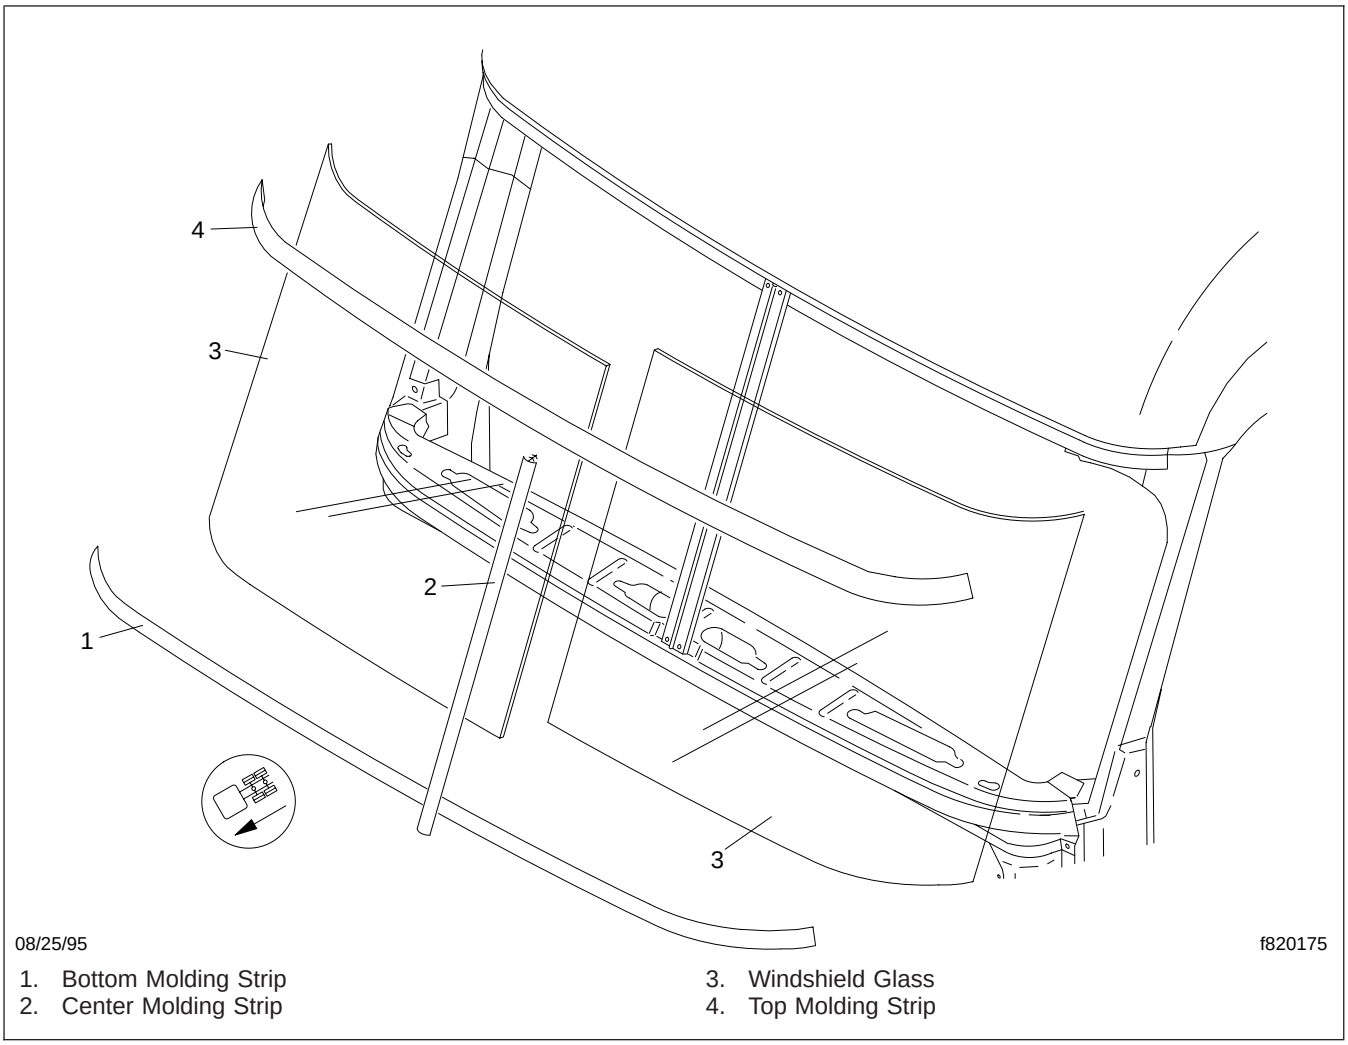
The procedure below specifies Dow adhesives and primers, though other manufacturers' systems can be used. Regardless of the system used, adhere to the adhesive manufacturer's instructions, and use that manufacturer's recommended primers and glass prep solutions for the entire procedure.

See **Fig. 1** for a two-piece windshield installation.

If the windshield is cracked, carefully inspect the glass, urethane sealant, and the windshield mask to determine the cause. Correct the problem before installing a new windshield. If the underlying cause for the crack is not corrected, the replacement windshield may crack when exposed to high winds, pressure, temperature extremes, or vehicle motion.

NOTE: At least two people are needed to replace a windshield.

1. Apply the parking brakes and chock the tires.

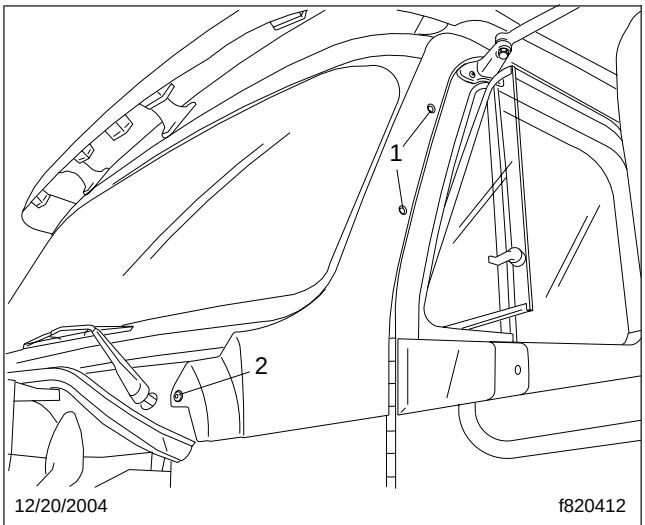


1. Bottom Molding Strip
2. Center Molding Strip
3. Windshield Glass
4. Top Molding Strip

Fig. 1, Two-Piece Windshield Installation

Two-Piece Windshield Replacement, Century Class Conventional and Coronado

2. Open the windows. Shutting the doors with the windows closed could pressurize the cab and create gaps in the uncured adhesive.
3. Open the hood.
4. Remove the windshield wiper arm(s); see **Group 82**.
5. Remove the exterior sun visor.
6. Protect the paint finish and instrument panel by taping paper around the inside and outside of the windshield opening.
7. Remove the lower capscrew from the exterior A-pillar panel; see **Fig. 2**.



1. Middle A-Pillar Fasteners (Coronado only)
2. Lower A-Pillar Fastener

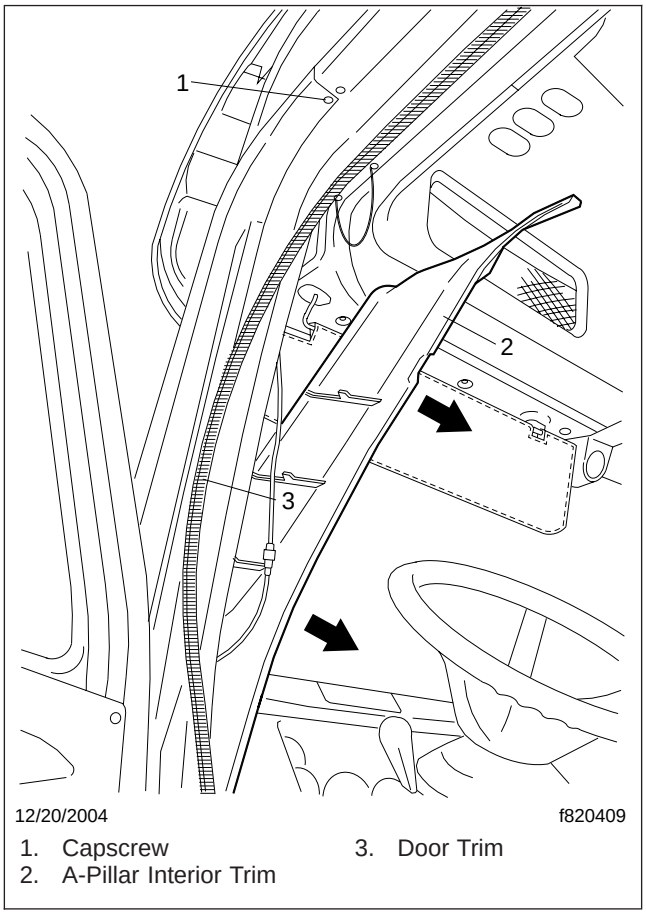
Fig. 2, A-Pillar Exterior Panel Fasteners

8. If the vehicle is a Coronado, remove the two fasteners that attach the middle span of the panel to the A-pillar.

   If the vehicle is a Century Class Conventional, the exterior panel mounting is concealed under the A-pillar interior trim. Remove the mounting nuts, as follows.

   8.1 If applicable, remove the grab handle from the right-hand A-pillar.

   8.2 Loosen the door trim, then remove the A-pillar interior trim; see **Fig. 3**.



1. Capscrew
2. A-Pillar Interior Trim
3. Door Trim

Fig. 3, Removing A-Pillar Interior Trim

   8.3 If applicable, disconnect the sensor for the Eaton® VORAD® collision warning system, located on the inside of the right-hand A-pillar.

   8.4 Through the access holes on the A-pillar, remove the three nuts that attach the exterior panel to the A-pillar; see **Fig. 4**.

9. Remove the capscrew that attaches the exterior A-pillar panel to the top of the door frame; see **Fig. 3**. Remove the panel.
10. Remove the center molding strip from the windshield center post; see **Fig. 1**.
11. Remove the Torx® screw and bushing at each end of the top molding strip; see **Fig. 5**.
12. Slide the top molding strip off the retainer strip.

Two-Piece Windshield Replacement, Century Class Conventional and Coronado

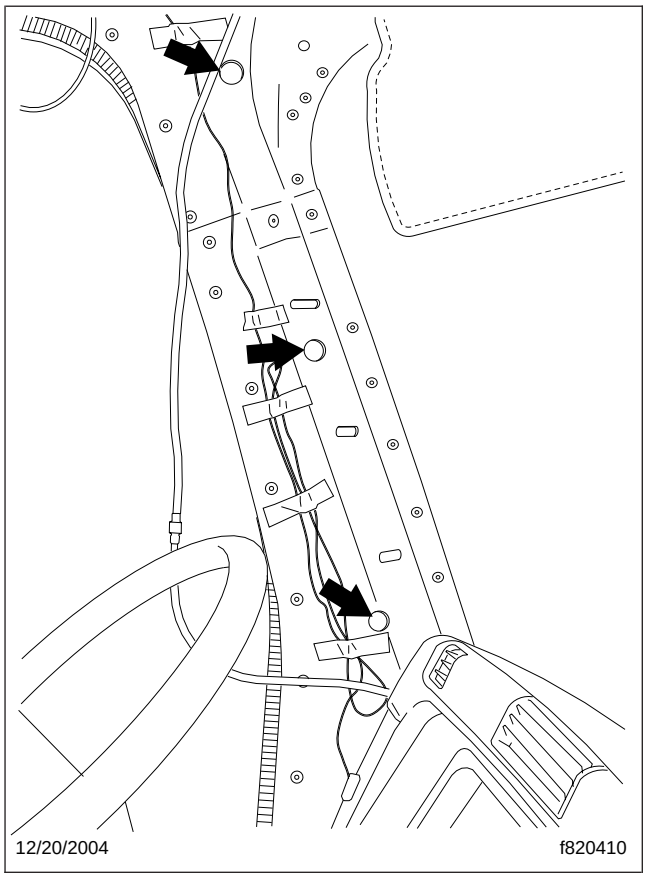


Fig. 4, A-Pillar Fastener Access Holes

NOTE: Vehicles built before July 21, 2000 are not equipped with a retainer strip; remove the top molding strip by pulling it loose from the gap between the windshield glass and the windshield mask.

13. Remove the bottom molding strip.
14. Using a pneumatic cutting tool (**Fig. 6**), a piano wire (**Fig. 7**), or a pull knife (**Fig. 8**), cut through the urethane sealant all around the edges of the windshield glass.

NOTE: To order a BTB pneumatic cutting tool, see **Specifications 400**.

⚠ WARNING

Wear protective gloves and safety glasses when replacing windshield glass. Gloves will protect your hands from sharp edges, and allow a better grip. Failure to wear gloves and safety glasses when handling glass could result in injury to hands or eyes.

5. Windshield Mask (lower)

Fig. 9, Cab Area for Windshield Installation

18. Check the windshield mask. Apply Betaprime® 5404A Pinchweld and Encapsulation Primer to any bare metal. Allow to dry for a minimum of 6 minutes.

NOTE: Exposed bare metal areas larger than 1/2 inch x 1/2 inch (13 mm x 13 mm) require the use of Betaprime 5201TF Bare Metal Etch Primer.

19. Install a spacer button in each corner of the windshield mask; see **Fig. 9**.
20. Install new positioning blocks at the bottom of the windshield mask. Make sure the front edge of each block is flush with the front edge of the windshield mask; see **Fig. 9**.
21. Put the new windshield glass on a suitable stand or fixture, with the inside surface of the glass facing up.
22. Clean the bonding surface of the glass with Betaclean GC-800.

Two-Piece Windshield Replacement, Century Class Conventional and Coronado

23. Apply Betaprime 5500 1-Step Glass/Frit Primer all the way around the edge of the glass to a width of about 1 inch (25 mm). *Do not get any of the primer on the black dot pattern of the glass.* Allow a minimum of six minutes for the primer to dry.
24. Holding the sealant applicator at a 90-degree angle to the windshield mask on the cab, apply a uniform and continuous bead of Betaseal U-400HV Adhesive all the way around the edges of the windshield mask. The bead should be a minimum of 3/8 inch (10 mm) thick.

    Keep the spiked edge of the applicator tip against the edge of the mask, and overlap the bead slightly.

IMPORTANT: Do not apply the urethane adhesive/sealant to the windshield glass. Aligning a windshield with adhesive on the glass is very difficult to do without getting the adhesive/sealant on the painted cab surface outside the windshield mask.

25. Using suction cups, carefully install the new windshield onto the windshield mask. Make sure the alignment marks on the glass are lined up with the center of the bolts holding the rain tray in place, and that the bottom edge of the windshield seats onto the positioning blocks correctly; see **Fig. 10** or **Fig. 11**.
26. Gently press down on the glass all the way around the bead line to firmly seat the windshield.
27. With a spatula or a paddle, smooth the adhesive flat along the edge of the windshield.
28. Install the center molding strip into the windshield center post, using Betaseal U-418 primerless auto glass urethane adhesive. Do not use a silicone hot glue.
29. Install the bottom rubber molding strip, using Betaseal U-418 primerless auto glass urethane adhesive.
30. Slide the top molding strip onto the retainer strip, if so equipped. Fasten each end of the strip to the A-pillar with a Torx screw and bushing; see **Fig. 5**.

NOTE: Vehicles built before July 21, 2000 are not equipped with a retainer strip. Attach the

molding strip using Betaseal U-418 primerless auto glass urethane adhesive.

31. Attach the A-pillar exterior panel to the top of the door frame with a capscrew; see **Fig. 3**.
32. If the vehicle is a Coronado, install the two fasteners that attach the middle span of the panel to the A-pillar; see **Fig. 2**.

    If the vehicle is a Century Class Conventional, install the A-pillar exterior panel mounting nuts and interior trim, as follows.

    32.1 Through the access holes on the A-pillar, install the three nuts that attach the exterior panel to the A-pillar; see **Fig. 4**.

    32.2 If applicable, connect the sensor for the Eaton® VORAD® collision warning system, located on the inside of the right-hand A-pillar.

    32.3 Install the A-pillar interior trim, then secure the door trim; see **Fig. 3**.

    32.4 If applicable, attach the grab handle to the right-hand A-pillar.
33. Secure the lower end of the A-pillar exterior panel with a capscrew; see **Fig. 2**.
34. Install the wiper arm(s); see **Group 82**.
35. Clean both sides of the new windshield glass.
36. Remove the protective coverings from the dash.
37. Install the exterior sun visor.
38. Close the hood.
39. See the adhesive manufacturer's documentation for cure and drive-away times.

One-Piece Windshield Replacement, Argosy COE

Replacement

NOTE: Freightliner recommends Sika Ultrafast, Dow U-400HV, or Bostik® 70-08A adhesive for windshield replacement.

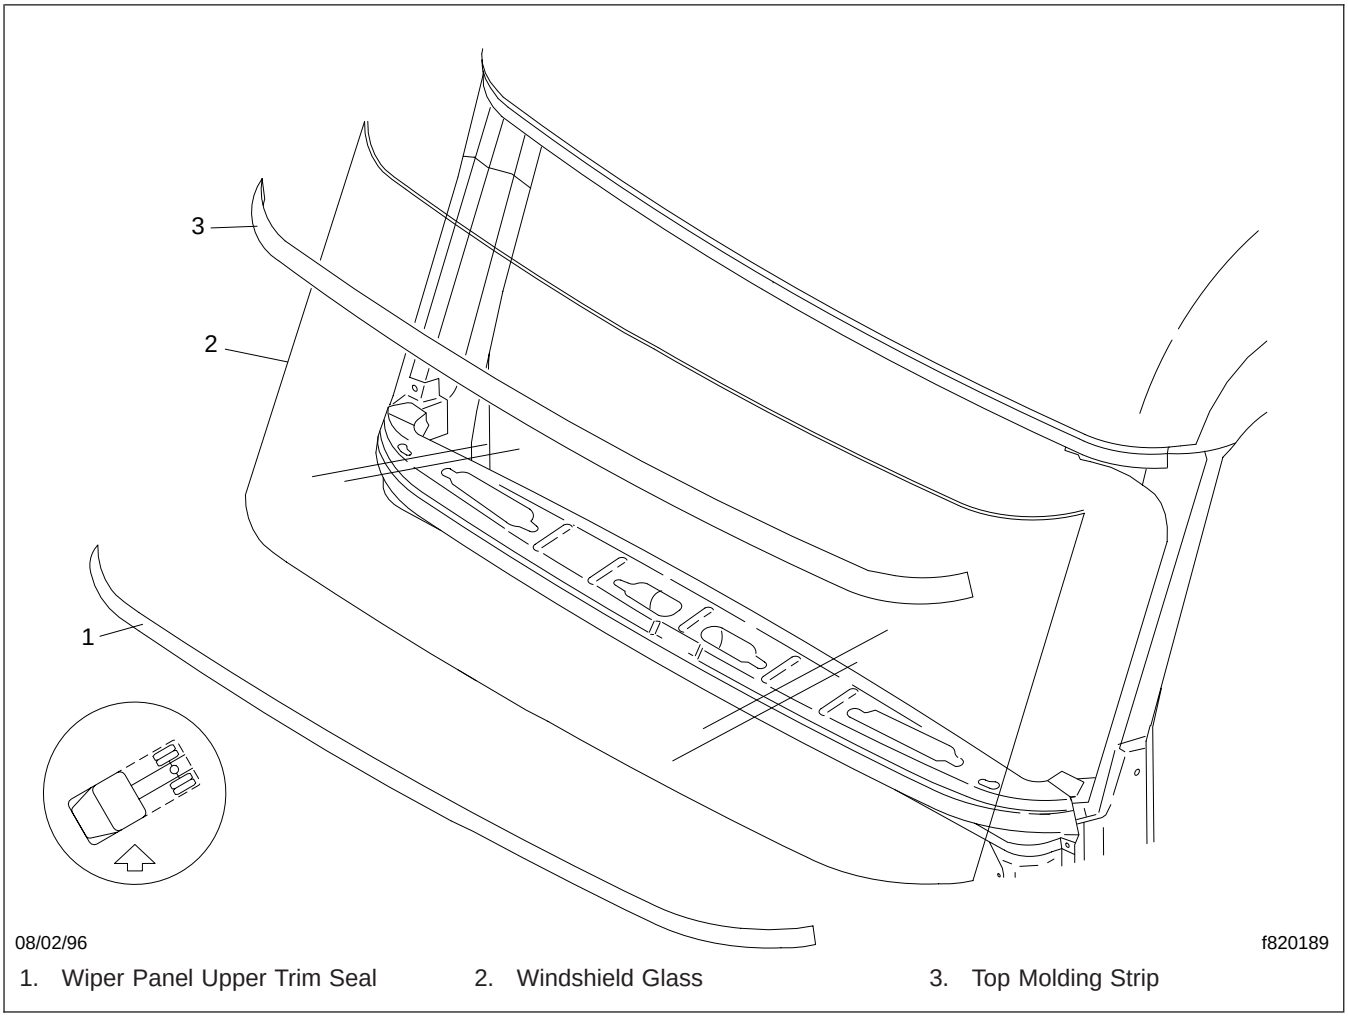
The procedure below specifies Dow adhesives and primers, though other manufacturers' systems can be used. Regardless of the system used, adhere to the adhesive manufacturer's instructions, and use that manufacturer's recommended primers and glass prep solutions for the entire procedure.

See **Fig. 1** for a one-piece windshield installation.

If the windshield is cracked, carefully inspect the glass, urethane sealant, and the windshield mask to determine the cause. Correct the problem before installing a new windshield. If the underlying cause for the crack is not corrected, the replacement windshield may crack when exposed to high winds, pressure, temperature extremes, or vehicle motion.

NOTE: At least two people are needed to replace a windshield.

1. Apply the parking brakes and chock the tires.
2. Open the windows. Shutting the doors with the windows closed could pressurize the cab and create gaps in the uncured adhesive.

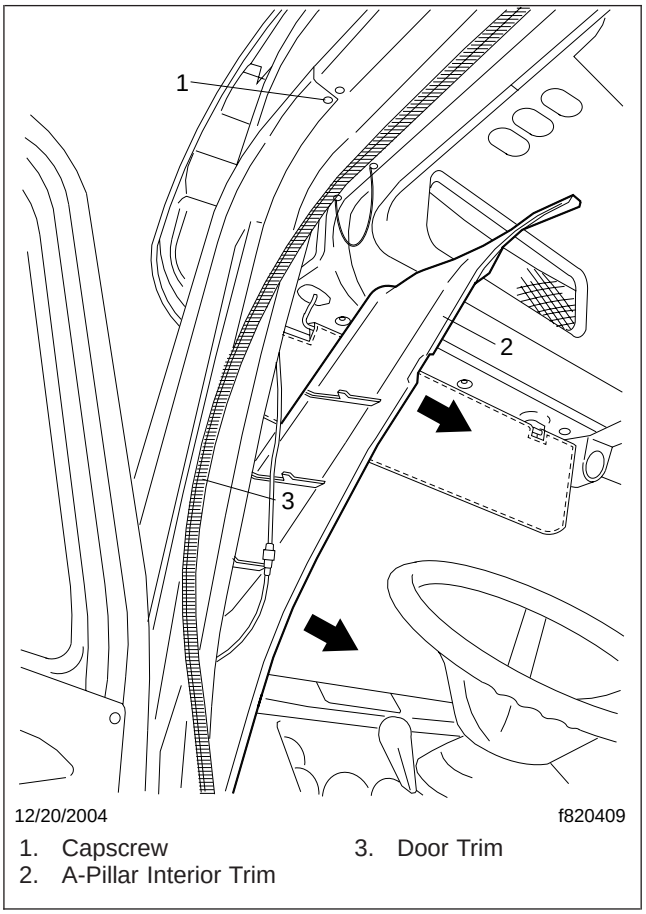


1. Wiper Panel Upper Trim Seal
2. Windshield Glass
3. Top Molding Strip

Fig. 1, One-Piece Windshield Installation

One-Piece Windshield Replacement, Argosy COE

3. Remove the windshield wiper arms; see **Group 82**.
4. Disconnect the windshield wiper fluid hoses.
5. Protect the paint finish and instrument panel by taping paper around the inside and outside of the windshield opening.
6. Remove the lower capscrew from the exterior A-pillar panel.
7. The exterior panel mounting is concealed under the A-pillar interior trim. Remove the mounting nuts, as follows.
   - 7.1 Remove the grab handle from the right-hand A-pillar.
   - 7.2 On both sides of the vehicle, loosen the door trim, then remove the A-pillar interior trim; see **Fig. 2**.



1. Capscrew
2. A-Pillar Interior Trim
3. Door Trim

Fig. 2, Removing A-Pillar Interior Trim

   - 7.3 If the vehicle is equipped with an Eaton® VORAD® collision warning system, disconnect the sensor located on the inside of the right-hand A-pillar.
   - 7.4 Through the access holes on each A-pillar, remove the three nuts that attach the exterior panel to the A-pillar; see **Fig. 3**.

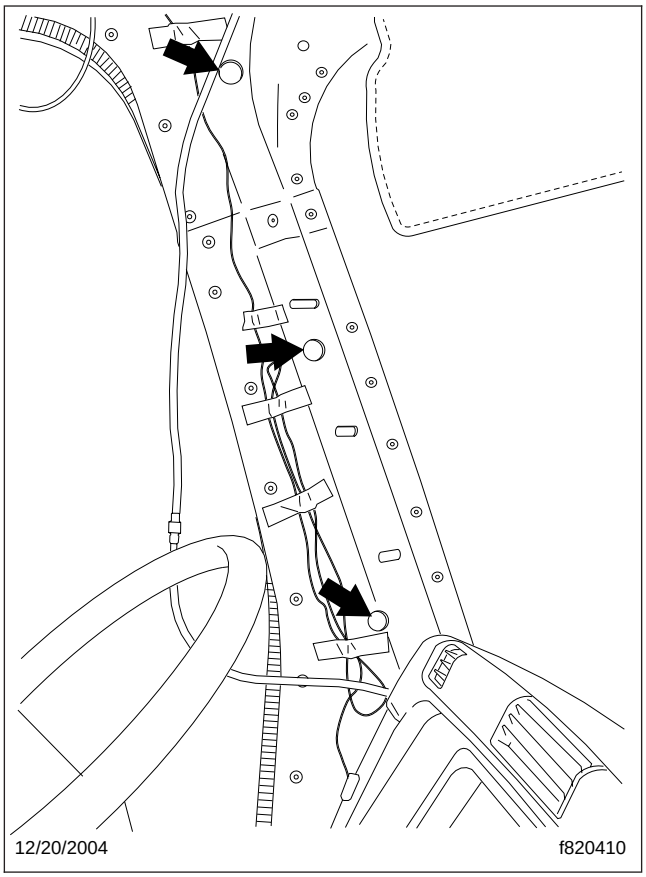


Fig. 3, A-Pillar Fastener Access Holes

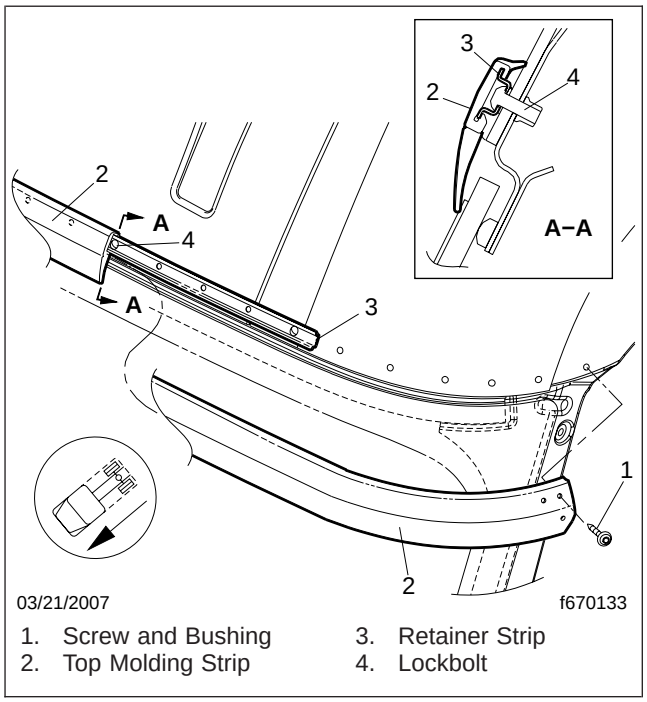
8. Remove the capscrew that attaches the exterior A-pillar panel to the top of the door frame; see **Fig. 2**. Remove the panel.
9. Remove the Torx® screw and bushing at each end of the top molding strip; see **Fig. 4**.
10. Slide the top molding strip off the retainer strip.

NOTE: Vehicles built before July 21, 2000 are not equipped with a retainer strip; remove the top molding strip by pulling it loose from the gap



1. Screw and Bushing
2. Top Molding Strip
3. Retainer Strip
4. Lockbolt

Fig. 4, Top Molding Strip Installation

between the windshield glass and the windshield mask.

11. Remove the wiper panel upper trim seal.
12. Remove the exterior sunvisor.
13. Using a pneumatic cutting tool (**Fig. 5**), a piano wire (**Fig. 6**), or a pull knife (**Fig. 7**), cut through the urethane sealant all around the edges of the windshield glass.

NOTE: To order a BTB pneumatic cutting tool, see **Specifications 400**.

14. Remove the four rubber positioning blocks from the lower windshield mask; see **Fig. 8**. Discard them.

⚠ WARNING

Wear protective gloves and safety glasses when replacing windshield glass. Gloves will protect your hands from sharp edges, and allow a better grip. Failure to wear gloves and safety glasses when handling glass could result in injury to hands or eyes.

15. Carefully remove the damaged windshield glass.

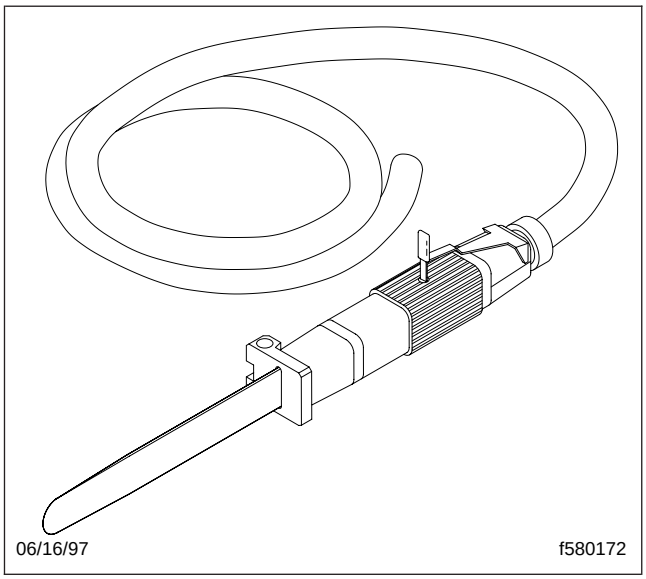


Fig. 5, BTB Pneumatic Cutting Tool

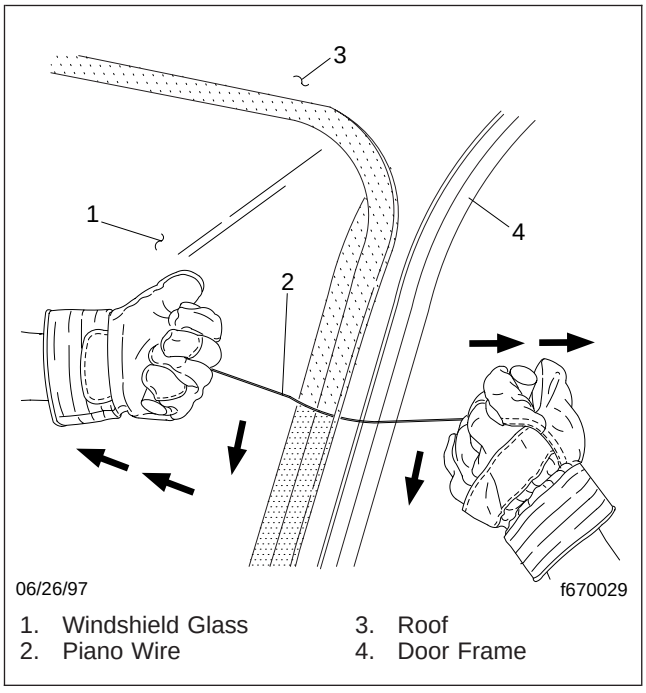

1. Windshield Glass
2. Piano Wire
3. Roof
4. Door Frame

Fig. 6, Windshield Glass Removal with Piano Wire

16. Using a BTB pneumatic cutting tool or a sharp knife, trim down the old urethane sealant to a thickness of about 1/16 inch (1 to 2 mm). Make sure any remaining adhesive has a smooth and even surface.

One-Piece Windshield Replacement, Argosy COE

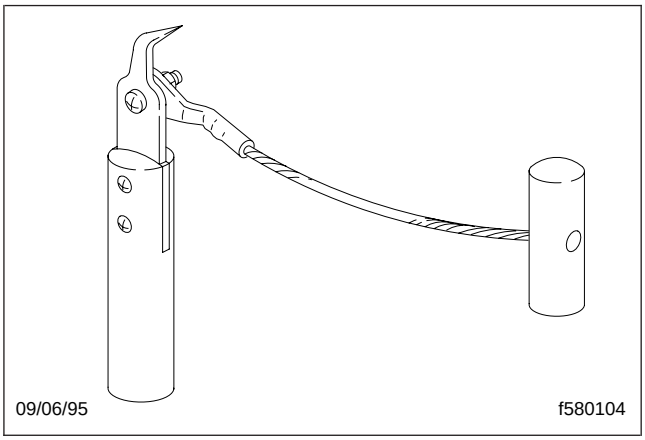

Fig. 7, Typical Pull Knife

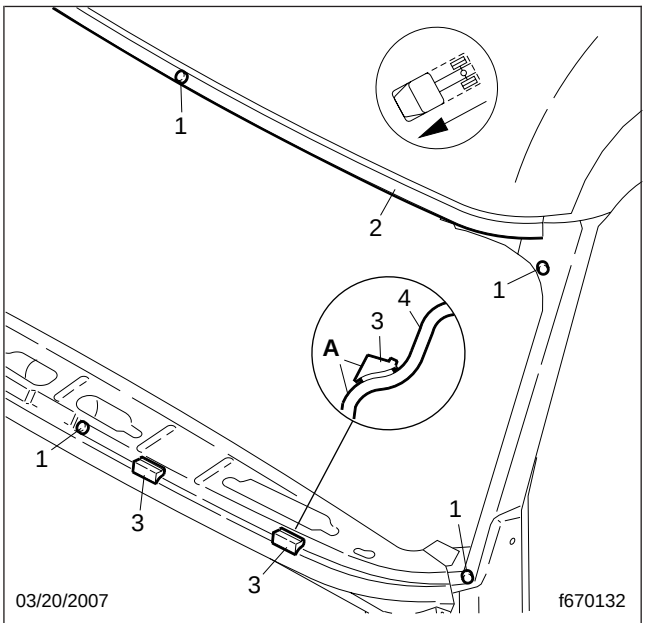

A. These two surfaces are to be flush.

1. Spacer Button
2. Windshield Mask (upper)
3. Positioning Block
4. Windshield Mask (lower)

Fig. 8, Cab Area for Windshield Installation

17. Brush the remaining adhesive and debris from the windshield-seating cavity.
18. Check the windshield mask. Apply Betaprime® 5404A Pinchweld and Encapsulation Primer to any bare metal. Allow to dry for a minimum of 6 minutes.

NOTE: Exposed bare metal areas larger than 1/2 inch x 1/2 inch (13 mm x 13 mm) require the use of Betaprime 5201TF Bare Metal Etch Primer.

19. Install eight spacer buttons on the windshield mask; see **Fig. 8**.
20. Install four new rubber positioning blocks in the cavity; see **Fig. 8**.
21. Put the new windshield glass on a suitable stand or fixture, with the inside surface of the glass facing up.
22. Clean the bonding surface of the glass with Betaclean GC-800.
23. Apply Betaprime 5500 1-Step Glass/Frit Primer all the way around the edge of the glass to a width of about 1 inch (25 mm). *Do not get any of the primer on the black dot pattern of the glass.* Allow a minimum of six minutes for the primer to dry.
24. Holding the sealant applicator at a 90-degree angle to the windshield mask on the cab, apply a uniform and continuous bead of Betaseal U-400HV Adhesive all the way around the edges of the windshield mask. The bead should be a minimum of 3/8 inch (10 mm) thick.

    Keep the spiked edge of the applicator tip against the edge of the mask, and overlap the bead slightly.

IMPORTANT: Do not apply the urethane adhesive/sealant to the windshield glass. Aligning a windshield with adhesive on the glass is very difficult to do without getting the adhesive/sealant on the painted cab surface outside the windshield mask.

25. Attach a suction device to the outside of the windshield. Lift and install the windshield. Make sure the glass is centered on the windshield mask, and that the bottom edge of the glass seats onto the positioning blocks correctly; see **Fig. 9** or **Fig. 10**.
26. Gently press down on the glass all the way around the bead line to firmly seat the windshield.
27. With a spatula or a paddle, smooth the adhesive flat along the edge of the windshield.

Fig. 10, Cross-Section View (vehicles built from July 21, 2000)

28. Install the wiper panel upper trim seal, using Betaseal U-418 primerless auto glass urethane adhesive. Do not use a silicone hot glue.
29. Slide the top molding strip onto the retainer strip, if so equipped. Fasten each end of the strip to the A-pillar with a Torx screw and bushing; see **Fig. 4**.

NOTE: Vehicles built before July 21, 2000 are not equipped with a retainer strip. Attach the molding strip using Betaseal U-418 primerless auto glass urethane adhesive.

30. Attach each A-pillar exterior panel to the top of the door frame with a capscrew; see **Fig. 2**.
31. Install the A-pillar exterior panel mounting nuts and interior trim, as follows.
    - 31.1 Through the access holes on each A-pillar, install the three nuts that attach the exterior panel to the A-pillar; see **Fig. 3**.
    - 31.2 If the vehicle is equipped with an Eaton® VORAD® collision warning system, connect the sensor located on the inside of the right-hand A-pillar.
    - 31.3 On both sides of the vehicle, install the A-pillar interior trim, then secure the door trim; see **Fig. 2**.
    - 31.4 Attach the grab handle to the right-hand A-pillar.
32. Secure the lower end of the A-pillar exterior panel with a capscrew.
33. Connect the windshield wiper fluid hoses.
34. Install the wiper arms; see **Group 82**.
35. Clean both sides of the new windshield glass.
36. Remove the protective coverings from the dash.
37. Install the exterior sunvisor.
38. See the adhesive manufacturer's documentation for cure and drive-away times.

Two-Piece Windshield Replacement, Argosy COE

Replacement

NOTE: Freightliner recommends Sika Ultrafast, Dow U-400HV, or Bostik® 70-08A adhesive for windshield replacement.

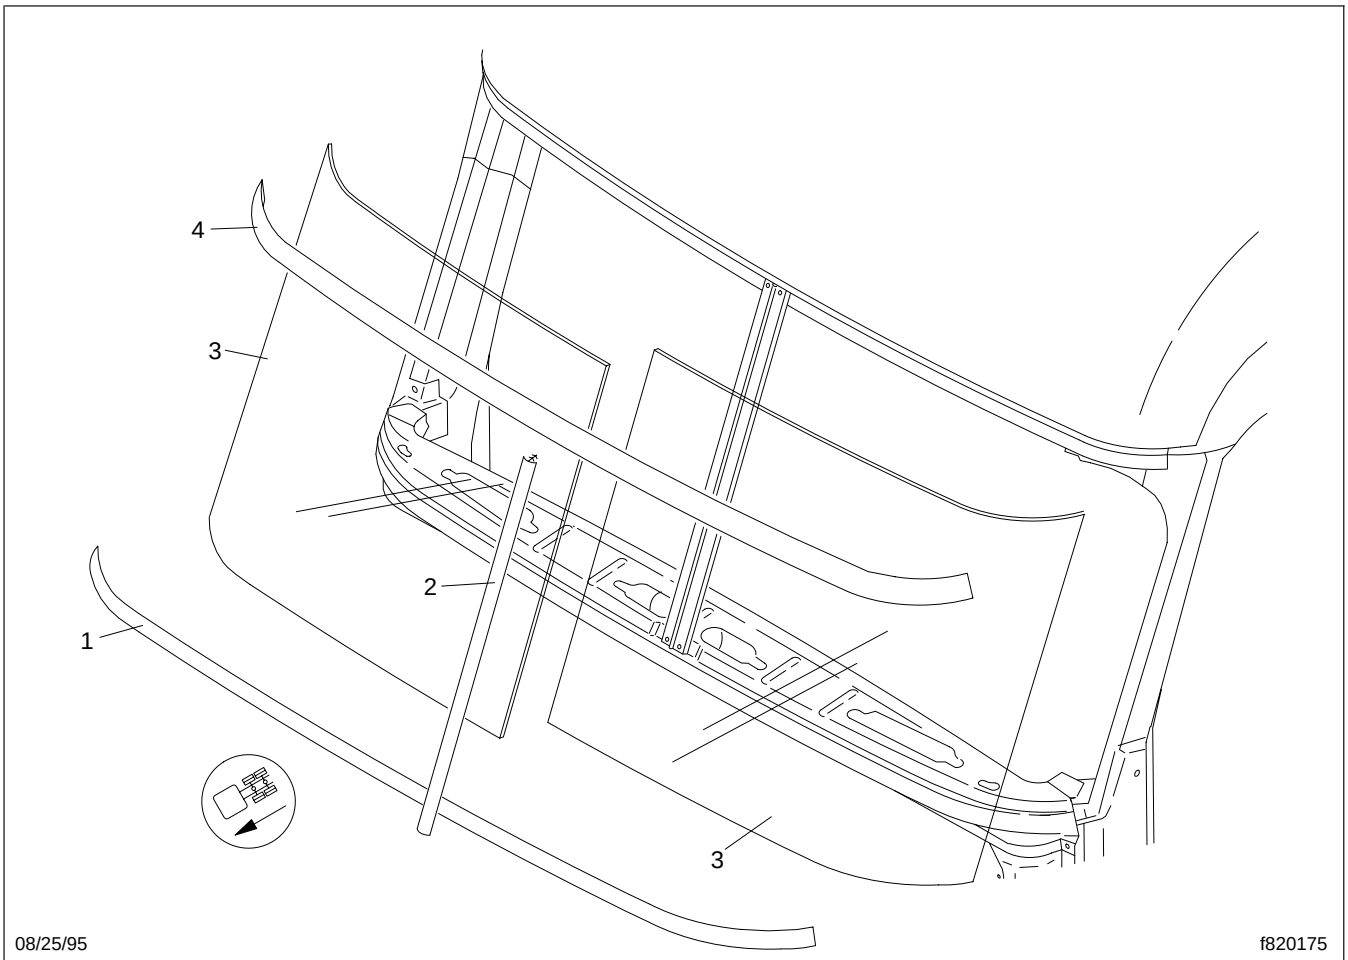
The procedure below specifies Dow adhesives and primers, though other manufacturers' systems can be used. Regardless of the system used, adhere to the adhesive manufacturer's instructions, and use that manufacturer's recommended primers and glass prep solutions for the entire procedure.

See **Fig. 1** for a two-piece windshield installation.

If the windshield is cracked, carefully inspect the glass, urethane sealant, and the windshield mask to determine the cause. Correct the problem before installing a new windshield. If the underlying cause for the crack is not corrected, the replacement windshield may crack when exposed to high winds, pressure, temperature extremes, or vehicle motion.

NOTE: At least two people are needed to replace a windshield.

1. Apply the parking brakes and chock the tires.



1. Wiper Panel Upper Trim Seal
2. Center Molding Strip
3. Windshield Glass
4. Top Molding Strip

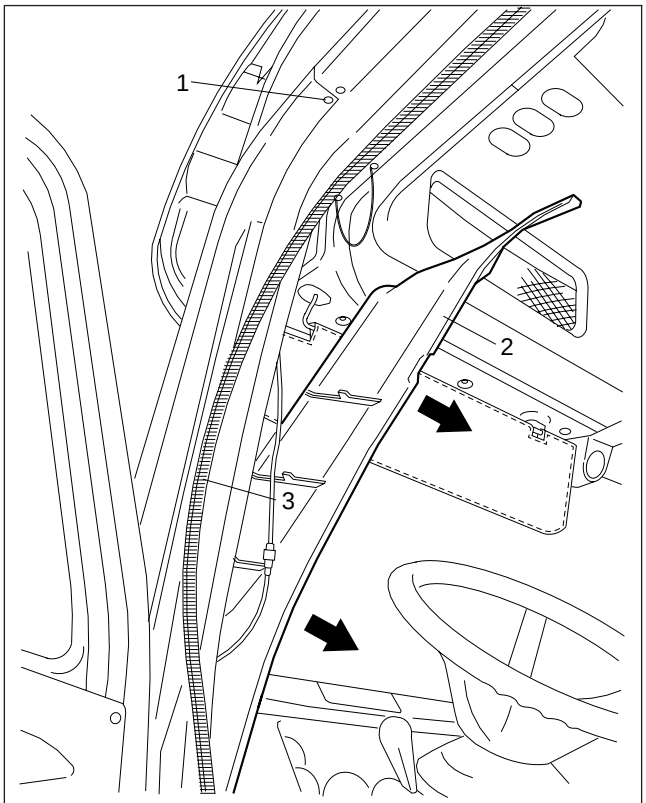
2. Open the windows. Shutting the doors with the windows closed could pressurize the cab and create gaps in the uncured adhesive.
3. Remove the windshield wiper arms; see **Group 82**.
4. Protect the paint finish and instrument panel by taping paper around the inside and outside of the windshield opening.
5. Remove the capscrew that attaches the lower end of the exterior A-pillar panel to the wiper panel.
6. The exterior panel mounting is concealed under the A-pillar interior trim. Remove the mounting nuts, as follows.
   - 6.1 If applicable, remove the grab handle from the right-hand A-pillar.
   - 6.2 Loosen the door trim, then remove the A-pillar interior trim; see **Fig. 2**.
   - 6.3 If applicable, disconnect the sensor for the Eaton® VORAD® collision warning system, located on the inside of the right-hand A-pillar.
   - 6.4 Through the access holes on the A-pillar, remove the three nuts that attach the exterior panel to the A-pillar; see **Fig. 3**.
7. Remove the capscrew that attaches the exterior A-pillar panel to the top of the door frame; see **Fig. 2**. Remove the panel.
8. Remove the center molding strip from the windshield center post; see **Fig. 1**.
9. Remove the Torx® screw and bushing at each end of the top molding strip; see **Fig. 4**.
10. Slide the top molding strip off the retainer strip.

NOTE: Vehicles built before July 21, 2000 are not equipped with a retainer strip; remove the top molding strip by pulling it loose from the gap between the windshield glass and the windshield mask.

11. Remove the wiper panel upper trim seal.
12. Remove the exterior sunvisor.
13. Using a pneumatic cutting tool (**Fig. 5**), a piano wire (**Fig. 6**), or a pull knife (**Fig. 7**), cut through the urethane sealant all around the edges of the windshield glass.



1. Capscrew
2. A-Pillar Interior Trim
3. Door Trim

32. Install the A-pillar exterior panel mounting nuts and interior trim, as follows.
    - 32.1 Through the access holes on the A-pillar, install the three nuts that attach the exterior panel to the A-pillar; see **Fig. 3**.
    - 32.2 If applicable, connect the sensor for the Eaton® VORAD® collision warning system, located on the inside of the right-hand A-pillar.
    - 32.3 If applicable, install the A-pillar interior trim, then secure the door trim; see **Fig. 2**.
    - 32.4 Attach the grab handle to the right-hand A-pillar.
33. Secure the lower end of the A-pillar exterior panel with a capscrew to the wiper panel.
34. Install the wiper arms; see **Group 82**.
35. Clean both sides of the new windshield glass.
36. Remove the protective coverings from the dash.
37. Install the exterior sunvisor.
38. See the adhesive manufacturer's documentation for cure and drive-away times.

See **Table 1** for the materials needed for windshield installation using Dow U-400HV urethane adhesive. The items in **Table 1** are available from your local Dow/Essex dealer.

If using another adhesive, refer to the adhesive manufacturer's instructions for applicable cleaners and primers.

Materials and Tools Needed for Windshield Installation	
Material or Tool	**Part Number**
Betapclean® Glass Cleaner	GC-800
Betaprime® Glass Primer	5500
Betaprime Body Primer	5404A
Betaseal® Adhesive	U-400HV
Betaseal Primerless Auto Glass Adhesive	U-418

Table 1, Materials and Tools Needed for Windshield Installation

See **Fig. 1** and **Fig. 2** for the special tools needed for windshield removal.

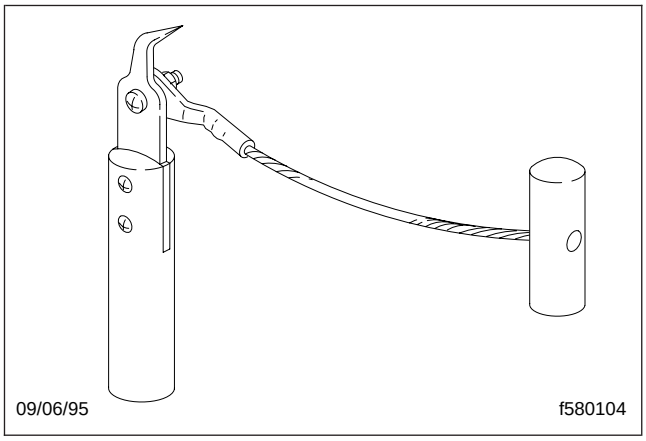

Fig. 2, Typical Pull Knife

General Information

Cab air-suspension systems consist of two air springs, a height-control valve, a lateral control rod or sway bar, two shock absorbers, and a vertical linkage; see **Fig. 1**, **Fig. 2**, and **Fig. 3**.

The cab rear air-suspension system absorbs road shocks better than a solid-mount system, and thus provides a smoother ride for cab occupants and cab-mounted equipment.

Air Springs

The top of the air spring is mounted to a bracket on the cab underbody, and the bottom is mounted to a bracket on the frame rail crossmember. On Argosy COEs, the air springs are connected to the sway bar assembly and the hydraulic cab latches. Together with the height-control valve, the air springs compensate for changes in cab load by maintaining the correct cab height at the rear of the cab.

Height-Control Valve

NOTE: If a leak occurs in the cab air-suspension system, a pressure protection valve (located at the secondary air tank, which supplies the air to the height-control valve) will maintain a minimum pressure of about 65 psi (450 kPa) in the vehicle secondary air system.

All of the air in the cab air-suspension system is admitted through or exhausted from the height-control valve. It mounts on the control rod bracket, which is attached to the frame rail. The height-control valve has a horizontal control lever, the outboard end of which is connected to a vertical linkage. The upper end of the vertical linkage is attached to the cab underbody.

When the load on the cab increases, the dimension between the cab and the crossmember decreases, causing the vertical linkage to push downward on the end of the horizontal control lever. This turns the height-control valve shaft, which activates the height-control valve. Air flows through the valve and into the air springs until the pressure in the springs raises the cab to the correct height. At this height, the control lever and the control shaft are returned to their neutral positions, closing the intake air supply.

When the load on the cab decreases, the rear of the cab rises, causing the vertical linkage to pull up on the end of the horizontal control lever. Turning the height-control valve shaft in this direction activates an exhaust port in the valve. This allows air pressure in the air springs to decrease until the cab is lowered to the correct height. Again, the control lever and control shaft are returned to their neutral positions, and air flow is stopped.

When the vehicle is in motion, small and abrupt movements of the cab will occur, resulting in small or abrupt movements of the control lever. These movements of the control lever do not activate the height-control valve to correct the cab ride height.

Changes in load that occur when occupants or heavy items are added to or removed from the cab will activate the height-control valve to correct the cab ride height. Also, when the vehicle is moving forward at high speed or in a high headwind, a major change in load occurs from the downforce applied to an optional air shield or air fairing. When these changes in load occur, the cab air-suspension system will correct the cab ride height at the rear of the cab.

Lateral Control Rod

On the Century Class Conventional, the lateral control rod limits the side-to-side motion of the rear of the cab. The inboard end of the control rod is mounted on the crossmember bracket that the height-control valve is mounted to, and the outboard end is attached to a bracket on the cab underbody.

Sway Bar

On the Argosy COE, a sway bar extends between the two air spring assemblies, and is supported on the overslung crossmember. The sway bar limits cab roll and the side-to-side movement of the cab.

Shock Absorbers

The shock absorbers control the air spring and cab suspension movement, and dampen oscillation in the cab suspension system.

If it is necessary to remove a Barksdale height-control valve from a mounting bracket, note the following.

CAUTION

When removing or loosening a Barksdale height-control valve from a mounting bracket, always hold the valve-side mounting studs in place with an Allen wrench while loosening or tightening the nuts that attach the valve to the bracket. Because the mounting studs are threaded into the valve body, loosening the nuts without holding the studs can tighten the studs, which can crush the valve body and damage the valve. Conversely, tightening the nuts without holding the studs can back the studs out, causing a separation of the two halves of the valve body, and possibly a leak.

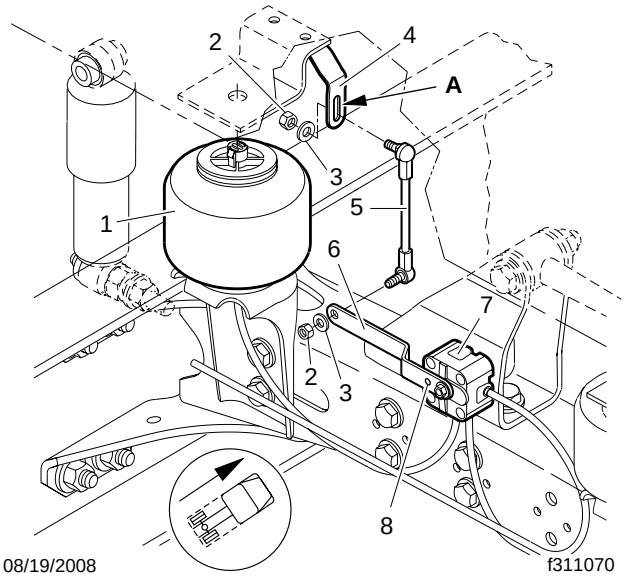
Height Adjustment

Century Class Conventional

1. Park the vehicle on a level surface, apply the parking brakes, and chock the tires.
2. Run the engine to build vehicle air pressure to at least 100 psi (690 kPa). Turn off the engine and wait 5 to 10 minutes for the system to equalize.
3. Disconnect the vertical linkage from the slotted hole in the bracket under the cab deck; see **Fig. 1**.

NOTE: On a day cab air suspension, the height-control valve is mounted outboard of the left-side air spring; see **Fig. 2**.

4. Raise the control lever on the height-control valve to exhaust the air from the air springs.
5. Lower the control lever on the height-control valve to fill the air springs. Raise the cab until the distance from the rear cab underbody flange to the lower shock absorber bolt is 9-1/16 to 9-7/16 inches (231 to 240 mm); see **Fig. 3** and **Fig. 4**.
6. Lock the height-control valve in the neutral position by inserting a 5/32-inch (4-mm) pin or drill bit in the neutral-position hole in the height-control valve and the horizontal control lever.
7. With the height-control valve locked in the neutral position, connect the vertical linkage to the bracket under the cab deck. The vertically slotted hole in the bracket allows for the height adjustment. Tighten the nut 96 lbf·in (1080 N·cm).
8. Remove the pin or drill bit previously inserted in the height-control valve.
9. Check the cab height again. The distance from the rear cab underbody flange to the lower shock absorber bolt should be 9-1/16 to 9-7/16 inches (231 to 240 mm). If the height is not correct, repeat the entire procedure.



A. Slotted hole allows for height adjustment.

Height-Control Valve Checking

It is normal to hear air leaking from the height-control valve for as much as five minutes after getting out of the vehicle. This air leakage is just the height-control valve exhausting air from the cab suspension air springs to reach the neutral position.

Height-control valves used on the Century Class are Barksdale valves. Two methods are available to check the operation of Barksdale height-control valves. A leak in the valve may be discovered without using a test kit, but a test kit is necessary to determine if the valve has an unacceptable rate of leakage.

Some Barksdale height-control valves have been returned for warranty because the four bolts in the valve housing were overtightened, often, enough to crack the valve housing. These bolts should not be loose, and should not normally require tightening, as there are no serviceable parts in the valve.

IMPORTANT: To prevent voiding the warranty on Barksdale height-control valves, note the following:

- Do not overtighten the bolts in the Barksdale height-control valve housing if you detect leaks in the housing. The bolts should not be loose, and should not require tightening. Only if necessary, tighten the valve housing bolts 45 lbf·in (500 N·cm). Any damage to the valve housing will void the warranty.
- Do not attempt to disassemble the Barksdale valve body or the control lever. There are no serviceable parts in the valve, and any disassembly will void the warranty.

⚠ CAUTION

When removing or loosening a Barksdale height-control valve from a mounting bracket, always hold the valve-side mounting studs in place with an Allen wrench while loosening or tightening the nuts that attach the valve to the bracket. Because the mounting studs are threaded into the valve body, loosening the nuts without holding the studs can tighten the studs, which can crush the valve body and damage the valve. Conversely, tightening the nuts without holding the studs can back the studs out, causing a separation of the two halves of the valve body, and possibly a leak.

Checking the Height-Control Valve Without Using a Test Kit

⚠ WARNING

Keep your hands and all objects away from the area under and around the cab when removing the pressure from the air system. Parts will move as the air is released and can cause personal injury or damage to any objects that are between the moving parts.

1. With the vehicle parked on a level surface, run the engine to build vehicle air pressure to at least 100 psi (690 kPa), then shut off the engine, apply the parking brakes, and chock the tires.
2. Wait 5 to 10 minutes for the air suspension system to equalize.

NOTE: Normal operation of the height-control valve requires a maximum of 10 minutes to settle. Any air leakage during this time is considered normal, and does not indicate a defective valve. This air leakage is the height-control valve exhausting air due to a decreased load on the cab suspension.

3. Disconnect the vertical linkage from the horizontal control lever.
4. Pull the control lever up about 45 degrees for 6 to 8 seconds. If air passes through the valve, that section of the valve is okay.
5. Return the control lever to the neutral position.
6. Push the control lever down about 45 degrees for 6 to 8 seconds. If the air spring inflates, that section of the valve is okay.
7. Return the control lever to the neutral position. If the air stops again in the neutral position, the valve is working correctly.
8. If the valve works as stated in all of the above steps, no further checking is needed. Connect the vertical linkage to the control lever, then tighten the linkage nut. If needed, adjust the cab ride height; see **Subject 100**.

NOTE: If the valve leaks, go to "Checking the Height-Control Valve Using a Test Kit." Barks-

Height-Control Valve Checking

dale valves have an acceptable leakage rate of 3 cubic inches (50 cc) per minute. You can determine if a leak is acceptable only by using the Barksdale test kit.

Checking the Height-Control Valve Using a Test Kit

IMPORTANT: The procedure described below is for use on Barksdale height-control valves only.

NOTE: The Barksdale field test kit is designed to be used with the height-control valve installed on the vehicle. Refer to **Specifications 400** for information on ordering the Barksdale height-control valve test kit KD2264.

1. If not already done, park the vehicle on a level surface, apply the parking brakes, and chock the tires.
2. Run the engine to build vehicle air pressure to at least 100 psi (690 kPa).
3. Shut off the engine and wait 5 to 10 minutes for the air suspension system to equalize.

NOTE: Normal operation of the height-control valve requires a maximum of 10 minutes to settle. Any air leakage during this time is considered normal, and does not indicate a defective valve.

4. Check the rubber exhaust flapper at the back of the valve housing for leaks. Use a soapy solution.
5. Disconnect the vertical linkage from the control lever.
6. Rotate and hold the control lever up at about 45 degrees to exhaust air from the air springs.
7. Disconnect the air lines from the air spring ports on the height-control valve. Leave the elbow fittings (if equipped) in place. Install a Parker plug into each air spring port (or elbow fitting); see **Fig. 1**.
8. If a flapper is present on the exhaust port of the height-control valve, remove it using needlenose pliers.
9. Clean the surface around the exhaust port, then install the test fitting into the exhaust port. The centering pin on the fitting must align with the slot on the exhaust port. Rotate the test fitting 45 degrees clockwise to lock it in place; see **Fig. 1**.
10. Connect one end of the air hose from the kit to the test connector on the exhaust port, and the other end to the test gauge.
11. Check the height-control valve in the fill mode, as follows.

    11.1 Rotate the valve control lever down 45 degrees from the horizontal to the fill position.

    11.2 Press the reset button on the test gauge.

    11.3 Observe the test gauge for 30 seconds. Refer to **Fig. 2** for the maximum allowable exhaust pressure change versus inlet pressure.

    The valve is not working correctly if the gauge pressure reading exceeds the maximum allowable within 30 seconds.

    If the gauge reads less than the maximum allowable pressure change in 30 seconds, the valve is okay.

NOTE: The test gauge will register the exhausting air. *This does not indicate a defective valve.*

12. Check the height-control valve in the exhaust mode, as follows.

    12.1 Rotate the valve control lever up 45 degrees from the horizontal to the exhaust position.

    12.2 Press the reset button on the test gauge.

    12.3 Observe the test gauge for 30 seconds. Refer to **Fig. 2** for the maximum allowable exhaust pressure change versus inlet pressure.

    The valve is not working correctly if the gauge pressure reading exceeds the maximum allowable within 30 seconds.

    If the gauge reads less than the maximum allowable pressure change in 30 seconds, the valve is okay.

NOTE: The test gauge will register the exhausting air. *This does not indicate a defective valve.*

13. Disconnect the test gauge and connector from the valve exhaust port.

4. Exhaust Port Test Fitting
5. Air Line
6. Reset Button
7. Test Gauge Assembly

Fig. 1, Test Connections

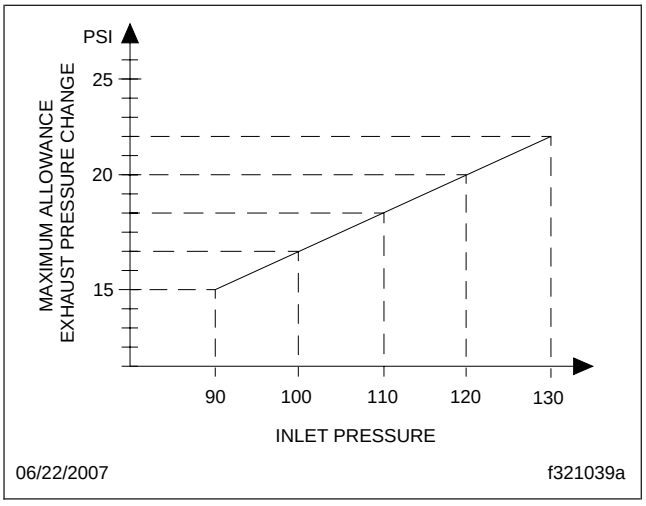

Fig. 2, Inlet Pressure vs. Exhaust Pressure Change in 30 Seconds

14. If the height-control valve is defective, replace it; see **Subject 120**.
15. Install the flapper on the exhaust port by pressing it into place.
16. Remove the two Parker plugs from the air spring ports, and connect the air lines to the air spring ports (or elbow fittings). Connect the vertical linkage to the height-control valve control lever. The ride height will automatically return to the correct position.

Replacement

IMPORTANT: Before replacing the height-control valve, perform the steps in **Subject 110** to see if the valve is actually damaged or just out of adjustment.

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.

⚠ WARNING

Do not disconnect any air lines in the cab suspension system without first blocking or tilting the cab. If the cab isn't securely blocked or tilted, disconnecting an air line could cause the cab to fall abruptly, possibly resulting in serious injury.

2. On the Century Class Conventional, block the cab at normal ride height by placing a wooden block between the cab underbody and the top of the frame crossmember.

   On the Argosy COE, tilt the cab; see **Section 60.15, Subject 060**.

3. Drain all air from the air tanks.

⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

4. Disconnect the height-control valve vertical linkage from the control lever; see **Fig. 1** or **Fig. 2**. Push the lever down, and hold it there until all air is exhausted from the air springs.
5. Mark the air lines to the height-control valve for later reference, then disconnect them.

⚠ CAUTION

When removing or loosening a Barksdale height-control valve from a mounting bracket, always hold the valve-side mounting studs in place with an Allen wrench while loosening or tightening the nuts that attach the valve to the bracket. Because the mounting studs are threaded into the valve body, loosening the nuts without holding the studs can tighten the studs, which can crush the valve body and damage the valve. Conversely, tightening the nuts without holding the studs can back the studs out, causing a separation of the two halves of the valve body, and possibly a leak.

6. While holding the height-control valve mounting studs in place with an Allen wrench, remove the nuts and washers that attach the valve to the mounting bracket. Remove the height-control valve.
7. Position the new height-control valve on the height-control bracket. While holding the height-control valve mounting studs in place with an Allen wrench, install the nuts and washers, and tighten the nuts 95 lbf·in (1100 N·cm). Do not overtighten.
8. Connect the air lines to the height-control valve. Install the air lines into the fittings until they seat completely. Tug on the lines to make sure they are completely seated.
9. Connect the vertical linkage to the horizontal control lever.
10. Close the drain cocks on all air reservoirs. Run the engine to build vehicle air pressure to at least 100 psi (690 kPa).
11. Check all air lines and connections for leaks; eliminate all leaks.
12. Check the operation of the new height-control valve; see **Subject 110**.
13. Adjust the height-control valve, if needed; see **Subject 100**.
14. On the Century Class Conventional, remove the cab supports.

    On the Argosy COE, return the cab to the operating position; see **Section 60.15, Subject 060**.

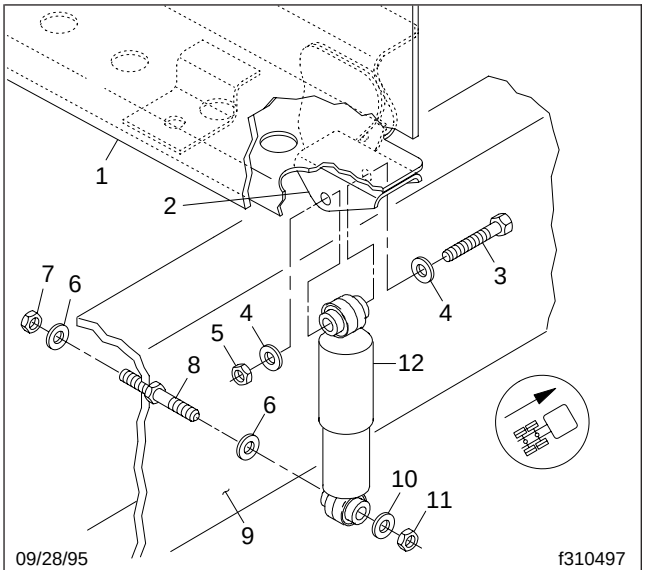
Fig. 2, Height-Control Valve And Linkage, Argosy COE

Replacement

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.
2. On the Century Class Conventional, place blocks between the frame and the bottom of the cab, or use jack stands to keep the cab in position when the shock is removed.

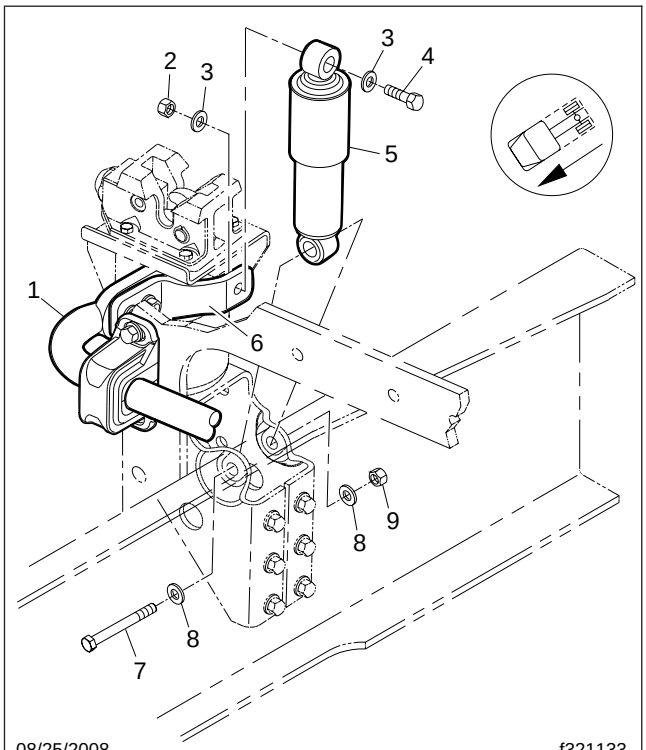
   On the Argosy COE, tilt the cab; see **Section 60.15, Subject 060**.
3. Remove the 7/16–20 hexnut and washer from the lower mounting stud; see **Fig. 1** or **Fig. 2**.



1. Rear of Cab
2. Shock Absorber Upper Mounting Bracket
3. 1/2–13 Hexbolt
4. Flatwasher
5. 1/2–13 Hexnut
6. 5/8" Flatwasher
7. 5/8–11 Hexnut
8. Shock Absorber Lower Mounting Stud
9. Frame Rail
10. 7/16" Washer
11. 7/16–20 Hexnut
12. Shock Absorber

Fig. 1, Shock Absorber Installation, Century Class Conventional

4. Remove the upper hexbolt, hexnut, and washers that attach the shock absorber to the shock absorber upper mounting bracket. On conventionals, the upper mounting bracket is attached to the cab underbody, on the Argosy COE, to the air spring upper support bracket. Remove the shock absorber.



1. Sway Bar
2. 1/2–13 Hexnut
3. Flatwasher
4. 1/2–13 Hexbolt
5. Shock Absorber
6. Shock Absorber Upper Mounting Bracket
7. 7/16–20 Hexbolt
8. 7/16" Washer
9. 7/16–20 Hexnut

Fig. 2, Shock Absorber Installation, Argosy COE

5. Install the new shock absorber on the mounting stud on the frame rail, using the hexnut and washers. Do not tighten the hexnut yet.
6. Position the upper end of the shock absorber in the upper bracket, and install the hexbolt, washers, and hexnut. On the Century Class Conventional, the hexbolt head should be facing toward the front of the vehicle, on the Argosy COE, to inboard.

Shock Absorber Replacement

7. Tighten the upper hexnut 45 lbf·ft (61 N·m). Tighten the lower hexnut 22 to 32 lbf·ft (30 to 44 N·m).
8. On the Century Class Conventional, remove the cab supports.

   On the Argosy COE, return the cab to the operating position; see **Section 60.15, Subject 060**.

Replacement

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.

⚠ WARNING

Do not disconnect any air lines in the cab suspension system without first blocking or tilting the cab. If the cab isn't securely blocked or tilted, disconnecting an air line could cause the cab to fall abruptly, possibly resulting in serious injury.

2. On the Century Class Conventional, jack up the cab, and block it at about 1 inch (25 mm) higher than its normal ride height. Block the cab between the frame rail crossmember and the cab underbody.

   On the Argosy COE, tilt the cab; see **Section 60.15, Subject 060**.

3. Drain all air from the air tanks.

⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

4. Remove the nut and washer that attach the vertical linkage to the horizontal control lever. Disconnect the vertical linkage from the control lever; see **Fig. 1** or **Fig. 2**.
5. Disconnect the supply air line from the bottom of the air spring to be replaced. Push in the brass ring at the connection, then pull the air line straight out. Cover the open end of the air line to prevent dirt or other foreign material from entering.
6. Using a screwdriver, depress the tangs at the top of the air spring, then pop it out of the upper bracket. Repeat the procedure for the bottom of the air spring, then remove the air spring.
7. Install the new air spring by snapping it in to the top bracket first, then the bottom bracket.
8. Remove the cover from the air line, then connect it by pushing it into the fitting on the bottom of the air spring. Push the air line all the way in. If it is not pushed all the way in, the connection will leak air. Tug on the air line to seat it completely.
9. Connect the vertical linkage to the horizontal control lever.
10. Start the engine, and run it until air pressure builds to at least 100 psi (690 kPa). Check for air leaks at the air springs and at the height-control valve. Tighten the fittings or replace the parts, as needed.
11. On the Century Class Conventional, jack up the cab, and remove the block.

    On the Argosy COE, return the cab to the operating position; see **Section 60.15, Subject 060**.

Sway Bar Replacement, Argosy COE

Replacement

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.
2. Drain all air from the air tanks.
3. Tilt the cab; see **Section 60.15, Subject 060**.
4. On both sides of the vehicle, remove the bolt, washer, and nut that attaches the sway bar and the sway bar isolator to the air spring upper support bracket; see **Fig. 1**.
5. On both sides of the vehicle, remove the two bolts, nuts, and washers that attach the sway bar to the shock absorber upper mounting bracket. On the right-hand side of the vehicle, the two bolts also secure the vertical linkage upper bracket to the shock absorber upper mounting bracket. Leave the bracket attached to the vertical linkage.
6. Remove the two bolts and nuts that attach each sway bar support bracket to the overslung crossmember.
7. Pull the sway bar away from the vehicle.
8. Position a new sway bar on the vehicle.
9. Install the two bolts that secure each sway bar support bracket to the overslung crossmember. Tighten the bolts 77 lbf·ft (104 N·m).
10. On both sides of the vehicle, install the bolt, nut, and washer that secures the sway bar and the sway bar isolator to the air spring upper support bracket. Tighten the bolt 77 lbf·ft (104 N·m).
11. On both sides of the vehicle, attach the sway bar to the shock absorber upper mounting bracket, using the two bolts, nuts, and washers. On the right-hand side of the vehicle, also install the vertical linkage upper bracket. Tighten the bolts 77 lbf·ft (104 N·m).
12. Return the cab to the operating position; see **Section 60.15, Subject 060**.

Troubleshooting Tables

Problem—Both Air Springs Are Flat

Problem—Both Air Springs Are Flat	
Possible Cause	**Remedy**
Low air pressure in the secondary air system.	Check the air pressure gauge on the instrument panel. If secondary air pressure is low, run the engine until at least 70 psi (482 kPa) is indicated.
Air is leaking from the cab air-suspension system.	Check for leakage from fittings, air lines, air springs, and the height-control valve. Tighten loose fittings to stop leakage; replace worn or damaged parts.
The height-control valve is out of adjustment.	Adjust the height-control valve; see **Subject 100**.
The height-control valve is inoperative.	If upward movement of the lever on a properly adjusted valve fails to inflate the air springs, replace the height-control valve; see **Subject 120**.
The height-control valve linkage is damaged.	Check for damage to the height-control valve linkage and the lever. Repair or replace damaged linkage parts.

Problem—Air Springs Deflate Rapidly When the Engine Is Not Running

Problem—Air Springs Deflate Rapidly When the Engine Is Not Running	
Possible Cause	**Remedy**
Air is leaking from the cab air-suspension system.	Check for leakage from fittings, air lines, air springs, and the height-control valve. Tighten loose fittings to stop leakage; replace worn or damaged parts.

Problem—Rear of Cab Rides Too High or Too Low

Problem—Rear of Cab Rides Too High or Too Low	
Possible Cause	**Remedy**
The height-control valve is out of adjustment.	Adjust the height-control valve; see **Subject 100**.

Problem—Collapsed Air Spring

Problem—Collapsed Air Spring	
Possible Cause	**Remedy**
An air spring is punctured.	Locate leaks by listening for escaping air, or by applying a soap and water solution to the air spring and watching for bubbles. Repair punctures and cuts that are less than 1/8 inch (3 mm). Replace the air spring if damage is greater. Check the area around the damaged air spring for contact with other components. Correct the problem areas as needed.
The air spring is continually or repeatedly over-extended.	Check the suspension height. Make sure the correct height is maintained. Adjust if needed; see **Subject 100** for the correct height and adjustment procedures. Check for a broken shock absorber or shock bracket; replace if broken.

Checking the Cab Height-Control System for Air Leaks

IMPORTANT: To prevent voiding the warranty on Barksdale height-control valves, note the following:

- Do not overtighten the bolts in the Barksdale height-control valve housing if you detect leaks in the housing. The bolts should not be loose, and should not require tightening. Only if necessary, tighten the valve housing bolts 45 lbf·in (500 N·cm). Any damage to the valve housing will void the warranty.
- Do not attempt to disassemble the Barksdale valve body or the control lever. There are no serviceable parts in the valve, and any disassembly will void the warranty.

⚠ CAUTION

When removing or loosening a Barksdale height-control valve from a mounting bracket, always hold the valve-side mounting studs in place with an Allen wrench while loosening or tightening the nuts that attach the valve to the bracket. Because the mounting studs are threaded into the valve body, loosening the nuts without holding the studs can tighten the studs, which can crush the valve body and damage the valve. Conversely, tightening the nuts without holding the studs can back the studs out, causing a separation of the two halves of the valve body, and possibly a leak.

1. Park the vehicle on a level surface, apply the parking brakes, and chock the tires.
2. Run the engine to build vehicle air pressure to at least 100 psi (690 kPa). Turn off the engine and wait 5 to 10 minutes for the system to equalize.

   NOTE: Normal operation of the height-control valve requires a maximum of 10 minutes to settle. Any air leakage during this time is considered normal and does not indicate a damaged valve.
3. Apply a soap-and-water solution to the outside of the air fittings on the height-control valve and on the suspension air springs. Look for bubbles indicating an air leak.
4. If bubbles are seen, check that the air tubing is installed correctly into the fitting.

   If no bubbles are seen, check the height-control valve for air leaks; see **Subject 110**.

Diagnostics and Testing

Air Spring

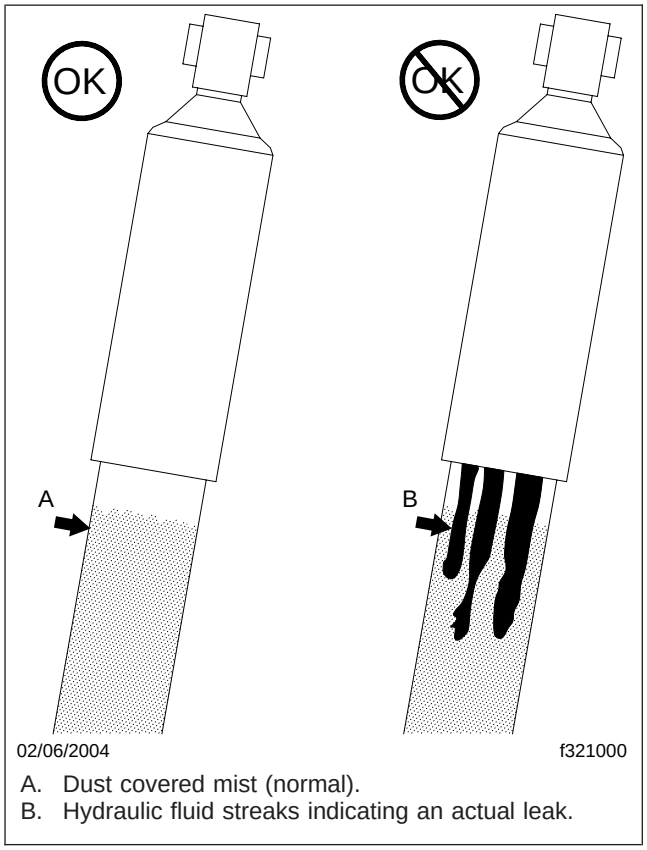
Inspect the exterior surfaces of the air spring, looking for wear. With the air spring fully inflated, check to see if there is sufficient clearance around the air spring to prevent lines or objects from rubbing against the air spring. Air tubing or cab components that rub against the air spring will cause damage to the air spring. If the air spring is not capable of lifting the cab to its proper ride height, check to see if the shock absorber is damaged. A binding shock absorber will limit the air spring's ability to extend. To clean the air spring, use soap and water.

NOTE: Do not use organic solvents, abrasives, or pressurized steam cleaners to clean the air spring.

Shock Absorber

Inspect the shock body for damage such as bends or dents in the piston. Bends or dents in the shock body will negatively affect the operation of the shock. Inspect the shock body for signs of leaking fluid. Normal operation of the shock will result in some misting of the hydraulic fluid onto the exterior shock body. Large streams of fluid indicate a leak and the shock should be replaced; see **Fig. 1**. To test the operation of a shock absorber, hold the shock in an upright position and cycle the piston at least five times by pushing the piston up and down. The piston should move evenly throughout each section of the cycle. If the shock does not move evenly when pushed down or pulled up, the shock should be replaced. Noises such as squeaks, which may be intermittent, may be caused by the valves used to regulate the internal hydraulic fluid. This problem is not repairable and the shock will need to be replaced. Noises from the shock, such as knocking or rattling, may be due to movement between the bushings and mounting brackets. Inspect the bushings or mounting brackets for wear. Repair worn components as necessary. Check the torque of the shock absorber mounting nuts and tighten if necessary.

NOTE: The shock absorber bushings do not require any type of lubrication. Do not attempt to stop bushing noise by lubricating them; grease and mineral-oil-base lubricants will deteriorate the bushing rubber.



A. Dust covered mist (normal).
B. Hydraulic fluid streaks indicating an actual leak.

Fig. 1, Differences Between Misting and Leaking

Torque Specifications

Unless listed in **Table 1**, tighten all fasteners using the torque specifications found in **Section 00.05**.

IMPORTANT: To prevent voiding the warranty on Barksdale height-control valves, note the following:

- Do not overtighten the bolts in the Barksdale height-control valve housing. The bolts should not be loose, and should not require tightening. Only if necessary, tighten the valve housing bolts 45 lbf·in (500 N·cm). Any damage to the valve housing will void the warranty.
- Do not attempt to disassemble the Barksdale valve body or the control lever. There are no serviceable parts in the valve, and any disassembly will void the warranty.

⚠ CAUTION

When removing or loosening a Barksdale height-control valve from a mounting bracket, always hold the valve-side mounting studs in place with an Allen wrench while loosening or tightening the nuts that attach the valve to the bracket. Because the mounting studs are threaded into the valve body, loosening the nuts without holding the studs can tighten the studs, which can crush the valve body and damage the valve. Conversely, tightening the nuts without holding the studs can back the studs out, causing a separation of the two halves of the valve body, and possibly a leak.

Plumbing Diagram

For the cab air suspension plumbing diagram, see **Fig. 1**.

Special Tools

Use the kit shown in **Fig. 2** to test a Barksdale height-control valve. Test kit BKS KD2264 is available via the Direct Ship program in paragon.

Torque Values			
Description	Size	Torque*	
		lbf·ft (N·m)	lbf·in (N·cm)
Height-Control Valve Housing Bolts†	1/4–20	—	45 (500)
Height-Control Valve Mounting Locknuts†	1/4–20	—	95 (1100)
Lower Shock Absorber Hexnuts	7/16–20	22–32 (30–44)	—
Upper Shock Absorber Hexnuts	1/2–13	45 (61)	—
Lateral Control Rod Fasteners	1/2–13	45 (61)	—

6. Flatwasher
7. Cab Framework
8. 5/8–11 Isolator Hexbolt
9. Cab Mount Assembly
10. 1/2–13 Hexnut

Fig. 1, Forward Cab Mount Fasteners

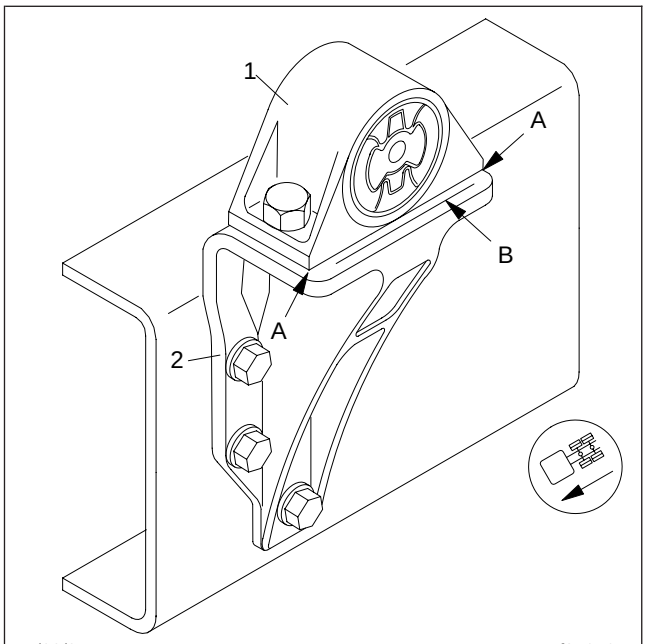
4. Remove the 5/8–11 fasteners that hold the cab mount assembly to the cab underbody bracket.
5. If needed, raise the cab so the tab on the bottom of the cab mount assembly clears the hole on the frame rail bracket; then remove the cab mount assembly.
6. Install a new cab mount assembly.

6.1 Put the cab mount assembly between the ears of the cab underbody bracket; then install the 5/8–11 isolator hexbolt, washers and nut. Make sure the bolt head is facing outboard.

6.2 Hand tighten the nut

6.3 Carefully lower the cab, making sure the tab at the bottom of the cab mount assembly lines up with the square hole in the frame rail bracket.

Make sure the outboard edge of the cab mount assembly is parallel with the grooves machined into the top surface of the frame rail mounting bracket. **See Fig. 2.** Also make sure that the same number of grooves is showing on both sides of the vehicle.



11/09/95 f310504

A. The edge of the cab mount assembly is to be parallel to the grooves on the bracket.
B. The same number of grooves is to be showing on both sides of the vehicle.
1. Cab Mount Assembly
2. Frame Rail Bracket

Fig. 2, Forward Cab Mount Installation

6.4 Install the 1/2–13 hexbolts, washers and nuts through the cab mount assembly and

Forward Cab Mount Replacement

the frame rail bracket, with the bolt heads facing up. Tighten the nuts 68 lbf·ft (92 N·m).

6.5 Tighten the nut on the isolator hexbolt 136 lbf·ft (184 N·m).

7. Remove the chocks from the tires.

Forward Cab Mount Replacement, Argosy COE

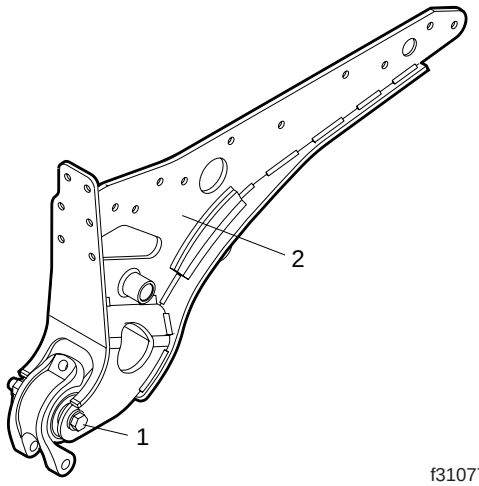
Replacement

1. With the vehicle parked, apply the parking brakes and chock the tires.

⚠ CAUTION

Stand away from the front-wall access panel when opening it. The access panel can open quickly and could hit a person, possibly resulting in personal injury.

2. Raise the front-wall access panel.
3. Remove the lower grille panel, as follows.
   - 3.1 Remove the four Allen-head screws that secure the grille panel support brackets to the front-wall crossmember.
   - 3.2 Lift the grille panel up and away from the vehicle.
4. Remove the headlight fascia, as follows.
   - 4.1 Disconnect the electrical connections to the headlights and parking lights.
   - 4.2 Remove the five fasteners that secure the headlight fascia to the cab, and remove the fascia.
5. Disconnect the tilt cylinder, as follows.
   - 5.1 Remove the cotter pin and washers. Have an assistant adjust the cab height until the clevis pin loosens.
   - 5.2 Remove the cylinder clevis pin.
   - 5.3 Disconnect the tilt cylinder.
6. Using a hydraulic jack, raise the cab and support it with jack stands.
7. Remove the cab mount hinge bolt; see **Fig. 1**.
8. On the left side of the vehicle, remove the clamps that secure the heater hoses to the front wall. Move the hoses aside.
9. On the right side of the vehicle, disconnect the clutch linkage; see **Section 25.03**.
10. Remove the six bolts that secure the cab mount bracket to the front wall.
11. Under the cab, remove the ten bolts that secure the cab mount bracket to the cab underbody.



1. Cab Mount Hinge Bolt
2. Cab Mount Bracket

Fig. 1, Forward Cab Mount Assembly

NOTE: For easier access to the cab mount on the left side of the vehicle, remove the engine oil and ATF/fill dipsticks.

12. On the left side of the vehicle, remove the brackets that secure the A/C lines to the cab underbody. Move the A/C lines aside.

NOTE: Using a hoist, or other suitable lifting device, adjust the cab height as necessary for clearance when removing the cab mount.

13. Remove the cab mount bracket.
14. Position a new cab mount on the cab underbody, and tighten the ten bolts finger-tight.
15. Place the brackets around the A/C lines, and tighten them securely.
16. If removed, install the engine oil and ATF/fill dipsticks.
17. Install the six bolts that secure the cab mount bracket to the front wall. Tighten the bolts 40 lbf·ft (54 N·m).
18. Tighten the ten bolts on the cab underbody 40 lbf·ft (54 N·m).
19. On the right side of the vehicle, connect the clutch linkage; see **Section 25.03**.

Forward Cab Mount Replacement, Argosy COE

20. On the left side of the vehicle, install the clamps that secure the heater hoses to the front wall. Tighten the clamps securely.
21. Support the cab with a hydraulic jack, and remove the jack stands. Lower the cab onto the vehicle chassis.
22. Install the cab mount hinge bolt; see **Fig. 1**. Tighten the bolt 130±10 lbf·ft (176±14 N·m).
23. Position the tilt cylinder on the cab underbody. Install the clevis pin, the washers, and the cotter pin.
24. Position the lower grille panel on the vehicle. Tighten the four support bolts 95 lbf·ft (129 N·m).
25. Install the headlight fascia, as follows.
    - 25.1 Attach the headlight fascia to the cab with the five fasteners.
    - 25.2 Connect the electrical connections to the headlights and parking lights.
26. Lower the front wall access panel.
27. Remove the chocks.

Forward Cab Isolator Replacement, Argosy COE

Replacement

1. Apply the parking brakes and chock the tires.

CAUTION

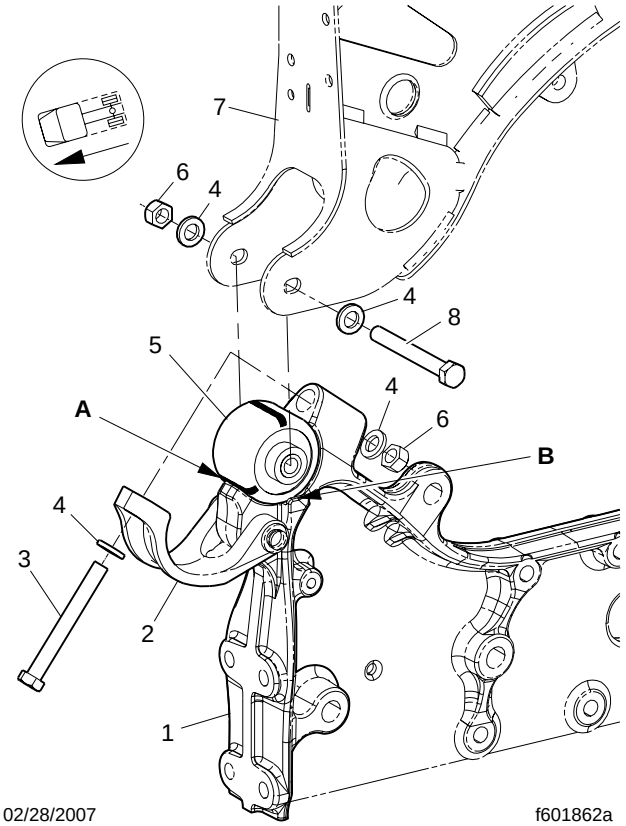
Stand away from the front-wall access panel when opening it. The access panel can open quickly and could hit a person, possibly resulting in personal injury.

2. Raise the front-wall access panel.
3. Remove the lower grille panel, as follows.
   - 3.1 Remove the four Allen-head screws that secure the grille panel support brackets to the front-wall crossmember.
   - 3.2 Lift the grille panel up and away from the vehicle.
4. Remove the headlight fascia, as follows.
   - 4.1 Disconnect the electrical connections to the headlights and parking lights.
   - 4.2 Remove the five fasteners that secure the headlight fascia to the cab, and remove the fascia.
5. Disconnect the tilt cylinder, as follows.
   - 5.1 Remove the cotter pin and washers. Have an assistant adjust the cab height until the clevis pin loosens.
   - 5.2 Remove the cylinder clevis pin.
   - 5.3 Disconnect the tilt cylinder.
6. Remove the isolator cap bolt, washers, and hexnut from the left-hand forward frame; see **Fig. 1**. Rotate the isolator cap downward to expose the isolator.

WARNING

When using a hydraulic jack to raise the cab, ensure that the jack is stabilized and that the cab remains in the intended position. An improperly raised cab can fall, possibly resulting in serious injury and property damage.

7. Using a hydraulic jack, raise the cab just enough to take the weight off the isolator.



A. Align the center of the wide stripe on the isolator with the forward edge of the casting.
B. The isolator must seat between the locator nubs on the casting.

1. Forward Frame
2. Isolator Cap
3. Isolator Cap Bolt
4. Washer
5. Isolator
6. Hexnut
7. Cab Mount Bracket
8. Cab Mount Hinge Bolt

Fig. 1, Cab Tilt Pivot Assembly (left-hand shown)

8. Remove the cab mount hinge bolt, washers, and hexnut. If necessary, raise or lower the cab slightly in order to remove the bolt.
9. Remove the isolator.
10. Repeat the above steps to remove the isolator cap bolt, cab mount hinge bolt, and isolator from the right-hand forward frame.
11. Carefully position a new isolator on the left-hand forward frame. Align the center of the wide stripe on the isolator with the forward edge of the for-

Forward Cab Isolator Replacement, Argosy COE

ward frame casting. Make sure the isolator is seated between the locator nubs on the casting; see **Fig. 1**.

NOTE: The elasticity of the isolator is direction-dependent to provide vertical flexibility and lateral stability. During installation, the isolator must be correctly aligned in the forward frame to function properly.

12. Insert the cab mount hinge bolt through a washer, the cab mount bracket, and the isolator. Install the second washer and hexnut on the bolt. Tighten the hexnut 130 lbf·ft (176 N·m).
13. Rotate the isolator cap up to enclose the isolator.
14. Install the isolator cap bolt, two washers, and the hexnut. Tighten the hexnut 90±10 lbf·ft (122±14 N·m).
15. Repeat the previous steps to install the isolator, cab mount hinge bolt, and isolator cap bolt on the right-hand forward frame.
16. Position the tilt cylinder on the cab underbody. Install the clevis pin, the washers, and the cotter pin.
17. Lower the cab and remove the hydraulic jack.
18. Install the headlight fascia, as follows.
    - 18.1 Attach the headlight fascia to the cab with the five fasteners.
    - 18.2 Connect the electrical connections to the headlights and parking lights.
19. Position the lower grille panel on the vehicle. Tighten the four support bolts 95 lbf·ft (129 N·m).
20. Lower and secure the cab front-wall access panel.
21. Remove the chocks.

Specifications

See **Table 1** for torque specifications.

Lower Bunk Structure Removal and Installation

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Disconnect the batteries.

⚠ WARNING

Support the bunk assembly before removing the gas springs. If not supported, the bunk could fall on you, which could result in personal injury.

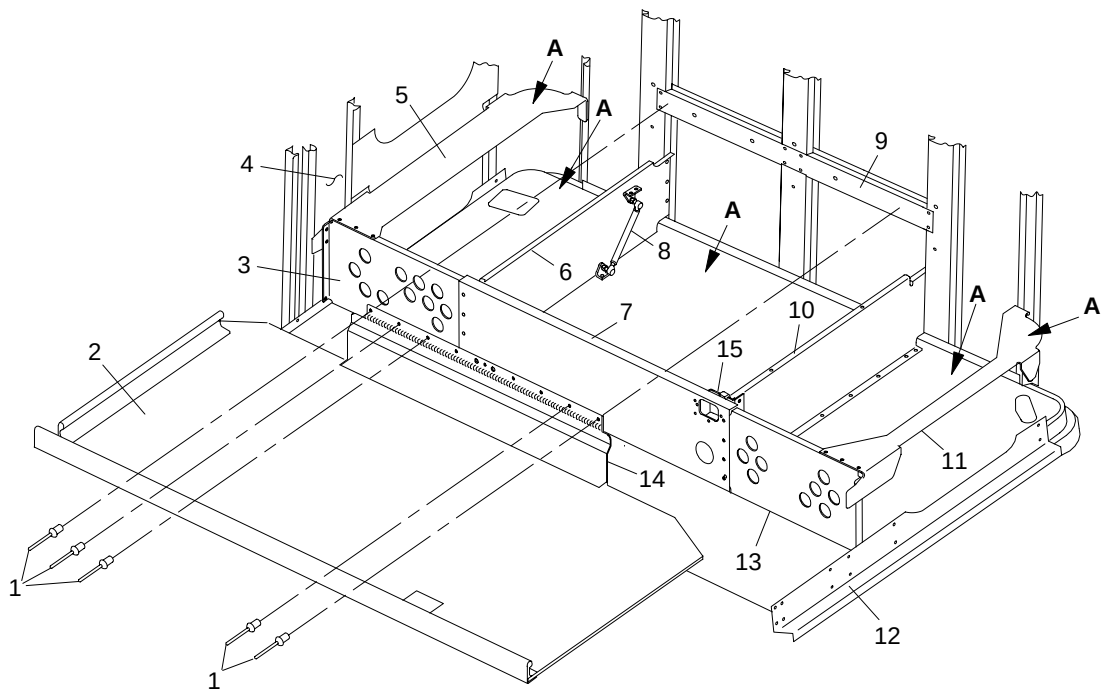
3. Remove the bunk. See **Fig. 1.**

3.1 Remove the mattress pad; then raise the bunk.

3.2 Disconnect the wiring from the lights on the bottom surface of the bunk.

3.3 Support the bunk to keep it from falling; then disconnect the two gas springs from the bunk and the bunk side partitions. Disconnect them by first pulling out the end cap, then removing the gas spring from the ball stud. See **Fig. 2.**

3.4 Lower the bunk; then remove the bunk hinge assembly from the sleeper back wall. See **Fig. 1.**



11/16/95 f601085

NOTE: Not all parts are shown.

A. Remove upholstery from here.

1. Blind Rivets
2. Bunk Assembly
3. Right Front Bunk Partition

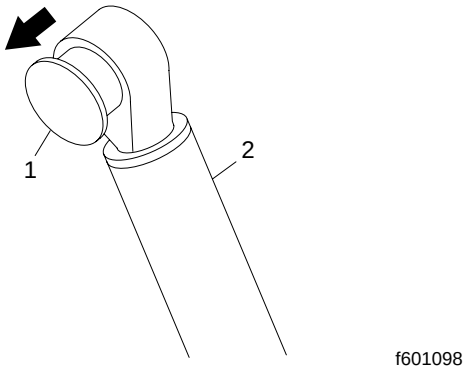
6. Right-Hand Side Bunk Partition
7. Front Center Bunk Partition
8. Right Gas Spring
9. Sleeper Back Wall
10. Left-Hand Side Bunk Partition
11. Left Bunk Support Angle
12. Sleeper Deck
13. Left Front Bunk Partition
14. Bunk Hinge Assembly
15. Bunk Latch Mounting Bracket

Fig. 1, Bunk Structure

Lower Bunk Structure Removal and Installation



1. End Cap (shown pulled out)
2. Gas Spring

Fig. 2, Disconnecting the Gas Spring

3.5 Remove the bunk assembly from the vehicle.

4. Remove the upholstery, floor mats, and carpeting from inside the bunk partition area and the tops of the bunk partitions and supports.

NOTE: Some vehicles have a slot built into the under bunk structure. This area may be used for a cooler. See **Fig. 3.**

5. Disconnect the wiring from the auxiliary HVAC; then move the wiring harness up forward by the "B" pillar, and out of the way.
6. Disconnect, then remove the auxiliary HVAC ducting.
7. Remove the bunk support angles and partitions. See **Fig. 1.**

7.1 Remove the fasteners holding the bunk latch mounting bracket in place; then remove it.

7.2 Remove the fasteners holding the support angles in place; then remove them.

7.3 Remove the fasteners holding the front center bunk partition in place; then remove it.

7.4 Remove the fasteners holding the right and left front bunk partitions in place; then remove them.

7.5 Remove the fasteners holding the right-hand and left-hand side bunk partitions in place; then remove them.

Installation

1. Using 1/4-inch Magnabulb fasteners, install the bunk partitions and support angles. See **Fig. 1.**

1.1 Install the front center bunk partition to the sleeper deck.

1.2 Install the right and left front bunk partitions to the sleeper deck; then the center front bunk partition and the side partitions.

1.3 Install the side support angles to the Z-strips on the back wall, the side walls, and the tops of the right and left front bunk partitions.

1.4 Install the left-hand and right-hand side bunk partitions to the sleeper deck, the back wall, and the front partitions.

1.5 Install the bunk latch mounting bracket to the center bunk partition and to the left-hand side bunk partition.

2. Install the HVAC ducting.
3. Route the wiring harness along the sleeper back wall, and inside the bunk partitions; then connect the wiring to the auxiliary HVAC unit.
4. Install the floor mats and carpeting inside the bunk partition.
5. Install the HVAC ducting.
6. Install the bunk.

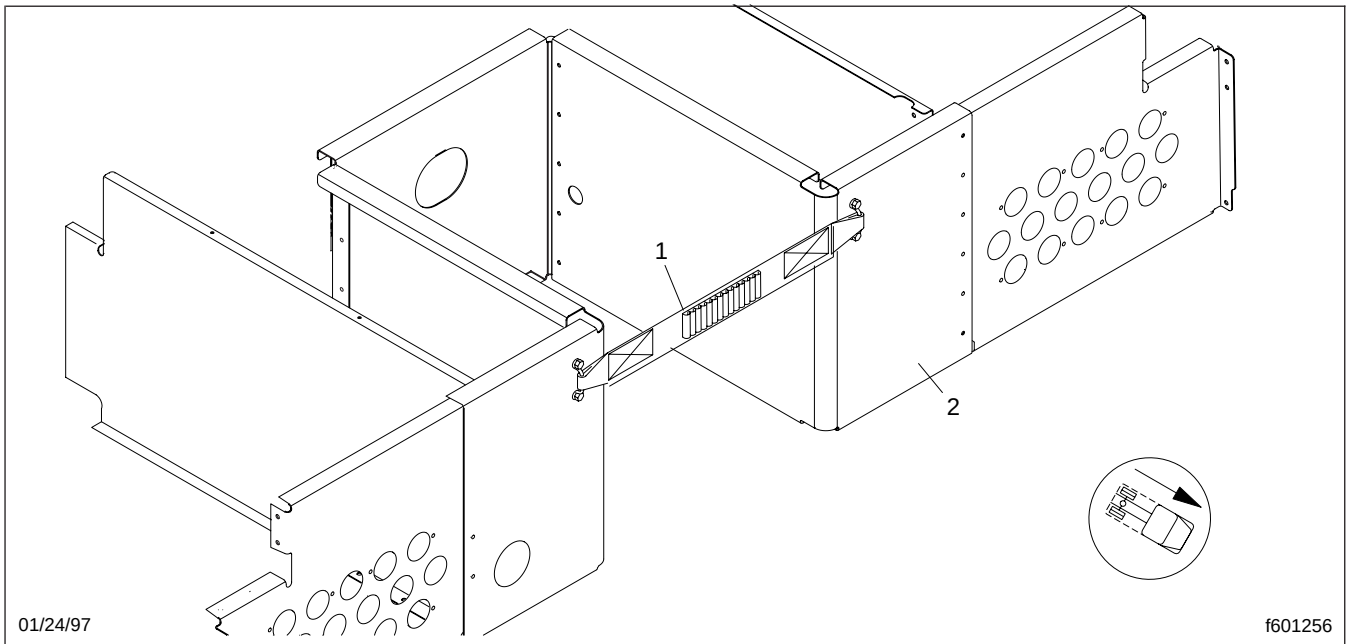
6.1 If not already done, install the hinge assembly to the rear edge of the bunk.

6.2 Using 1/4-inch Magnabulb fasteners, install the bunk and hinge assembly to the back wall of the sleeper.

6.3 Install the gas springs to the bunk and bunk side partitions.

6.4 Connect the wiring to the lights on the bottom surface of the bunk.

7. Close the bunk, then install the mattress pad.
8. Remove the chocks from the tires.



1. Strap
2. Bunk Partition

Fig. 3, Under Bunk Slot

Dymetrol Upper Bunk Removal and Installation

Removal

1. Park the vehicle and apply the parking brake.
2. Chock the tires.
3. Remove the bunk. See **Fig. 1.**

WARNING

WARNING: Support the bunk assembly before removing the mounting bolts. If not supported, the bunk could fall on you, which could result in

3.2 Remove the two bunk mounting bracket covers.

personal injury.

3.3 Support the bunk assembly, then remove the nut, bolt, and washers from each of the two bunk mounts.

Dymetrol Upper Bunk Removal and Installation

3.4 With the aid of a helper, remove the bunk assembly from the vehicle.

Installation

1. Install the bunk. See **Fig. 1.**

   1.1 With the aid of a helper, set the bunk in its raised position onto the mounts. Support the bunk securely.

⚠ WARNING

WARNING: Support the bunk assembly while installing the mounting bolts. If not supported, the bunk could fall on you, which could result in personal injury.

   1.2 Carefully lower the bunk and secure the latches to the striker pins.

   1.3 On each side, install the mounting bolt and washers and tighten the nut.

   1.4 Place the two mounting bracket covers in position over the bunk mounting brackets.

   1.5 Secure each cover with two Christmas-tree fasteners.

2. Remove the chocks from the tires.

General Information

Although the raised roof cap exterior panels and the interior panels are made of different materials, they are closely related in manufacture and repair procedures.

Exterior Panel Manufacture

Raised roof cap panels are made of glass fiber reinforced plastic (FRP) materials. FRP panels are manufactured using both male and female molds. The steel molds are maintained at temperatures ranging between 120° and 150°F (49° and 66°C).

Initially, the mold halves are coated with a release agent to permit part removal after the resin hardens. Next, the glass reinforcing fabric is attached to the female mold half. Now the resin is catalyzed and poured into the female mold half. The mold halves are then nested together, but with a gap between them in order to produce the specified thickness in the finished panel.

The resin is allowed to harden in the mold. After the resin hardens, the mold is separated and the part removed. This process produces parts with uniform wall thickness and smooth inner and outer walls.

Roof Cap Construction

The roof cap is assembled in the following manner:

1. After the parts are molded, any holes or cutouts that were not molded are added.
2. All parts are cleaned and then sanded.
3. A two-part urethane adhesive is applied to the mating surfaces.
4. The exterior cap panels are assembled in a fixture. The fixture includes heated clamping blocks that clamp the outer panels at the bond lines to speed the cure process.
5. The outer panel assembly is inverted in another fixture. The front interior panels and the rear interior panels have urethane adhesive applied to their bonding surfaces and are then bonded to the exterior cap subassembly.
6. Finally, the rear interior panel subassemblies are bonded to the exterior cap, completing the roof cap assembly. After assembly, the interior panels provide structural reinforcement to the exterior cap panels.

If it is damaged, the cap can be repaired by following the procedures specified in **Subject 100**. If the cap is so badly damaged that the major subassemblies described above need to be replaced, remove the entire roof cap and replace it with a service cap available through the Daimler Trucks North America Parts Distribution Centers.

Interior Panel Manufacture

The interior panels are made of RIM polyurethane. Because it is a different material than fiberglass, the repair and replacement of the RIM components varies from the repair of the exterior panels of the raised roof components.

The RIM components are manufactured using a closed-mold process, in which a male and a female mold are brought together to form a part.

The mold, or cavity, is textured, which gives the part its final surface texture. Just prior to closing the mold, the mold is painted with the final surface finish.

A mixture of two liquid compounds is then injected into the closed molds. This, coupled with the mold temperature, initiates a chemical reaction that will eventually yield the finished part after the liquid mixture is allowed to harden in the mold.

The mold is separated, and the part is removed. This process produces parts with uniform wall thickness and surfaces of any given texture and color.

If damaged, the cabinets can be repaired by following the procedures specified in **Subject 110**.

Repair Safety Precautions

Before performing any roof cap repairs, read the following precautions. Observe any additional precautions given by the manufacturers of the repair materials used.

1. All of the raw materials used in repairing roof cap panels are harmful to the eyes and could cause blindness. Wear goggles or other protective eye shields to reduce the chances of splash contacting your eyes.
2. Wear protective gloves, as some people may have skin sensitivity to repair adhesives. Also, don't allow the adhesives to contact your skin; the adhesives can be a skin irritant.

IMPORTANT: In case the adhesives contact your skin, wash with soap and water. If the hardener or resin should contact your eyes, rinse with plenty of water (15 minutes), and call a doctor.

3. When working with roof cap materials, wear disposable or old clothing, since the repair adhesives may damage the cloth. Wash the clothing before wearing it again.
4. Most of the liquids involved in panel repair and cleanup (especially when using acetone as a solvent) are flammable; some are also toxic. Don't perform repairs in areas where exposed (or stored) flammable liquids may contact an open flame or any burning material, such as a cigarette. Don't perform repairs in areas that are not well ventilated.

⚠ WARNING

WARNING: Ensure that roof cap panel repairs are done in a safe workshop area with adequate ventilation. Failure to do so could result in severe personal injury due to explosion of flammable liquids or breathing of toxic fumes.

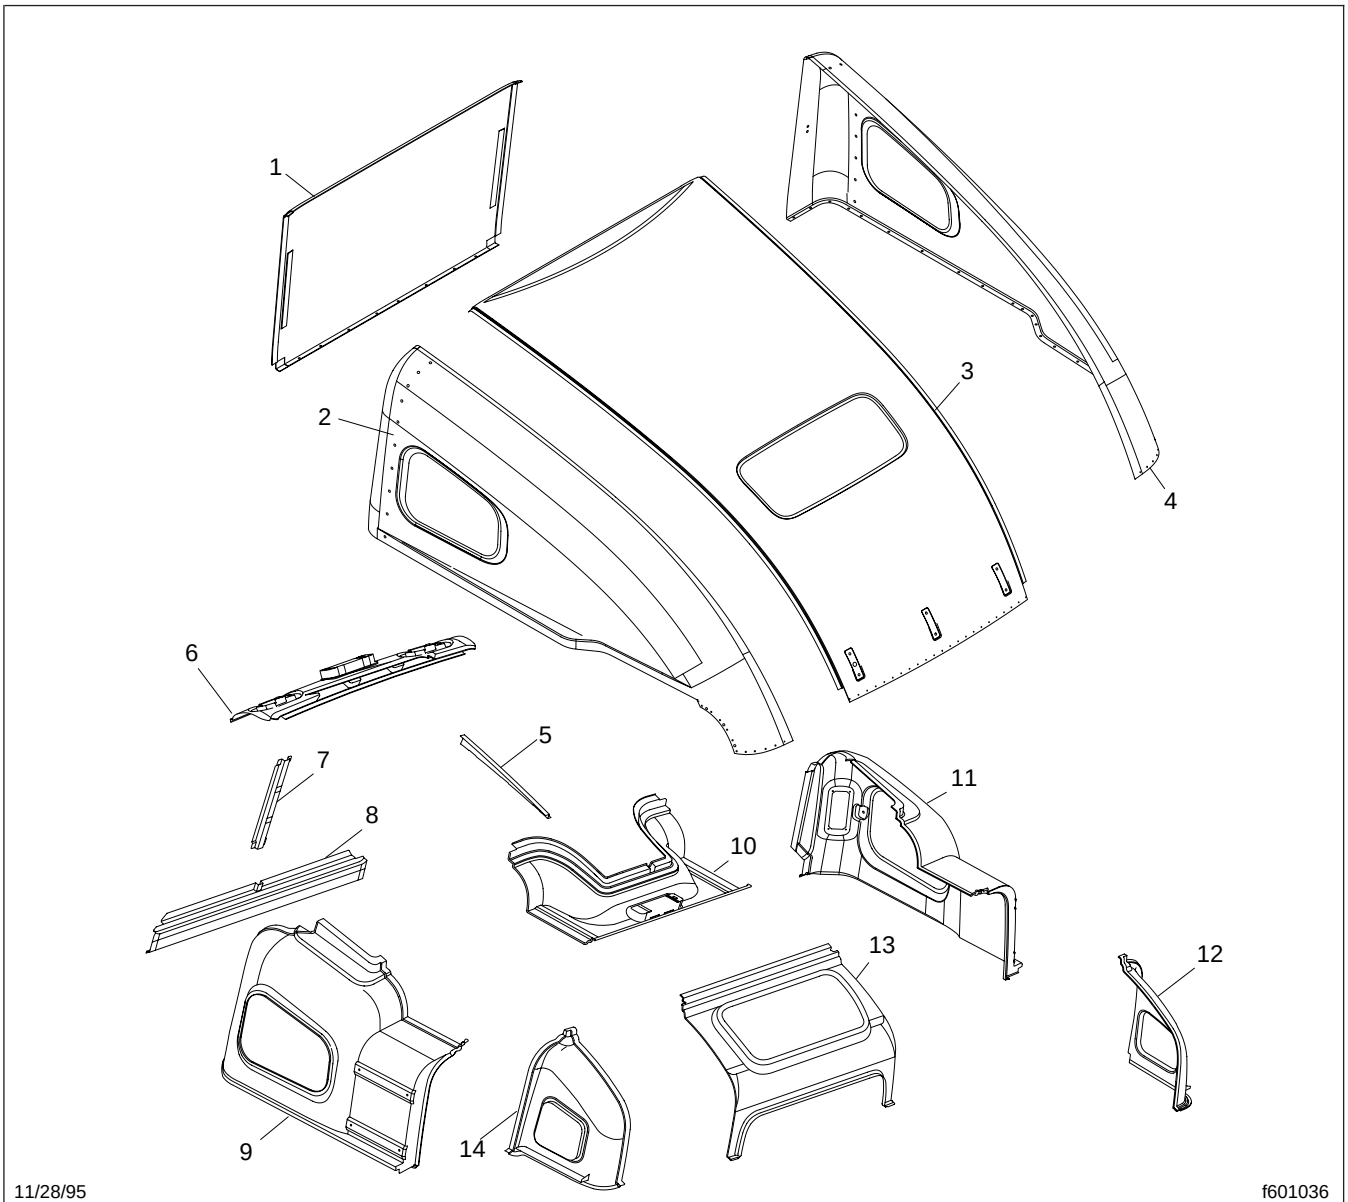
5. Do not use electric tools when the fumes of flammable solvents are present. The heat or sparks generated by the tools could create a fire hazard.
6. When grinding or sanding roof cap panels, wear goggles or other protective eye shields, and also an air-purifying respirator, either a throwaway type or one with a replaceable particulate filter(s). Don't breathe grinding dust or particles, otherwise irritation may occur. Also, during grinding and sanding operations, wear a disposable (paper) shop coat to keep dust and fibers off your clothing.
7. Because fiberglass dust can shorten the life of electrical units, air-powered tools are preferred (for frequent use).

Surface Damage Repair — Exterior and Interior Panels

Surface damage refers to scratches, chips, or nicks on the exterior roof cap panels or roof cap panels. See **Fig. 1**. To repair surface damage, do the following steps:

1. Locate the damaged area. If there are cracks, see if they go all the way through the panel. If they do, refer to "Structural Damage Repair" for instructions.
2. Clean the area with xylene or an equivalent grease- and wax-removing solvent. Inspect the area closely.
3. Using 220-grit or finer sandpaper, remove all of the paint around the damaged area to a distance of about 1-1/2 inches (4 cm). See **Fig. 2**.
4. Using an air nozzle, blow off all dust.
5. Wipe filler (Ashland Pliogrip 7775L) over the non-coated area and spread a thin layer using a squeegee applicator. Cover the entire damaged area, overlapping onto the painted surface. Leave a crowned excess of filler, slightly higher than the painted surface.
6. After the filler dries (about 50 minutes), sand it with a hand-held disc pad. Use 320-grit or finer sandpaper. Feather the edges of the fill so there are no visible sharp edges.
7. Clean the area with compressed air. Mask the area, then spot prime and paint it. Use Sherwin Williams BB–11 black conductive primer. See **Group 98** for spot-painting instructions.

Raised Roof Cap Repairs



1. Center Rear Skin
2. Right-Hand Side Skin

3. Scratch

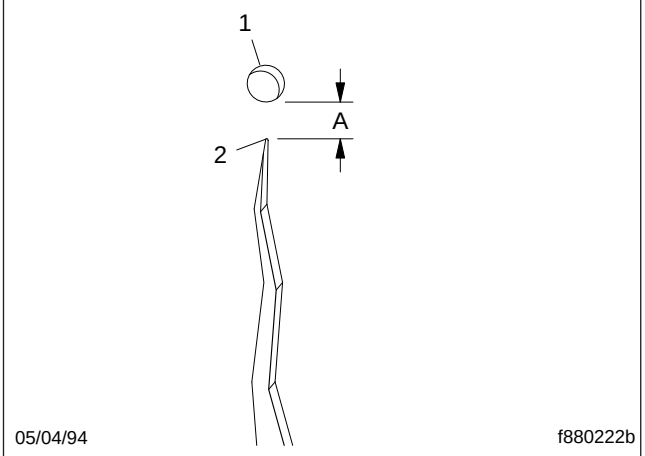
Fig. 2, Damaged Area With Paint Removed

Structural Damage Repair

CRACK OR SMALL HOLE REPAIR

A crack (fracture) or small hole through the laminate requires repair with a fiberglass reinforced patch. This repair is valid for panels 1 through 4, **Fig. 1**.

1. Examine the damage to the roof cap assembly. Apply hand pressure all around the damaged area to check for any concealed damage.
2. If upholstery and/or thermal insulating material is present in the damaged area, remove the material to provide an adequate working area.
3. Clean the area with xylene, acetone, or an equivalent grease- and wax-removing solvent. Inspect the area closely. All dirt, water, grease, and oils must be removed.
4. If repairing a crack, use a 1/8-inch diameter bit to drill a hole completely through the uncracked laminate 1/8 inch (3 mm) from each end of the crack, to prevent the crack from lengthening. See **Fig. 3**
5. On the inner surface of the panel, use a router bit (on a grinder or a drill) to grind away a shallow recess one-quarter the depth of the roof panel and 1/2 inch (13 mm) outward from all sides of the damage. Taper the outside edge of the ground area. See **Fig. 4**.

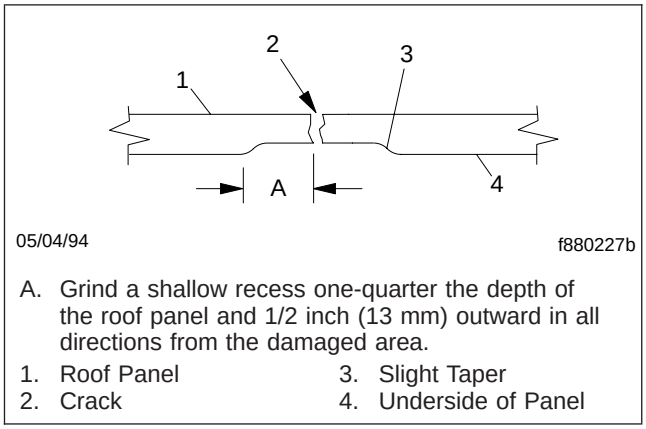


A. Drill a 1/8-inch hole, 1/8 inch (3 mm) away from the end of a crack.

1. 1/8-Inch Hole
2. End of Crack

Fig. 3, Crack Prevention

If repairing a crack, grind outward to the drilled hole at the end of the crack, but not beyond. See **Fig. 5**, Ref. A.



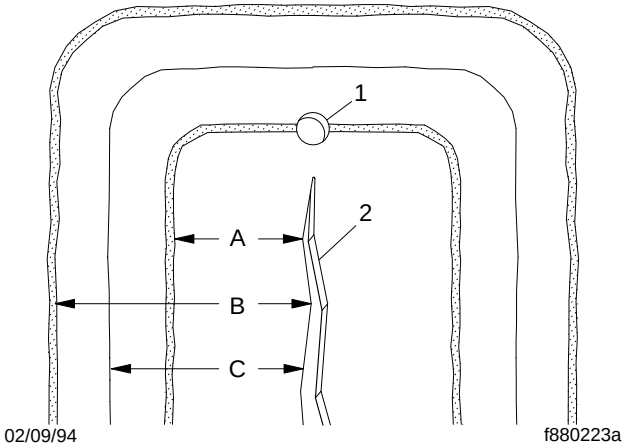
A. Grind a shallow recess one-quarter the depth of the roof panel and 1/2 inch (13 mm) outward in all directions from the damaged area.

1. Roof Panel
2. Crack
3. Slight Taper
4. Underside of Panel

Fig. 4, Recessed Area (cross-sectional view)

6. Use 80- to 220-grit sandpaper to scuff an area at least 1 inch (25 mm) away from the fracture on all sides. Be sure to scuff thoroughly, since this will give the patch a surface to which it can stick. See **Fig. 5**, Ref. B.
7. Blow the dust away with compressed air and wipe the area with a clean cloth.

Raised Roof Cap Repairs



A. Use a router to grind away a shallow recess one-quarter the depth of the roof panel and 1/2 inch (13 mm) outward from the damage. If repairing a crack, don't grind past the hole drilled at the end of the crack.
B. Use 80- to 220-grit sandpaper to scuff the area one inch (25 mm) around the damage.
C. Cut the fiberglass cloth to fully cover the damage, and overlay about 3/4 inch (19 mm).
1. Hole
2. Crack

Fig. 5, Preparing the Damaged Area on the Inner Side of the Roof Panel

8. If necessary, align the panel sections on both sides of the crack, using weights or clamps to re-establish the original panel profile.
9. With a razor-blade knife, cut a section of woven fiberglass cloth to fully cover the crack and to overlay about 3/4 inch (19 mm). See **Fig. 5**, Ref. C.
10. To bond the fiberglass cloth to the damaged panel, use Ashland Pliogrip® 7775 urethane adhesive.

    When using Ashland Pliogrip 7775: Dispense the required adhesive from the cartridge in a continuous bead of uniform size and a uniform green color. Discard the initial few inches of discolored bead.
11. Use a plastic or metal device to spread a thin layer of the bonding agent over the scuffed area.
12. Lay the cut section of fiberglass cloth on the repair area, centered over the damage. Using a fiberglass roller, press the cloth down firmly into the layer of bonding agent to completely soak the glass fibers.
13. Apply another layer of bonding agent over the glass cloth. Spread the agent evenly using the fiberglass roller.
14. After two to five minutes, the bonding agent will start to jell. It may take more time when cool, less when warm.

IMPORTANT: To avoid pre-jelling or skin-over, mate the FRP parts to be bonded within five minutes after extruding and applying the bonding agent.

NOTE: To get a smoother surface, press a piece of masking tape, wider than the repair, directly over the wet bonding agent and smooth it before it hardens. The tape can be removed after 15 minutes when the agent has set.

15. The patch should be hard enough in 50 minutes to allow sanding to a smooth flat surface if required.
16. Repair the damage on the outside surface of the panel and paint the surface on both sides, using the instructions in "Surface Damage Repair."

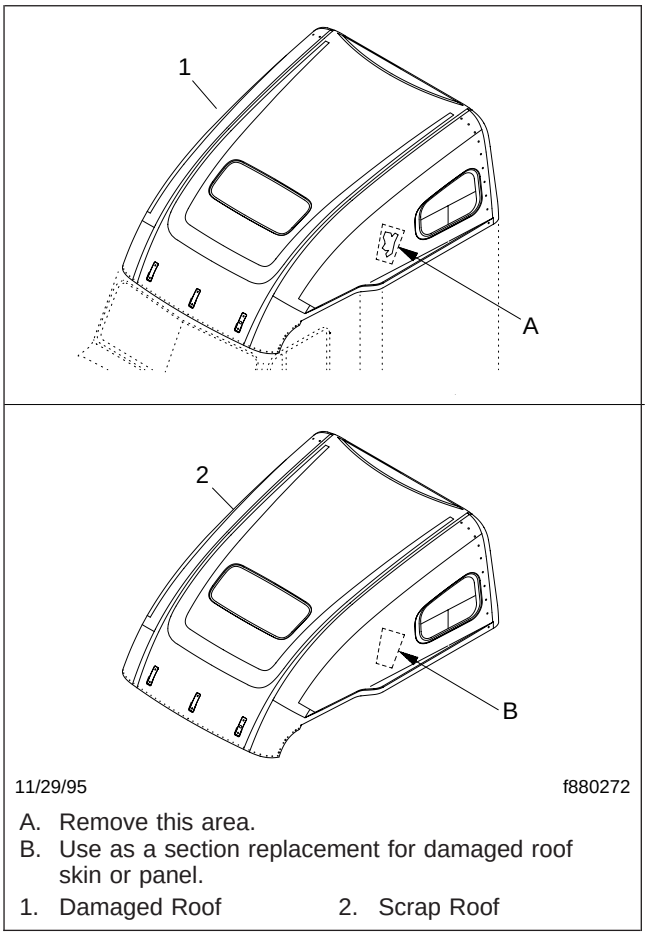
PUNCTURE AND LARGE FRACTURE REPAIR (SECTION REPLACEMENT)

On very large damaged areas (for example, structural damage on the roof cap covering an area of a square foot or more) it may be easier to do a section replacement rather than make a patch. Panels and roof reinforcements may be used in section replacements. Also, another damaged roof with the needed section intact may be available as scrap.

IMPORTANT: Do not use interior panel sections as replacement for damaged outer skin panels. The interior panels have no reinforcement, and cannot be sanded and refinished.

1. Push in on the area immediately surrounding and underneath the damaged area to determine the extent of the damage.
2. If upholstery and/or thermal insulating material is present in the damaged area, remove the material to provide an adequate working area.

3. Clean the area with xylene, acetone, or an equivalent grease- and wax-removing solvent. Inspect the area closely. All dirt, water, grease, and oils must be removed.
4. Using a saber saw, cut out a large, straight-sided panel containing the damaged area. See the example in **Fig. 6**, Ref. A. If the damage extends to a joint where the part is bonded to another, first separate the bonded portion of the damaged section with a heat gun and putty knife before cutting.



A. Remove this area.
B. Use as a section replacement for damaged roof skin or panel.
1. Damaged Roof
2. Scrap Roof

Fig. 6, Section Replacement of a Damaged Fiberglass Roof

WARNING

WARNING: Wear goggles and an air purifying respirator when grinding, cutting, or sanding during all fiberglass repairs. The ground dust and particles could cause temporary or permanent damage to your eyes and, if inhaled, could cause throat or lung irritation.

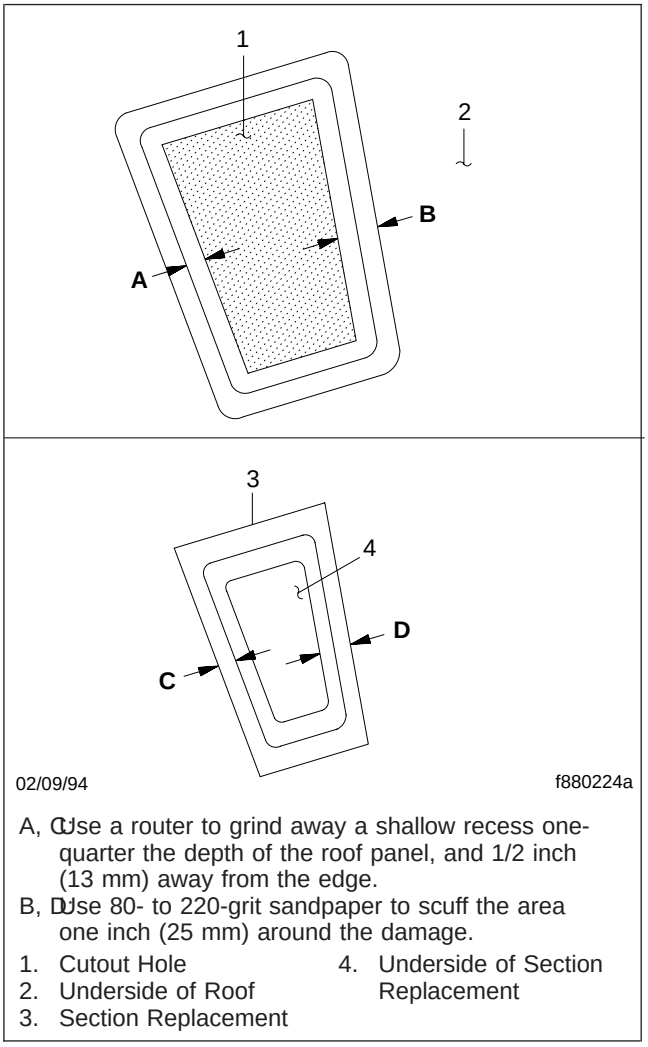
CAUTION

CAUTION: Do not use a heat gun on the interior panels. The interior roof cap panels are made with a urethane based material that has the same melting properties as the urethane adhesive used to manufacture the cap. Heat will destroy the interior panel before the glue debonds.

5. From the scrap roof panel or new part, cut a section replacement panel from the same area, only slightly larger than the original cutout. See the example in **Fig. 6**, Ref. B. Then, trim the section replacement to fit both the size and contour of the original cutout.
6. After the trimming is completed, sand the edges to allow a 1/16- to 1/8-inch (about 2- to 3-mm) gap around the cutout.
7. On the inner side of the panel, use a router bit (on a grinder or drill) to grind away a shallow recess one-quarter the depth of the roof panel, 1/2 inch (13 mm) outward from all sides of the cutout area. See **Fig. 7**, Ref. A. Also, grind 1/2 inch (13 mm) inward from all sides of the section replacement. See **Fig. 7**, Ref. C. Slightly taper the outside edge of the ground area on the roof panel and the inside edge of the ground area on the section replacement. See **Fig. 8**.
8. Use 80- to 220-grit sandpaper to scuff an area at least 1 inch (25 mm) out from all sides of the cutout area. See **Fig. 7**, Ref. B.

   Also, scuff at least 1 inch (25 mm) in from all sides of the section replacement. See **Fig. 7**, Ref. D. Be sure to scuff thoroughly, since this will give the section replacement a surface to which it can stick. Be sure to completely sand off any undercoating sprayed on these areas.
9. On the outer sides of both the cutout and the section replacement, bevel the edges about 45 degrees. See **Fig. 9**.
10. Gently feather the outer painted surfaces back about 1/2 inch (13 mm) beyond the edges of the repair areas (on both the cutout and the section replacement), using 220-grit or finer sandpaper.

Raised Roof Cap Repairs



A, C. Use a router to grind away a shallow recess one-quarter the depth of the roof panel, and 1/2 inch (13 mm) away from the edge.
B, D. Use 80- to 220-grit sandpaper to scuff the area one inch (25 mm) around the damage.

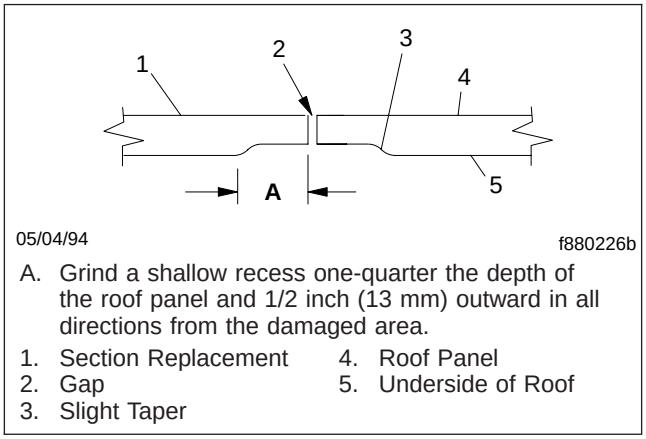
1. Cutout Hole
2. Underside of Roof
3. Section Replacement
4. Underside of Section Replacement

Fig. 7, Preparing the Section Replacement and Roof Panel Cutout on the Unexposed Side

11. Blow the dust away with compressed air and wipe the area with a clean cloth.

12. If the section replacement is close enough to an edge, use clamps to temporarily secure it during the repair. If the replacement is too far from an edge to use clamps, use bond strips as shown in **Fig. 10**.

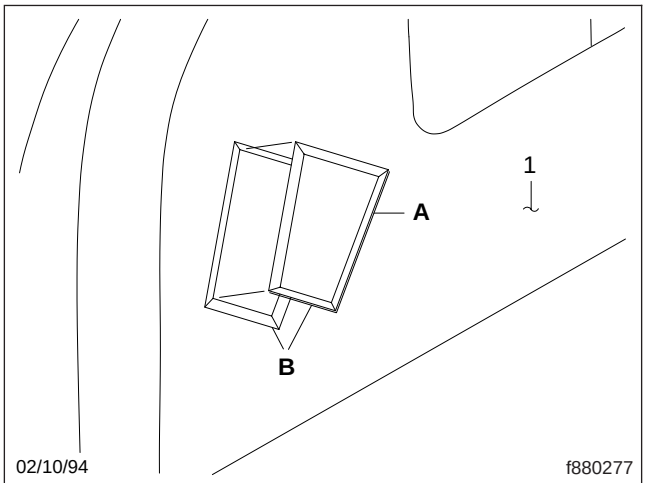
    12.1 Cut some scrap FRP into strips. Make enough strips to hold the section replacement in position, about one every six inches (15 cm). If the surface of the replacement panel is contoured or curved,



A. Grind a shallow recess one-quarter the depth of the roof panel and 1/2 inch (13 mm) outward in all directions from the damaged area.

1. Section Replacement
2. Gap
3. Slight Taper
4. Roof Panel
5. Underside of Roof

Fig. 8, Cutout Area (cross-sectional view)



A. Insert section replacement.
B. Bevel outer surface edges on all sides.

1. Exposed Side of Roof

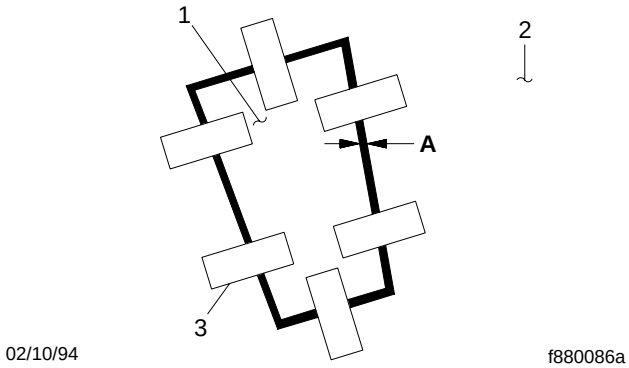
Fig. 9, Areas to be Beveled

use many small bond strips. Larger strips could deform the curves.

12.2 On the inner side of the repair, use 80- to 220-grit sandpaper to scuff sand the areas on the roof and section replacement panels where you plan to bond the strips.

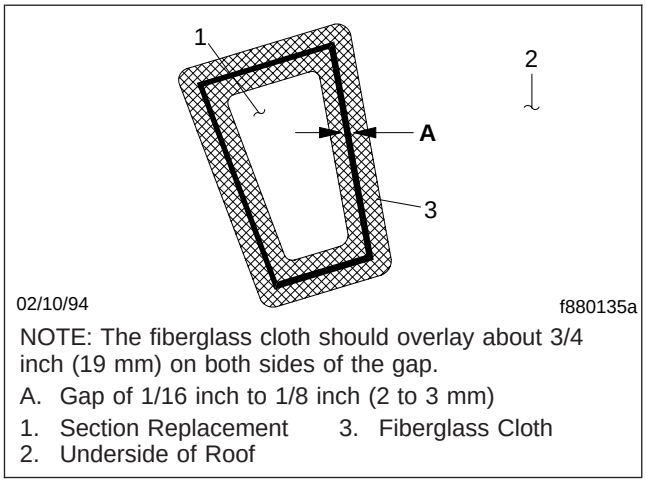
12.3 If a joint between parts was separated for the repair, rebond the joint. Refer to "Roof Cap Assembly Rebonding" for instructions.

12.4 Holding the section replacement in position, bond the strips to both roof and replacement panels in the area already



A. Gap of 1/16 inch to 1/8 inch (2 to 3 mm)
1. Section Replacement
2. Underside of Roof
3. Bond Strip

Fig. 10, Securing the Section Replacement to the Roof Panel Using Bond Strips



NOTE: The fiberglass cloth should overlay about 3/4 inch (19 mm) on both sides of the gap.

A. Gap of 1/16 inch to 1/8 inch (2 to 3 mm)
1. Section Replacement
2. Underside of Roof
3. Fiberglass Cloth

Fig. 11, Fiberglass Cloth Overlay

scuffed. Use Ashland Pliogrip 7773 to bond the strips.

12.5 The Pliogrip 7773 adhesive will set in 10 minutes, and will be sandable in 30 minutes. Cure times may be shortened by using a heat gun. Do not expose the adhesive to temperatures in excess of 180°F (82°C).

12.6 After the bonding agent has hardened, use 80- to 220-grit sandpaper to scuff the bond strips.

12.7 Blow the dust away with compressed air and wipe the area with a clean cloth.

13. With a razor-blade knife, cut sections of woven fiberglass cloth to fully cover the gap between the cutout and the section replacement, all the way around the damaged area. The cloth should overlay about 3/4 inch (19 mm) on both sides of the gap. See **Fig. 11**.

14. To bond the fiberglass cloth to the damaged panel, use Ashland Pliogrip 7775L urethane adhesive.

    When using Ashland Pliogrip 7775L: Dispense the required adhesive from the cartridge in a continuous bead of uniform size and a uniform green color. Discard the initial few inches of discolored bead.

15. Use a plastic or metal device to spread a thin layer of the bonding agent over the scuffed area.

16. Lay the cut sections of fiberglass cloth on the repair area, centered over the damage. Using a fiberglass roller, press the cloth down firmly into the layer of bonding agent to completely soak the glass fibers.

17. Apply another layer of bonding agent over the glass cloth. Spread the agent evenly using the fiberglass roller.

18. After two to five minutes, the bonding agent will start to jell. It may take more time when cool, less when warm.

IMPORTANT: To avoid pre-jelling or skin-over, mate the FRP parts to be bonded within five minutes after extruding and applying the bonding agent.

NOTE: To get a smoother surface, press a piece of masking tape, wider than the repair, directly over the wet bonding agent and smooth it before it hardens. The tape can be removed after fifteen minutes when the bonding agent has set.

19. Repair the damage on both inner and outer surfaces of the roof, and paint the surface on both sides, using the instructions in "Surface Damage Repair." Surfaces on the inside of the roof cap that will be covered with insulation and upholstery panels do not require paint.

Raised Roof Cap Repairs

ROOF CAP ASSEMBLY REBONDING

1. If rebonding a joint that has separated, or if replacing a damaged part, completely separate each part. The outer FRP panels are separated using a heat gun and putty knife. Remove as much of the old adhesive as possible. The heat gun will soften the adhesive and allow it to be peeled off the FRP roof cap subassemblies. The inner RIM panels must be separated mechanically. Work folded medium-grit sandpaper or a section of a steel hacksaw blade between the two surfaces to remove the old adhesive.
2. Scuff the surfaces of the outer FRP panels with with 80- to 220-grit sandpaper. Do not sand or scratch the interior RIM panels.
3. Clean the surfaces to be bonded with Ashland 6036 primer or methylene chloride. Inspect the area closely to be sure all of the old adhesive, dirt, water, grease, and oils are removed.
4. If replacing a large part, such as an outer panel, align the part on the roof cap assembly and clamp it in place. Drill holes through the bonding surfaces and install clamping bolts in the holes. Use two washers, one on each side of the joint. See **Fig. 12**. There should be enough clamping bolts to hold the panel in place and keep the bonding surfaces together, or at least one bolt every 12 to 18 inches (30 to 45 cm). Remove the part for application of bonding agent. If RIM panels will be drilled, use a fluted or a parabolic drill bit. Do not use standard 180-degree ground drill bits.
5. Use the Pliogrip urethane cartridge materials 7773 or 7779 or equivalents to bond panels together.

   When using Ashland Pliogrip 7773 or 7779: Dispense the required adhesive from the cartridge in a continuous bead of uniform size and a uniform green color. Discard the initial few inches of discolored bead.
6. Within four minutes after applying the bead, align the part on the roof assembly and clamp it firmly in place. If it is a large part, install the clamping bolts. Tighten the clamps or clamping bolts just enough to ensure that a uniform amount of pressure is applied along the seam. Ideally, the bonding agent should be compressed to form a bond line one inch (25 mm) wide and 0.030 inch (0.76 mm) thick. This thickness can be ensured by sprinkling 0.030 inch glass beads into the bonding agent before mating the parts.

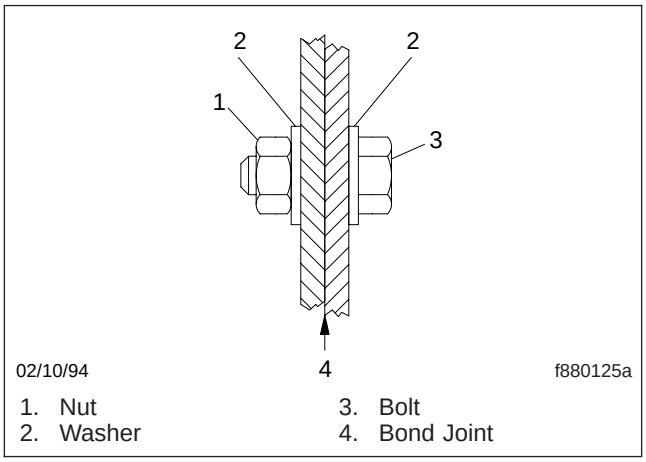


Fig. 12, Clamping Bolt at Bond Joint

7. Before it cures, within seven to 10 minutes, remove any excess bonding agent that squeezes out the edges of the bond.
8. If a heat gun is used, remove the clamps when the bonded FRP parts are cool to the touch; in about one hour. If no heat is applied, leave the bonded parts clamped together for twenty-four hours.

NOTE: Do not use a heat gun in excess of 180°F (82°C) when working with Ashland Pliogrip adhesive.

9. If holes were drilled for clamping bolts, repair them using the instructions under "Crack or Small Hole Repair."
10. If necessary, prime and paint the repair area using the instructions under "Surface Damage Repair."

Repair Safety Precautions

Before performing any polyurethane repairs, read the following precautions. Observe any additional precautions given by the manufacturers of the repair materials used.

1. All of the raw materials used in repairing polyurethane are harmful to the eyes and could cause blindness. Wear goggles or other protective eye shields to reduce the chances of splash contacting your eyes.
2. Wear protective gloves, as some people may have skin sensitivity to resin, epoxy, or other repair material. Also, don't allow the hardener to contact your skin; the hardener can be a skin irritant.

IMPORTANT: In case the hardener or resin contacts your skin, wash with soap and water. If the hardener or resin should contact your eyes, rinse with plenty of water for 15 minutes, and call a doctor.

3. When working with these materials, wear old clothing, since the resin may damage the cloth. Wash the clothing before wearing it again.
4. Most of the liquids involved in repair and cleanup (especially when using acetone as a solvent) are flammable; some are also toxic. Don't perform repairs in areas where exposed (or stored) flammable liquids may contact an open flame or any burning material, such as a cigarette. Don't perform repairs in areas that are not well ventilated.

⚠ WARNING

WARNING: Ensure that polyurethane repairs are done in a safe workshop area with adequate ventilation. Failure to do so could result in severe personal injury due to explosion of flammable liquids or breathing of toxic fumes.

5. Do not use electric tools when the fumes of flammable solvents are present. The heat or sparks generated by the tools could create a fire hazard.
6. When grinding or sanding polyurethane surfaces, wear goggles or other protective eye shields, and also an air-purifying respirator, either a throwaway type or one with a replaceable particulate filter(s). Don't breathe grinding dust or particles, otherwise irritation may occur. Also, during grinding and sanding operations, wear a disposable (paper) shop coat to keep dust and fiber slivers off your clothing.
7. Because dust can shorten the life of electrical units, air-powered tools are preferred (for frequent use).
8. Unless repairs are done on a regular (daily) basis, don't save leftover liquids. If liquids must be saved, store them in cool, dark areas, away from direct sunlight.

Surface Damage Repair

Surface damage refers to scratches, chips, or nicks in the outer surface of the interior panels. To repair surface damage, do the following steps:

1. Locate the damaged area. If there are cracks, see if they go all the way through the component. If they do, refer to "Structural Damage Repair" for instructions.
2. Clean the area with xylene or an equivalent grease- and wax-removing solvent. Inspect the area closely.
3. Depending on the depth and extent of the damage, simply retouching the affected areas with paint may be sufficient. If the damage is significant, follow the next steps.
4. Using an air nozzle, blow off all dust.
5. Wipe filler (Akemi AP–3030) over the non-coated area and spread a thin layer using a squeegee applicator. Cover the entire damaged area, overlapping onto the painted surface. Leave a crowned excess of filler, slightly higher than the painted surface.
6. After the filler dries (about five minutes), sand it with a hand-held disc pad. Use 320-grit or finer sandpaper. Feather the edges of the fill so there are no visible sharp edges.
7. Clean the area with compressed air. Mask the area, then spot prime and paint it. Use Sherwin Williams BB–11 black conductive primer. See **Group 98** for spot-painting instructions.

Interior Panel Repairs

Structural Damage Repair

The interior panels are bonded together with a structural bonding agent.

If there is damage at any joint between two parts, the damage is not repairable. For example, if the panel is damaged so badly that the roof panel is also damaged, replace the panel.

If a joint between two parts has separated and there is no damage at the joint area, the parts can be rebonded. Or, if a part is damaged and its adjoining parts are not damaged, the damaged part can be separated from the roof and new or used parts can be bonded in place. A section of a part can be replaced as long as the section does not include a joint between two parts. Panels are available as replacement parts or for use in section replacements.

CAUTION

CAUTION: As noted above, the panels serve as structural reinforcement for the outer panels. Removing the larger interior panels may cause the outer panels to deform, making reassembly impossible.

If the damage is such that the parts cannot be replaced, or a section replacement cannot be done, replace the entire roof cap assembly.

For damage in the form of a small crack or hole, refer to "Crack or Small Hole Repair."

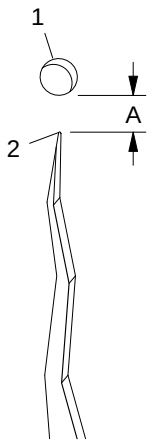
For larger damaged areas, see **Subject 100**.

For replacing or rebonding parts, see **Subject 100**.

CRACK OR SMALL HOLE REPAIR

A crack (fracture) or small hole through the polyurethane may require repair with a fiberglass reinforced patch, depending on the size and the extent of the fracture.

1. Examine the damage to the assembly. Apply hand pressure all around the damaged area to check for any concealed damage.
2. If upholstery and/or thermal insulating material is present in the damaged area, remove the material to provide an adequate working area.
3. Clean the area with xylene, acetone, or an equivalent grease- and wax-removing solvent. Inspect the area closely. All dirt, water, grease, and oils must be removed.
4. If repairing a crack, use a 1/8-inch diameter bit to drill a hole completely through the uncracked polyurethane 1/8 inch (3 mm) from each end of the crack, to prevent the crack from lengthening. See **Fig. 1**.



A. Drill a 1/8-inch hole, 1/8 inch (3 mm) away from the end of a crack.
1. 1/8-Inch Hole
2. End of Crack

Fig. 1, Drilling for Repair

5. On the outer surface (at the surface between the interior panels and the exterior panel skins), use 80- to 220-grit sandpaper to scuff an area at least 1 to 2 inches (25 to 51 mm) surrounding the damaged area. This will give the patch a surface to stick to.
6. Blow the dust away with compressed air and wipe the area with a clean cloth.
7. If necessary, align the panel sections on both sides of the crack, using weights or clamps to re-establish the original panel profile.
8. With a razor-blade knife, cut a section of woven fiberglass cloth to fully cover the crack and to overlay about 3/4 inch (19 mm).
9. To bond the fiberglass cloth to the damaged panel, choose one of the following bonding agents:

- Magnolia Magnabond 58 epoxy resin
- Ashland Pliogrip® 7773 polyurethane adhesive

IMPORTANT: Do not mix epoxy and polyurethane.

When using Magnolia Magnabond 58: Measuring the volumes with a spoon, and using a wooden stir stick, mix equal parts of Magnolia Magnabond 58 A and B epoxy resins on a clean sheet of glass, metal, or a section of scrap laminate. Mix for fifteen seconds to ensure a good blend.

IMPORTANT: With Magnolia Magnabond 58, it is critical to measure the A:B ratio accurately. Also, make sure the two components are adequately mixed.

When using Ashland Pliogrip 7773: Dispense the required adhesive from the cartridge in a continuous bead of uniform size and a uniform green color. Discard the initial few inches of discolored bead.

10. Use a plastic or metal device to spread a thin layer of the bonding agent over the scuffed area.
11. Lay the cut section of fiberglass cloth on the repair area, centered over the damage. Using a fiberglass roller, press the cloth down firmly into the layer of bonding agent to completely soak the glass fibers.
12. Apply another layer of bonding agent over the glass cloth. Spread the agent evenly using the fiberglass roller.
13. After two to five minutes, the bonding agent will start to jell. It may take more time when cool, less when warm.

IMPORTANT: To avoid pre-jelling or skin-over, mate the parts to be bonded within one to four minutes after extruding and applying the bonding agent.

NOTE: To get a smoother surface, press a piece of masking tape, wider than the repair, directly over the wet bonding agent and smooth it before it hardens. The tape can be removed after fifteen minutes when the agent has set.

14. The patch should be hard enough in fifteen minutes to allow sanding to a smooth flat surface if required.
15. Repair the damage on the outside surface of the panel and paint the surface on both sides, using the instructions in "Surface Damage Repair."

Skylight Window Glass Replacement

Replacement

⚠ WARNING

WARNING: When handling glass, wear protective gloves to protect your hands from sharp edges and to allow a better grip. Not wearing protective gloves when handling glass could result in personal injury.

1. Park the vehicle on a flat surface. Shut down the engine, set the parking brake, and chock the tires.
2. Inside the cab, attach a suction device onto the skylight window glass surface. See **Fig. 1**. See **Fig. 2** for the tools needed to perform this procedure.

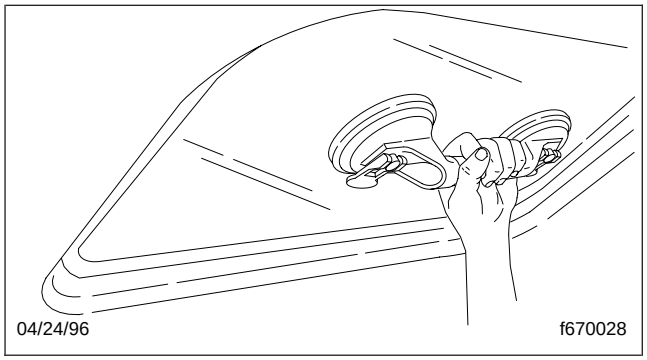


Fig. 1, Attaching the Suction Device to Skylight Window Glass

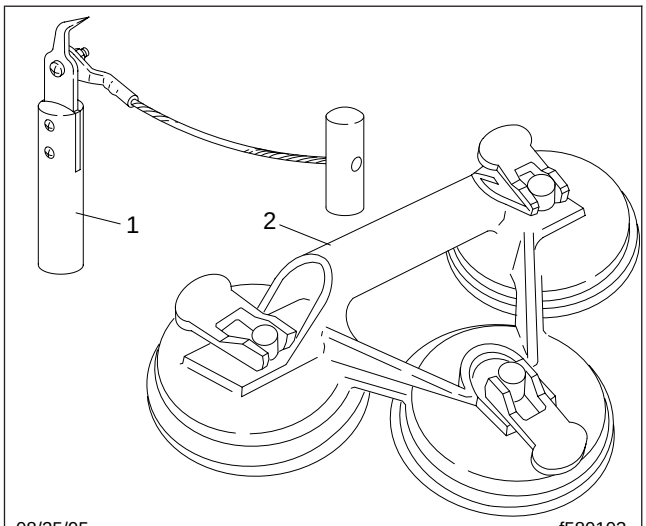
3. With a pull-knife and a utility knife, cut through the adhesive attaching the glass and seal to the roof.
4. Apply a slight upward pressure to the glass.

NOTE: When removing the glass be sure to note the location of the manufacturer's ID on the lower left corner of the inside surface of the glass. The new glass must be replaced in the same position.

5. From inside the cab, remove the glass from the opening.
6. Check for rough spots on the roof cap panel perimeter, and sand and prime, as necessary. Apply urethane primer to the opening.
7. Prepare the new skylight glass.



1. Pull Knife
2. Suction Device

Fig. 2, Typical Windshield Tools

⚠ CAUTION

CAUTION: When handling the replacement skylight window glass, be careful not to nick or splinter the edges of the glass. Chipped edges could cause cracking later on.

7.1 Put the new glass on a suitable stand or fixture, with the inside surface of the glass facing up.

7.2 Clean the edges of the glass with a mixture of 50/50 isopropyl alcohol and water.

7.3 Apply Betaseal® U–401 Glass Prep all the way around the edge of the glass to a width of about 1-1/2 inches (40 mm).

7.4 Wait five seconds, then wipe off the glass prep, using a clean, lint-free cloth.

8. With a Betagun, first discard the first 6 to 8 inches (15 to 20 cm) of the adhesive before applying any to the glass, then apply a continuous bead of adhesive approximately 1/2 inch (13 mm) high around the inside sealing surface of the glass (not on the rubber seal).
9. Check the location of the manufacturer's ID on the glass.
10. Return the assembly to the cab.

Skylight Window Glass Replacement

11. Attach the suction device to the glass.
12. Position the glass from the inside of the vehicle above the window opening.
13. Lower the glass into place on the opening. Pull the glass into position by gripping the suction device.
14. Remove the suction device, and clean the glass and the area surrounding the skylight window.

Cab Removal and Installation

When removing the cab, make sure you have equipment that is suitable for lifting the entire weight of the cab. For the front wall disconnections, work first on one side of the vehicle, then the other.

Removal

1. Park the vehicle, set the parking brakes, then chock the tires
2. Support the rear of the cab with blocks.
3. Disconnect the batteries at the negative terminal.
4. Drain the air system tanks.
5. Tilt the hood, and support it on a padded table or bench.
6. If so equipped, remove the roof fairing and side extenders.
7. Remove the chassis side fairings. See the applicable section in **Group 31** for instructions.
8. Drain the radiator.

NOTE: The following steps are done on the left side of the vehicle.

9. Remove the windshield washer reservoir.
10. Disconnect the left-side radiator strut from the front wall.
11. Mark the upper end of the steering column connection, then disconnect it from the lower end of the steering column.
12. Disconnect the lower steering column from the steering gear and the upper steering column. See the applicable section in **Group 46** for instructions.
13. Mark, then disconnect all the electrical wiring from the left side of the front wall.
14. Disconnect the clutch linkage. See the applicable section in **Group 25** for instructions.
15. Mark, then disconnect all the air lines at their quick-disconnects.
16. Mark, then disconnect all the lines from the air/oil junction block.
17. Remove the left-side mudflap and bracket assembly.
18. Find the ground wire coming from under the cab, below the forward cab-mount bracket. Disconnect it from the frame rail.
19. If so equipped, disconnect the engine block heater wiring from the chassis.
20. Remove fasteners holding the forward cab-mount assemblies to the frame rail mounting brackets.
21. Disconnect the air line from the air horn, which is mounted underneath the cab deck, below the driver's seat.
22. If so equipped, disconnect the front-axle ABS harness from the underside of the cab deck, in back of the driver's seat area.
23. Go to the right side of the front wall.
24. Disconnect the right radiator strut from the front wall.
25. Remove the air cleaner and the heat shield below it.
26. Mark, then disconnect all the electrical wiring from the right side of the front wall.
27. Evacuate the air conditioning system. See the applicable section in **Group 83** for instructions.
28. Mark, then disconnect the lines from the HVAC receiver/drier. Cover the lines to keep out contaminants.
29. Mark, then disconnect the cab heater supply and return hoses.
30. Disconnect the auxiliary (sleeper) heater hose from the large supply hose coming from the radiator.
31. Put a container under the engine, then disconnect the auxiliary heater supply hose from the engine block.
32. Disconnect the lines from the HVAC expansion valve on the right side of the front wall.
33. Remove the right-side mud flap and bracket assembly
34. Remove the transmission shift lever.
    - 34.1 From inside the cab, remove the metal bezel from the cab deck, then slide the rubber boot up the shift lever
    - 34.2 If so equipped, disconnect the splitter airline and the cruise control wiring.

Cab Removal and Installation

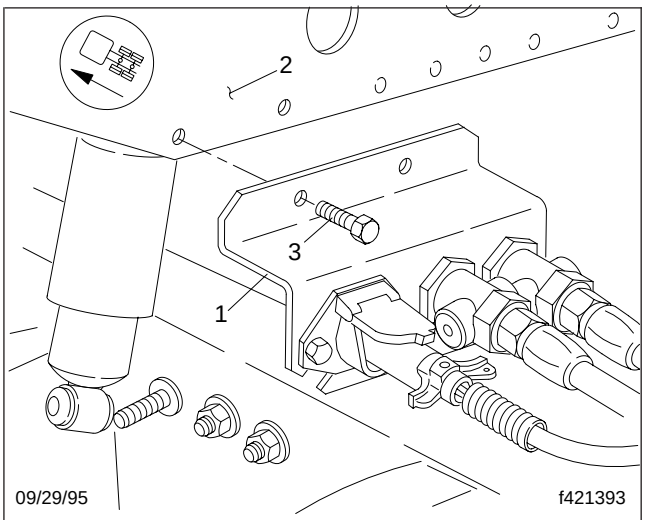
34.3 Using a 5/32-inch allen wrench, and a 1/2-inch crescent wrench, disconnect the shift lever from the shift tower.

35. Remove the fasteners holding the right-side forward cab-mount bracket to the frame rail mounting bracket.

36. At the back of the cab, disconnect the cab rear air suspension. See the applicable section in this group for instructions.

37. Remove the mufflers and heat shields. See the applicable section in **Group 47** for instructions.

38. Remove the bracket for the trailer air connections from the back wall of the cab. **See Fig. 1.**



1. Bracket
2. Back Wall of Cab
3. Hexbolt (2 qty.)

Fig. 1, Trailer Air-Connection Bracket

⚠ WARNING

Before lifting the cab from the chassis, make sure the cab is correctly balanced, that it is supported in at least four places, and that the hoist is strong enough to support the cab. Failure to do so could result in the cab falling, which could cause serious personal injury and damage to the cab.

39. Using a suitable hoist, and attaching straps at four points on the cab (two forward, and two rear), lift the cab off the chassis.

⚠ CAUTION

CAUTION: Do not try to lift the cab by the door frames unless you install a special door lifting insert into each door frame. The door frames are not strong enough to support the full weight of the cab, and damage to the cab could result if it is lifted without the use of lifting inserts. Using the inserts also ensures that the cab will be correctly balanced in the lifting straps.

39.1 Open the doors; then install a lifting insert into each door frame, and clamp it in place, using padded clamps. **See Fig. 2.**

Right and left lifting door insert assemblies are available through Daimler Trucks North America Parts Distribution Centers. The part numbers are A22-45473-000 (left-side), and A22-45473-001 (right-side).

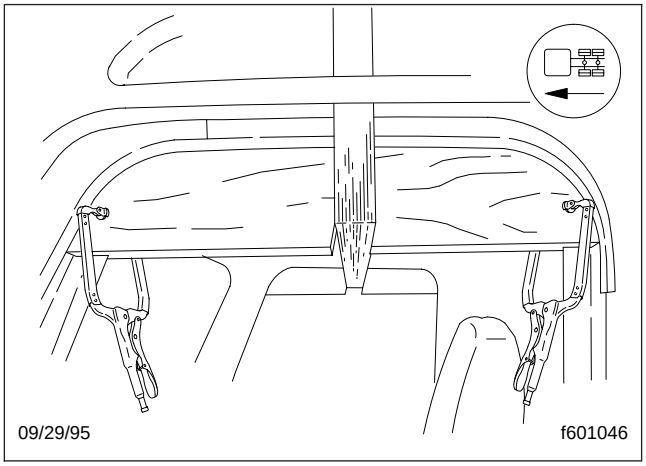


Fig. 2, Door Lifting Insert Installed and Lifting Strap in Place

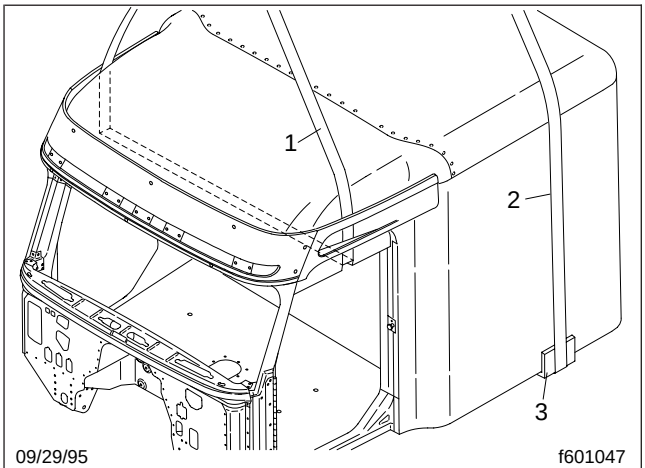
39.2 Attach the forward lifting strap. Make sure it fits into the groove of each lifting insert.

39.3 Attach lifting straps to the rear of the right and left side walls, using suitable padded clamps. **See Fig. 3.**

39.4 Lift the cab slightly to make sure it is balanced, and that nothing is holding it to the chassis. If needed, lower the cab and adjust the placement of the rear straps.

39.5 Lift the cab clear of the chassis.



1. Forward Lifting Strap
2. Rear Lifting Strap
3. Padded Clamp

Fig. 3, Lifting the Cab

Installation

1. Lower the cab onto the chassis. Make sure the forward cab mounts line up with the frame rail mounting brackets, both fore and aft, and side to side.
2. Attach the forward cab mounts to the frame rail mounting brackets. See the applicable section in this group for instructions.
3. Connect the rear cab air suspension. See the applicable section in this group for instructions.
4. Install the bracket for the trailer air connections to the left side of the cab back wall.
5. Install the mufflers and heat shields. See the applicable section in **Group 47** for instructions.
6. From inside the cab, connect the transmission shift lever to the shift tower. Install the rubber boot to the cab deck.
7. On the right side of the front wall, connect the lines to the HVAC expansion valve.
8. Connect the lines to the HVAC receiver-drier.
9. Connect the auxiliary (sleeper) heater supply hose to the engine block.
10. Connect the other auxiliary heater hose to the large supply hose coming from the radiator.
11. Connect the cab heater hoses as previously marked.
12. As previously marked, connect all the wiring on the right side of the front wall.
13. Install the air cleaner and the heat shield.
14. Attach the right radiator strut to the front wall.
15. On the left side of the vehicle, connect the front-axle ABS wiring harness to the underside of the cab deck, at the rear of the driver's seat.
16. Connect the air line to the air horn.
17. If so equipped, connect the engine block heater wiring.
18. Connect the ground wire coming from under the cab deck.
19. As previously marked, connect the lines to the air/oil junction block.
20. As previously marked, connect all the air lines.
21. As previously marked, connect all the electrical wiring on the left side of the front wall.
22. Connect the clutch linkage. See the applicable section in **Group 25** for instructions.
23. Connect the lower steering column to the steering gear and the upper steering column. Make sure you use a new pinch bolt at the steering gear connection. See the applicable section in **Group 46** for instructions.
24. Attach the right radiator strut to the front wall.
25. Install the windshield washer reservoir.
26. Install the right- and left-side mudflaps and brackets to the chassis.
27. If so equipped, install the chassis side fairings. See the applicable section in **Group 31** for instructions.
28. If so equipped, install the roof fairing and side extenders.
29. Fill the radiator with coolant.
30. Connect the batteries.
31. Charge the HVAC system. See the applicable section in **Group 83** for instructions.
32. Start the engine and check all the coolant and heater hoses for leaks. Check all the electrical systems and gauges.

Cab Removal and Installation

33. Build the air pressure to 110 psi.
34. Adjust the cab height. For instructions, see the section on cab air suspension in this group.
35. Close the hood.
36. Remove the chocks from the tires.

Cab Removal and Installation, Argosy COE

Removal

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.
2. Tilt the cab slightly, until the cab latches are disengaged; see **Section 60.15, Subject 060**. Place blocks on the cab latches, then lower the cab.
3. Drain the air system.
4. Evacuate the refrigerant; see **Section 83.02, Subject 250**.
5. Drain the radiator; see **Section 20.01, Subject 100**.
6. Remove the cab access stairs; see **Section 60.20, Subject 100**.

⚠ CAUTION

Stand away from the front-wall access panel when opening it. The access panel can open quickly and could hit a person, possibly resulting in personal injury.

7. Raise the front-wall access panel.
8. Remove the lower grille panel, as follows; see **Fig. 1**.
   - 8.1 Remove the four Allen screws that secure the grille panel support brackets to the front-wall crossmember.
   - 8.2 Lift the grille panel up and away from the vehicle.
9. Tilt the cab; see **Section 60.15, Subject 060**.
10. Disconnect the batteries.
11. Disconnect the shift cables, as follows.
    - 11.1 Remove the shift tower boot.
    - 11.2 Remove the four bolts that secure the shift assembly to the cab inner wall; see **Fig. 2**. Pull the assembly, including the shift lever, away from the cab inner wall.
    - 11.3 Remove the clamps that secure the shift cables to the cab inner wall.
    - 11.4 Remove the shift lever electrical line from the shift chassis.
    - 11.5 Pull the shift assembly away from the vehicle.
12. On the right side of the cab underbody, mark and disconnect the electrical harness. This includes the solenoid wire, the actuator wires, and the ABS wires; see **Fig. 3**.
13. Working on the left side of the cab underbody, disconnect the following components:
    - 13.1 Disconnect and cover the A/C lines.
    - 13.2 Mark and disconnect the ACPU wires.
    - 13.3 Place a container under the engine to catch any remaining fluid, then disconnect the heater lines.
14. Remove tie straps as needed from the cab front wall.
15. Mark and disconnect the air brake lines.
16. Disconnect the cab ground, located on the cab inner wall above the headlights, on the right side of the vehicle.

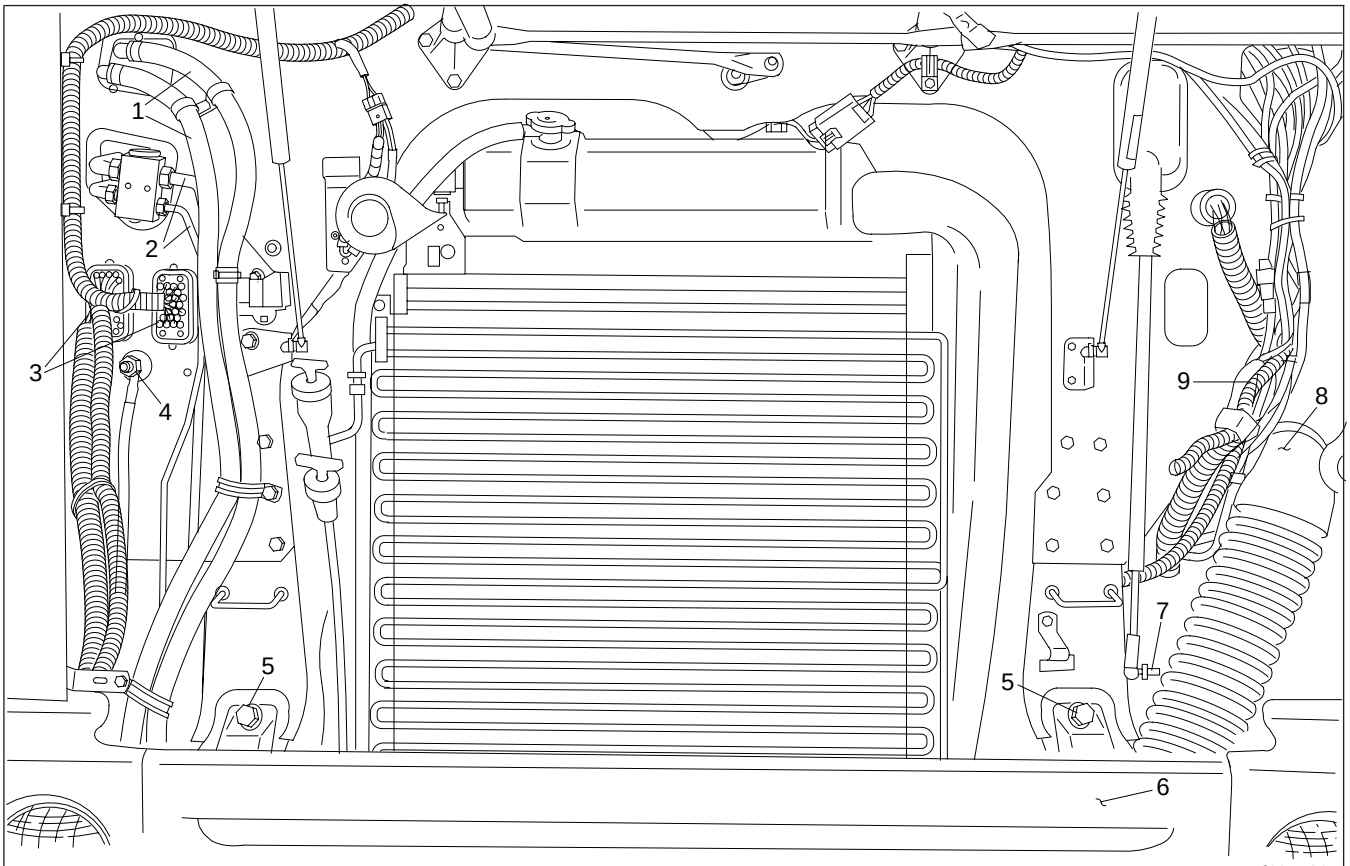
NOTE: For easier access to the cab ground, remove the cowl side panel; see **Section 60.16, Subject 100**.

17. Disconnect the air junction block.
18. Remove the two harness plugs from the left side of the front wall.
19. Disconnect the lower clutch linkage; see **Section 25.03, Subject 120**.
20. Disconnect the steering driveline, as follows.
    - 20.1 Loosen the clamp that secures the boot over the driveline linkage, and pull the boot down.
    - 20.2 Remove the pinch bolt that secures the steering driveline linkage to the steering column; see **Fig. 4**.

NOTE: Before disconnecting the heater lines, have a pan ready to catch any remaining coolant.

21. Remove all tie straps from the auxiliary heater lines, then disconnect the lines. Plug the lines and cap the fittings.
22. Remove the positive cab stud on the left side of the front wall.

Cab Removal and Installation, Argosy COE



1. Auxiliary Heater Lines
2. A/C Lines
3. Cab Harness Plugs
4. Positive Cab Stud
5. Cab Pivot Bushing Swingout Bolt
6. Lower Grille Panel
7. Lower Clutch Linkage
8. Steering Column (covered)
9. Air Brake Lines

Fig. 1, Cab Front Wall

23. Disconnect the tilt cylinders, located on the left and right side of the cab underbody, as follows.
    - 23.1 Remove the cotter pins and washers. Have an assistant adjust the cab height until the clevis pin loosens.
    - 23.2 Remove the cylinder clevis pins.
    - 23.3 Disconnect the two tilt cylinders.
24. Support the cab with a hoist or other suitable lifting device; see **Fig. 5**.
25. Disconnect the cab mounts. This includes the hinge bolt and the bushing swingout bracket bolt; see **Fig. 6**.

⚠ DANGER

Before lifting the cab from the chassis, make sure the cab is correctly balanced, that it is supported in at least four places, and that the hoist is strong enough to support the cab. Failure to do so could result in the cab falling, which could cause serious personal injury and damage to the cab.

26. Using a suitable hoist, and attaching straps at four points on the cab (two forward, and two rear), lift the cab off the chassis, as follows.

Cab Removal and Installation, Argosy COE

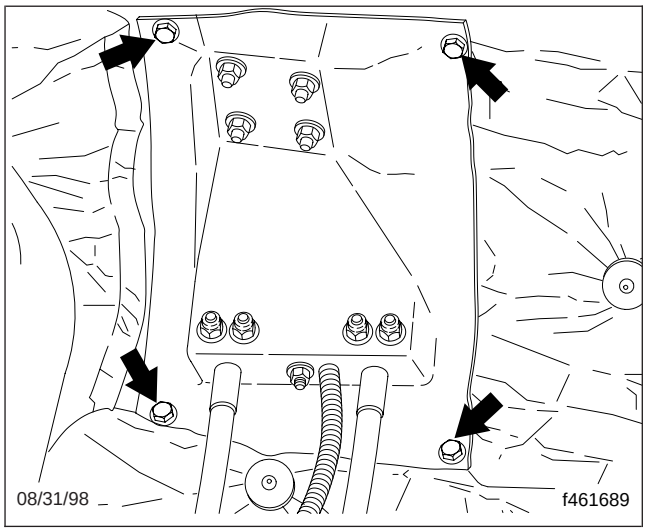


Fig. 2, Shift Panel Support Bolts

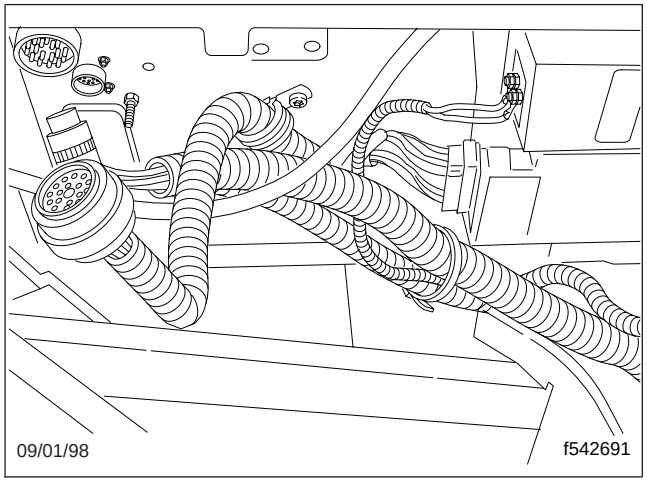

Fig. 3, Cab Electrical Harness

⚠ CAUTION

Do not try to lift the cab by the door frames unless you install a special door lifting insert in to each door frame. The door frames are not strong enough to support the full weight of the cab, and damage to the cab could result if it is lifted without the use of lifting inserts. Using the inserts also ensures that the cab will be correctly balanced in the lifting straps.

26.1 Open the doors; then install a lifting insert into each door frame, and, using padded clamps, clamp it in place; see **Fig. 7**.

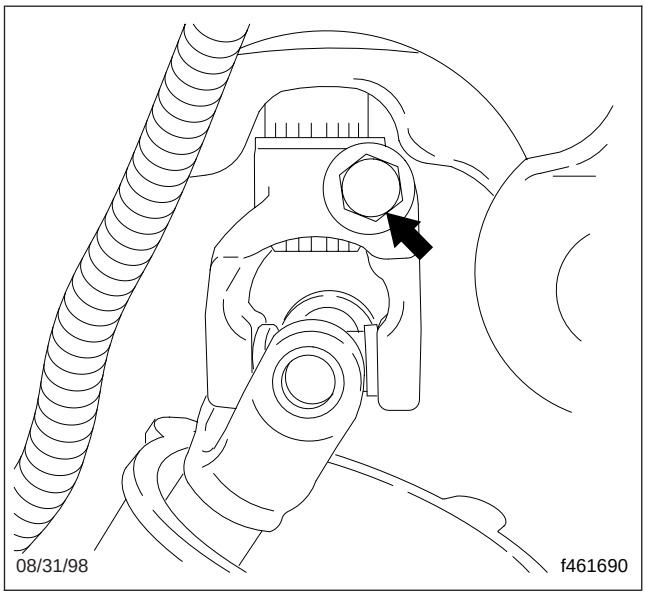

Fig. 4, Steering Linkage Pinch Bolt

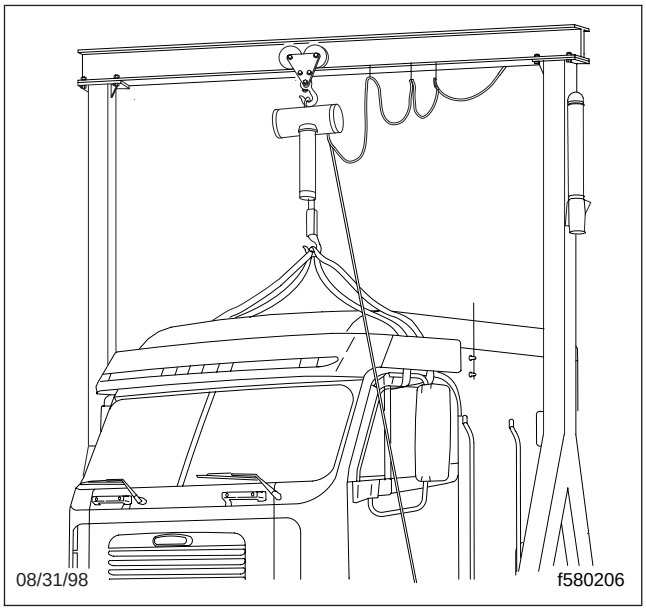

Fig. 5, Cab Lifting Device

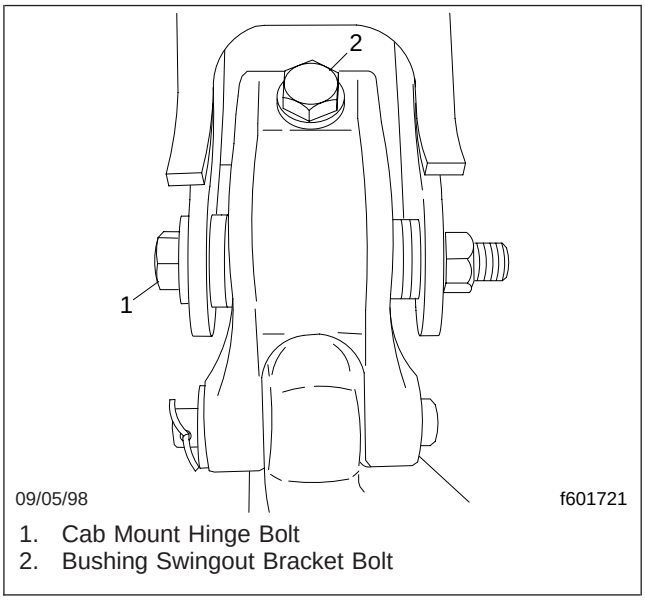
26.2 Attach the forward lifting strap. Make sure it fits into the groove of each lifting insert.

26.3 Using suitable padded clamps, attach lifting straps to the rear of the right and left side walls.

Cab Removal and Installation, Argosy COE



1. Cab Mount Hinge Bolt
2. Bushing Swingout Bracket Bolt

Fig. 6, Forward Cab Mount Assembly

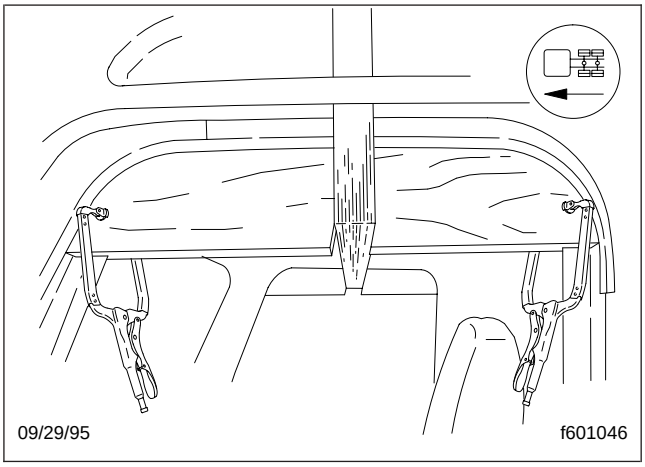


Fig. 7, Door Lifting Insert Installed and Lifting Device Strap in Place

26.4 Lift the cab slightly to make sure it is balanced, and that nothing is holding it to the chassis. If needed, lower the cab and adjust the placement of the rear straps.

26.5 Lift the cab clear of the chassis.

Installation

1. Lower the cab onto the chassis. Make sure the forward cab mounts line up with the frame rail mounting brackets.
2. Install the left and right cab mount hinge bolts. Tighten the bolts 95 lbf·ft (129 N·m).
3. Remove the lifting straps.
4. Install the left and right bushing swingout bracket bolts. Tighten the bolts 95 lbf·ft (129 N·m).
5. Position the tilt cylinders on the left and right side of the cab underbody. Install the clevis pins and the washers, and install new cotter pins.
6. Connect the positive cab stud on the front wall, and tighten the screw securely.
7. Connect the engine harness plugs on the front wall, and tighten the capscrews securely.
8. Connect the auxiliary heater lines.
9. Connect the steering driveline, as follows.

   9.1 Have an assistant adjust the steering wheel until the driveline is properly aligned.

   9.2 Using a new bolt, connect the steering column to the driveline, and tighten the bolt 70 lbf·ft (95 N·m).

   9.3 Pull the boot over the driveline, and tighten the clamp.

10. Connect the lower clutch linkage; see **Section 25.03, Subject 120**. Tighten the bolt 28 lbf·ft (38 N·m).
11. Connect the air junction block.
12. Connect the cab ground to the cab inner wall above the headlights, on the right side of the vehicle. Tighten the bolt securely.
13. Connect the air brake lines.
14. If removed, install the cowl side panel; see **Section 60.16, Subject 100**.
15. Tilt the cab; see **Section 60.15, Subject 060**.
16. On the left side of the cab underbody, connect the A/C lines, the ACPU wires, and the heater lines.

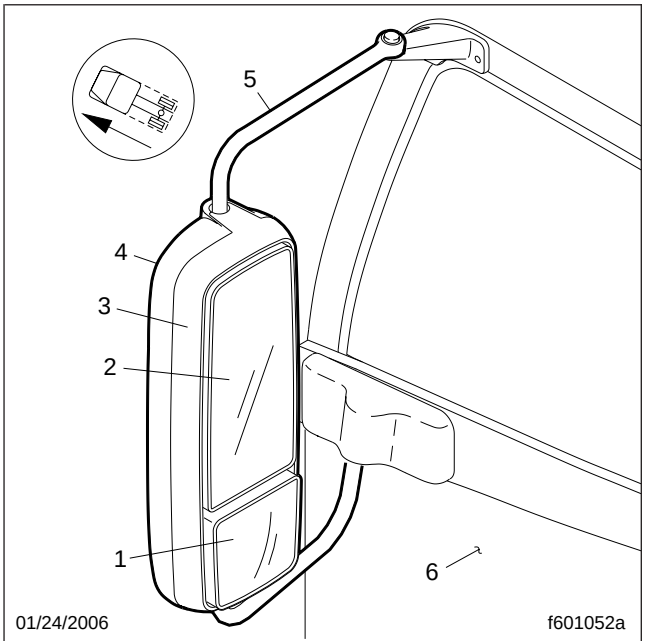
17. On the right side of the cab underbody, connect the solenoid wire, the actuator wires, and the ABS wires.
18. Connect the shift cables, as follows.
    - 18.1 Clamp the shift cables to the cab inner wall.
    - 18.2 Connect the electrical line to the shift chassis.
    - 18.3 Position the shift lever in the vehicle.
    - 18.4 Insert the four bolts that secure the shift panel to the cab inner wall. Tighten the bolts 22 lbf·ft (30 N·m).
19. Return the cab to the operating position; see **Section 60.15**.
20. Install the shift tower boot.
21. Position the lower grille panel on the front-wall crossmember. Insert the four support bolts, and tighten 95 lbf·ft (129 N·m).
22. Install the cab access stairs; see **Section 60.20, Subject 100**.
23. Fill the radiator with coolant; see **Section 20.01, Subject 100**.
24. Connect the batteries.
25. Charge the A/C system; see **Section 83.02, Subject 250**.
26. Start the engine and check all the coolant and heater hoses for leaks. Check all the electrical systems and gauges.
27. Close the front-wall access panel.
28. Remove the chocks.

General Information

The Lang-Mekra and Truck-Lite mirrors are electrically heated, remote-controlled mirrors. The mirror unit consists of an upper rectangular main (flat) mirror, and a lower square (convex) mirror. The mirror is mounted in a housing, and the entire mirror head assembly is mounted to the door by a fold-away tubular support loop. See **Fig. 1** and **Fig. 2**.

The main mirror can be actuated remotely, or moved manually in case of an electrical problem. The convex mirror is not remotely actuated, but can be adjusted manually. An indicator light on the dash alerts the driver that the heating element in the mirror is on.

Dual electric motors (one for vertical movement, and one for horizontal movement) are mounted inside the mirror housing, and are equipped with a clutch to prevent damage in case of binding. All the wiring is hidden within the support loop and the mirror housing.

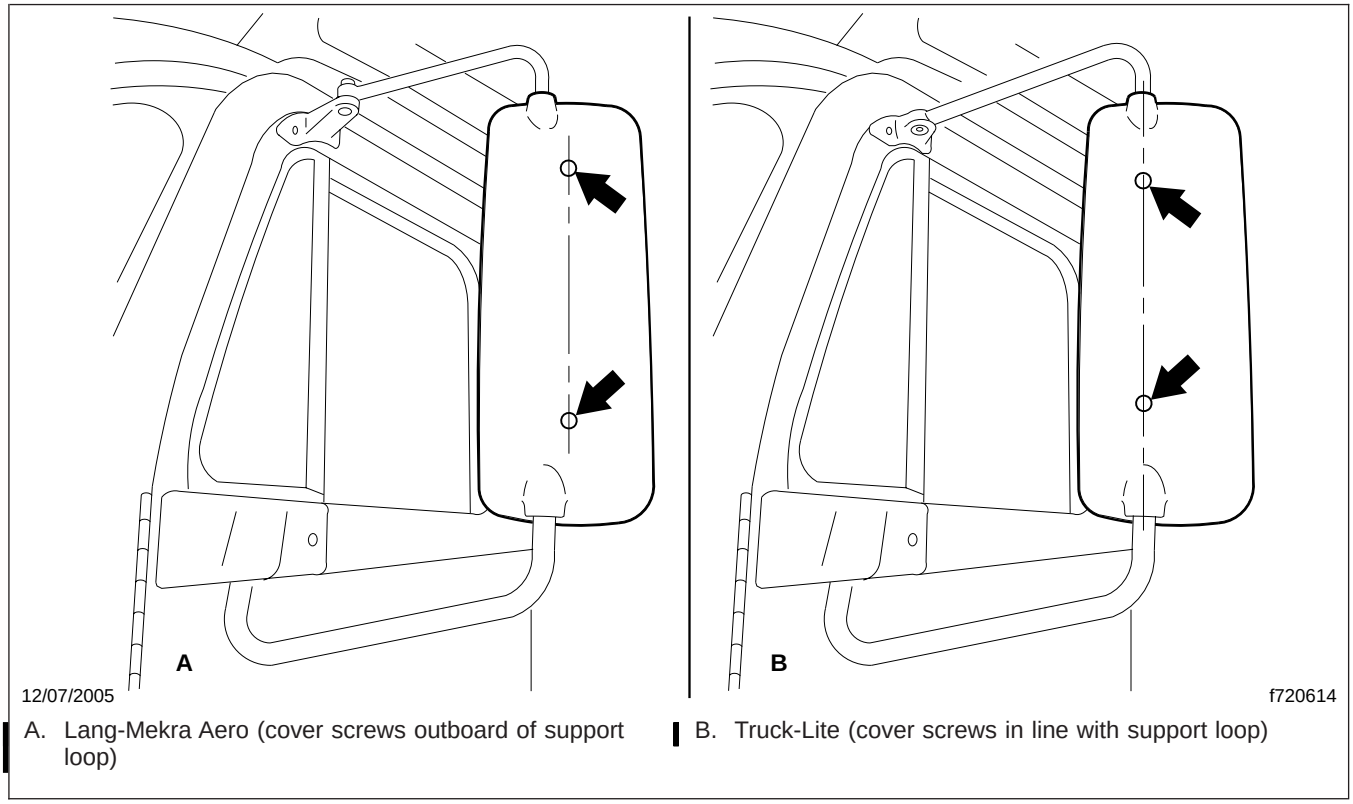


1. Square, Convex Mirror
2. Rectangular, Flat Main Mirror
3. Housing
4. Back Cover
5. Fold-Away Support Loop
6. Door (left side)

Fig. 1, Mirror Assembly (Lang-Mekra Aero Shown)

The mirror can be identified as a Lang-Mekra Aero or a Truck-Lite by the placement of the two screws that attach the back cover to the mirror housing assembly. On the Truck-Lite mirror they are in line with the support loop, while on the Lang-Mekra they are offset, outboard from the support loop. See **Fig. 2**. There are also differences in the upper mounting bracket and pivot joint.

General Information



A. Lang-Mekra Aero (cover screws outboard of support loop)

B. Truck-Lite (cover screws in line with support loop)

Fig. 2, Mirror Identification

Mirror Assembly Removal and Installation

This procedure applies to the following mirrors:

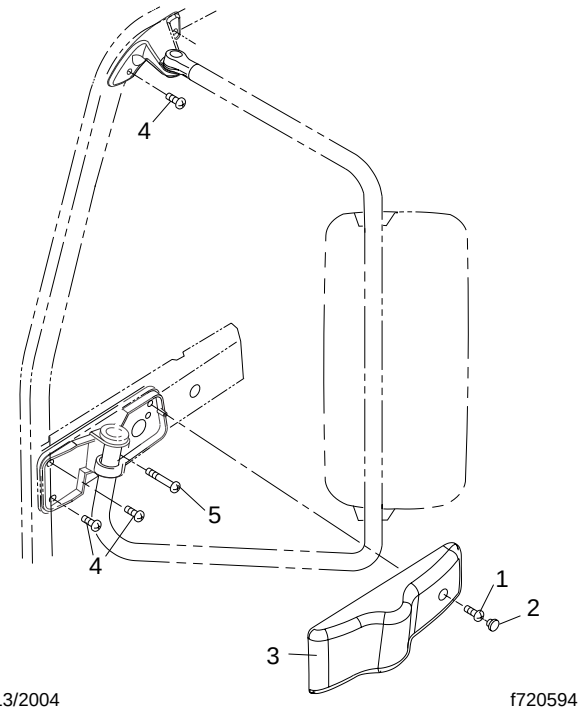
- Lang-Mekra Aero
- Truck-Lite

The procedure is the same for both mirrors.

NOTE: Many parts of the mirror can be serviced without removing the entire mirror assembly from the vehicle. If the entire mirror assembly need not be replaced, see the appropriate procedure for the component to be serviced.

Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the lower mirror-bracket cover. See **Fig. 1**.



1. Bracket Cover Mounting Screw
2. Screw Cover Cap
3. Lower Bracket Cover
4. Bracket Screws
5. Hexbolt

Fig. 1, Mirror Assembly Mounting

   2.1 Remove the screw cover cap from the lower mirror-bracket cover.

   2.2 Remove the screw that attaches the cover to the mirror bracket.

   2.3 Remove the cover by pulling the rear of the cover away from the bracket while sliding the front of the cover towards the front of the vehicle.
3. Disconnect the cables at the lower bracket.
4. Remove the three screws that attach the lower bracket to the door.
5. While supporting the mirror, remove the two screws that attach the upper bracket to the door. Remove the mirror assembly from the door.

Installation

1. Position the mirror assembly on the door.
2. Attach the upper bracket to the door with the two screws. Torque the screws 11 lbf·ft (15 N·m).
3. Attach the lower bracket to the door with the three screws. Torque the screws 11 lbf·ft (15 N·m).
4. Connect the cables at the lower bracket.
5. Install the lower mirror-bracket cover.

   5.1 Slide the front of the cover onto the lower bracket and push the rear of the cover onto the bracket.

   5.2 Install the screw that attaches the cover to the bracket.

   5.3 Install the screw cover cap.
6. Remove the chocks from the tires.

Mirror Support Loop Folding Repair

This procedure applies to the following mirrors:

- Lang-Mekra Aero
- Truck-Lite

The procedure is the same for both mirrors.

Folding Repair

Mirrors are designed to fold away if they contact an immovable object. In some cases, however, the mirror support loop may pivot too easily.

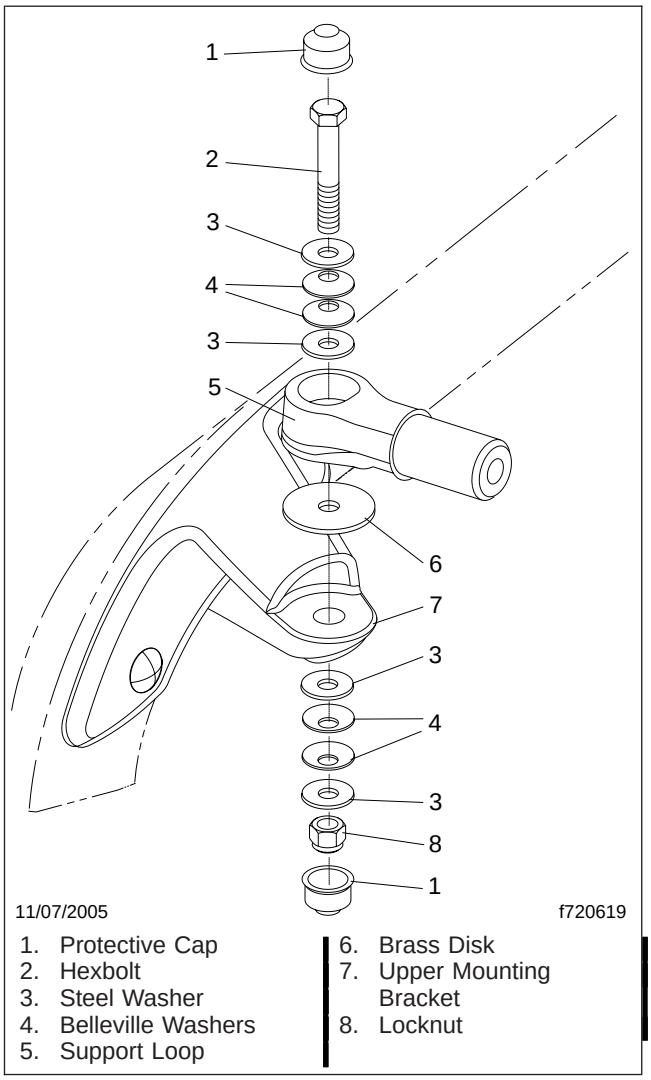
During manufacture, the upper pivot-point fasteners are torqued 31 to 35 lbf·ft (42 to 48 N·m).

If a mirror support loop moves due to high wind loads or slamming the door, retorque the upper pivot-point fasteners after removing the two protective caps from the hexbolt and locknut. See **Fig. 1**. Check the fastener torque to confirm that it is 31 to 35 lbf·ft (42 to 48 N·m).

If the torque is correct and the support loop continues to move too easily, disassemble the pivots, remove any grease, replace the hexbolt with a 3/8–24 x 2 bolt, and then assemble the pivots.

An upper pivot-point fastener kit is available for Lang-Mekra mirrors. See **Subject 210** for instructions on replacing the upper pivot-point fasteners.

NOTE: The upper pivot-point fastener kit is not serviceable on Truck-Lite mirrors.



1. Protective Cap
2. Hexbolt
3. Steel Washer
4. Belleville Washers
5. Support Loop
6. Brass Disk
7. Upper Mounting Bracket
8. Locknut

Fig. 1, Upper Pivot-Point Fasteners (Lang-Mekra)

Mirror Back Cover Removal and Installation

This procedure applies to the following mirrors:

- Lang-Mekra Aero
- Truck-Lite

The procedure is slightly different for each mirror.

Lang-Mekra Aero

Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the CB antenna from the mirror head, using a wrench to keep the antenna base from loosening.
3. Remove the two screw covers on the back of the mirror.
4. Remove the two screws that attach the back cover to the mirror head.
5. Pull the bottom of the cover away from the mirror head, and carefully lift the cover up over the antenna base.

Installation

1. Position the top of the cover over the antenna base, and push the bottom of the cover into place against the mirror head.
2. Install the two screws that attach the cover to the mirror head. Torque the screws 36 lbf·in (400 N·cm).
3. Install the two screw covers.
4. Install the CB antenna on the mirror head assembly. Tighten the antenna hexnut 85 lbf·in (960 N·cm).
5. Remove the chocks from the tires.

Truck-Lite

Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the CB antenna from the mirror head, using a wrench to keep the antenna base from loosening.
3. Remove the two screw covers on the back of the mirror.
4. Remove the two screws that attach the back cover to the mirror housing.
5. Pull the bottom of the cover away from the mirror housing, and carefully lift the cover up over the antenna base.

Installation

1. Position the top of the cover over the antenna base, and push the bottom of the cover into place against the mirror head.

IMPORTANT: Ensure that the mirror back cover is properly seated in the mirror housing. The gap around the edge should be uniform, and the tabs at the top and bottom should seat securely in their respective grooves.

2. Install the two screws that attach the cover to the mirror housing. Torque the screws 31 lbf·in (340 N·cm).
3. Install the two screw covers.
4. Install the CB antenna on the mirror head assembly. Tighten the antenna hexnut 85 lbf·in (960 N·cm).
5. Remove the chocks from the tires.

Mirror Head Assembly Removal and Installation

This procedure applies to the following mirrors:

- Lang-Mekra Aero
- Truck-Lite

The Lang-Mekra Aero is attached to the support loop with four clamps, while the Truck-Lite is attached to the support loop with the actuator and pivot assembly screws, requiring the removal of the mirror plate.

Lang-Mekra Aero

Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the CB antenna from the mirror head, using a wrench to keep the antenna base from loosening.
3. Remove the mirror back cover.
   - 3.1 Remove the two screw cover caps on the back of the mirror.
   - 3.2 Remove the two screws that attach the back cover to the mirror housing.
   - 3.3 Pull the bottom of the cover away from the mirror housing, and carefully lift the cover up over the antenna base.
4. Disconnect the CB and control cables from the mirror head. See **Fig. 1**.
5. While holding the mirror head, remove the screws on the four mounting clamps. Remove the mirror head from the support loop.

Installation

1. Position the mirror head assembly on the support loop.
2. Attach the mirror head assembly to the support loop by placing the four mounting clamps over the support loop and attaching them to the mirror head using the screws.
3. Adjust the angle of the mirror head on the support loop as needed. The angle of the mirror glass to the window glass should be 55 degrees on the driver's side, and 45 degrees on the passenger's side. Tighten the screws 53 lbf·in (600 N·cm).

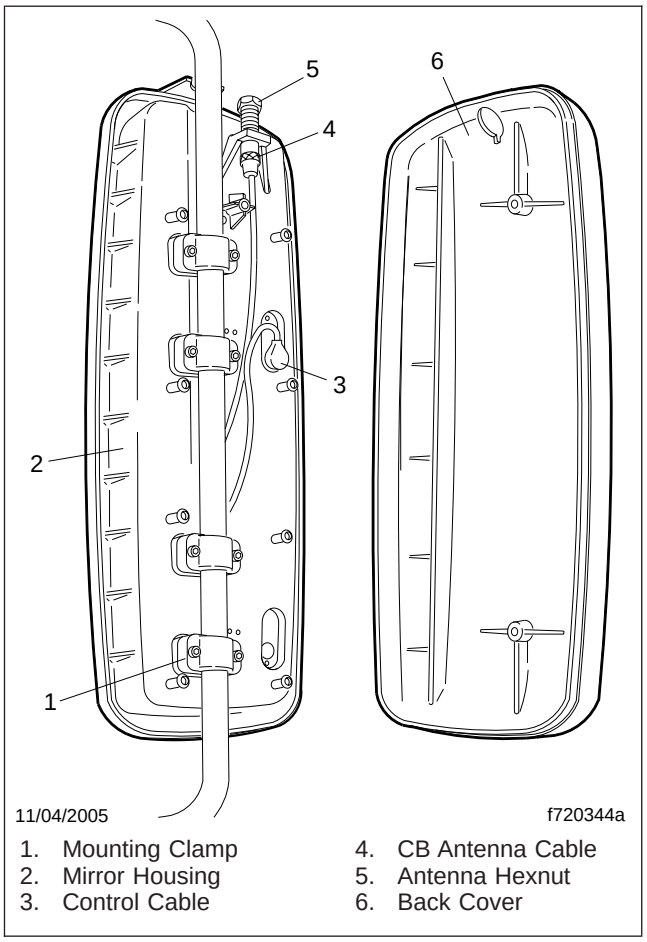


Fig. 1, Mirror Head Installation, Lang-Mekra Aero

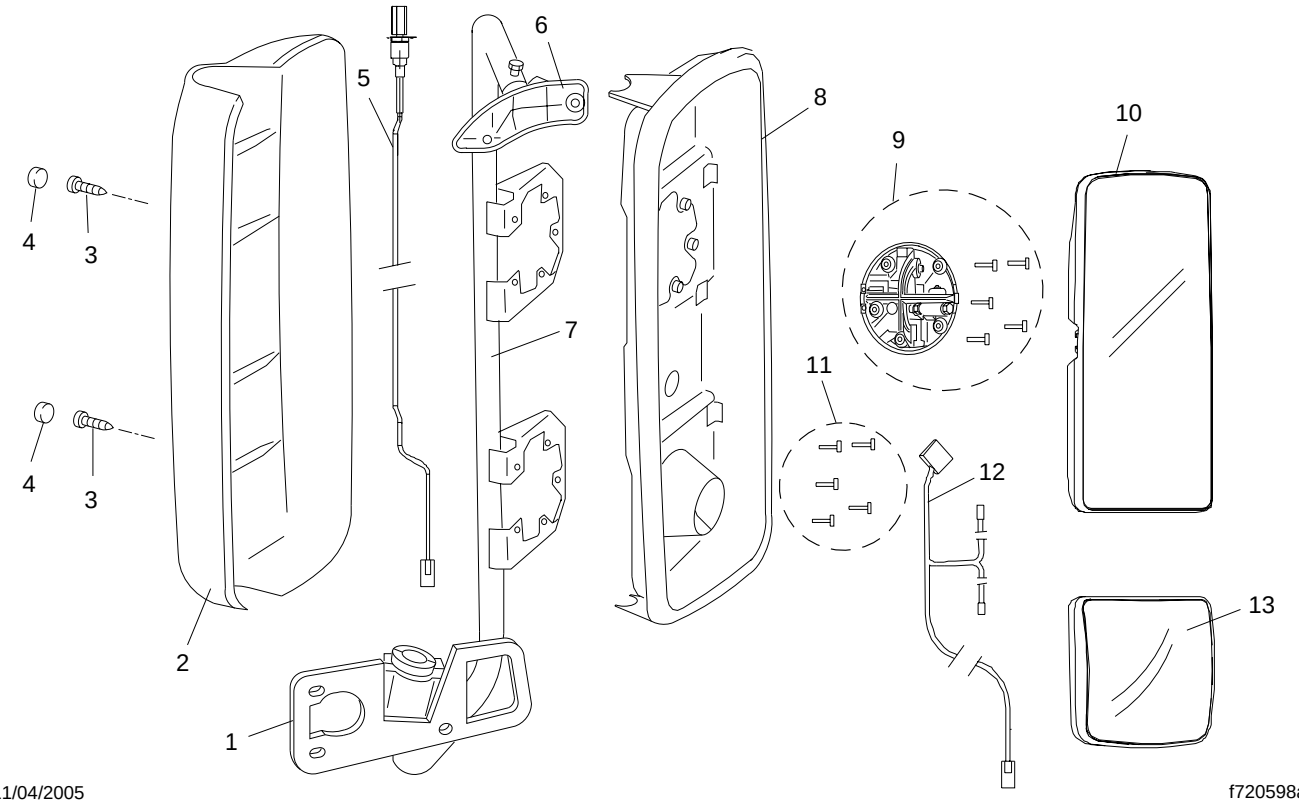
4. Attach the CB cable and the control cable to the mirror head.
5. Install the mirror back cover.
   - 5.1 Position the top of the cover over the antenna base, and push the bottom of the cover into place against the mirror housing.
   - 5.2 Install the two screws that attach the cover to the mirror housing. Torque the screws 36 lbf·in (400 N·cm).
   - 5.3 Install the two screw cover caps.
6. Install the CB antenna on the mirror head assembly. Tighten the antenna hexnut 85 lbf·in (960 N·cm).
7. Remove the chocks from the tires.

Mirror Head Assembly Removal and Installation

Truck-Lite

Removal

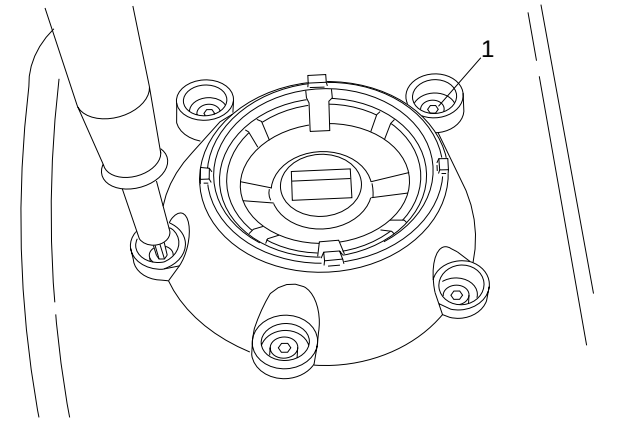
1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the CB antenna from the mirror head, using a wrench to keep the antenna base from loosening.
3. Remove the mirror back cover. See **Fig. 2**.
   - 3.1 Remove the two screw covers on the back of the mirror.
   - 3.2 Remove the two screws that attach the back cover to the mirror head.
   - 3.3 Pull the bottom of the cover away from the mirror head, and carefully lift the cover up over the antenna base.
4. Remove the main mirror plate. See **Subject 150** for instructions.
5. Remove the convex mirror plate. See **Subject 160** for instructions.
6. Remove the actuator assembly. See **Subject 170** for instructions.



1. Lower Mounting Bracket
2. Back Cover
3. Screw
4. Screw Cover Cap
5. CB Coax Assembly
6. Upper Mounting Bracket
7. Support Loop
8. Mirror Housing
9. Actuator Assembly
10. Flat Mirror
11. Pivot Assembly Screws
12. Heater Wiring Harness
13. Convex Mirror

Fig. 2, Truck-Lite Mirror Assembly

7. Remove the five screws that attach the convex glass pivot assembly to the support loop. See **Fig. 3**. Remove the mirror head from the support loop.



1. Pivot Assembly Mounting Screw

Fig. 3, Convex Glass Pivot Assembly

Installation

1. Position the mirror head on the support loop.
2. Attach the convex glass pivot assembly to the support loop with the five screws.
3. Install the actuator assembly. See **Subject 170** for instructions.
4. Install the convex mirror plate. See **Subject 160** for instructions.
5. Install the main mirror plate. See **Subject 150** for instructions.
6. Install the mirror back cover.
   - 6.1 Position the top of the cover over the antenna base, and push the bottom of the cover into place against the mirror head.

   IMPORTANT: Ensure that the mirror back cover is properly seated in the mirror housing. The gap around the edge should be uniform, and the tabs at the top and bottom should seat securely in their respective grooves.

   - 6.2 Install the two screws that attach the cover to the mirror head. Torque the screws 31 lbf·in (340 N·cm).
   - 6.3 Install the two screw covers.
7. Install the CB antenna on the mirror head assembly. Tighten the antenna hexnut 85 lbf·in (960 N·cm).
8. Remove the chocks from the tires.

Support Loop Replacement

This procedure applies to the following mirrors:

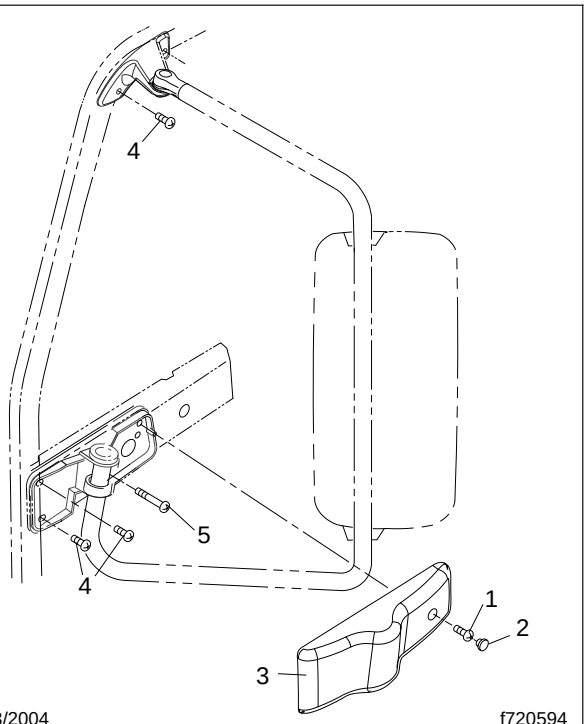
- Lang-Mekra Aero
- Truck-Lite

The Lang-Mekra Aero and Truck-Lite support loops are slightly different, but the replacement procedure is similar, with the exception of the removal and installation of the mirror head.

Replacement

NOTE: The lower bracket and the wiring harness are not serviceable. If there is a problem with either one, replace the whole support loop assembly.

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the lower mirror-bracket cover. See **Fig. 1**.
   - 2.1 Remove the screw cover cap from the lower mirror-bracket cover.
   - 2.2 Remove the screw that attaches the cover to the mirror bracket.
   - 2.3 Remove the cover by pulling the rear of the cover away from the bracket while sliding the front of the cover towards the front of the vehicle.
3. Remove the mirror head assembly from the support loop. The procedure is different for each mirror. See **Subject 130** for applicable instructions.
4. Disconnect the cables at the lower bracket.
5. Remove the three screws that attach the lower bracket to the door.
6. While supporting the support loop, remove the two screws that attach the upper bracket to the door. Remove the support loop from the door.
7. Position the new support loop on the door.
8. Attach the upper bracket to the door using the two screws. Torque the screws 11 lbf·ft (15 N·m).
9. Attach the lower bracket to the door using the three screws. Torque the screws 11 lbf·ft (15 N·m).
10. Connect the cables at the lower bracket.



1. Bracket Cover Mounting Screw
2. Screw Cover Cap
3. Lower Bracket Cover
4. Bracket Screws
5. Hexbolt

Fig. 1, Mirror Assembly Mounting

11. Install the mirror head on the support loop. The procedure is different for each mirror. See **Subject 130** for applicable instructions.
12. Install the lower mirror-bracket cover.
    - 12.1 Slide the front of the cover onto the lower bracket and push the rear of the cover onto the bracket.
    - 12.2 Install the screw that attaches the cover to the bracket.
    - 12.3 Install the screw cover cap.
13. Remove the chocks from the tires.

Main Mirror Plate Removal and Installation

This procedure applies to the following mirrors:

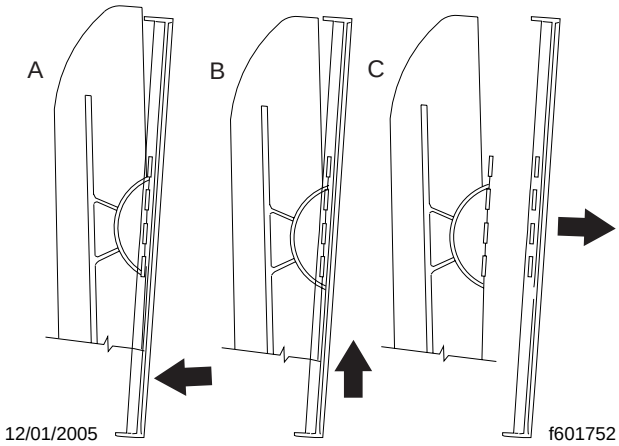
- Lang-Mekra Aero
- Truck-Lite

The procedure is different for each mirror.

Lang-Mekra Aero

Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Move the mirror plate in at the bottom, either manually or by remote actuation. See **Fig. 1**.



A. Actuate the mirror down.
B. Slide the mirror plate up.
C. Pull the mirror plate out.

Fig. 1, Mirror Plate Removal

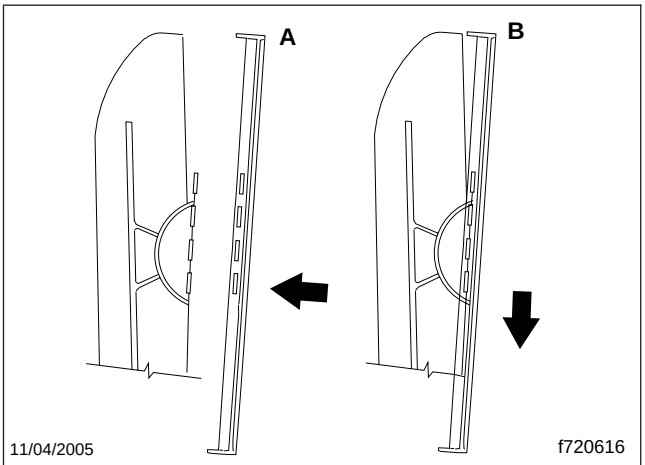
3. Slide the mirror plate up.
4. When the mirror plate is disengaged, carefully lift it to expose the heater wires.

IMPORTANT: Do not pull or cut the wires when disconnecting them. Disconnect the wires by pulling on the wire terminal covers only. Connect the wires by pushing on the wire terminal covers only.

5. Disconnect the heater wires by pulling on the wire terminal covers.
6. Remove the mirror plate.

Installation

1. Attach the wire terminals to the back of the mirror plate.
2. Position the mirror plate against the structure plate, using care not to pinch the heater wires between the socket plate and the mirror plate.
3. Slide the mirror plate down to engage the locking tabs. See **Fig. 2**.



A. Position the mirror plate against the structure plate.
B. Slide the mirror plate down.

Fig. 2, Mirror Plate Installation

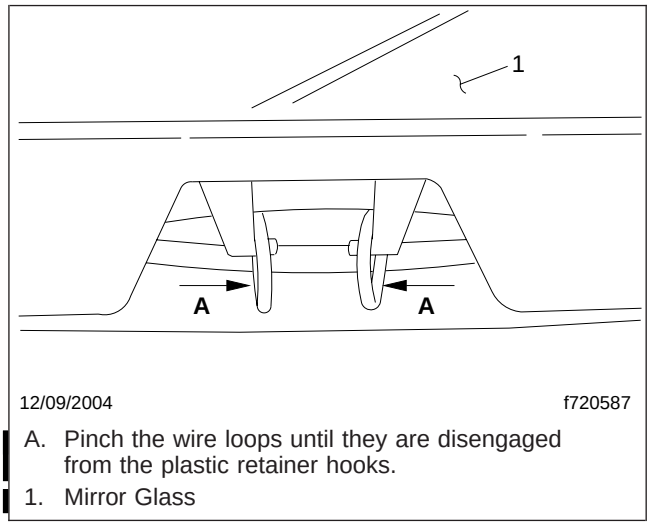
4. Pull on the mirror to ensure that the plate is properly locked.
5. Remove the chocks from the tires.

Truck-Lite

Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Manually adjust the mirror plate to the fully outboard position to allow access to the plastic retainer hooks.
3. Using your fingers or a pair of needlenose pliers, unlatch the wire loops from the plastic retainer hooks by squeezing the ends of the two loops together. See **Fig. 3**.

Main Mirror Plate Removal and Installation



A. Pinch the wire loops until they are disengaged from the plastic retainer hooks.
1. Mirror Glass

Fig. 3, Mirror Plate Brackets

NOTE: It is only necessary to disengage the wire loops on one side of the mirror.

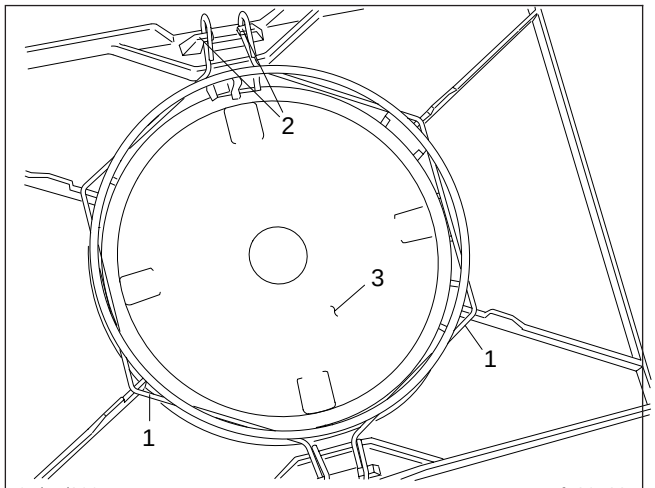
4. When disengaged, carefully lift the mirror plate from the actuator to expose the heater wires.
5. Slide the mirror plate connector off the mirror housing support tab, and disconnect it from the mirror wiring harness.
6. Remove the mirror plate from the mirror assembly.

Installation

1. Install the wire loops on the back of the mirror plate. Engage the ends of the wire loops on the plastic retainer hooks. See **Fig. 4**.
2. Connect the mirror plate connector to the mirror wiring harness, and slide the connector onto the mirror housing support tab.

NOTE: Keep the wires free of the socket plate. Do not pinch the wires between the socket plate and the mirror plate.

3. Position the mirror plate over the actuator and press it securely in place.
4. Actuate the glass in all directions, and gently pull on the outer edges to ensure proper assembly.
5. Remove the chocks from the tires.



1. Wire Loops
2. Plastic Hooks
3. Actuator

Fig. 4, Wire Loop Installation

Convex Mirror Plate Removal and Installation

This procedure applies to the following mirrors:

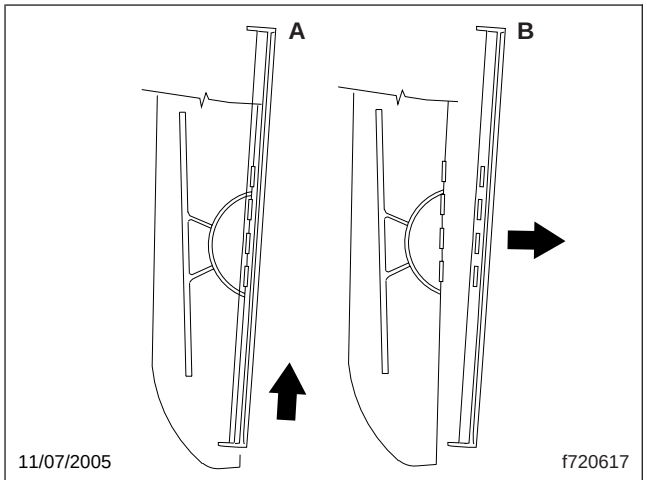
- Lang-Mekra Aero
- Truck-Lite

The procedure is different for each mirror. In order to remove the convex mirror plate on the Lang-Mekra Aero mirror, it is necessary to remove the main mirror plate first. On the Truck-Lite mirror, it is necessary to remove the back cover first.

Lang-Mekra Aero

Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the main mirror plate. See **Subject 150** for instructions.
3. Slide the convex mirror plate up. See **Fig. 1**.



A. Slide the mirror plate up.
C. Pull the mirror plate out.

Fig. 1, Mirror Plate Removal

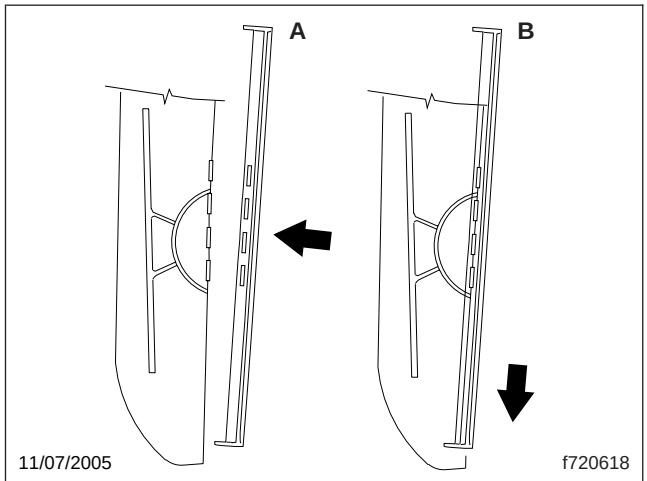
4. When the mirror plate is disengaged, carefully pull it out to expose the heater wires.

IMPORTANT: Do not pull or cut the wires when disconnecting them. Disconnect the wires by pulling on the wire terminal covers only. Connect the wires by pushing on the wire terminal covers only.

5. Disconnect the heater wires by pulling on the wire terminal covers.
6. Remove the mirror plate.

Installation

1. Attach the wire terminals to the back of the convex mirror plate.
2. Position the convex mirror plate against the structure plate, using care not to pinch the heater wires between the socket plate and the mirror plate.
3. Slide the convex mirror plate down to engage the locking tabs. See **Fig. 2**.



A. Position the mirror plate against the structure plate.
B. Slide the mirror plate down.

Fig. 2, Mirror Plate Installation

4. Pull on the mirror to ensure that the plate is properly locked.
5. Install the main mirror plate. See **Subject 150** for instructions.
6. Remove the chocks from the tires.

Truck-Lite

Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.

Convex Mirror Plate Removal and Installation

2. Remove the mirror back cover.
   - 2.1 Remove the two screw covers on the back of the mirror.
   - 2.2 Remove the two screws that attach the back cover to the mirror head.
   - 2.3 Pull the bottom of the cover away from the mirror head, and carefully lift the cover up over the antenna base.
3. Using a pair of needlenose pliers, pull and twist the white tab on the back of the convex mirror plate one quarter turn to align with the slot. See **Fig. 3**.

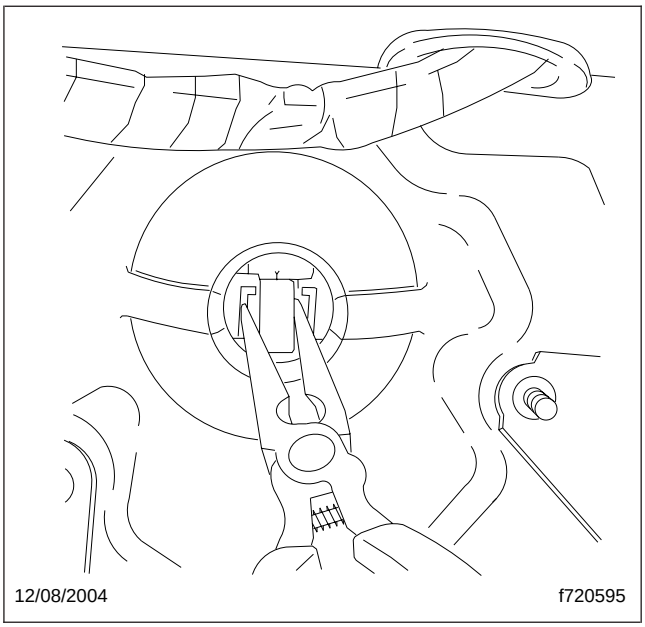


Fig. 3, Turning the White Tab to Align with the Slot

4. Disconnect the electrical connector from the mirror heater.
5. Remove the convex mirror plate from the mirror housing.

Installation

1. Connect the electrical connector to the mirror heater.
2. Position the convex mirror plate in the mirror housing. Twist the white tab on the back of the convex mirror one quarter turn until it locks.
3. Install the mirror back cover.
   - 3.1 Position the top of the cover over the antenna base, and push the bottom of the cover into place against the mirror head.

   IMPORTANT: Ensure that the mirror back cover is properly seated in the mirror housing. The gap around the edge should be uniform, and the tabs at the top and bottom should seat securely in their respective grooves.
   - 3.2 Install the two screws that attach the cover to the mirror housing. Torque the screws 31 lbf·in (340 N·cm).
   - 3.3 Install the two screw covers.
4. Remove the chocks from the tires.

Mirror Actuator Replacement

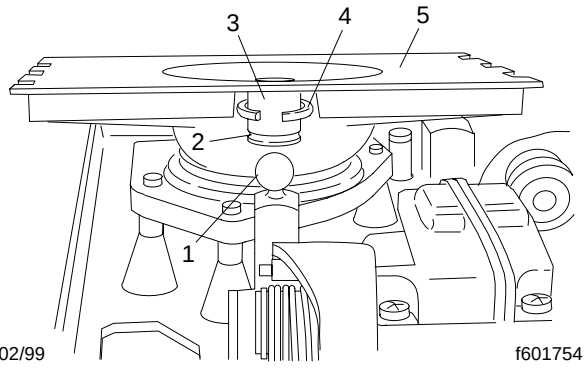
This procedure applies to the following mirrors:

- Lang-Mekra Aero
- Truck-Lite

The procedure is different for each mirror.

Lang-Mekra Aero

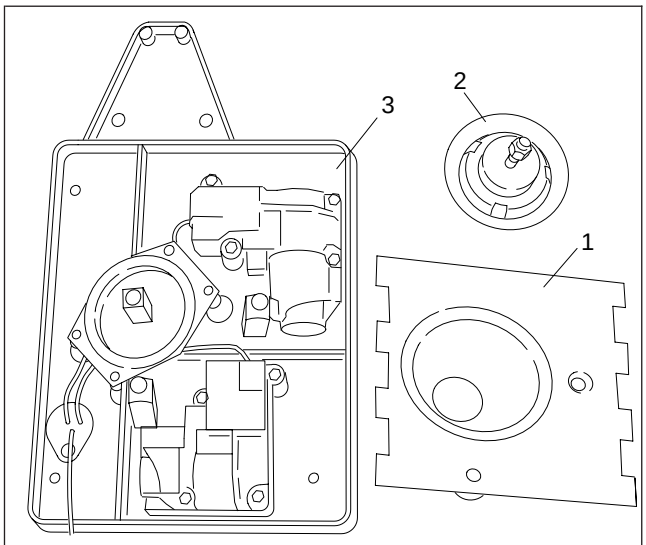
1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Disconnect the batteries.
3. Remove the main mirror plate. See **Subject 150** for instructions.
4. Disassemble the two ball-and-socket joints. See **Fig. 1**.
   - 4.1 On one of the split socket tubes, slide the split ring out of the retaining groove and away from the motor.
   - 4.2 Firmly press down on the opposite side of the socket plate to detach the ball-and-socket joint.
   - 4.3 Repeat the disassembly steps for the other ball-and-socket joint.



1. Ball
2. Retaining Groove
3. Split Socket Tube
4. Split Ring
5. Socket Plate

Fig. 1, Ball-and-Socket Joint

5. Remove the socket plate by removing the center pivot screw. See **Fig. 2**. Note the order of the center pivot components.



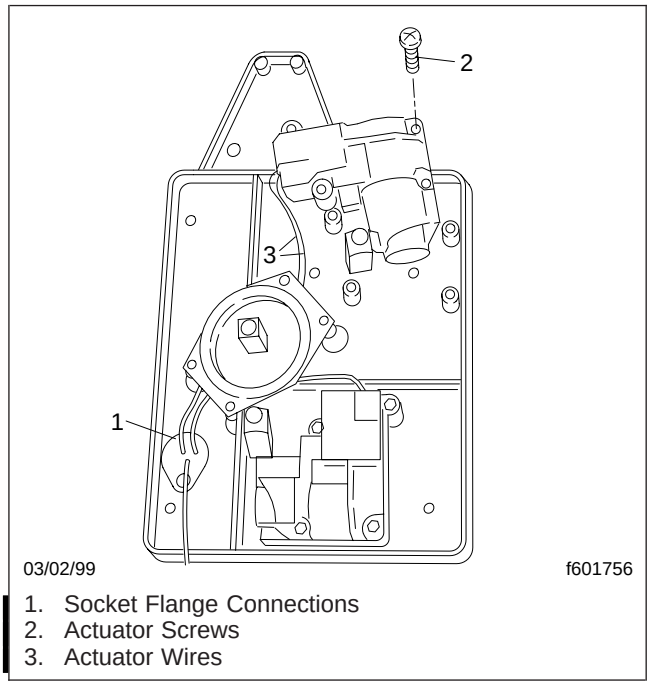
1. Socket Plate
2. Center Pivot Assembly
3. Structure Plate

Fig. 2, Socket Plate Assembly

IMPORTANT: Use care not to damage the socket flange connections when cutting the actuator wires.

6. Cut the two wires (Ref. 3 in **Fig. 3**) to the actuator, leaving at least 2-1/2 inches (60 mm) of wire for the socket.
7. Remove the four screws that attach the actuator to the structure plate. Remove the actuator. See **Fig. 3**.
8. Place the new actuator in position and attach it to the structure plate using the four screws. See **Fig. 3**. Tighten the screws 13 lbf·in (150 N·cm).
9. Connect the wires from the new actuator to the wires leading from the socket. Use butt splice connectors, or solder and shrink wrap.
10. Place the socket plate in position. Install the center pivot components and screw, in reverse order of removal. Tighten the screw 44 lbf·in (500 N·cm).
11. Assemble the two ball-and-socket joints. See **Fig. 1**.

Mirror Actuator Replacement



1. Socket Flange Connections
2. Actuator Screws
3. Actuator Wires

Fig. 3, Actuator Wiring Harness

11.1 Push the split ring up one of the split socket tubes, away from the motor assembly.

11.2 Actuate the motor towards the split socket tube.

11.3 Align the motor arm into the split socket tube.

11.4 Push firmly on the socket plate to snap the ball into the split socket tube.

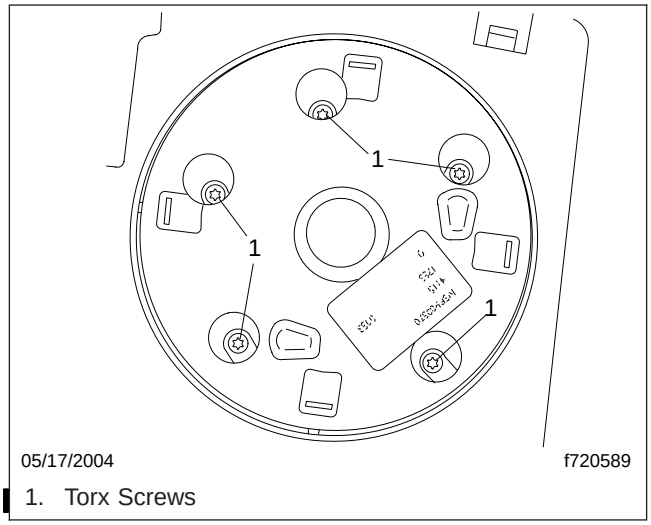
11.5 Slide the split ring into the retaining groove on the split socket tube.

11.6 Repeat the assembly steps for the other ball-and-socket joint.

12. Install the main mirror plate. See **Subject 150** for instructions.
13. Connect the batteries.
14. Remove the chocks from the tires.

Truck-Lite

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Disconnect the batteries.
3. Remove the main mirror plate. See **Subject 150** for instructions.
4. Remove the five Torx® screws that attach the actuator to the mirror housing. See **Fig. 4**.



1. Torx Screws

Fig. 4, Actuator Retaining Screws

5. Lift the actuator out of the mirror housing and disconnect the electrical wires. See **Fig. 5**.

NOTE: The electrical connections are labeled A and B to prevent incorrect installation.

6. Connect the electrical wires to the new actuator. See **Fig. 5**
7. Position the actuator in the mirror housing and install the five Torx screws. Tighten the screws 35 to 40 lbf·in (400 to 460 N·cm).
8. Install the main mirror plate. See **Subject 150** for instructions.
9. Connect the batteries.
10. Remove the chocks from the tires.

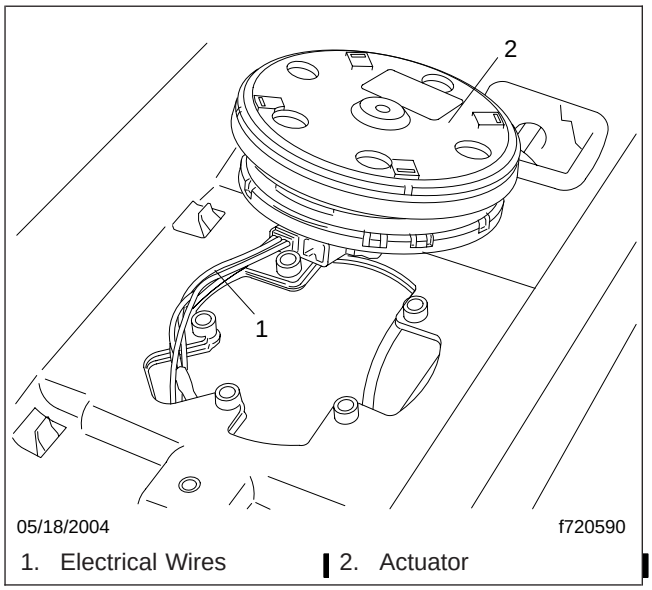


Fig. 5, Actuator Electrical Wires

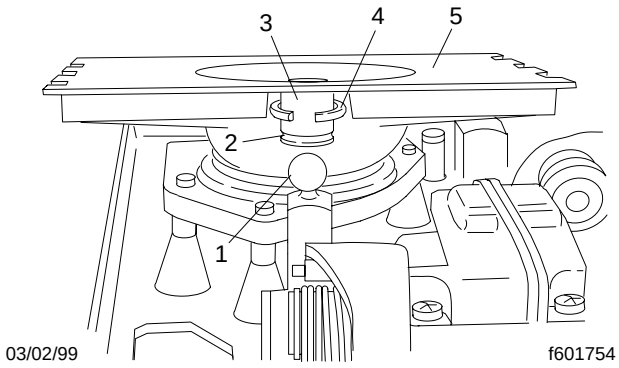
Ball-and-Socket Joint

This procedure applies to the following mirror only:

- Lang-Mekra Aero

Disassembly

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Disconnect the batteries.
3. Remove the main mirror plate. See **Subject 150** for instructions.
4. Slide the split ring out of the retaining groove and away from the motor. See **Fig. 1**.



1. Ball
2. Retaining Groove
3. Split Socket Tube
4. Split Ring
5. Socket Plate

Fig. 1, Ball-and-Socket Joint

5. Firmly press down on the opposite side of the socket plate to disengage the ball-and-socket joint.

Assembly

1. Push the split ring up the split socket tube, away from the motor assembly. See **Fig. 1**.
2. Actuate the motor towards the split socket tube.
3. Align the motor arm into the split socket tube.
4. Push firmly on the socket plate to snap the ball into the split socket tube.
5. Slide the split ring into the retaining groove on the split socket tube.
6. Install the main mirror plate. See **Subject 150** for instructions.
7. Connect the batteries.
8. Remove the chocks from the tires.

Structure Plate Assembly Replacement

This procedure applies to the following mirror only:

- Lang-Mekra Aero

Replacement

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the mirror head assembly from the support loop. See **Subject 130** for instructions.
3. Remove the applicable mirror plate from the mirror housing. See **Subject 150** for instructions.
4. If replacing the main mirror structure plate assembly, remove the CB antenna mount from the structure plate.
5. Disconnect the electrical wiring from the structure plate.
6. Remove the screws that attach the structure plate to the mirror housing. See **Fig. 1**.

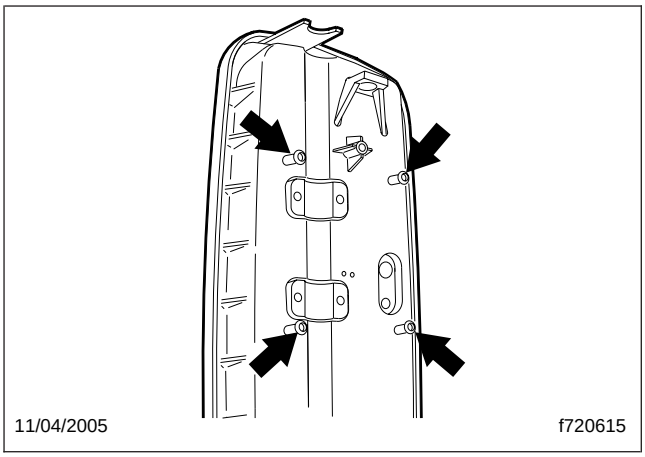


Fig. 1, Main Mirror Structure Plate Screws

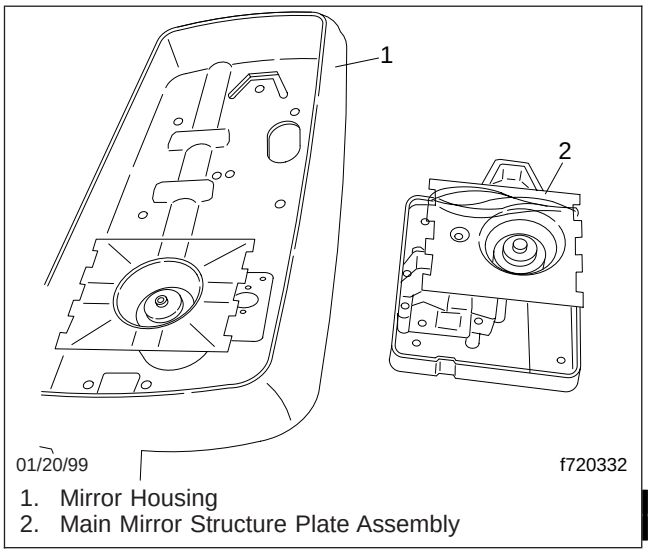
7. Remove the structure plate from the mirror housing. See **Fig. 2**.
8. Position the new structure plate in the mirror housing.
9. Install the screws that attach the structure plate to the mirror housing. See **Fig. 1**.
10. Connect the electrical wiring to the structure plate.



1. Mirror Housing
2. Main Mirror Structure Plate Assembly

Fig. 2, Mirror Housing with Main Mirror Structure Plate Removed

11. Install the CB antenna mount on the main mirror structure plate, if applicable.
12. Install the mirror plate in the mirror housing. See **Subject 150** for instructions.
13. Attach the mirror head to the support loop. See **Subject 130** for instructions.
14. Remove the chocks from the tires.

Mirror Housing Replacement

This procedure applies to the following mirrors:

- Lang-Mekra Aero
- Truck-Lite

The procedure is different for each mirror.

Lang-Mekra Aero

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the mirror head assembly from the support loop. See **Subject 130** for instructions.
3. Remove the main mirror plate from the mirror housing. See **Subject 150** for instructions.
4. Remove the convex mirror plate from the mirror housing. See **Subject 160** for instructions.
5. Remove the CB antenna mount from the main mirror structure plate.
6. Disconnect the electrical connections from the main and convex mirror structure plates.
7. Remove the screws that attach the main mirror structure plate to the mirror housing. See **Fig. 1**. Remove the main mirror structure plate from the mirror housing.

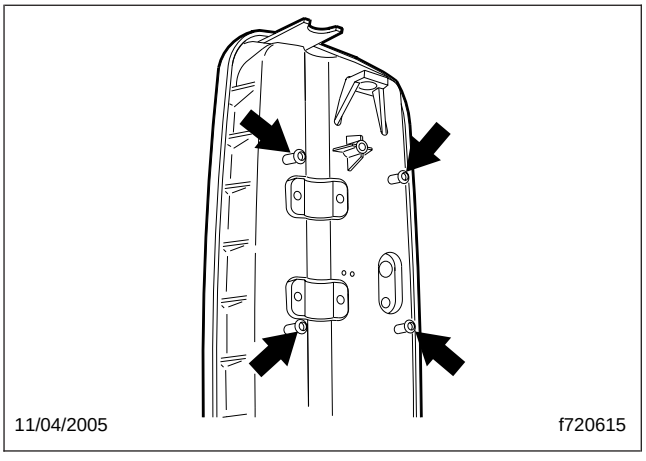


Fig. 1, Main Mirror Structure Plate Screws

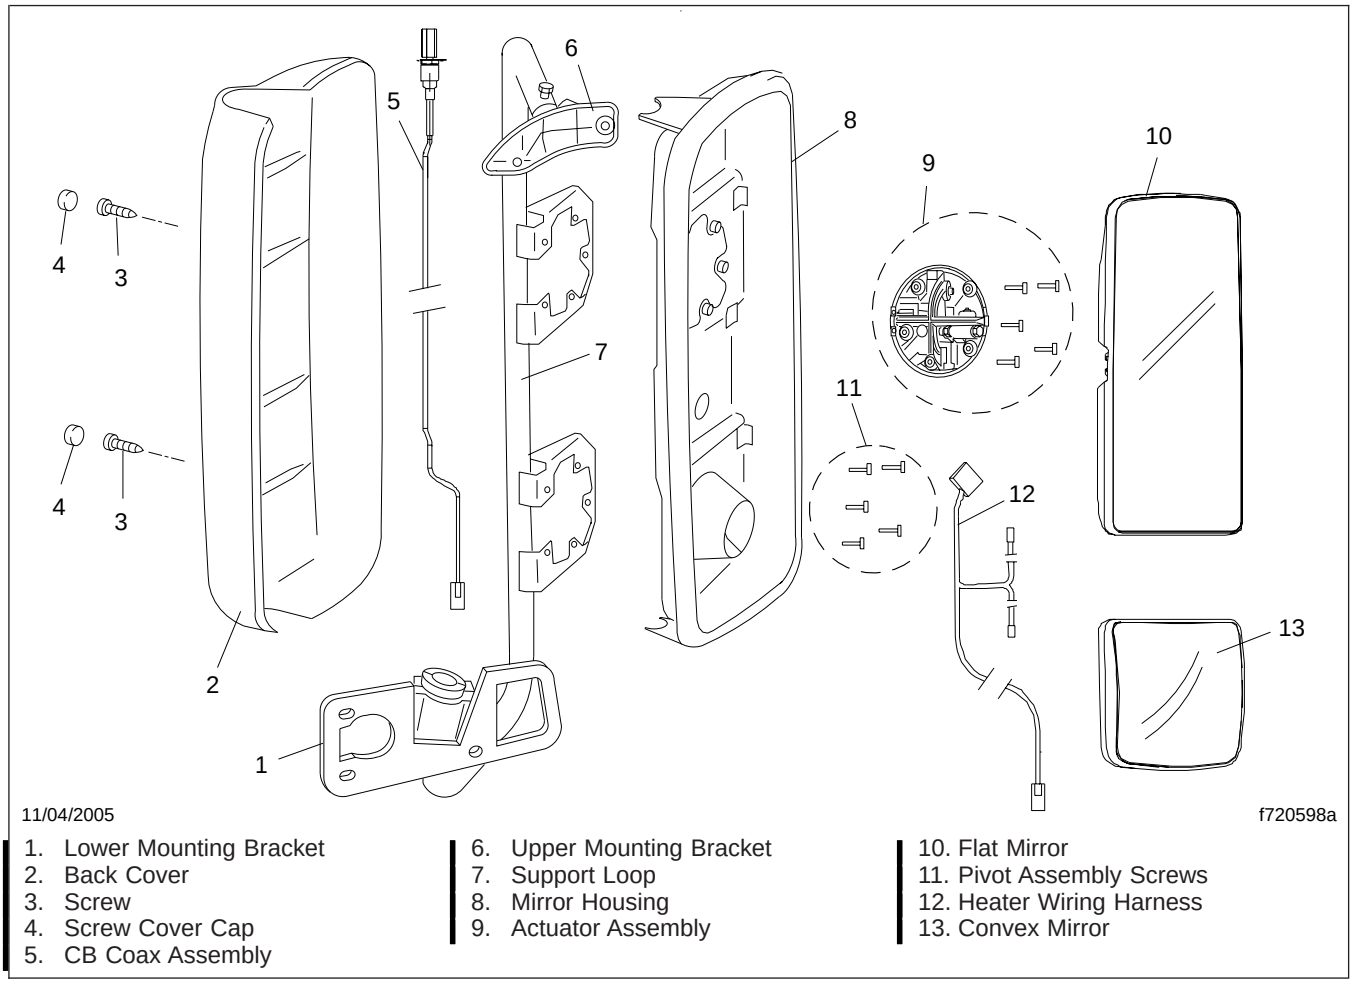
8. Remove the screws that attach the convex mirror structure plate to the mirror housing. Remove the convex mirror structure plate from the mirror housing.
9. Position the convex mirror structure plate in the new mirror housing.
10. Install the screws that attach the convex mirror structure plate to the mirror housing.
11. Position the main mirror structure plate in the new mirror housing.
12. Install the screws that attach the main mirror structure plate to the mirror housing. See **Fig. 1**.
13. Connect the electrical connections to both structure plates.
14. Install the CB antenna mount on the main mirror structure plate.
15. Install the convex mirror plate in the mirror housing. See **Subject 160** for instructions.
16. Install the main mirror plate in the mirror housing. See **Subject 150** for instructions.
17. Attach the mirror head to the support loop. See **Subject 130** for instructions.
18. Remove the chocks from the tires.

Truck-Lite

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the CB antenna from the mirror head, using a wrench to keep the antenna base from loosening.
3. Remove the mirror back cover. See **Fig. 2**.
   - 3.1 Remove the two screw covers on the back of the mirror.
   - 3.2 Remove the two screws that attach the back cover to the mirror head.
   - 3.3 Pull the bottom of the cover away from the mirror head, and carefully lift the cover up over the antenna base.
4. Remove the main mirror plate from the mirror housing. See **Subject 150** for instructions.
5. Remove the convex mirror plate from the mirror housing. See **Subject 160** for instructions.
6. Remove the actuator assembly from the mirror head. See **Subject 170** for instructions.

Mirror Housing Replacement



1. Lower Mounting Bracket
2. Back Cover
3. Screw
4. Screw Cover Cap
5. CB Coax Assembly
6. Upper Mounting Bracket
7. Support Loop
8. Mirror Housing
9. Actuator Assembly
10. Flat Mirror
11. Pivot Assembly Screws
12. Heater Wiring Harness
13. Convex Mirror

Fig. 2, Truck-Lite Mirror Assembly

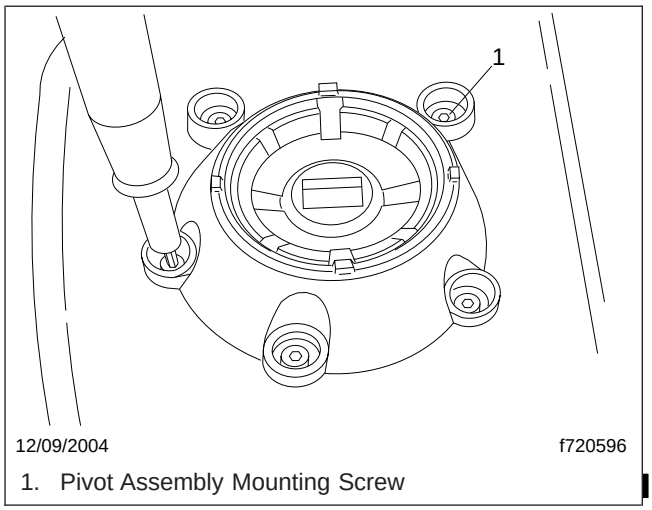
7. Remove the five screws that attach the convex glass pivot assembly to the support loop. See **Fig. 3**. Remove the mirror housing from the support loop.
8. Position the new mirror housing on the support loop.
9. Attach the convex glass pivot assembly to the support loop with the five screws. See **Fig. 3**.
10. Install the actuator assembly. See **Subject 170** for instructions.
11. Install the convex mirror plate. See **Subject 160** for instructions.
12. Install the main mirror plate. See **Subject 150** for instructions.
13. Install the mirror back cover.

    13.1 Position the top of the cover over the antenna base, and push the bottom of the cover into place against the mirror head.

    IMPORTANT: Ensure that the mirror back cover is properly seated in the mirror housing. The gap around the edge should be uniform, and the tabs at the top and bottom should seat securely in their respective grooves.

    13.2 Install the two screws that attach the cover to the mirror head. Torque the screws 31 lbf·ft (340 N·m).

    13.3 Install the two screw covers.



1. Pivot Assembly Mounting Screw

Fig. 3, Convex Glass Pivot Assembly

14. Install the CB antenna on the mirror head assembly. Tighten the antenna hexnut 85 lbf·in (960 N·cm).
15. Remove the chocks from the tires.

Upper Pivot-Point Fastener Kit Replacement

This procedure applies to the following mirror only:

- Lang-Mekra Aero

NOTE: The upper pivot-point fastener kit is not serviceable on Truck-Lite mirrors.

Replacement

CAUTION

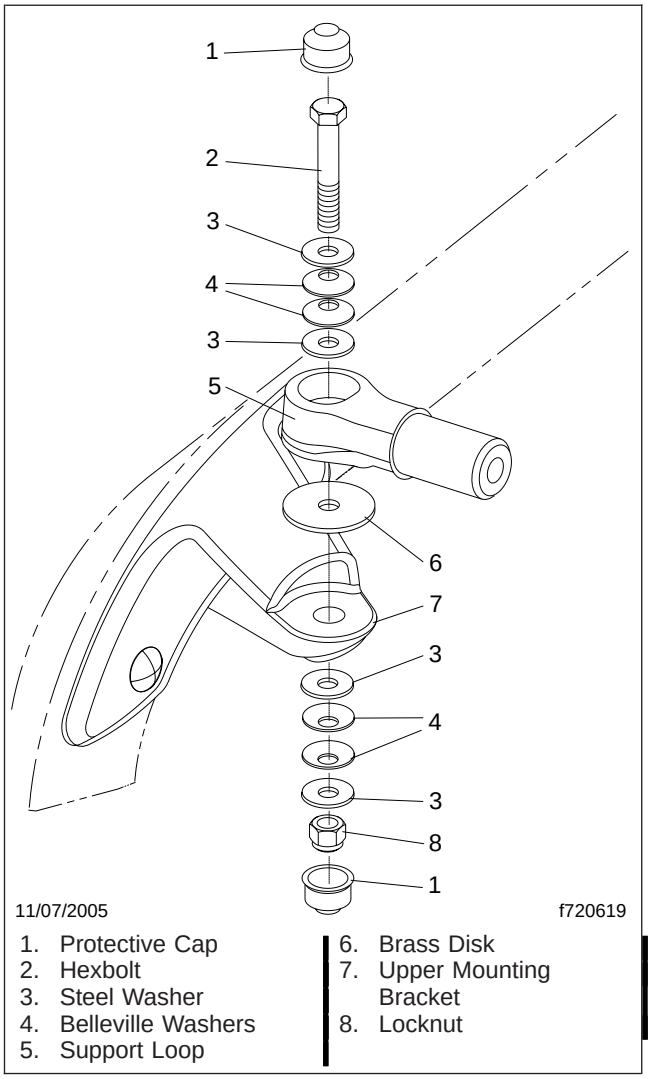
If any fasteners in the kit are over-torqued, the entire fastener kit must be replaced.

1. Remove the two protective fastener caps from the nut and bolt. See **Fig. 1**.
2. Remove the nut and bolt from the upper mounting bracket. If reinstalling the fasteners, note the order of the washers.
3. Lightly grease both sides of the brass disk.

CAUTION

When assembling the fastener kit, make sure that all components are installed in the correct order, and that the Belleville washers are oriented with the concave sides facing the upper mounting bracket and support loop. Incorrect installation may damage the fastener kit and cause the support loop pivot to bind or move too easily.

4. Place the brass disk between the upper mounting bracket and the upper arm of the support loop. See **Fig. 1**.
5. Insert the bolt through, in this order, a steel washer, two Belleville washers with concave sides towards the end of the bolt, and a permaglide steel washer with the lubricated side towards the end of the bolt.
6. Insert the assembled bolt and washers through the support loop, the brass disk, and the upper mounting bracket.
7. Install, in this order, a permaglide washer with the lubricated side towards the upper support bracket, two Belleville washers with the concave sides towards the upper support bracket, and a steel washer on the bolt.
8. Install the locknut on the bolt. Torque the nut 31 to 35 lbf·ft (42 to 48 N·m).



1. Protective Cap
2. Hexbolt
3. Steel Washer
4. Belleville Washers
5. Support Loop
6. Brass Disk
7. Upper Mounting Bracket
8. Locknut

Fig. 1, Fastener Kit Installation

9. Install the two protective caps on the nut and bolt.

Troubleshooting Tables

Problem—Mirror Support Loop Does Not Fold Back

Problem—Mirror Support Loop Does Not Fold Back	
Possible Cause	**Remedy**
An incorrect adjustment of the upper mirror-pivot bolt.	Adjust the upper mirror-pivot bolt. See **Subject 110** for instructions.

Problem—Mirror Support Loop Folds Back Too Easily or Vibrates

Problem—Mirror Support Loop Folds Back Too Easily or Vibrates	
Possible Cause	**Remedy**
The upper mirror-pivot bolt is loose.	Adjust the upper mirror-pivot bolt. See **Subject 110** for instructions.
The upper mirror-pivot bolt has been over-torqued (Lang-Mekra Aero).	Replace the upper mirror-pivot bolt, bushing, and hexnut. See **Subject 210** for instructions.
The attachments to the door are loose.	Secure the brackets to the door. See **Subject 100** for instructions.

Problem—Remote-Controlled Mirror Will Not Adjust

Problem—Remote-Controlled Mirror Will Not Adjust	
Possible Cause	**Remedy**
Loose or damaged cables.	Connect any loose cables. Check all cables for damage and replace as needed.
Detached ball and socket joint (Lang-Mekra Aero).	Push the split ring up the split socket tube, away from the actuator. Direct the actuator towards the split socket tube, then align the actuator arm into the tube. Push firmly on the socket plate to snap the ball into the split socket tube. Slide the split ring back into the retaining groove. See **Subject 180** for instructions.
Broken rivet or socket at ball and socket joint (Lang-Mekra Aero).	Replace the socket plate. See **Subject 180** for instructions.
Broken actuator arm (Lang-Mekra Aero).	Replace the failed actuator. See **Subject 170** for instructions.
Faulty control cable (Lang-Mekra Aero).	Replace the control cable. See **Subject 130** for instructions.
Failed actuator.	Replace the failed actuator. See **Subject 170** for instructions.
No continuity from socket flange (Lang-Mekra Aero).	Replace the structure plate assembly, including the actuators. See **Subject 190** for instructions.

Problem—Mirror Plate Will Not Heat

Problem—Mirror Plate Will Not Heat	
Possible Cause	**Remedy**
Loose or damaged cables.	Connect any loose cables. Check all cables for damage and replace as needed.
Detached heater wires.	Attach the heater wires. See **Subject 150** (main mirror), or **Subject 160** (convex mirror) for instructions.

Troubleshooting

Problem—Mirror Plate Will Not Heat	
Possible Cause	**Remedy**
Loose or damaged heater spades.	Replace the mirror plate assembly. See **Subject 150** (main mirror), or **Subject 160** (convex mirror) for instructions.
Faulty control cable.	Replace the control cable. See **Subject 130** for instructions.
Faulty glass plate assembly.	Replace the mirror plate assembly. See **Subject 150** (main mirror), or **Subject 160** (convex mirror) for instructions.
No continuity from socket flange (Lang-Mekra Aero).	Replace the structure plate assembly. See **Subject 190** for instructions.

See **Fig. 1**, **Fig. 2**, and **Fig. 3** for the wiring diagram for a motorized and/or heated mirror.

Specifications

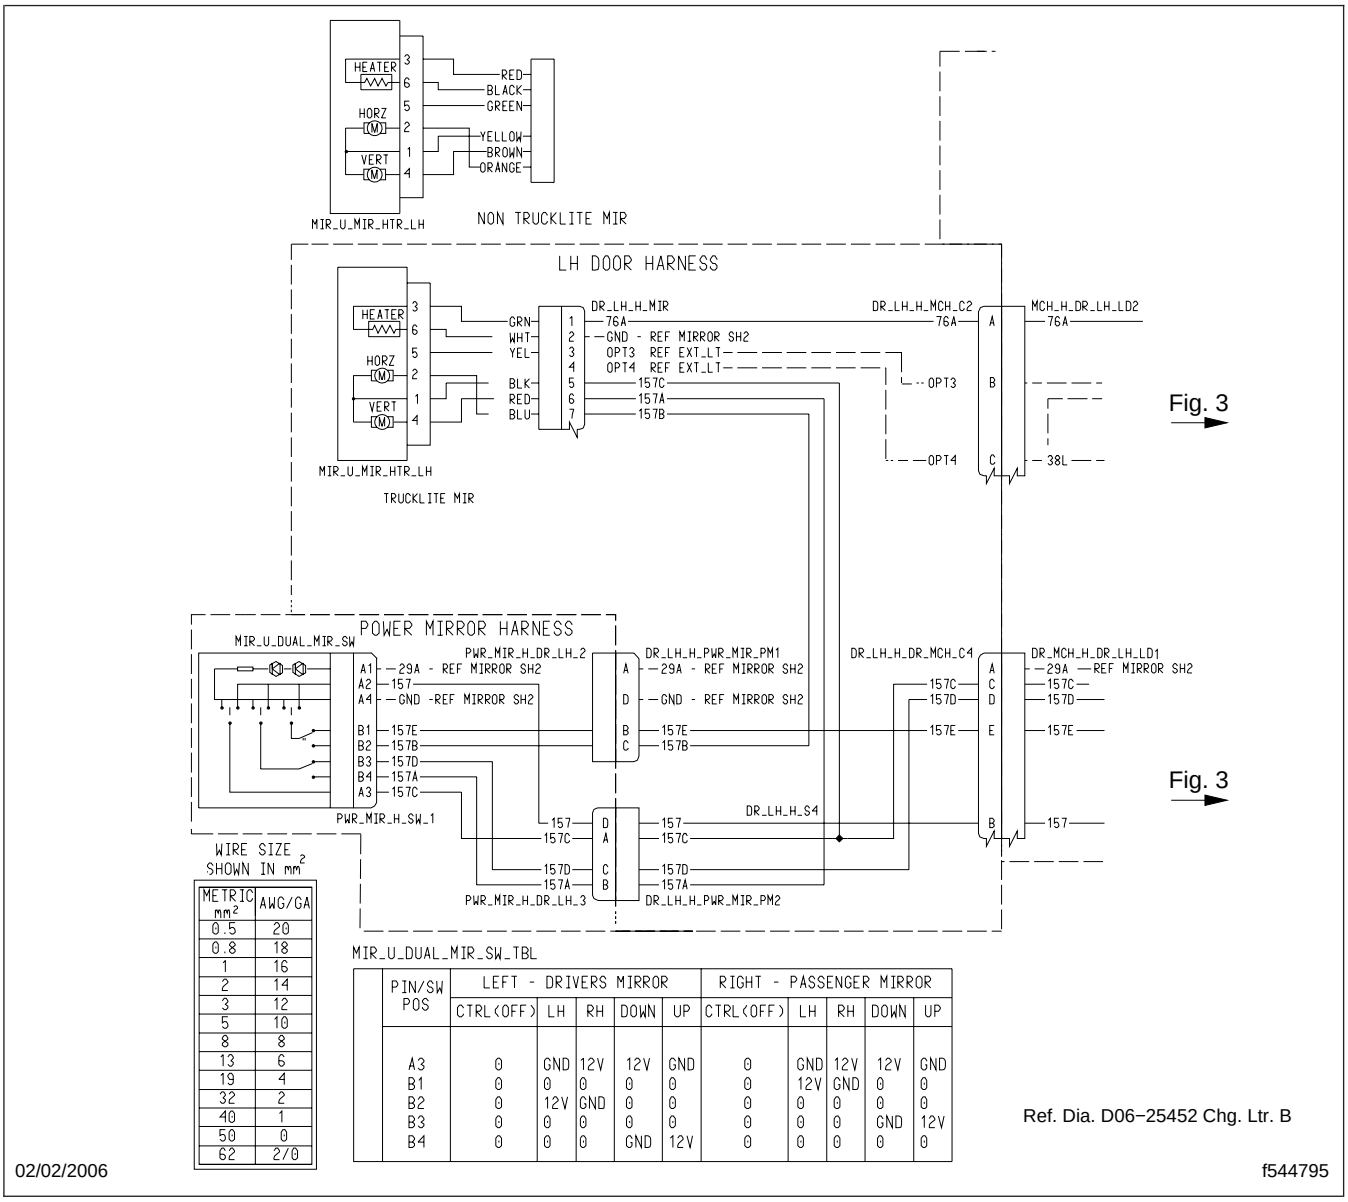

Fig. 2, Mirror Wiring Diagram (detailed view)

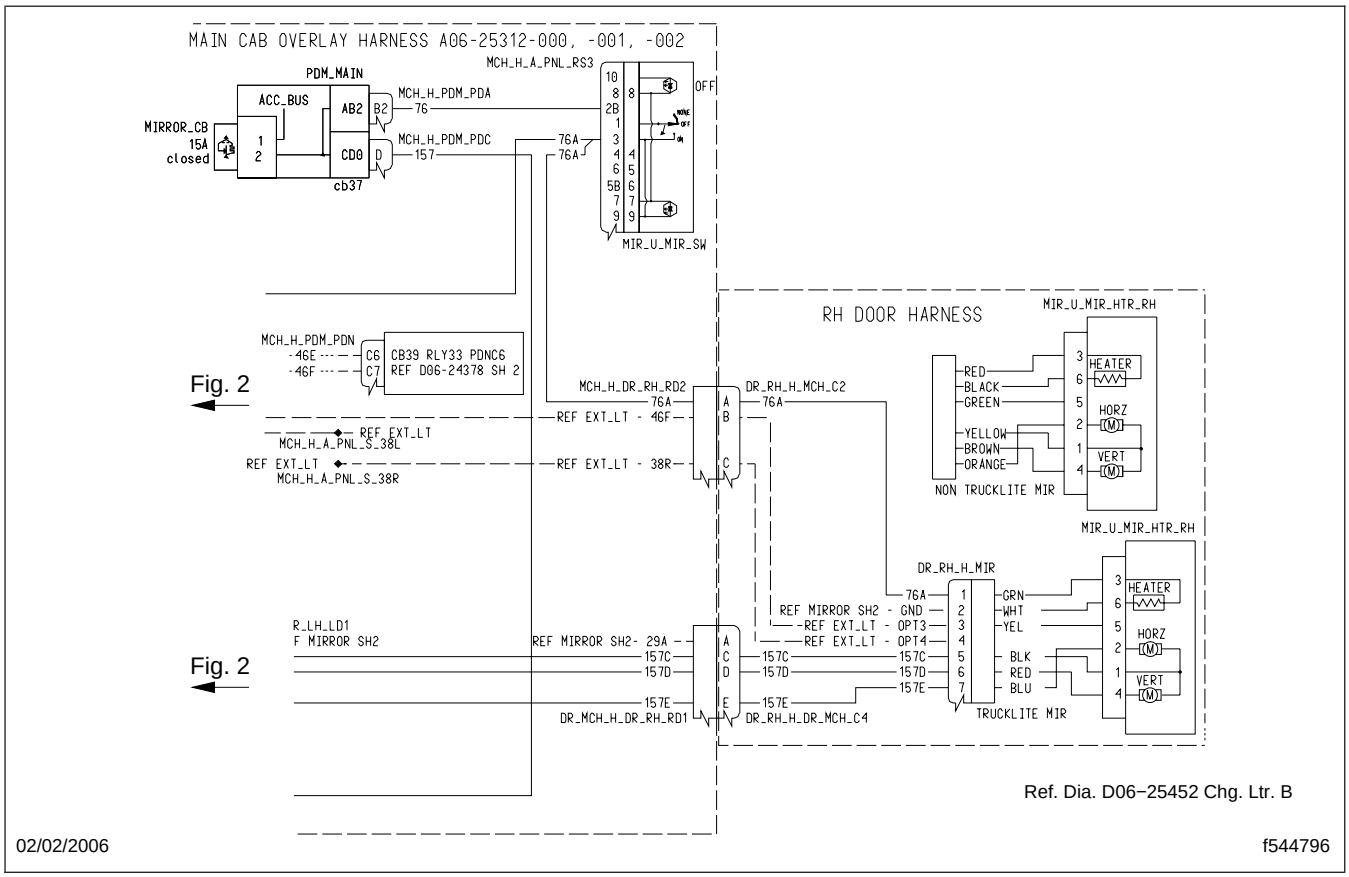

Fig. 3, Mirror Wiring Diagram (detailed view)

General Information

The aluminum cab is a semi-monocoque design, which means that the outer skin panels are load-bearing as is the internal framework. This type of construction requires less framework than standard cab construction, and results in a very strong, yet lightweight cab. See **Fig. 1**.

There are three basic cab configurations: non-sleeper cab, mid-roof SleeperCab®, and raised-roof SleeperCab. Non-sleeper cabs are 48-inch lengths. The mid-roof SleeperCabs are 48-inch, 58-inch, or 70-inch lengths. Raised-roof SleeperCabs are 58-inch or 70-inch lengths.

The major cab parts are the front-wall assembly, right and left door-frame assemblies, right and left side-wall assemblies, back-wall assembly, front and rear roof cap assemblies (for mid-roof SleeperCabs), and the cab deck assembly. See **Fig. 2**. Non-sleeper cabs have one roof-cap assembly. Raised-roof SleeperCabs have one SMC fiberglass roof assembly.

The side-wall skins are bonded to the frame instead of riveted. The roof cap assemblies are attached to the cab side walls and the back wall by means of a coach joint. The coach joint is held together with 5/16–18 Torx®-head screws. Foam sealant tape is installed between the roof caps and the side walls and back wall.

The cab deck consists of a framework of longitudinal sills and transverse crossmembers, with forward and rear deck plates fastened to them. Non-SleeperCabs have one deck plate.

The cab front-wall assembly is a complete unit attached to the front of the door frame assemblies. It can be replaced as an entire unit, or in parts.

The cab parts are held together with a variety of fasteners. See **Subject 100** for more information on cab fasteners.

When any repairs are done to the cab, it is necessary to check the frame rails for correct alignment and squaring. Then the cab must be leveled and squared. If the cab is repaired without straightening the frame rails, undue stress could be put on the cab, which could weaken it. Also, it may be impossible to square up the cab.

General Information

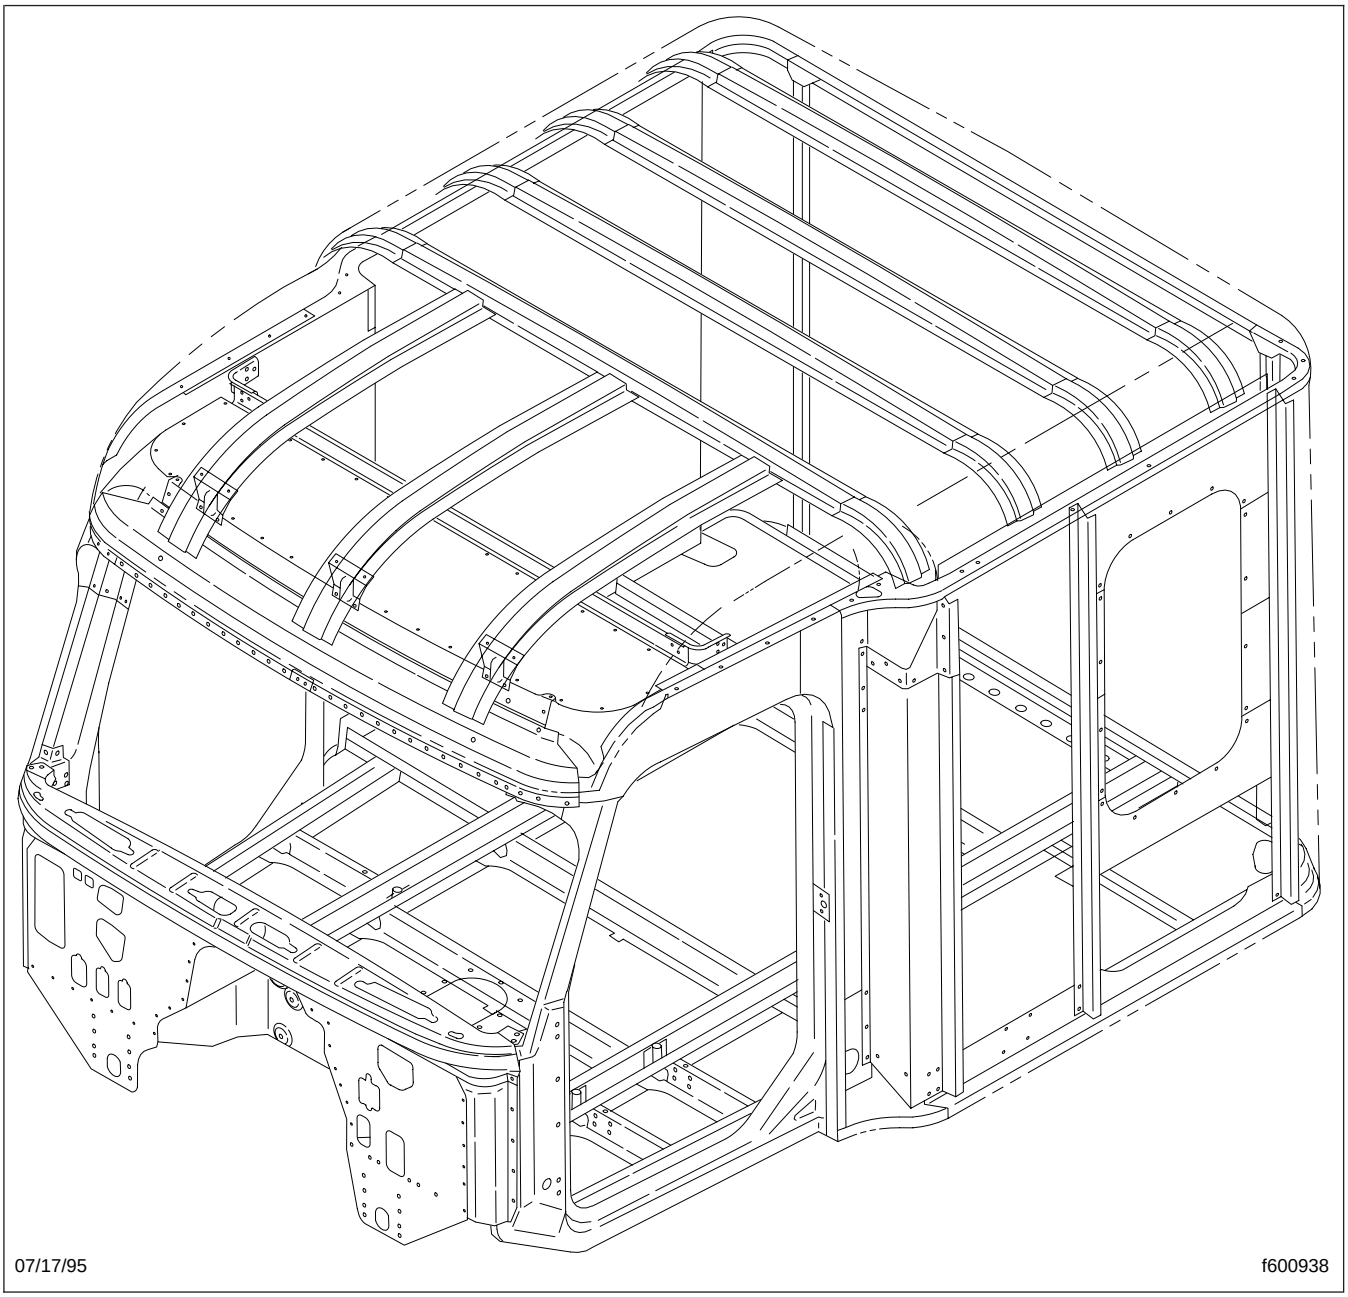

Fig. 1, Cab Structure (48-inch SleeperCab® shown)

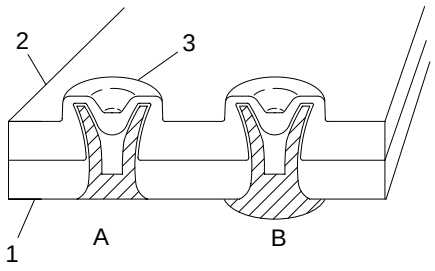
7. Left Door Frame Assembly
8. Cab Deck Assembly
9. Windshield Header Assembly

Fig. 2, Major Cab Parts, Typical 48-Inch SleeperCab

Different types of fasteners are used to hold the cab together. In addition to Huck® bolts and blind rivets, steel Henrob® rivets are used extensively. These differ from other fasteners, in that they are installed without drilling holes in the material. Specialized equipment punches them directly through the metal, then extrudes a bulb on the opposite metal surface. No bucking bar is used. Henrob rivets have hollow shanks, and either brazier or countersunk heads. **See Fig. 1.** They are replaced with either Huck fasteners, aluminum bucked rivets, or blind rivets, such as Magnabulb® or Monobolt® fasteners.



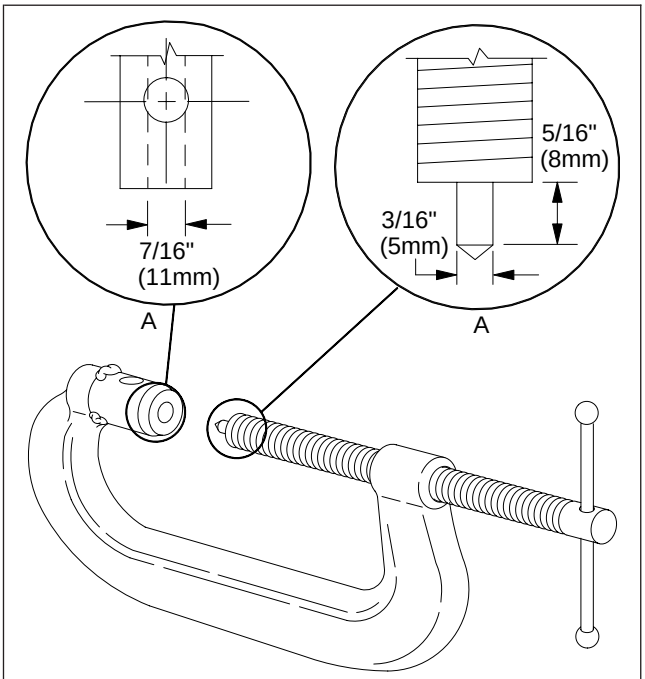
11/13/95 f600905

A. Countersunk Head
B. Brazier Head
1. Outer Skin
2. Inner Skin
3. Extruded Bulb

Fig. 1, Henrob Rivet Types

Remove Huck fasteners by chiseling off the collars. Remove a blind rivets by either grinding off the head, then punching out the center, or by drilling out the center, and then removing the fastener.

Remove Henrob rivets by drilling them out or pushing them out. To drill them out, use a 3/16-inch cobalt drill on low speed. When you have drilled completely through the material, remove the rivet head using a cold chisel or a punch. To push out Henrob rivets, a special tool can be made from a C-clamp. **See Fig. 2.** Grind down the extruded bulb on the back surface of the metal until it is flush. Put the special C-clamp, with the cylinder end over the head of the rivet, then line up the peg on the other end of the C-clamp with the depresssion of the shank. Tighten the C-clamp until the Henrob rivet is pushed out the front surface, and into the C-clamp cylinder.



08/03/95 f580102

A. Top View

Fig. 2, C-Clamp Specially Adapted for Removing Henrob Rivets

Leveling and Squaring the Cab

IMPORTANT: Before any repairs can be made to a damaged cab, the vehicle frame rails must be level and squared. If this is not done, the cab sections will not fit together correctly. Level the frame rails using jackstands. For instructions on squaring the frame rails, see the applicable section in **Group 31**.

There are several methods for correctly squaring the cab. This subject will cover only one technique, using a specially made squaring tool. The tool can be used for measuring squareness, and can be lengthened or shortened to bring the cab parts into correct alignment. The measurements given in this procedure are also applicable for any other method of cab squaring. All measurements are to be taken from inside the cab, and with all the interior contents, and the roof cap(s) and doors removed.

1. With the cab empty, and using a 4- to 5-foot (122 to 152 cm) long straight-edge of suitable material, make sure the cab deck is level.

    1.1 Place the straight-edge cross-wise on the cab deck at the front of the cab, then the middle, then at the rear. At each place, check that the deck plates are parallel and flush with the straight-edge.

    1.2 Place the straight-edge lengthwise on the cab deck on the right side, the middle, then the left side. At each place, check that the deck plates are parallel and flush with the straight-edge.

    1.3 If the cab deck surface is not flush and parallel with the straight-edge everywhere, level the deck, using jackstands or a suitable fixture.

NOTE: The following procedure for squaring the cab involves using a special squaring tool that can be fabricated from suitable metal stock. See **Specifications, 400** for the configuration and measurements of this tool.

2. Measure the cab for squareness, starting at the front, and moving to the rear. **See Fig. 1.** Each measurement is diagonal, and taken from both the left and right sides of the cab, in an "X" configuration. For example, if you measure from the top right side to the bottom left side of the cab, you then need to take the identical measurement from the top left side to the bottom right side of the cab.

    Install a door plug into each door frame before beginning the squaring procedure. See **Specifications, 400** for measurements and materials needed to construct the door plugs.

    2.1 Find the outboard, forward clinch-nut hole on the left-side cab deck (Ref. 6). Remove the fastener (if present) from the hole. (The clinch nut itself is underneath the cab deck). Install the lower end of the squaring tool into the hole, using a 5/16–18 hexbolt or screw. Then, on the right side-wall top flange, find the second fastener hole from the front (Ref. 1). Install the top end of the squaring tool into the hole, using a 5/16–18 hexbolt or screw and hexnut. Use the turnbuckle on the tool to lengthen or shorten the tool as needed. Measure the distance between the two holes (Ref. A). It should be 97-5/16 inches (2488 mm). If it is not, shorten or lengthen the squaring tool as needed, to push or pull the side walls into alignment.

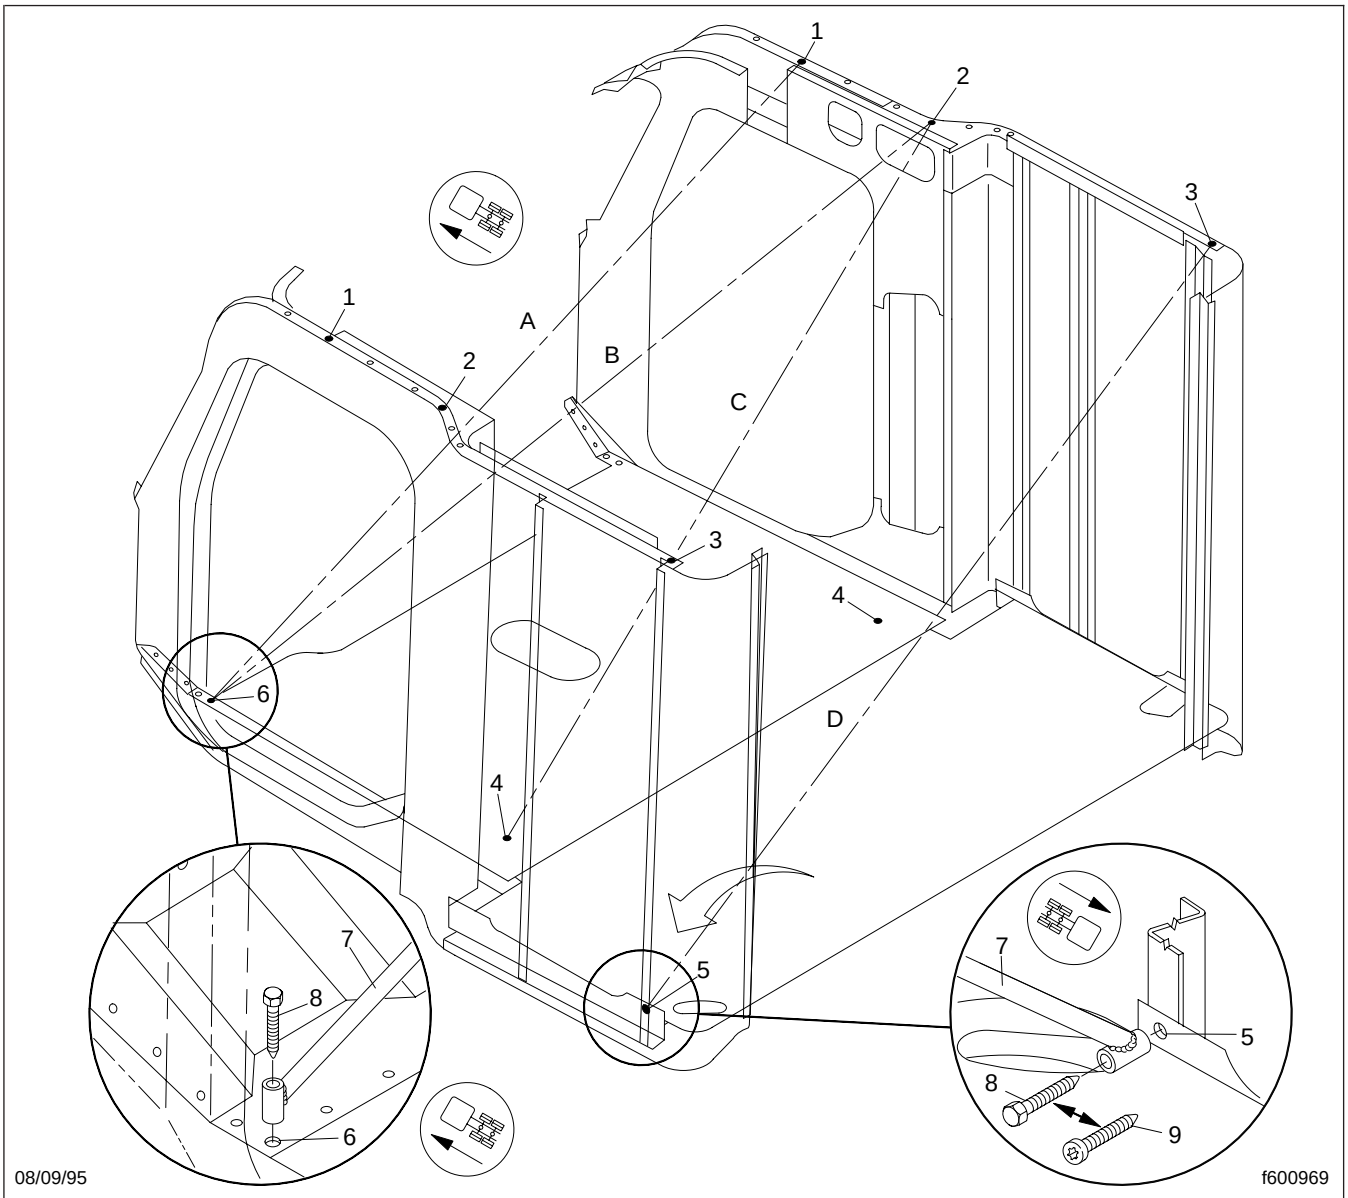
    Repeat the procedure on the other side of the cab, measuring from the right-side cab deck to the left-side top of the side wall.

    2.2 On the right side-wall top flange, find the first fastener hole (Ref. 2) at the start of the sleeper transition bracket. For a non-SleeperCab, find the last hole in the side wall top flange before the corner radius. Install the top end of the squaring tool into the hole, using a 5/16–18 hexbolt or screw and hexnut. Install the other end of the squaring tool into the outboard, most forward clinch nut hole on the right side of the cab deck (Ref. 6). Measure the distance between the two holes (Ref. B). It should be 104-7/16 inches (2653 mm). If it is not, lengthen or shorten the squaring tool as needed.

    Repeat the procedure on the other side of the cab, measuring from the right-side cab deck to the left-side top of the side wall.

    2.3 Find the same fastener hole (Ref. 2) in the side-wall top flange that was used in the previous substep, and install the top end

Leveling and Squaring the Cab



A. 97-5/16 inches (2488 mm)
B. 104-7/16 inches (2653 mm)
C. 94-5/16 inches (2396 mm)
D. 108-3/16 inches (2748 mm)

1. Outboard, Most Forward Clinch-Nut Hole
2. First Fastener Hole at the Beginning of the Sleeper Transition Bracket
3. Rearmost Fastener Hole in Side-Wall Top Flange
4. Outboard Seat Belt Anchor Hole
5. Bottom Clinch-Nut Hole on Rearmost Z-Strip
6. Outboard Forward Clinch-Nut Hole
7. Squaring Tool
8. 5/16–18 Hexbolt
9. 5/16–18 Torx-Head Screw

Fig. 1, Squaring Measurements and Location Holes, Front and Back Walls Not Shown

of the squaring tool into it. Install the other end of the squaring tool into the threaded hole on the cab deck that is used to anchor the right outboard seat belt (Ref. 4).

Measure the distance between the two holes (Ref. C). It should be 94-5/16 inches (2396 mm). If it's not, lengthen or shorten the tool as needed.

Repeat the procedure on the other side of the cab, measuring from the right-side cab deck to the left-side top of the side wall.

For a non-SleeperCab®), the procedure is complete. If the cab is a SleeperCab, go to the next substep.

2.4 For a SleeperCab, find the bottom clinch nut hole on the last Z-strip before the corner of the right side wall (Ref.5). Install the bottom end of the squaring tool, using a 5/16–18 hexbolt or screw. Then find the rearmost fastener hole on the left side-wall top flange (Ref. 3). Install the top end of the special squaring tool, using a 5/16–18 hexbolt or screw, and hexnut to hold the tool in the upper hole. Measure the distance between the two holes (Ref. D). It should be 108-3/16 inches (2748 mm). Lengthen or shorten the squaring tool as needed.

Repeat the procedure on the other side of the cab, measuring from the bottom of the left side wall to the top of the right side wall.

Sidewall Assembly Replacement

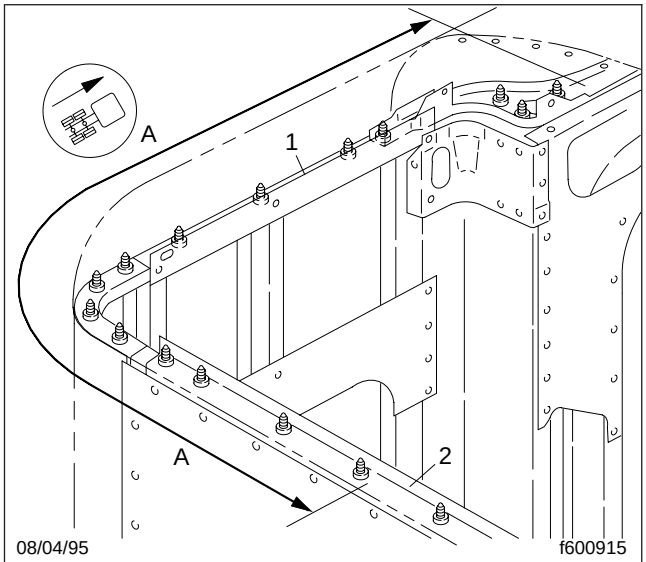
Removal

CAUTION

Check the vehicle chassis for correct alignment before making repairs to the cab. Failure to repair and align the chassis before repairing the cab could prevent you from correctly squaring the cab, and cause undue stress on the cab structure.

IMPORTANT: Prior to any work being performed on the sidewall assembly, the vehicle must be prepared. See the applicable groups and sections in this manual for instructions.

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Level the chassis, using jack stands.
3. Remove the seats, the bunk(s), the upholstery panels, the cabinets, the floor mats, and the carpeting from the cab interior. If so equipped, remove the auxiliary HVAC unit.
4. Move the wiring harness and all wiring located in or near the sidewall assembly out of the way.
5. Remove the door from the affected side of the vehicle. See **Group 72** for instructions.
6. Cover the remaining interior components of the cab to protect them during the replacement work.
7. Install a door plug in the open door frame. See **Specifications, 400** for the measurements and materials needed to construct door plugs.
8. Remove the brackets attaching the sun visor to the side of the cab above the door frame.
9. Remove the eight Torx®-head screws that attach the side extender and extender brackets to the rear wall assembly. Remove the side extender.
10. From inside the cab, remove the Torx-head screws holding the roof cap assembly to the upper edge of the damaged sidewall. Remove the screws from along the sidewall, around the rear wall, and as far forward on the opposite sidewall as the door frame. See **Fig. 1**.
11. Raise and block up the rear roof cap enough to allow removal of the monobolts at the top of the roof transition bracket.
12. Remove the fasteners attaching the upper B-pillar to the upper B-pillar reinforcement assembly.
13. Remove the fasteners that attach the upper and lower assembly to the sidewall. See **Fig. 2**. There is no need to remove the fasteners that attach the door plates to the door frame assembly.

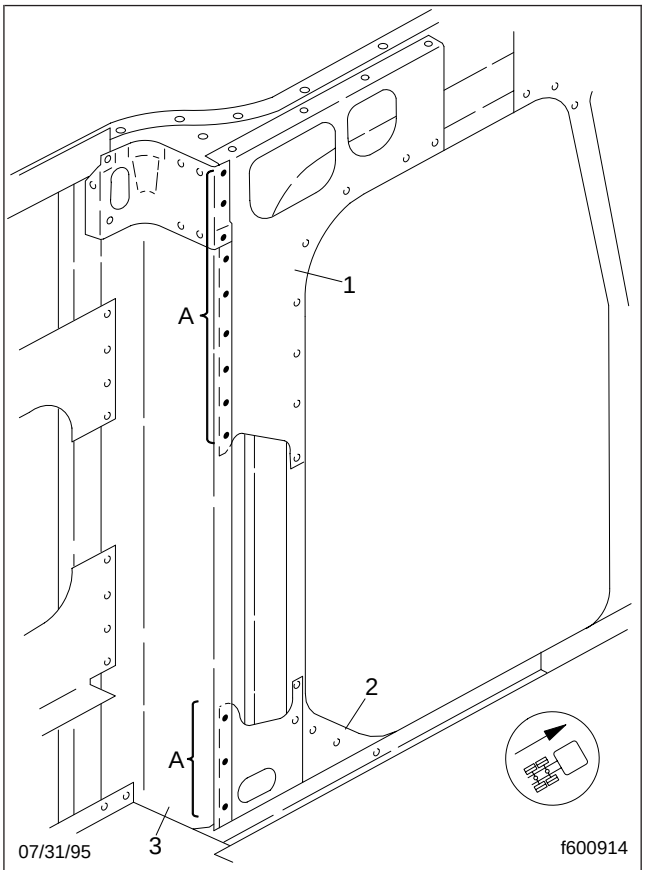


A. Remove all of these Torx-head screws.
1. Sidewall Assembly 2. Rear Wall Assembly

Fig. 1, Rear Roof Cap Fasteners, SleeperCab

14. Remove the three monobolts that attach the roof transition bracket to the sidewall. See **Fig. 3**.
15. Remove the fasteners that attach the sidewall transition bracket to the door frame. See **Fig. 3**.
16. Remove the Torx-head screws that attach the lower ends of the Z-strips to the cab deck sill. Make sure to also remove those screws that are underneath the cab deck. See **Fig. 4**.
17. From outside the cab, remove the monobolts that attach the drip rail to the door frame.
18. Remove the nine Henrob rivets and three monobolts that attach the forward edge of the sidewall skin to the door frame. See **Fig. 5**.

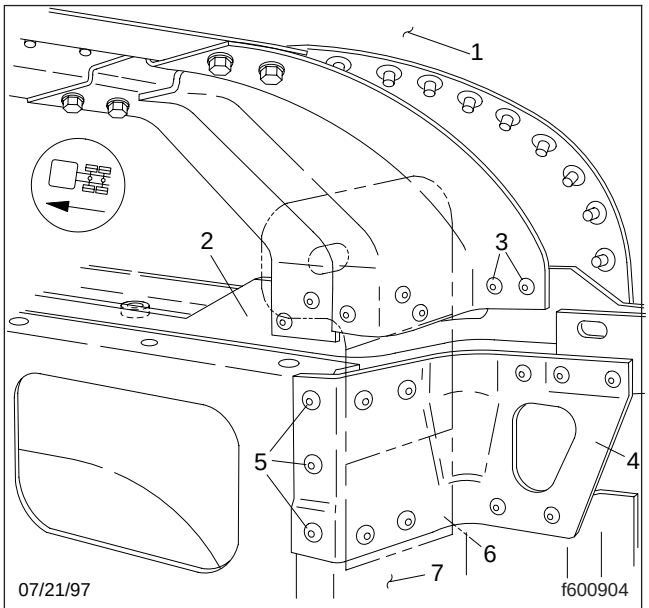
Sidewall Assembly Replacement



A. Remove these fasteners.
1. Upper B-pillar Reinforcement Assembly
2. Lower B-pillar Reinforcement Assembly
3. B-pillar

Fig. 2, Left Side, Inside View

19. Remove the Henrob rivets that attach the lower edge of the sidewall skin to the bottom of the deck sill. See **Fig. 6**.
20. Remove the fasteners that join the rear edge of the sidewall skin to the rear wall. See **Fig. 6**. Carefully pry up the skin to loosen the adhesive-tape bond.
21. Remove the two outer fasteners that attach the top side extender bracket to the rear wall.
22. Check to be sure that all wiring is routed or taped out of the way.
23. Support the sidewall assembly.



1. Roof Cap
2. Sidewall Transition Reinforcement
3. Roof Transition Mounting Bracket Fasteners
4. Upper B-pillar
5. Sidewall Transition Mounting Bracket Monobolts
6. Upper B-pillar Reinforcement (mid-roof only)
7. Sidewall (interior wall)

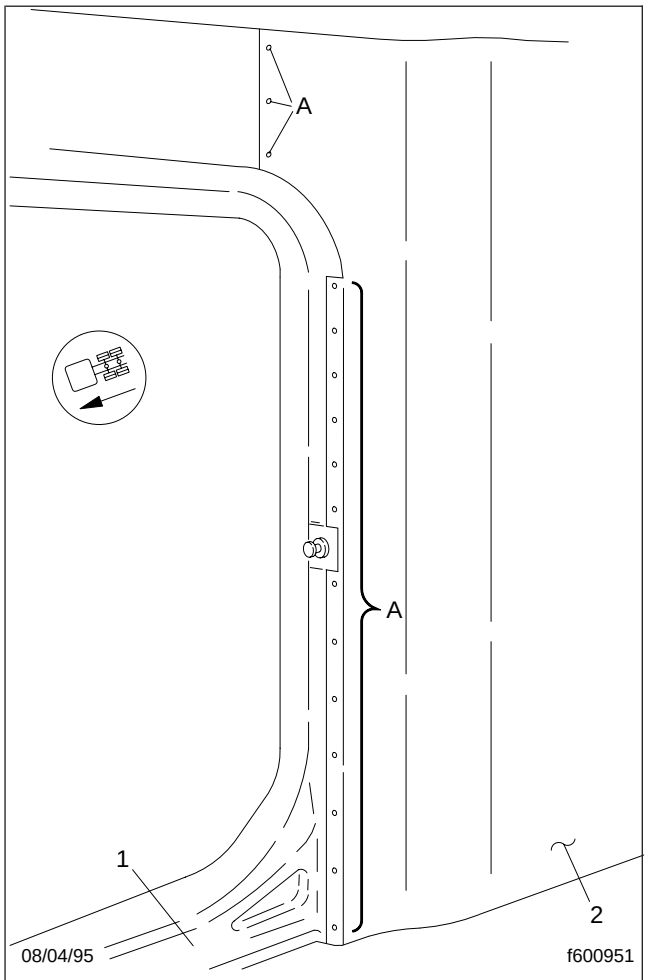
2. Cab Deck Sill
3. Sidewall Transition Area

Fig. 4, Left Side, Interior View



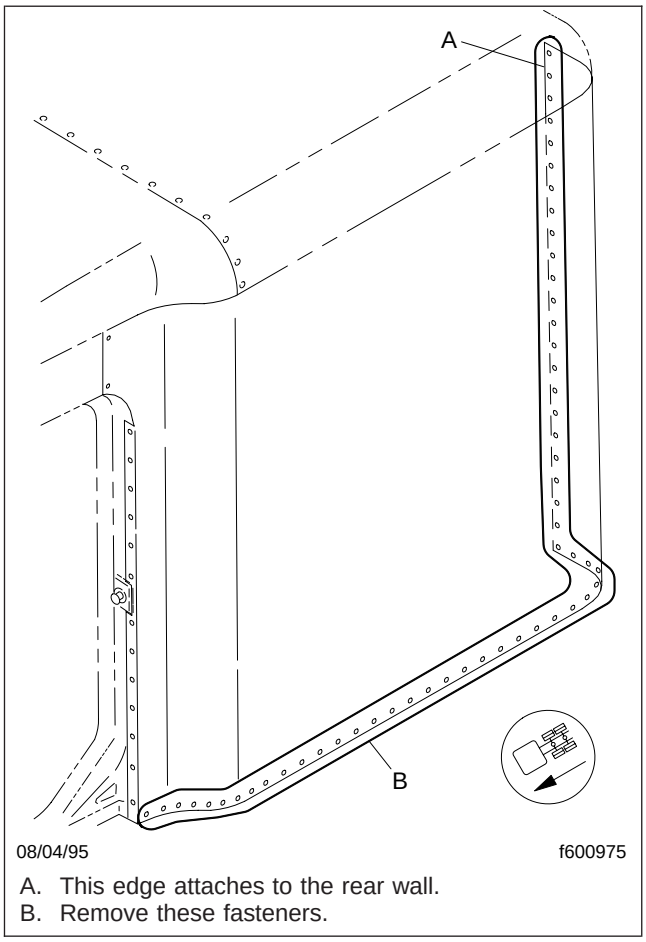
A. Remove these fasteners (lower three are monobolts).
1. Left Door-Frame Assembly
2. Left Sidewall Assembly

Fig. 5, Sidewall-to-Door Frame Henrob Rivets

CAUTION

Do not overheat the sidewall skin. Aluminum will melt or change shape under extreme heat, and overheating can damage the side skin.

24. Using a suitable heat source, such as a heat gun or a propane torch, and working on the cab exterior, heat the forward edge of the sidewall skin at the door frame to release the glue bond. The glue bond will soften at about 275°F (135°C). Pry up the edge to prevent the glue from rebonding.



A. This edge attaches to the rear wall.
B. Remove these fasteners.

Fig. 6, Sidewall Fasteners to the Cab Deck and Rear Wall

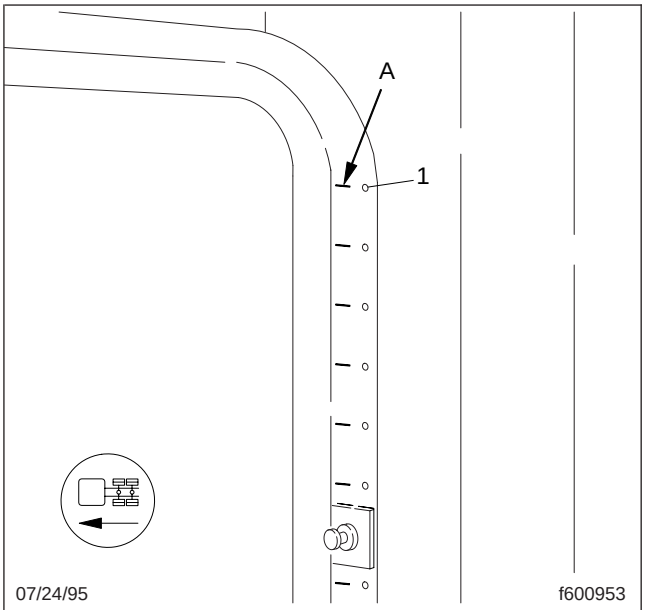
25. Remove the sidewall assembly from the cab.

Installation

1. With the door plug in place, make sure the cab is square and level. See **Subject 110** for instructions.
2. Using a putty knife, then fine sandpaper or a grinding disk, remove any adhesive residue from the surface of the door frame. Sand down to bare metal.
3. Clean the surface of the metal with a cloth.
4. Clean the exposed, bottom edge of the roof cap assembly.

Sidewall Assembly Replacement

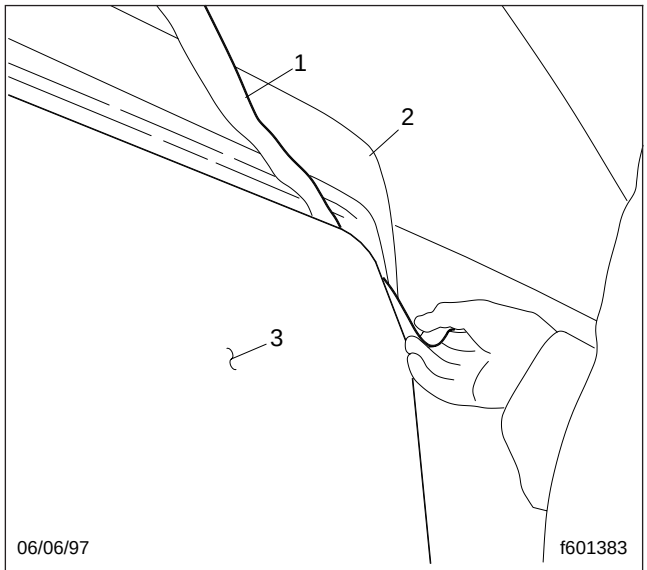
5. On the inboard edge of the rear door frame, mark the location of the existing holes that were used to attach the forward edge of the sidewall skin to the door frame. Make sure the marks are far enough inboard so they won't be covered up by the forward edge of the new sidewall skin. See **Fig. 7**.



A. Put marks here.
1. Existing B-Pillar Hole

Fig. 7, Marking the Existing Holes in the B-Pillar

6. Install new foam seal tape along the rear edge of the sidewall skin (where it joins the edge of the rear wall skin).
7. Apply foam seal tape along the entire upper edge of the sidewall assembly, where it will be attached to the roof cap assembly. See **Fig. 8**.
8. Using a knife, remove the portions of foam seal tape from the areas of the upper edge of the sidewall assembly where the Torx-head screws will be installed.
9. Clean with Scotchbrite® the forward edge of the new sideskin that joins the door frame.
10. Position the new sidewall assembly in place, making sure the holes in the bottom of the Z-strips line up with those in the deck sill, and the holes at the top hem line up with those in the clinch nuts in the roof cap hem. Also, make sure the forward edge of the sidewall skin is flush against the door frame.



1. Foam Seal Tape
2. Roof Cap
3. Sidewall Skin

Fig. 8, Applying Foam Seal Tape

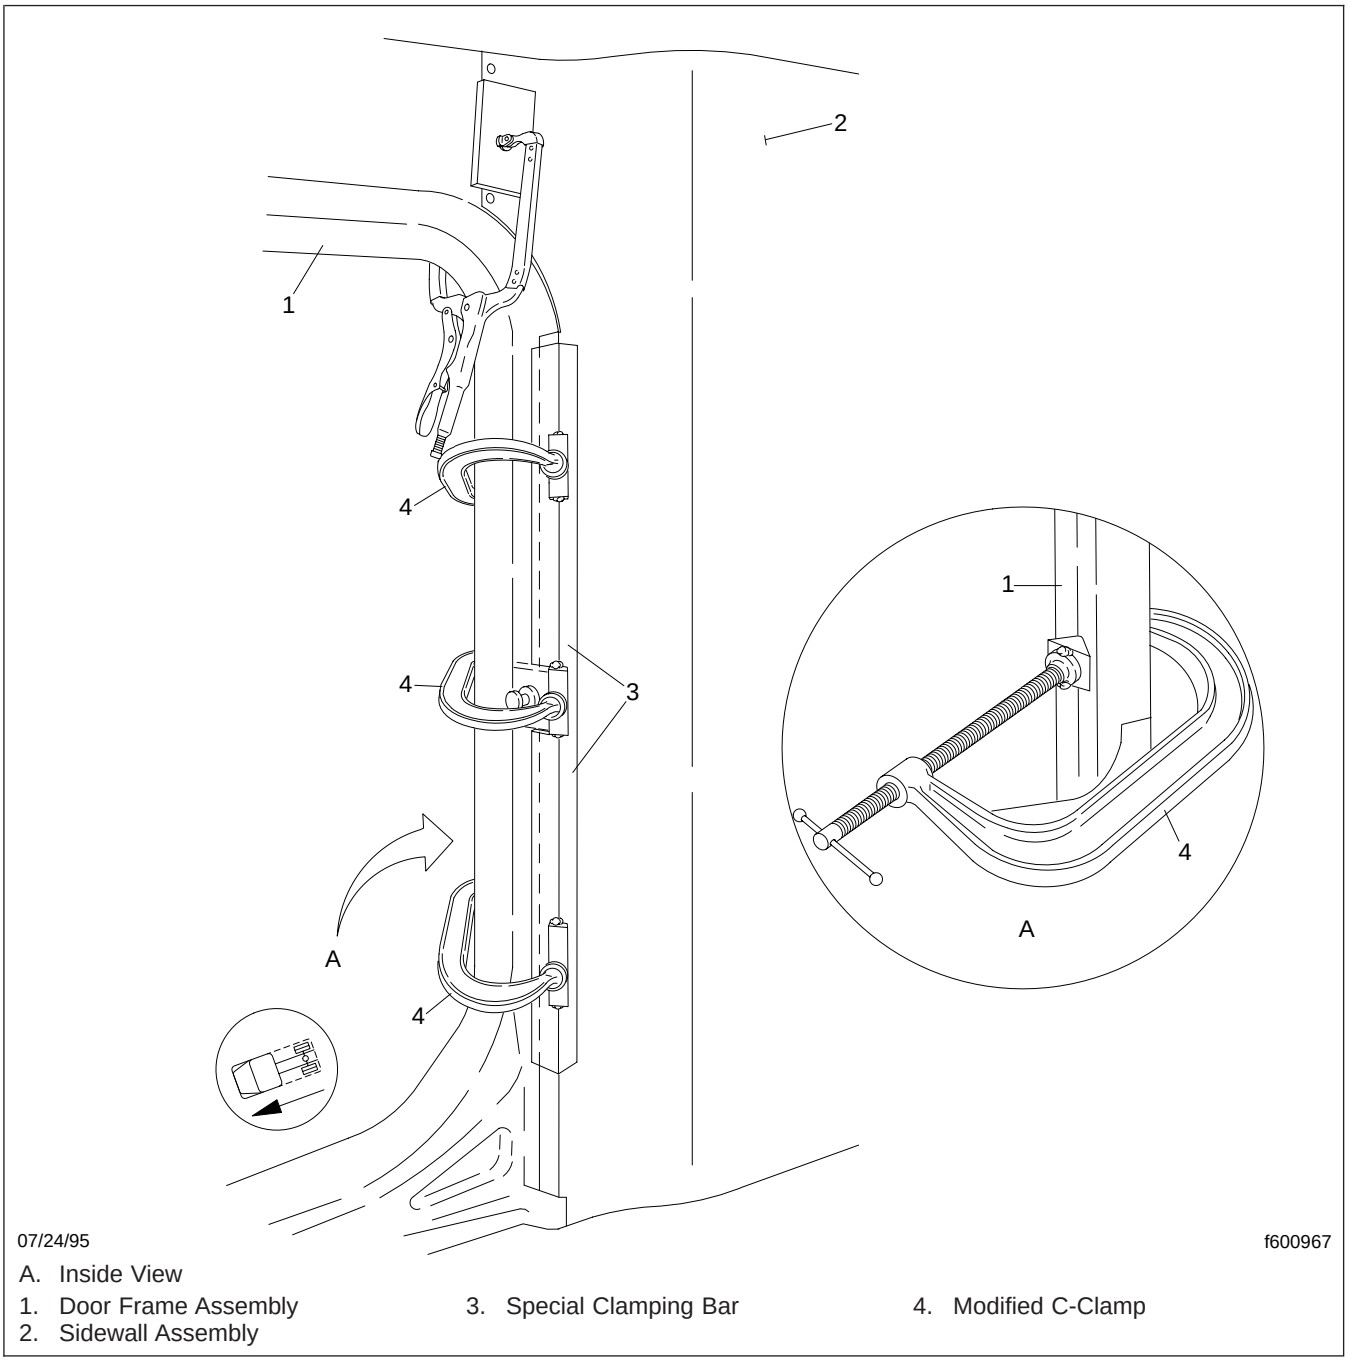
11. Attach enough fasteners to keep the sidewall assembly in position during the installation procedure.
12. Apply a 1/8 inch (3 mm) bead of Magnolia 112–448 A & B two-part adhesive to the surface of the door frame between the frame surface and the sidewall skin. Apply the adhesive from the top of the door to the bottom. Follow the manufacturer's directions and safety information when using the adhesive.
13. Make sure the sidewall assembly is in position, then clamp the forward edge of the sidewall skin to the door frame, using the special clamping bar and modified C-clamps. See **Fig. 9**.
14. Allow the adhesive to cure for at least 40 minutes. Complete curing takes 24 hours. Remove any excess adhesive that is squeezed out.
15. Using 5/16–18 Torx-head screws, attach the front edge of the sidewall assembly to the forward edge of the roof cap. Don't tighten the screws all the way.

16. Attach the upper B-pillar bracket to the upper B-pillar reinforcement assembly.
17. Attach the sidewall transition bracket to the door frame.
18. Attach the sidewall to the upper B-pillar and lower B-pillar reinforcement assembly.
19. Using the marks on the door frame as a guide for locating existing holes, use a #11 drill bit and drill 12 new holes through the new sidewall skin and the door frame.
20. Using a 5/16-inch counterbore, countersink from the top the nine holes and install countersunk bucked rivets that have a 5/16-inch head and a 3/16-inch shank into these nine holes. Then, install 3/16-inch monobolts in the bottom three holes.
21. Drill out along the bottom edge of the sidewall assembly the holes for fastening the sidewall skin to the cab deck. From underneath the cab, use the existing holes as a guide for drilling through the sidewall skin.
22. Remove the burrs from the drilled holes in the exterior sidewall skin.

IMPORTANT: Perform the next steps in the procedure as listed so that the sidewall skin is fastened forward-to-aft. This allows the metal to more or less remain tight against the cab structure from the door frame to where the skin joins to the rear wall. Otherwise, gaps may appear between the fasteners.

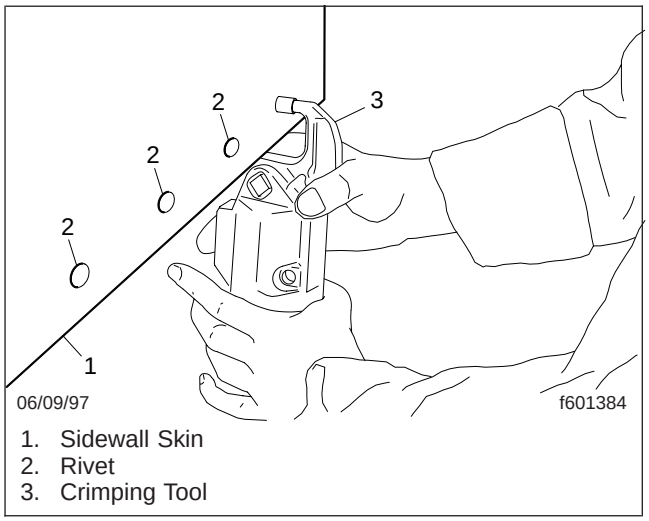
23. Using an air-powered crimping tool (see **Fig. 10**) or a buck-riveter, install 3/16 inch aluminum brazier-head bucked rivets along the bottom edge of the sidewall assembly.
24. Install the remaining 5/16–18 Torx-head screws in the upper sidewall and rear roof cap. Tighten 15 lbf·ft (20 N·m). See **Fig. 11**.
25. Using 3/16-inch aluminum brazier-head Huck® bolts (p/n lockbolt, 23–12209–000; collar, 23–11037–603), and adding a special patch of sealant on the underside of each bolt head, attach the sidewall skin to the rear wall skin. Install the bolts with the heads outside. Be sure the side extender tapping plate, if the vehicle is so equipped, is installed with this row of fasteners.
26. Install the side extender brackets and side extender.
27. Install the drip rail. Then, install the sun visor and its rear mounting bracket.
28. Prime and paint the new sidewall assembly.
29. Remove the protective coverings from the interior of the cab.
30. Remove the door plug and install the door. See **Group 72** for instructions.
31. Route the wiring harness as needed. If so equipped, install the auxiliary HVAC unit. Install the seats, the bunk(s), the upholstery panels, the cabinets, the floor mats, and the carpeting in the cab. See the applicable groups and sections for instructions.
32. Remove the jack stands from the chassis.
33. Remove the chocks from the tires.

Sidewall Assembly Replacement



A. Inside View
1. Door Frame Assembly
2. Sidewall Assembly
3. Special Clamping Bar
4. Modified C-Clamp

Fig. 9, Special Clamp for Door Frame



1. Sidewall Skin
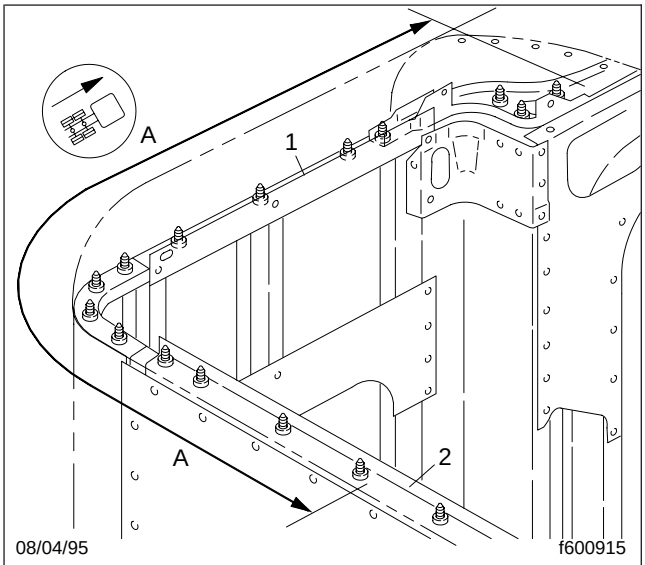
2. Air-Powered Rachet
3. Roof Cap
4. Rear Wall

Fig. 11, Install the Roof Cap Screws

Removal

1. Park the vehicle, apply the parking brakes, then chock the tires.
2. If not already done, remove the seats, the bunk(s), the upholstery panels, the cabinets, the floor mats, and the carpeting from the cab. Put the electrical harness to one side. See the applicable sections is this group for instructions.
3. From inside the cab, remove the Torx®-head screws holding the roof cap assembly to the upper edge of the back wall and the left and right side walls. See **Fig. 1.**
4. Remove the fasteners that attach the back-wall hat sections to the cab deck. See **Fig. 2.**



A. Remove these Torx-head screws.
1. Side-Wall Assembly
2. Back-Wall Assembly

Fig. 1, Rear Roof Cap Fasteners

5. Remove the fasteners that hold the bottom of the back wall to the deck sill.
   - 5.1 Remove the two rows of fasteners that attach the reinforcement plate and the bottom of the back wall to the deck sill and the cab suspension mounting bracket. See **Fig. 3.**
   - 5.2 Remove the fasteners that attach the outboard edges of the back-wall bottom to the deck sill and the rear outboard edge of the side wall skin.
   - 5.3 Pry up the skin to loosen the sealant tape adhesive bond.
6. Support the back-wall assembly.
7. Lift up the rear roof cap assembly, and support it.
8. Using a putty knife, remove the foam sealant tape between the underside of the roof cap assembly and the chair section at the top of the back wall.
9. On each outboard side, pull the upper part of the back wall out of the corner bracket. See **Fig. 4.** (These are slip-joints.)
10. Remove the back-wall assembly from the cab.

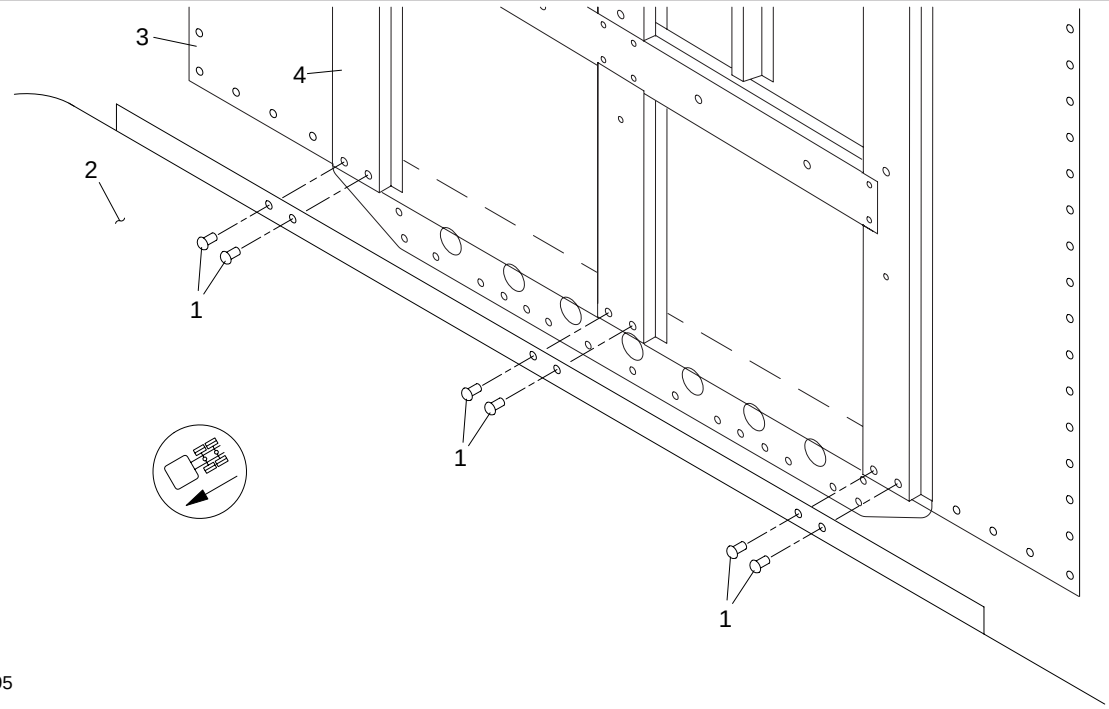
Installation

CAUTION

CAUTION: Check the vehicle chassis for correct alignment before making repairs to the cab. Failure to repair and align the chassis before repairing the cab could prevent you from correctly squaring the cab, and cause undue stress on the cab structure.

1. Level the chassis, using jackstands.
2. Remove any traces of adhesive or foam sealant tape from the bottom surfaces of the rear roof cap assembly and the side wall Z-strips.
3. Make sure the cab is square and level. See **Subject 110** for instructions.
4. Install new foam sealant tape on the bottom surface of the rear roof cap hem and the outer surface of the rearmost side wall Z-strips.
5. Place the new back-wall assembly against the rear of the cab with the upper part tilted in under the roof cap hem..
6. On each side, put the upper framework into the corner bracket slip joint.
7. Line up the back-wall assembly, top and bottom, and left and right.
8. Clamp the back-wall assembly in place.
9. From inside the cab, and using a #11 drill bit, backdrill through the existing holes in the rearmost side-wall Z-strip, side-wall skin, and the

Back-Wall Assembly Removal and Installation

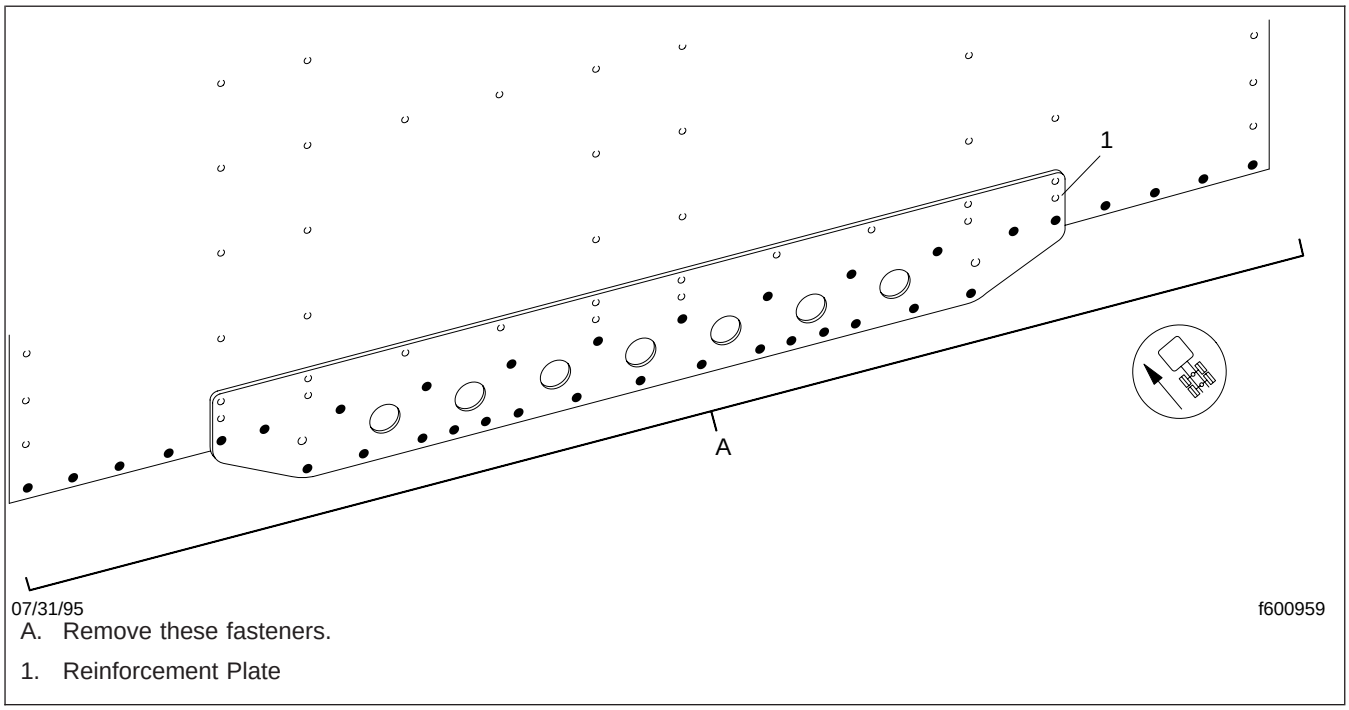


1. Torx-Head Screws
2. Cab Deck Assembly
3. Back-Wall Assembly
4. Hat Section

Fig. 2, Inside Back-Wall-to Cab Deck Fasteners

new back-wall skin. Do this on both sides of the back wall.

10. Install the special 3/16-inch diameter aluminum Huckbolts (with the sealant patch on the underside of the heads) through the side wall Z-strips, the side wall skin, and the new back-wall skin. Install the Huckbolts with the heads on the outside of the cab.
11. Install 3/16-inch diameter aluminum bucked rivets with countersunk heads along the outer edges of the bottom of the back wall and the deck sill.
12. Attach the back-wall reinforcement plate to the deck sill and the cab suspension mounting bracket, using #13 Magnabulb® rivets.
13. Install Monobolt® rivets in the upper corners of the back wall.
14. Prime and paint the new back-wall assembly.
15. Install the cab upholstery panels, bunk(s), cabinets, carpeting, floor mats, and seats. For instructions, refer to the applicable sections in this group of the service manual.
16. Remove the jackstands from the chassis
17. Remove the chocks from the tires.



A. Remove these fasteners.

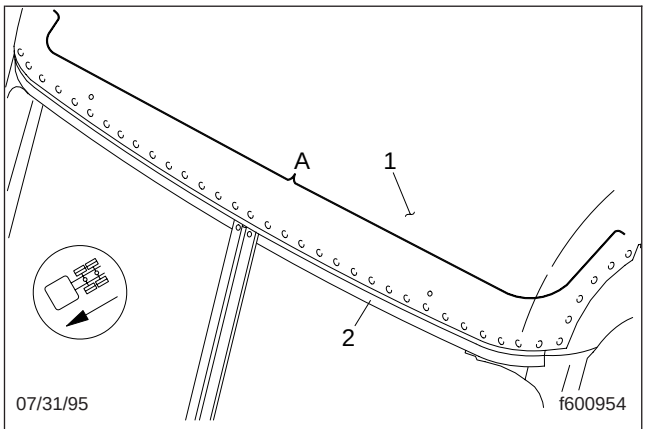
Front Roof-Cap Assembly Removal and Installation

Removal

NOTE: Use both this subject and **Subject 150** to replace the roof cap on a non-SleeperCab®.

1. Park the vehicle on a level surface. Apply the parking brakes; then chock the tires.
2. Remove the exterior sun visor and its mounting brackets from the front of the roof cap and the top of the door frame.
   - 2.1 Mark, then disconnect the wiring from the marker lights.
   - 2.2 Remove the fasteners that attach the sun visor brackets to the roof cap; then remove the exterior sunvisor and its mounting brackets.
   - 2.3 If the exterior sun visor is undamaged, set it aside.
3. If not already done, remove the seats, the upholstery panels, cabinets, carpeting, the floor mats, and the wiring harness from the cab. See the applicable sections is this group for instructions.
4. From inside the cab, grind down the extruded bulb on the back side of each Henrob rivet holding the windshield header to the front edge of the roof cap.
5. From outside the cab, and using a 7/32-inch cobalt drill on low speed, drill out and remove the Henrob rivets that attach the front edge of the roof cap to the windshield header. See **Fig. 1.** See **Subject 100** for information on removing Henrob rivets
6. Remove the fasteners from the front corners of the roof cap.
7. Remove the Huckbolts® that attach the front and rear roof caps to the curtain bow roof support. See **Fig. 2.**
8. From inside the cab, loosen the Torx®-head screws that hold the front roof cap assembly to the top of the door frames.
9. Remove the Magnabulb® rivets that attach the three forward brackets on the longitudinal roof bows to the edge of the front storage console. See **Fig. 3.**
10. Pry up the front roof cap assembly; then remove it from the cab.



A. Remove these fasteners.
1. Front Roof-Cap Assembly
2. Windshield Header

Fig. 1, Front Roof Cap Assembly Fasteners

11. If the front storage console is damaged, remove it. See **Fig. 4.**
    - 11.1 Remove the bolts from the L-brackets that attach the sides of the front storage console to the door frames.
    - 11.2 Remove the fasteners that attach the forward edge of the front storage console to the windshield header.
    - 11.3 Remove the front storage console.
12. If the windshield header is damaged, remove it. See **Subject 170** for instructions.

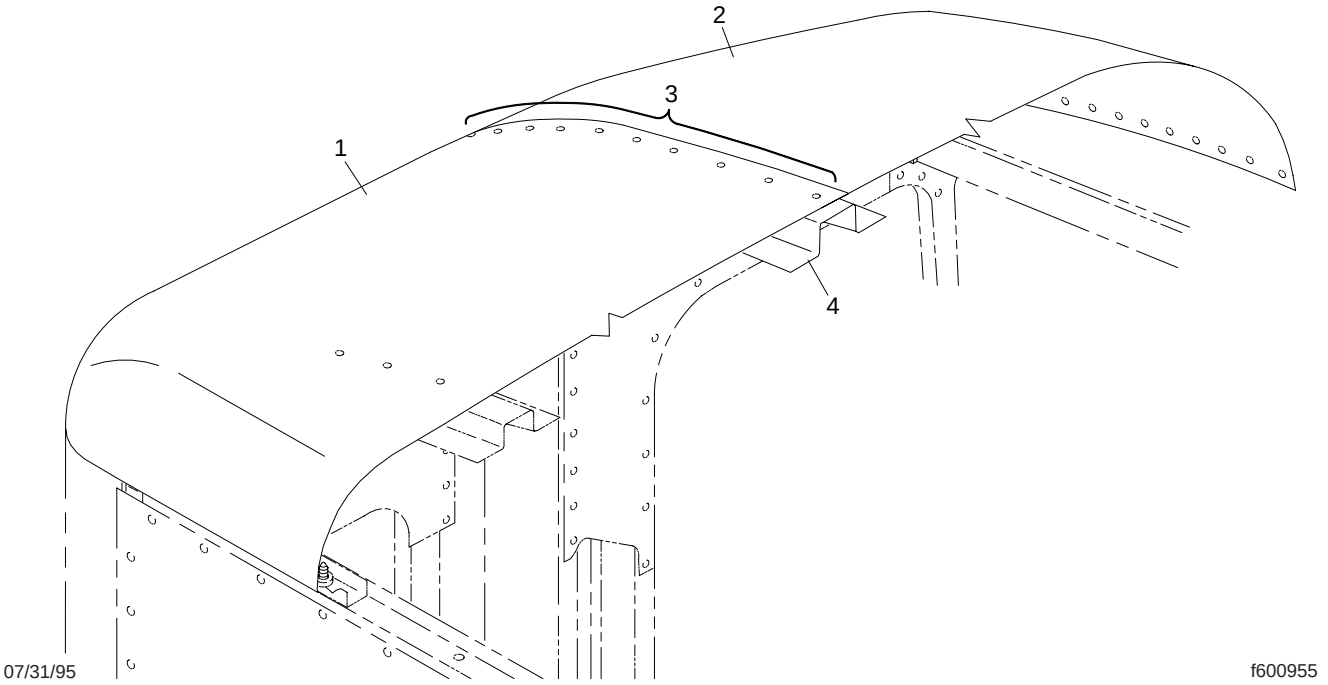
Installation

CAUTION

CAUTION: Check the vehicle chassis for correct alignment before making repairs to the cab. Failure to repair and align the chassis before repairing the cab could prevent you from correctly squaring the cab, and cause undue stress on the cab structure.

1. Level the chassis, using jackstands.
2. Make sure the cab is level and square. See **Subject 110** for instructions.
3. If the front storage console is being replaced, install a new one. See **Fig. 4.**

Front Roof-Cap Assembly Removal and Installation



1. Rear Roof Cap
2. Front Roof Cap
3. Huckbolts
4. Curtain Bow Roof Support

Fig. 2, Rear View, 48-Inch SleeperCab

3.1 Install the fasteners that attach the front storage console to the windshield header.

3.2 Attach the existing L-brackets to the new front storage console.

3.3 Attach the L-brackets to the door frames. Tighten the Torx-head screws 15 lbf·ft (20 N·m).

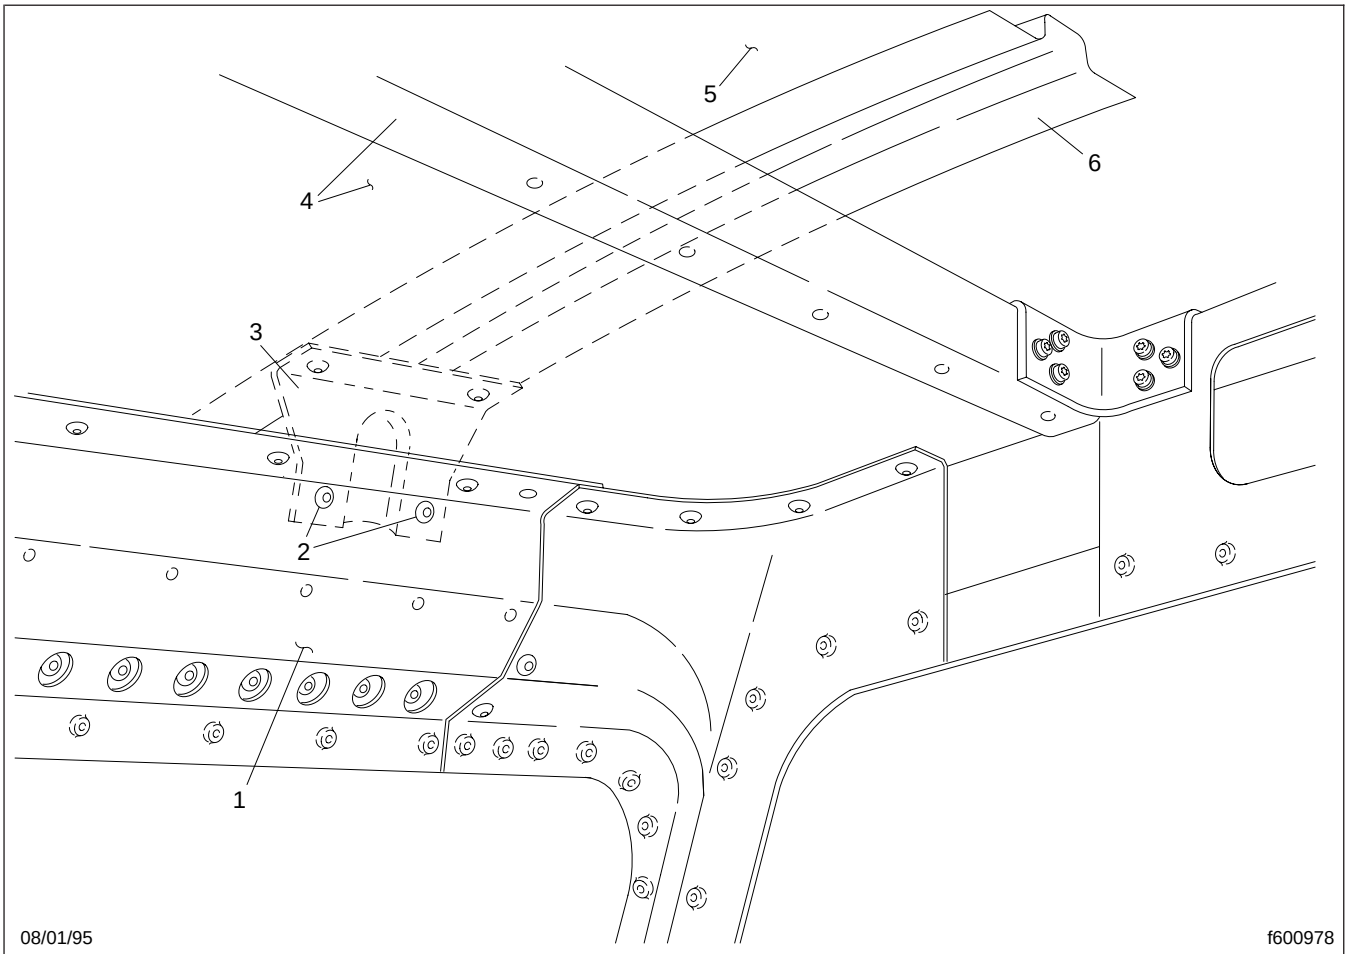
4. Clean the top surface of the door frames. Make sure all traces of foam tape and adhesive are removed.
5. Apply new foam sealant tape to the top of the door frames.
6. Apply Uniseal® 116.15 sealant along the top edge of the windshield header, where the edge of the roof cap was.
7. Put the new forward roof cap assembly in place, making sure it is centered and fits flush against the windshield header. Clamp it in place.
8. Attach the forward edge of the roof cap to the windshield header, using 3/16-inch countersunk aluminum Huck bolts or countersunk bucked rivets.

   8.1 Using the existing holes in the windshield header, backdrill through the roof-cap skin.

   8.2 Counterbore the holes, using a 5/16-inch counterbore.

   8.3 Install 3/16-inch aluminum bucked rivets with countersunk heads, or countersunk aluminum Huck fasteners. Install the fasteners in an alternating sequence. See **Fig. 5.**
9. Line up the sides of the roof cap with the door frame
10. Make sure the holes in the roof-cap align with those of the clinch nuts in the door frames and forward part of the side walls.
11. Install the Torx-head screws. Tighten them 15 lbf·ft (20 N·m.)

Front Roof-Cap Assembly Removal and Installation



1. Windshield Header
2. Magnabulb Rivets
3. Forward Bracket (3 qty.)
4. Front Storage Console
5. Front Roof Cap
6. Longitudinal Roof Bow (3 qty.)

Fig. 3, Right Side, Interior View

12. Using 3/16-inch diameter Monobolts® rivets, attach the three forward roof-bow brackets to the windshield header.
13. Using 3/16-diameter special seal Huck bolts, attach the front roof-cap skin to the rear roof-cap skin and the curtain bow roof support.
    - 13.1 Clamp the front roof-cap skin in place, underneath the rear roof-cap skin.
    - 13.2 Using a #11 drill bit, and the existing holes in the rear roof-cap skin, drill through the new front roof-cap skin.
    - 13.3 Install 3/16-inch diameter Huck bolts, with the heads facing out.
14. Prime and paint the new roof cap assembly .
15. Install the cab upholstery panels, cabinets, seats, floor mats, carpeting, and the wiring harness. See the applicable groups and sections in this manual for instructions.
16. Remove the jackstands from the chassis.
17. Remove the chocks from the tires.

Front Roof-Cap Assembly Removal and Installation

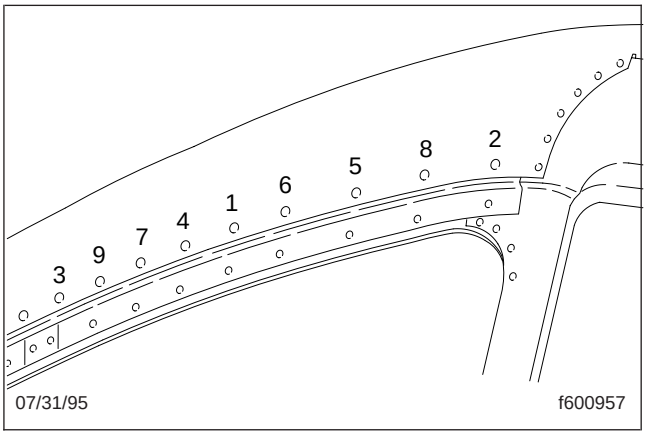

Fig. 5, Installation Sequence for Front Roof Cap Fasteners (left side)

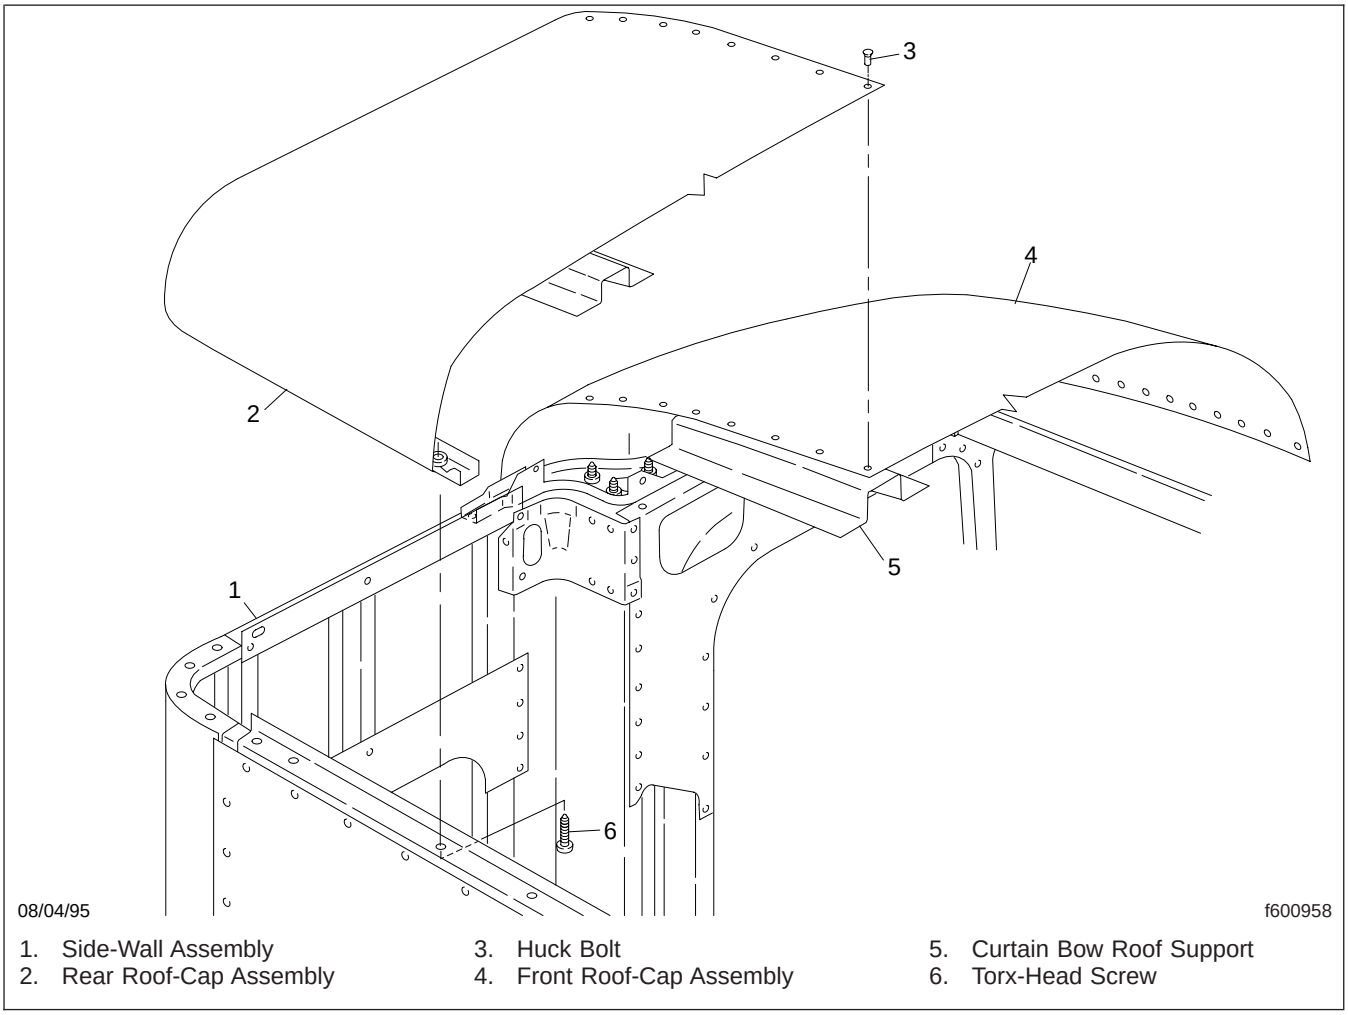
Rear Roof-Cap Assembly Removal and Installation

Removal

NOTE: Use both this subject and **Subject 140** to replace the roof cap on a non-SleeperCab®.

1. Park the vehicle on a level surface. Apply the parking brakes; then chock the tires.
2. If not already done, remove the seats, the bunk(s), all the upholstery panels, the floor mats, the carpeting, and the wiring harness from the cab. See the applicable groups and sections in this manual for instructions.
3. Remove the 5/16–18 Torx®-head screws that attach the roof cap assembly to the back wall and the side walls. See **Fig. 1.**
4. For a SleeperCab, remove the Huck® bolts that attach the forward edge of the rear roof cap to the curtain bow roof support and the front roof cap assembly.
5. Pry up the roof cap section from the back wall and the side walls to release the foam sealant tape.
6. Remove the rear roof cap assembly.



1. Side-Wall Assembly
2. Rear Roof-Cap Assembly
3. Huck Bolt
4. Front Roof-Cap Assembly
5. Curtain Bow Roof Support
6. Torx-Head Screw

Fig. 1, 48-Inch SleeperCab Shown

Rear Roof-Cap Assembly Removal and Installation

Installation

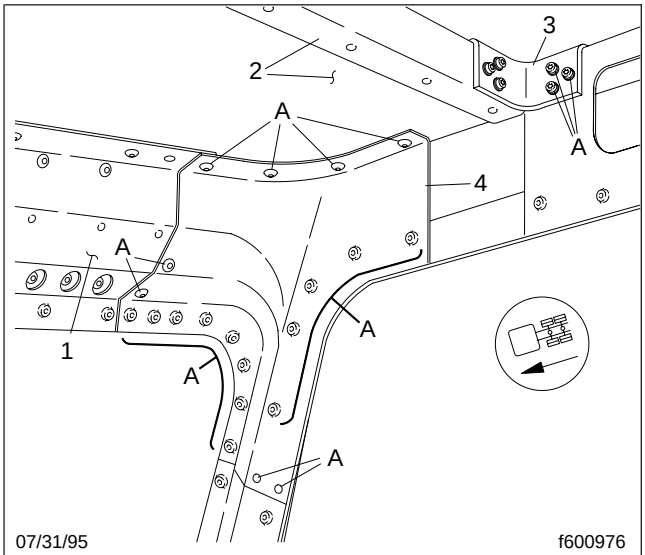
CAUTION

CAUTION: Check the vehicle chassis for correct alignment before making repairs to the cab. Failure to repair and align the chassis before repairing the cab could prevent you from correctly squaring the cab, and cause undue stress on the cab structure.

1. Level the chassis, using jackstands.
2. Make sure the cab is level and square. See **Subject 110** for instructions.
3. Clean the top edge of the side walls and the back wall. Remove all adhesive and foam sealant tape.
4. Install new foam sealant tape all the way around the top of the side walls.
5. Put the new rear roof cap assembly in place, making sure the holes in the hem line up with those in the clinch nuts in the back wall and side walls.
6. Install the 5/16–18 Torx-head screws holding the roof cap assembly to the side walls and back wall.
   - 6.1 Install the two front screws on both sides loosely.
   - 6.2 Push the edges of the roof cap in or out to line up the holes in the roof cap and the side walls; then install the screws, working your way back toward the back wall.
   - 6.3 Install the screws that attach the roof-cap assembly to the back wall.
   - 6.4 Tighten all the Torx-head screws 15 lbf·ft (20 N·m).
7. Using 3/16-diameter special seal Huck bolts, attach the front roof-cap skin to the rear roof-cap skin and the curtain bow roof support.
   - 7.1 Clamp the front roof-cap skin in place, underneath the rear roof-cap skin.
   - 7.2 Using a #11 drill bit, and the existing holes in the rear roof-cap skin, drill through the new front roof-cap skin.
   - 7.3 Install 3/16-inch diameter Huckbolts, with the heads facing out.
8. Prime and paint the new back wall.
9. Install the seats, upholstery panels, bunk(s), cabinets, floor mats, and carpeting. See the applicable groups and sections in this manual for instructions.
10. Remove the jackstands from the chassis.
11. Remove the chocks from the tires.

Door-Frame Assembly Removal and Installation

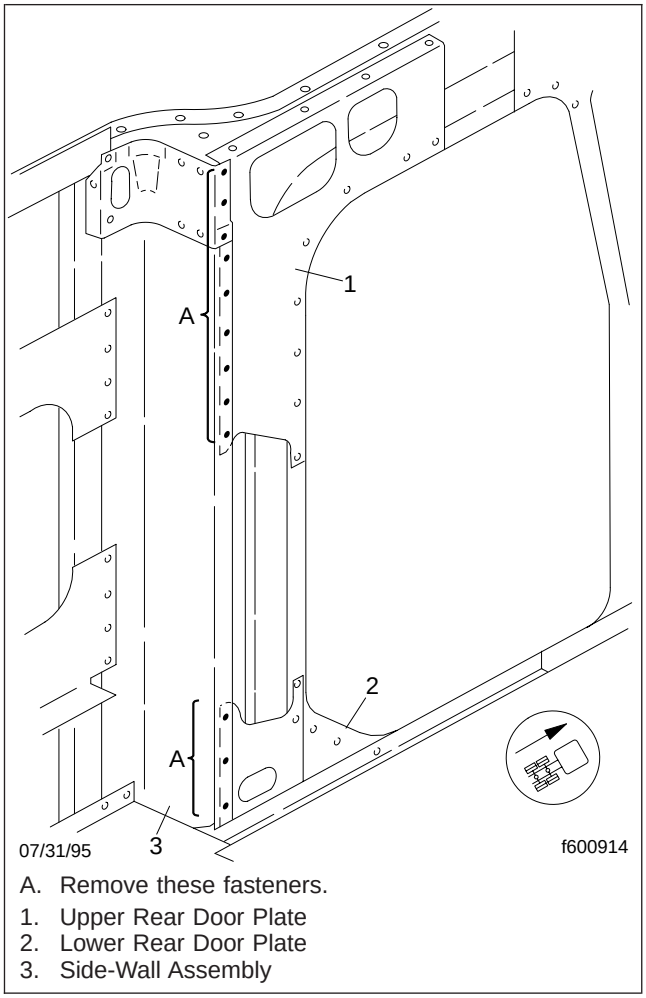
1. Park the vehicle on a level surface. Apply the parking brakes; then chock the tires.
2. If not already done, remove the seats, the side upholstery panels, the dash panels, cabinets, carpeting, and the floor mats from the cab. See the applicable sections in this group for instructions.
3. Remove the door. See the applicable section in **Group 72** for instructions.
4. If not already done, remove the windshield. See the windshield section in this group for instructions.
5. From inside the cab, remove the fasteners holding the door header plate to the door frame and the windshield header; then remove the door header. See **Fig. 1**.



A. Remove these fasteners.
1. Windshield Header
2. Front Storage Console
3. L-Bracket
4. Door Header

Fig. 1, Right Side, Inside View

6. Remove the bolts that attach the front console L-bracket to the top of the door-frame assembly. See **Fig. 1**.
7. Remove the fasteners that hold the upper and lower rear door plates to the side-wall assembly. See **Fig. 2**.

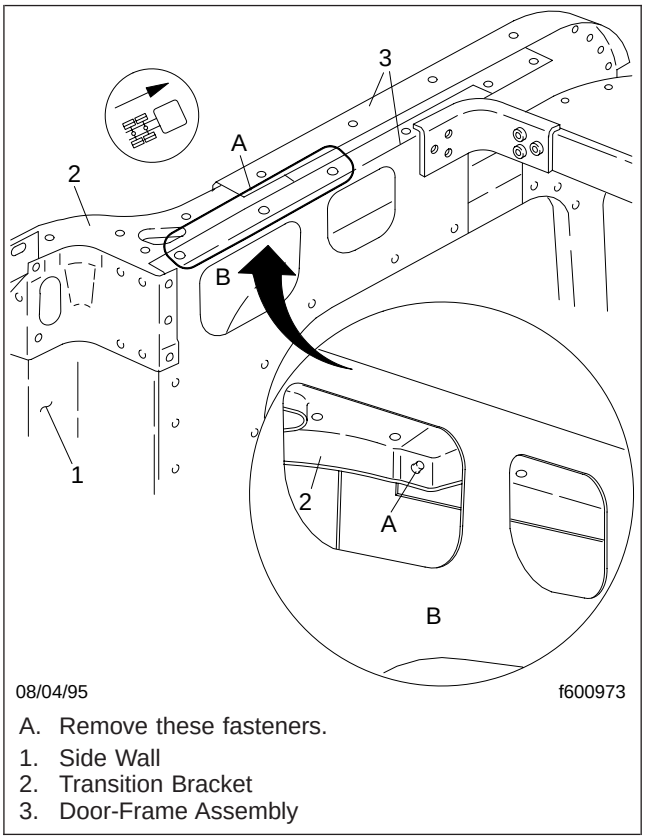


A. Remove these fasteners.
1. Upper Rear Door Plate
2. Lower Rear Door Plate
3. Side-Wall Assembly

Fig. 2, Door Plate Fasteners, Inside View

8. Remove the fasteners that hold the transition bracket to the door frame. See **Fig. 3**.
9. From outside the cab, remove the two rows of Henrob® rivets that hold the bottom of the door frame to the cab deck. See **Fig. 4**. See **Subject 100** for information on removing Henrob rivets.
10. Remove the fasteners that attach the front corner of the roof-cap skin and the windshield header to the top of the door frame assembly. See **Fig. 5**.

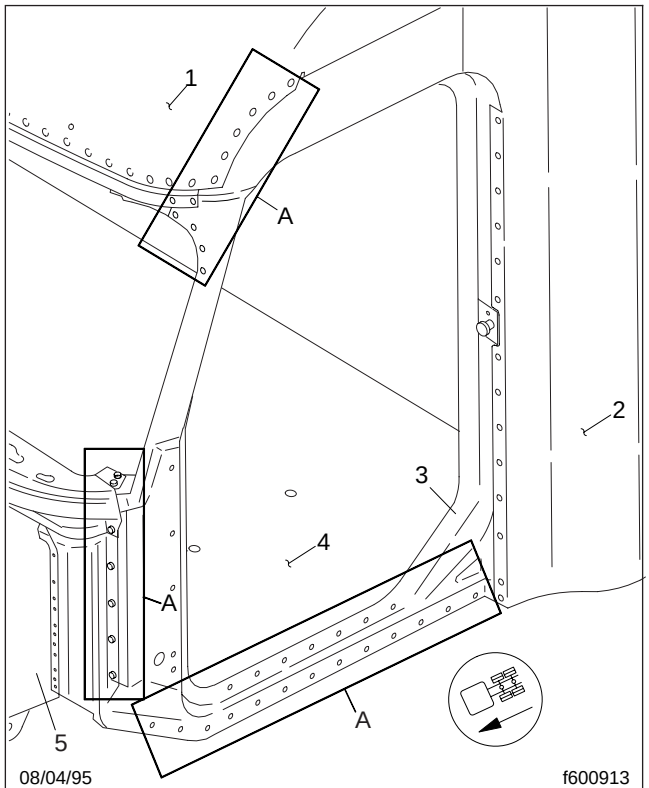
Door-Frame Assembly Removal and Installation



A. Remove these fasteners.
1. Side Wall
2. Transition Bracket
3. Door-Frame Assembly

Fig. 3, Transition Bracket Fasteners

11. Remove the bolts that hold the front of the door frame assembly to the front wall assembly. See **Fig. 3**.
12. Remove the Henrob rivets that attach the side-wall skin to the door frame. See **Fig. 6**.
13. Using a suitable heat source, such as a heat gun or a propane torch, heat the forward edge of the side-wall skin to release the glue bond at the door frame. The glue bond will soften at about 275°F (135°C). Pry up the edge to prevent the glue from rebonding.
14. Pull the rear end of the door frame out of the slip joint at the sidewall.
15. Remove the door frame from the vehicle.



A. Remove these fasteners.
1. Front Roof-Cap Assembly
2. Side-Wall Assembly
3. Door-Frame Assembly
4. Cab Deck
5. Front-Wall Assembly

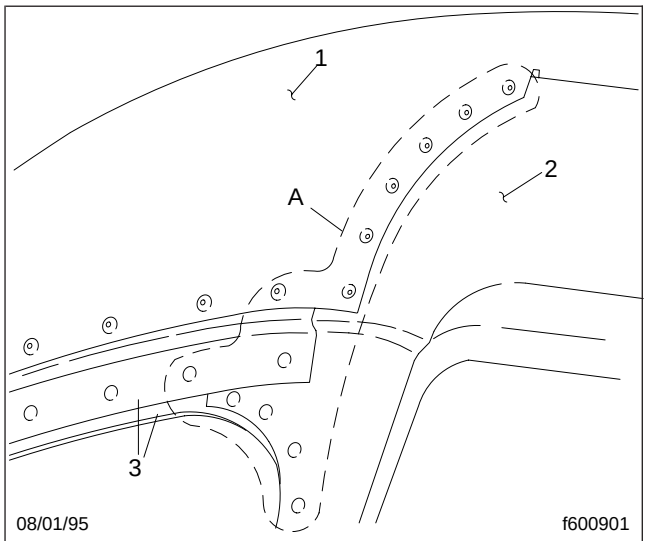
Fig. 4, Door Frame Fasteners

Installation

CAUTION

Check the vehicle chassis for correct alignment before making repairs to the cab. Failure to repair and align the chassis before repairing the cab could prevent you from correctly squaring the cab, and cause undue stress on the cab structure.

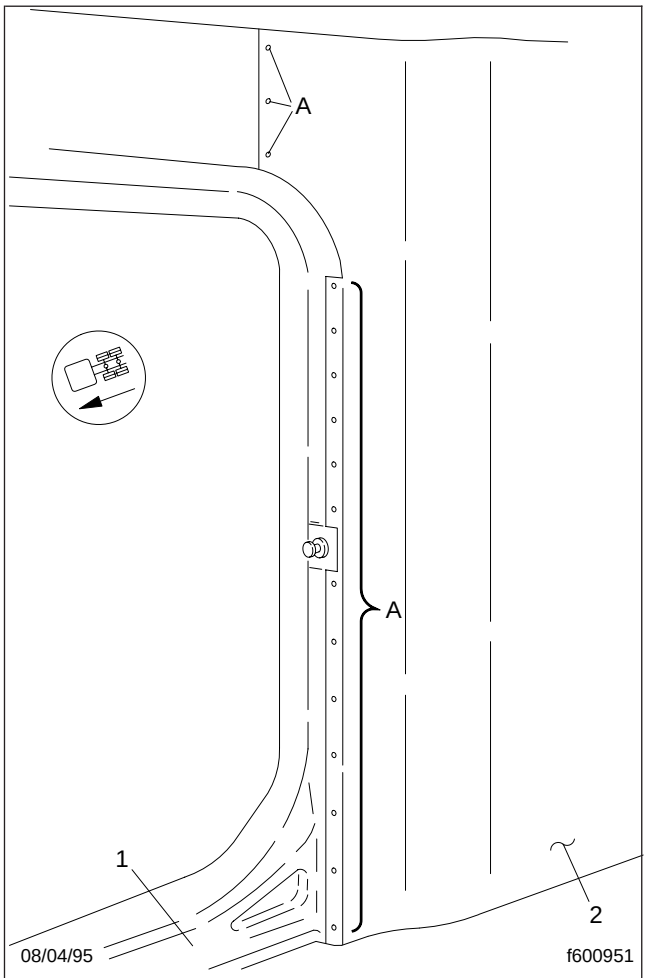
1. Level the chassis, using jack stands.
2. Make sure the cab is level and square. See **Subject 110** for instructions.



A. Remove these fasteners.
1. Roof Cap Assembly
2. Door Frame Assembly
3. Windshield Header Assembly

Fig. 5, Fasteners Attaching Door Frame to Windshield Header and Roof Cap

3. Put the new door frame in place up against the front wall, with the top of the door frame inside of the windshield header.
4. Attach the new door frame assembly to the front wall, using the Torx-head bolts previously removed.
5. From inside the cab, attach the front console L-brackets to the door frame assembly, using the previously removed Torx-head bolts.
6. Attach the upper plate of the door frame to the side wall.
7. Attach the lower plate of the door frame to the lower part of the side wall.
8. Install the transition bracket into the upper part of the door frame.
9. Clamp the bottom of the door frame to the cab deck sill.
10. Using the existing holes in the cab sill, backdrill into the new door frame with a #11 drill bit. On the outside of the door frame, counterbore the holes with a 5/16-inch counterbore.

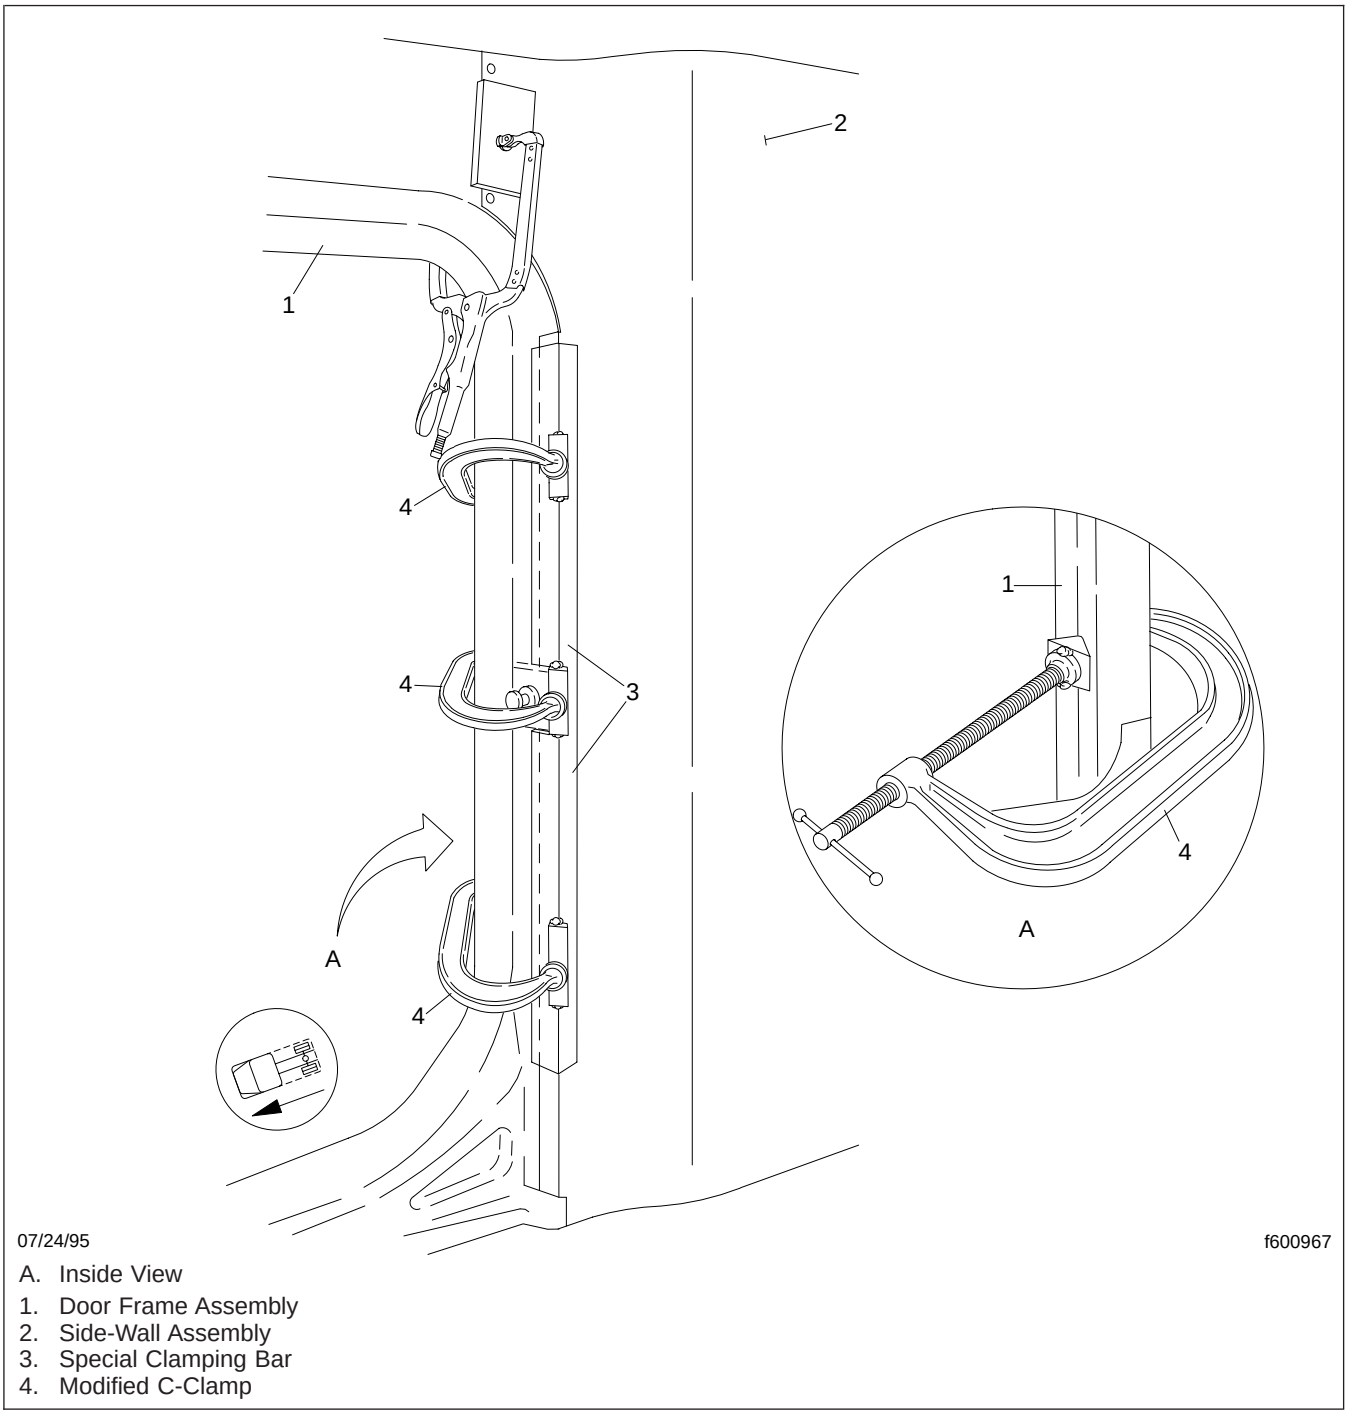


A. Remove these fasteners.
1. Left Door-Frame Assembly
2. Left Side-Wall Assembly

Fig. 6, Side-Wall to Door Frame Henrob® Rivets

11. Install 3/16-inch-diameter countersunk-head aluminum Huck bolts in the bottom row of holes.
12. Install 3/16-inch-diameter aluminum bucked rivets in the top row of holes.
13. Using a caulking gun, apply a 1/8-inch (3-mm) bead of Magnolia MPI 6155 A & B two-part adhesive to the surface of the door frame. Follow the manufacturer's directions and safety information when using the adhesive.
14. Clamp the forward edge of the side-wall skin to the door frame, using the special clamping bar and modified C-clamps. See **Fig. 7**.

Door-Frame Assembly Removal and Installation



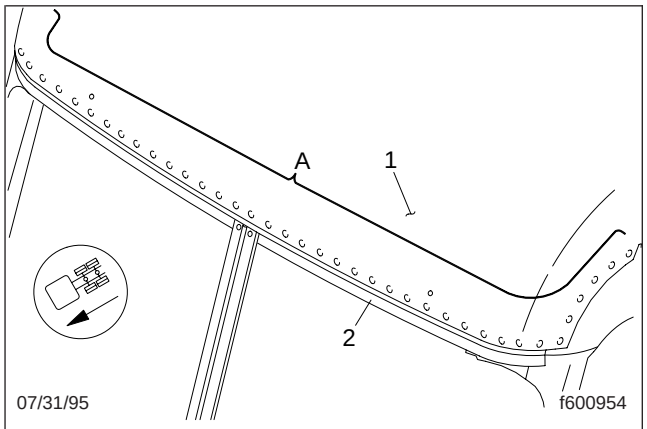
A. Inside View
1. Door Frame Assembly
2. Side-Wall Assembly
3. Special Clamping Bar
4. Modified C-Clamp

Fig. 7, Special Clamp for Door Frame

15. Remove any excess adhesive that is squeezed out. Let the adhesive cure for at least 40 minutes. Complete curing takes 24 hours.
16. Using a #11 drill bit, and the existing holes in the side-wall skin, drill holes through the new door frame.
17. Using a 5/16-inch counterbore, countersink each hole, then install countersunk aluminum bucked rivets that have a 5/16-inch head and a 3/16-inch shank. See **Specifications, 400** for the correct fastener part number.
18. Prime and paint the new door assembly.
19. Install the windshield. See the windshield section in this group for instructions.
20. Install the side upholstery panels, cabinets, dash panels, seats, floor mats, and carpeting. See the applicable groups and sections in this manual for instructions.
21. Remove the jack stands from the chassis.
22. Remove the chocks from the tires.

Removal

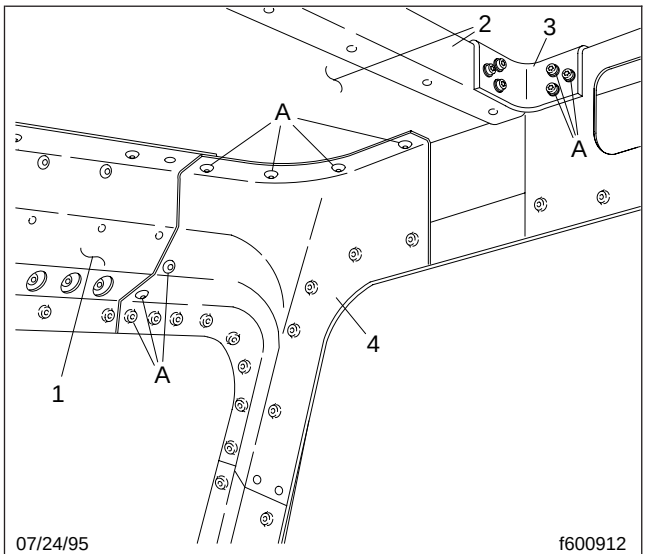
1. Park the vehicle on a level surface. Apply the parking brakes; then chock the tires.
2. If not already done, remove all the windshield glass. See the windshield section for instructions.
3. If not already done, remove the seats, the bunk(s), the upholstery panels, the dash panels, the floor mats, the carpeting, and the doors from the cab. See the applicable groups and sections is this manual for instructions.
4. If the front roof cap assembly is damaged, remove it. **See Subject 140** for instructions.
5. If the front roof cap assembly is not being removed, remove the Henrob® rivets that attach it to the windshield header assembly. **See Fig. 1.** See **Subject 100** for information on removal of Henrob rivets.



A. Remove these fasteners.
1. Front Roof Cap
2. Windshield Header

Fig. 1, Fasteners Holding Roof Cap to Windshield Header

6. From inside the cab, remove the fasteners that attach the right and left door headers to the windshield header. **See Fig. 2.**
7. Remove the bolts that hold the front storage console L-brackets to the door frame assemblies. **See Fig. 2.**
8. Remove the Magnabulb® rivets that hold the three roof-bow brackets to the windshield header. **See Fig. 3.**



A. Remove these fasteners.
1. Windshield Header
2. Front Storage Console
3. L-Bracket
4. Door Header

Fig. 2, Passenger-Side, Interior View

9. Remove the windshield center post, if present. **See Fig. 4.**
10. Remove the windshield header assembly and the front storage console assembly from the cab.
11. Remove the front storage console from the windshield header. Save it if it is undamaged.

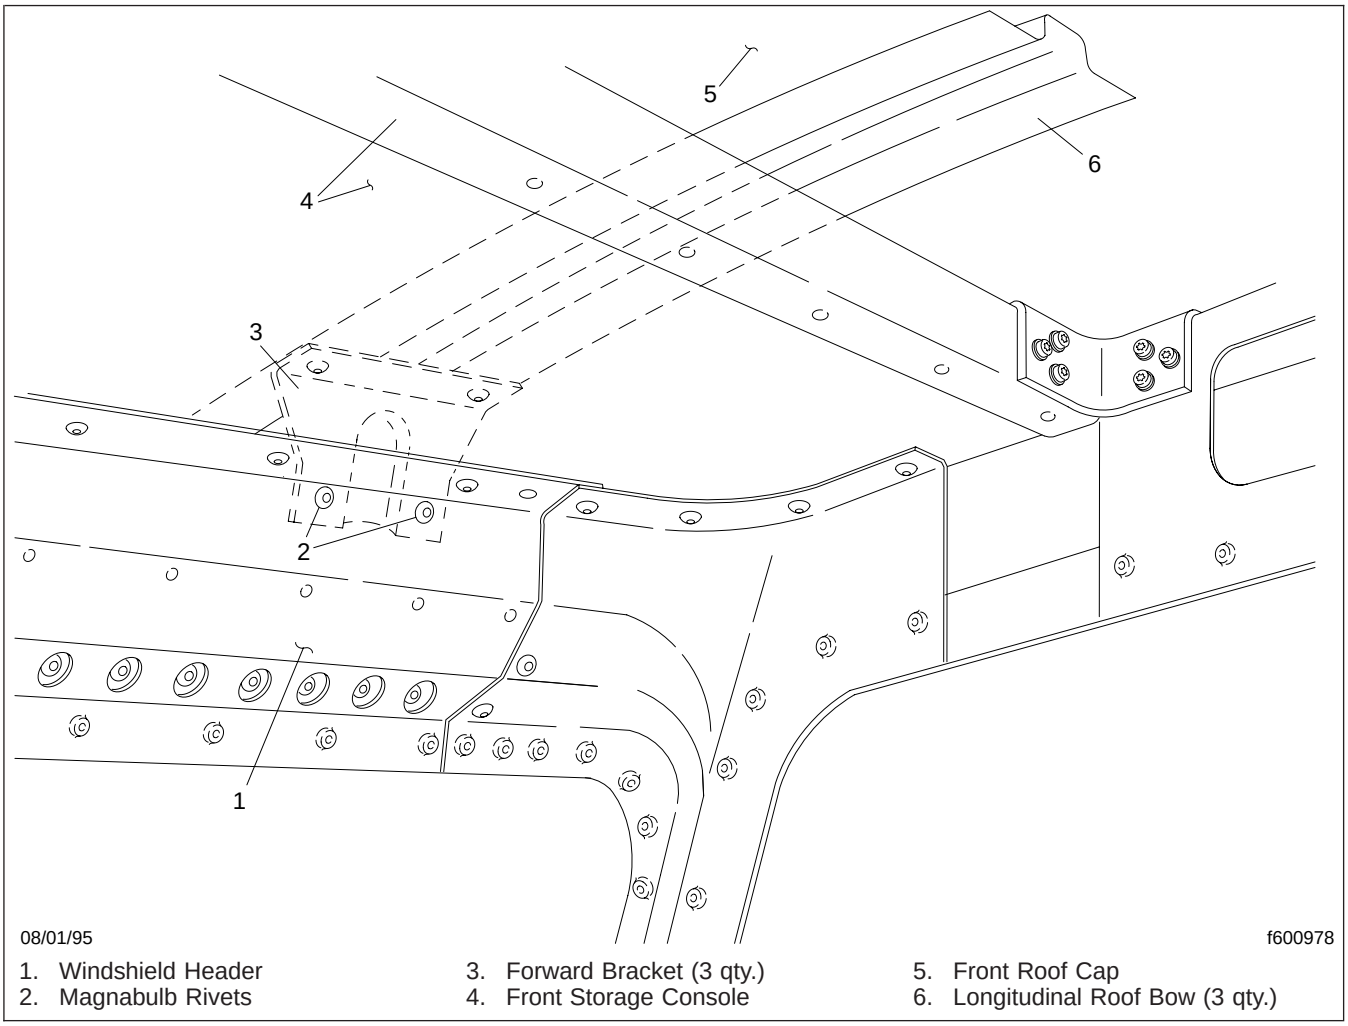
Installation

CAUTION

CAUTION: Check the vehicle chassis for correct alignment before making repairs to the cab. Failure to repair and align the chassis before repairing the cab could prevent you from correctly squaring the cab, and cause undue stress on the cab structure.

1. Level the chassis, using jackstands.
2. Make sure the cab is level and square. **See Subject 110** for instructions.
3. Attach the front storage console assembly to the new windshield header. Use 3/16-inch diameter

Windshield Header Removal and Installation

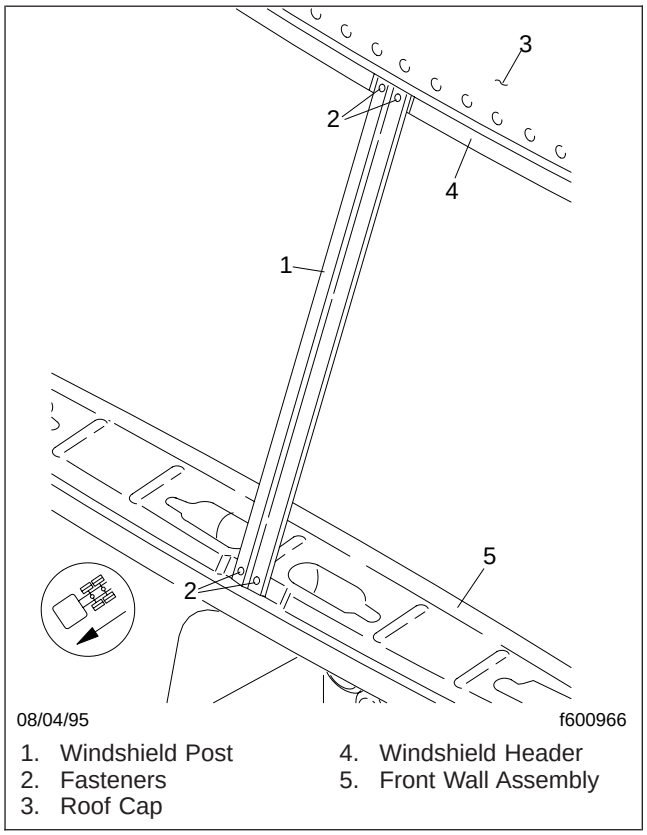


1. Windshield Header
2. Magnabulb Rivets
3. Forward Bracket (3 qty.)
4. Front Storage Console
5. Front Roof Cap
6. Longitudinal Roof Bow (3 qty.)

Fig. 3, Right Side, Interior View

Monobolt® blind rivets. If holes are not present, drill them, using a #11 drill bit. Install the Monobolts with the heads on the bottom surface of the windshield header.

4. Put the windshield header and the front storage console assembly in place.
5. Attach the windshield header to the door headers.
   - 5.1 Using 3/16-inch diameter aluminum rivets with countersunk heads, attach each corner of the windshield header to the top of each door header.
   - 5.2 Install 3/16-inch Monobolt rivets in the remaining existing door header holes
6. From outside the cab, install the roof cap onto the windshield header.
   - 6.1 Put the roof cap in place over the new windshield header
   - 6.2 Using the existing holes in the roof cap, drill through the new windshield header.
   - 6.3 Counterbore the holes, using a 5/16-inch counterbore.
   - 6.4 Install 3/16-inch flush-head countersunk aluminum bucked rivets or countersunk



1. Windshield Post
2. Fasteners
3. Roof Cap
4. Windshield Header
5. Front Wall Assembly

Fig. 4, Windshield Post Fasteners

aluminum Huck bolts. Install them in an alternate sequence. **See Fig. 5.**

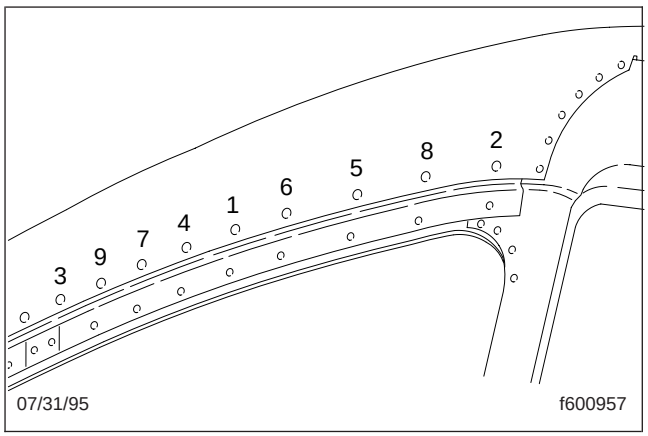


Fig. 5, Installation Sequence for Roof Cap Rivets

7. If equipped with a two-piece windshield, install the windshield post, using two #15 Magnabulb rivets at the top and bottom of the windshield post. **See Fig. 4.**
8. Prime and paint the new windshield header.
9. Install the windshield glass. See the windshield section for instructions.
10. Install the dash panels, upholstery panels, bunk(s), cabinets, seats, floor mats, and carpeting. See the applicable groups and sections in this manual for instructions
11. Remove the jackstands from the chassis.
12. Remove the chocks from the tires.

Removal

IMPORTANT: Depending on the amount and severity of damage, you may need to remove the cab from the chassis to correctly repair the cab deck.

1. Park the vehicle on a level surface. Apply the parking brakes; then chock the tires.
2. If not already done, remove the seats, the bunk(s), the upholstery panels, dash panels, cabinets, the floor mats, and the carpeting from the cab. See the applicable groups and sections is this manual for instructions.
3. Remove the doors. See **Group 72** for instructions.
4. If necessary, remove the cab from the chassis. See the applicable section in this group for instructions.
5. Remove all the fasteners that attach the deck plate to the framework. **See Fig. 1.** Remove only the deck plate needed.
6. Remove the damaged section of framework.
   - 6.1 Remove the necessary cab structures to expose the damaged area. For example, if you need to replace an outboard longitudinal sill, you will need to remove the sidewall assembly. See the applicable subject in this section for instructions.
   - 6.2 Remove the Huck® fasteners and brackets needed.

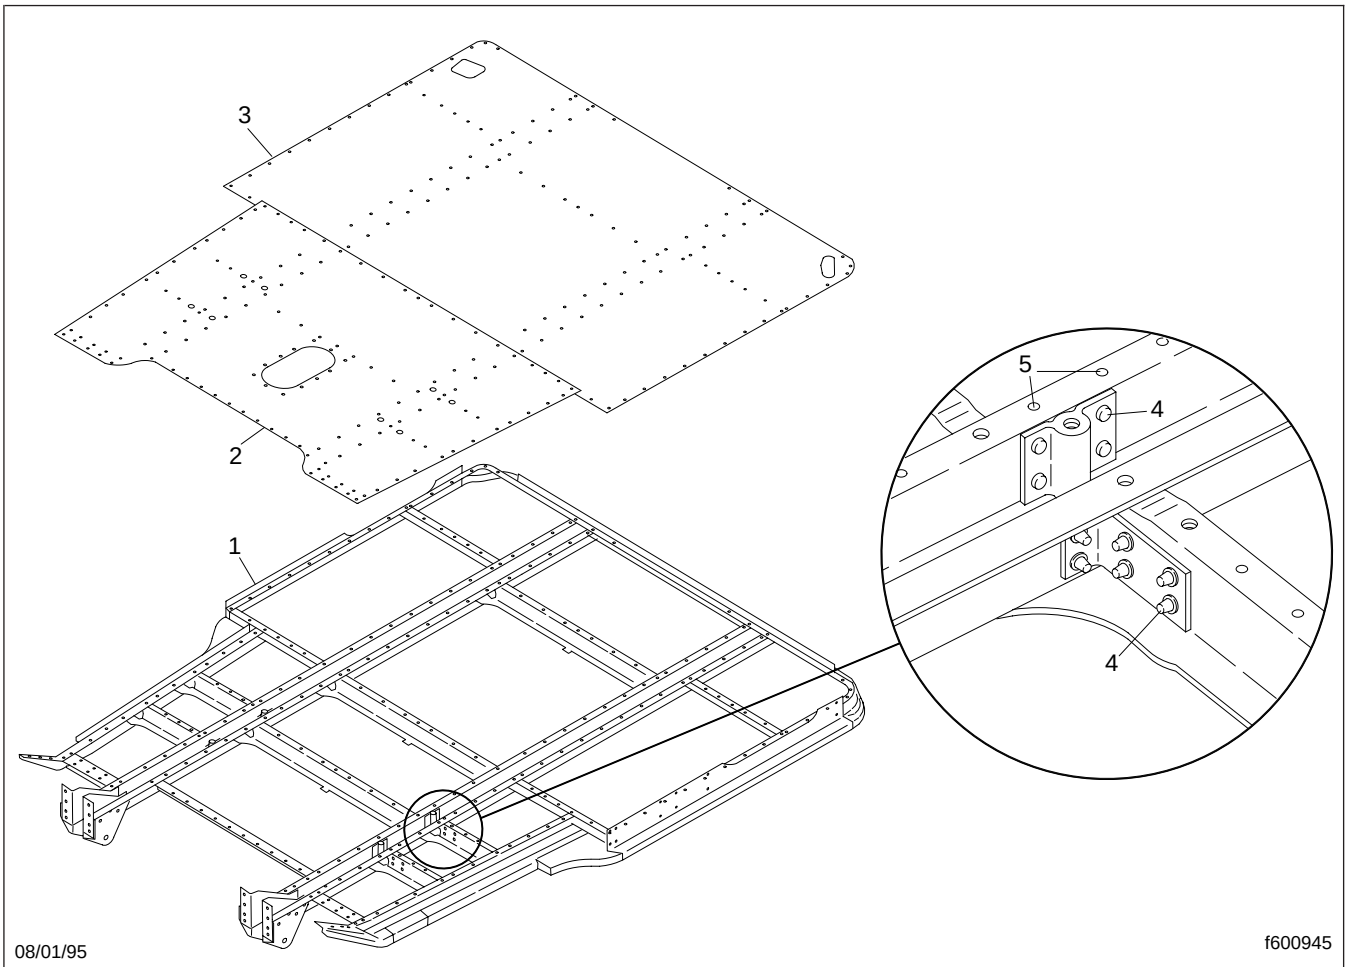
Installation

⚠ CAUTION

CAUTION: Check the vehicle chassis for correct alignment before making repairs to the cab. Failure to repair and align the chassis before repairing the cab could prevent you from correctly squaring the cab, and cause undue stress on the cab structure.

1. Level the chassis, using jackstands.
2. Install the new replacement part, using Huck bolts. Make sure that the fasteners match those that were removed, especially on the top surface of the frameworks. These must be flush, so that you can install the deck plate.
3. Install the deck plate, using the same kind of fasteners that were removed.
4. Make sure the cab deck is level and square. See **Subject 110** for instructions.
5. Install any cab structures that were removed, then make sure the cab is square. See **Subject 110** for instructions.
6. If the cab was removed from the chassis, install it on the chassis. See the applicable section in this group for instructions.
7. Install the bunk(s), cabinets, seats, dash panels, upholstery panels, floor mats, and carpeting. See the applicable groups and sections in this manual for instructions.
8. Install the cab doors. See **Group 72** for instructions.
9. Remove the jackstands from the chassis.
10. Remove the chocks from the tires.

Cab Deck Repair



1. Cab Deck Framework
2. Forward Deck Plate
3. Rear Deck Plate
4. Huck Bolt
5. Countersunk (flush) Fasteners

Fig. 1, Cab Deck Parts

Cab Water-Leak Detection

Use the following procedure to locate areas where water may intrude into the cab.

1. Park the vehicle, apply the parking brakes, and chock the front and rear tires.
2. Prepare a wash solution of at least one-quarter cup of soap to one gallon of water in a spray bottle.
3. Place tape over the cab exhausters.
4. Close all doors, windows, and vents.
5. With the HVAC system in "Fresh Air" mode, turn the fan blower motor on high.

NOTE: Perform the leak detection test with the HVAC system in the "Fresh Air" mode only. Do not set the system in the "Recirculation" mode.

6. Spray the cab, and sleeper if so equipped, with the wash solution, and look for bubbles. See **Fig. 1**. Inspect all applicable areas listed below:
    - windshield center post
    - windshield perimeter (especially the lower outboard corners)
    - upper windshield molding retainer strip
    - visor brackets (outboard more likely than center)
    - air horns and marker lights
    - roof deflector mounts (if so equipped)
    - coach joint
    - cab roof seams (especially raised-roof cap fore-aft seams)
    - sleeper roof seams (if present)
    - sleeper roof side windows (if present)
    - skylight window
7. Mark areas of suspected leaks.

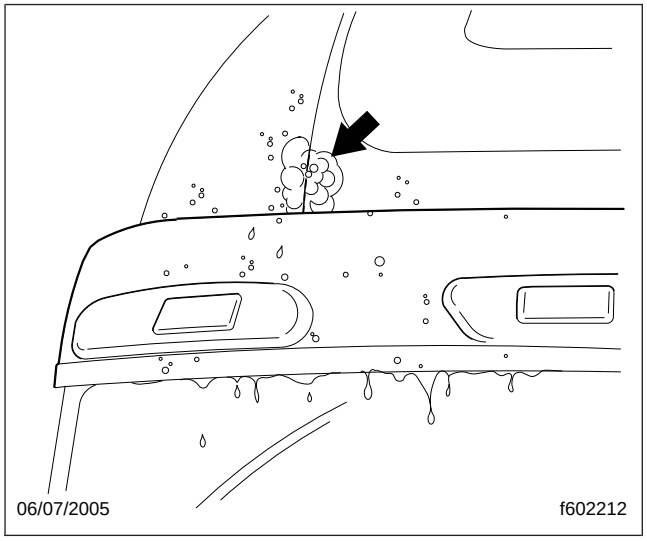


Fig. 1, Cab Water-Leak Detection with Wash Solution

NOTE: This method of leak detection may also identify areas that will not leak water, even though those areas produce bubbles. Bubbles around door seals, baggage doors, and along the vehicle side walls will likely not cause water intrusion issues.

If small bubbles are found in an area that is not suspected to leak, a repair may not be necessary.

8. Rinse the wash solution off the vehicle with water.
9. Turn off the fan blower motor.
10. Remove the tape from the cab exhausters.
11. Remove the chocks from the tires.

Cab Water-Leak Repair

If a leak is found, the repair method will depend on the area and type of leak. It may be necessary to remove some components, though most leaks should be repairable by sealing the area of the leak with silicone sealant.

Leaks in the Windshield or Skylight Sealant

Repair leaks in the windshield or skylight sealant using the approved method and adhesive. Refer to **Section 60.00** for instructions on windshield repair.

Leaks Caused by Structural Damage to a Roof Cap

Repair leaks caused by structural damage to a roof cap by using the procedures outlined in the appli-

Cab Water-Leak Detection and Repair

cable sections in this manual. Use the repair method appropriate to the material used in the roof cap construction.

To repair small leaks, clean with shop air and a clean rag, then seal with a silicone sealant.

Leaks in the Coach Joint Area

Repair leaks in the coach joint area without removing the roof cap, if possible. Seal the leak with silicone or a similar sealant.

See **Fig. 1** and **Fig. 2** for information and measurements to fabricate door plug assemblies.

See **Fig. 3** for information and measurements to fabricate the cab squaring tool.

See **Fig. 4** for information and measurements to fabricate door frame clamps.

See **Fig. 5** for information to modify C-clamps for use with door frame clamps.

Dash Panels Removal and Installation

Removal

NOTE: When the dash is completely assembled (see **Fig. 1**), all dash fasteners are hidden from view.

Removing the right-hand dash panels allows access to the following components: blower motor, resistor module, thermostat, heater core, evaporator core, and power distribution module.

Removing the left-hand dash panels allows access to the following components: the instrumentation control unit and auxiliary instrument panel.

Removing the upper dash assembly allows access to the following components: the face and defrost ducts, cab wiring, and the rear of the instrument panel.

Removing the lower dash panels allows access to the following components: the steering column cover, the keyswitch housing, waste bin slides, and the driver's console support.

Right-Hand Dash Panels

⚠ CAUTION

If the right-hand upper dash cover is difficult to remove, pry gently with a small screwdriver against the edge of the cover, using the slots provided. Be careful to protect the underlying dash panel and not damage its finish.

1. Remove the right-hand upper dash cover by pulling gently aftward on the corners to disengage the four speed clips. This will expose the two screws that attach the top of the HVAC cover to the HVAC unit. See **Fig. 2**.

NOTE: All screws used in the dash installation, unless otherwise called out, are T25 Torx® dog-point screws. See **Fig. 3**.

2. Remove the HVAC cover and footwell light (see **Fig. 4**).
   - 2.1 Remove the two screws at the top of the HVAC cover.
   - 2.2 Remove the two screws at the bottom of the HVAC cover. Remove the HVAC cover from the dash.
   - 2.3 Disconnect the electrical connector on the footwell light.
   - 2.4 If needed, pry out the footwell light lens and replace the bulb.
3. Remove the electrical cover from the dash by pushing the push-button release that attaches the electrical cover to the upper dash assembly.
4. Remove the waste bin.
   - 4.1 Slide the waste bin out as far as it will go.
   - 4.2 Reach inside the waste bin and push the release tab.
   - 4.3 Remove the waste bin from the dash assembly.
5. Remove the cup holder by pulling up on the cup holder to unseat the two speed clips.
6. Remove the ashtray assembly.
   - 6.1 Open the ashtray.
   - 6.2 Press on the metal tab and pull the ashtray out.
   - 6.3 Remove the two 1-inch (25-mm) Torx screws that hold the ashtray housing to the left-hand console cover.
   - 6.4 Remove the ashtray housing.
7. Remove the right-hand console cover.
   - 7.1 Remove the two screws that attach the cover to the lower left-hand console cover.
   - 7.2 Remove the screw that attaches the cover to the lower left-hand console cover.
   - 7.3 Remove the screw at the back of the cover in the passenger footwell.
   - 7.4 Remove the screw that attaches the cover to the HVAC unit.
   - 7.5 Pull the bottom of the cover out to clear the tabs at the top of the lower right-hand console cover from the upper dash assembly.
   - 7.6 Remove the console cover.

Left-Hand Dash Panels

1. Remove the left-hand dash trim panels. See **Fig. 5**.

NOTE: Removing the left-hand dash trim allows access to the left-hand and right-hand accessory switch panels.

1.1 Rotate the driver's cupholder up and out of the way to expose two T25 dog-point screws that attach the HVAC/radio trimplate to the upper dash panel. Remove these screws.

1.2 Remove the four speed clips that attach the HVAC/radio trimplate to the upper dash panel. Remove the HVAC/radio trimplate from the dash.

1.3 Remove the two speed clips that attach the keyswitch trimplate to the keyswitch housing. Remove the keyswitch trimplate from the dash.

1.4 Remove the screw and the speed clip that attaches the right-hand dash trimcap to the upper dash panel. Remove the right-hand dash trimcap from the dash.

2. Remove the instrument panel trim. See **Fig. 6**.

NOTE: Removing the instrument panel trim allows access to the instrumentation control unit and auxiliary instrument panels.

2.1 Remove the screw that attaches the left-hand dash endcap to the keyswitch housing. Remove the speed clip that attaches the left-hand dash endcap to the dash

3. Remove the upper dash assembly. See **Fig. 7**.
   - 3.1 Remove the three 1-1/4 inch (3 cm) screws that attach the upper dash panel to the inserts along the underside of the upper dash assembly (left-hand panel).
   - 3.2 Remove the three 1-1/4 inch (3 cm) screws that attach the upper dash assembly to the dash panel trim top.
   - 3.3 Remove the plug in the lower right-hand console cover.
   - 3.4 Remove the screw that attaches the dash brace to the upper dash assembly (center panel).
   - 3.5 Remove the two screws that attach the upper dash assembly (right-hand panel) to the HVAC unit.
   - 3.6 Remove the six screws located in the recessed areas around the louvers along the edge of the windshield.
   - 3.7 Remove the two screws that attach the upper dash assembly to the upper dash panel.
   - 3.8 Remove the upper dash assembly from the vehicle.

Lower Dash Panels

1. Remove the driver's knee bolster. See **Fig. 8**.

   NOTE: Removing the driver's knee bolster allows access to the steering column cover (clamshell cover).
   - 1.1 Remove the two speed clips that attach the lower part of the bolster to the keyswitch housing and the steering column bracket.
   - 1.2 Unhook the knee bolster from the slots in the keyswitch housing and upper dash panel.
   - 1.3 Remove the driver's knee bolster from the dash.

8. T25 Dog-Point Screw

Fig. 6, Instrument Panel Trim

2. Remove the cup holder by pulling up on the cup holder to unseat the two speed clips.
3. Remove the HVAC/radio trimplate.
   - 3.1 Remove the two screws and washers that attach the trimplate to the upper dash panel.
   - 3.2 Pull up on the trimplate to disengage the four speed clips.
4. Remove the ashtray assembly.
   - 4.1 Open the ashtray.
   - 4.2 Press on the metal tab.
   - 4.3 Pull the ashtray out.
   - 4.4 Remove the two 1-inch (25-mm) Torx screws that hold the ashtray housing to the left-hand console cover.
   - 4.5 Pull the housing out.
5. Remove the waste bin.
   - 5.1 Slide the waste bin out as far as it will go.
   - 5.2 Reach in the waste bin and push up on the tab at the top of the waste bin compartment.
   - 5.3 Remove the waste bin.

Dash Panels Removal and Installation

2. T25 Dog-Point Screw
3. Upper Dash Assembly (right-hand panel)
4. Upper Dash Assembly (center panel)
5. Dash Brace
6. Dash Brace Screw
7. Upper Dash Panel

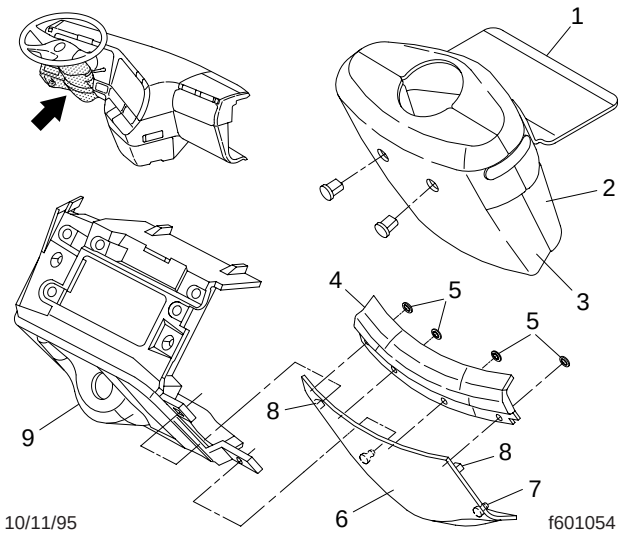
Fig. 7, Upper Dash Assembly

6. Remove the left-hand console cover.
   - 6.1 Remove the screw located behind the cover along the driver-side footwell edge.
   - 6.2 Remove the screw and washer that attaches the cover to the steering column bracket.
   - 6.3 Remove the three screws that attach the cover to the upper dash panel.
   - 6.4 Remove the two screws that hold the cover to the lower right-hand console cover located through the ashtray and waste bin openings.
   - 6.5 Remove the two 1-1/4 inch (30 mm) Torx screws that hold the cover to the engine tunnel cover.
   - 6.6 Pull the cover out and reach behind to disconnect the cigarette lighter connector.
   - 6.7 Remove the cover.

Installation

Lower Dash Panels

1. Install the left-hand console cover.
   - 1.1 Connect the cigarette lighter connector to the cigarette lighter housing.
   - 1.2 Install the two Torx screws that hold the cover to the engine tunnel cover.
   - 1.3 Install the two screws that hold the left-hand console cover to the lower right-hand console cover located through the ashtray and waste bin opening.



1. Steering Column Upper Cover Seal
2. Upper Steering Column Cover

4. Steering Column Lower Cover Seal
5. Push-On Retainer
6. Driver's Knee Bolster
7. Speed Clip
8. Hook
9. Keyswitch Housing

Fig. 8, Driver's Knee Bolster

1.4 Remove the three screws that attach the cover to the upper dash panel.

1.5 Install the screw and washer that attaches the cover to the steering column bracket.

1.6 Install the screw located behind the cover along the driver side foot-well edge.

2. Install the ashtray assembly.

2.1 Install the ashtray housing into the left-hand console cover.

2.2 Install the two Torx screws that hold the housing to the left-hand console cover.

2.3 Slide the ashtray in the ashtray housing and close the ashtray.

3. Slide the waste bin into the left-hand console cover.

4. Install the HVAC/radio trim plate.

4.1 Position the speed clips over the holes in the upper dash panel.

4.2 Install the two screws and washers that attach the trimplate to the upper dash panel.

5. Align the speed clips on the cup holder with the holes in the left-hand console cover and push the cupholder down into position.

6. Install the driver's knee bolster. See **Fig. 8**.

6.1 Install the hooks on the top of the driver's knee bolster into the slots in the keyswitch housing and the upper dash panel.

6.2 Install the speed clips that attach the knee bolster to the keyswitch housing and the steering column bracket.

6.3 Press firmly against all four corners of the knee bolster to be sure all hooks and clips are firmly seated.

Upper Dash Assembly

1. Install the upper dash assembly. See **Fig. 7**.

1.1 Fit the dash assembly into place along the edge of the windshield and over the top of the instrument panels.

1.2 Install the six T25 dog-point screws in the recessed areas around the louvers along the edge of the windshield.

1.3 Install the two screws that attach the upper dash assembly to the upper dash panel.

1.4 Install the screw that attaches the dash brace to the upper dash assembly (center panel).

1.5 Install the plug in the lower right-hand console cover.

1.6 Install the three screws that attach the upper dash panel to the underside of the upper dash assembly.

1.7 Install the three screws that attach the upper dash panel to the dash panel trim top.

1.8 Install the two screws that attach the upper dash assembly (right-hand panel) to the HVAC unit.

2. Install the electrical cover and right-hand upper dash cover using the instructions in "Right-Hand Dash Panels."

Dash Panels Removal and Installation

3. Install the keyswitch trimplate and left-hand dash endcap, using the instructions in "Left-Hand Dash Panels."

Left-Hand Dash Panels

1. Install the instrument panel trim. See **Fig. 6**.
   - 1.1 Insert the top edge of the instrument panel trim into its mating surface on the upper dash assembly. Insert the bottom edge of the instrument panel center trim down into the slot in the upper dash panel until it snaps into place.
   - 1.2 If removed, install the steering column cover (clamshell cover).
   - 1.3 Install the two screws that attach the dash panel trimtop to the upper dash assembly (left-hand panel).
   - 1.4 Snap the dash message center bezel into place.
   - 1.5 Install the speed clip that attaches the left-hand dash endcap to the dash panel upper trimtop. Install the screw that attaches the left-hand dash endcap to the keyswitch housing.
2. Install the left-hand dash trim panels. See **Fig. 3**.
   - 2.1 Install the screw and the speed clip that attaches the right-hand dash trimcap to the upper dash panel.
   - 2.2 Install the two speed clips that attach the keyswitch trimplate to the keyswitch housing. If needed, replace the left-hand accessory/switch panel.
   - 2.3 Install the four speed clips and two screws that attach the HVAC/radio trimplate to the upper dash panel.
   - 2.4 Rotate the driver's cupholder down and into place, covering the screws on the HVAC/radio trimplate.

Right-Hand Dash Panels

1. Install the right-hand console cover.
   - 1.1 Slide the tabs at the top of the cover into the slots in the upper dash panel assembly.
   - 1.2 Install the screw that attaches the cover to the HVAC unit.
   - 1.3 Install the screw at the back of the cover in the passenger footwell area.
   - 1.4 Install the screw that attaches the cover to the left-hand console cover located in the cup holder area.
   - 1.5 Install the two screws that attach the cover to the left-hand console cover located through the ashtray and waste bin openings.
2. Install the HVAC cover (see **Fig. 2**) and footwell light.
   - 2.1 Connect the electrical connector on the footwell light.
   - 2.2 Place the HVAC cover into position over the upper dash assembly and install the two screws into the holes at the top of the HVAC cover.
   - 2.3 Install the two screws at the bottom of the HVAC cover.
3. Install the electrical cover on the dash.
4. Attach the four speed clips on the right-hand upper dash cover to the HVAC cover. See **Fig. 2**.
5. Align the speed clips on the cup holder with the holes in the left-hand console cover and push the cup holder into position.
6. Slide the waste bin into the left-hand console cover.
7. Install the ashtray assembly.
   - 7.1 Place the ashtray housing into the left-hand console cover.
   - 7.2 Install the two Torx screws that attach the ashtray housing to the left-hand console cover.
   - 7.3 Slide the ashtray into the ashtray housing and close the ashtray.

Dash Panels Removal and Installation, Argosy COE

Removal

IMPORTANT: Many of the dash components are accessible only after the removal of other dash components. The following service procedures start on the right side of the dash and generally move left toward the operator's side of the vehicle.

NOTE: When the dash is completely assembled (see **Fig. 1**), all dash fasteners are hidden from view.

Removing the right-hand dash panels allows access to the following components: blower motor, resistor module, thermostat, heater core, evaporator core, and power distribution module.

Removing the left-hand dash panels allows access to the following components: the instrumentation control unit and the auxiliary instrument panel.

Removing the upper dash assembly allows access to the following components: the face and defrost ducts, cab wiring, and the rear of the instrument panel.

Removing the lower dash panels allows access to the following components: the steering column cover and the keyswitch housing.

RIGHT-HAND UPPER DASH PANELS

⚠ CAUTION

If the right-hand upper dash cover is difficult to remove, pry gently with a small screwdriver against the edge of the cover, using the slots provided. Be careful to protect the underlying dash panel and not damage its finish.

1. Remove the upper dash electrical access panel by pushing the button in the middle of the panel fore edge.
2. Remove the righthand upper dash cover by pulling gently aftward on the corners to disengage the four speed clips and expose the two screws attaching the top of the HVAC cover to the HVAC unit. See **Fig. 2**.

IMPORTANT: All screws used in the dash installation, unless otherwise called out, are T25 Torx-head dog-point screws. See **Fig. 3**.

3. Remove the HVAC cover and footwell light (see **Fig. 4**).
   - 3.1 Remove the two screws at the top of the HVAC cover.
   - 3.2 Remove the two screws at the bottom of the HVAC cover. Remove the HVAC cover from the dash.
   - 3.3 Disconnect the electrical connector on the footwell light.
   - 3.4 If needed, pry out the footwell light lens and replace the bulb.

LOWER DASH CONSOLE

1. Remove the HVAC/radio assembly trimplate and the transmission boot. See **Fig. 1**.
2. Remove the knee bolster. See **Fig. 5**.

   NOTE: Removing the driver's knee bolster allows access to the steering column cover (clamshell cover).
   - 2.1 Remove the two speed clips attaching the lower part of the bolster to the keyswitch housing and the steering column bracket.
   - 2.2 Unhook the knee bolster from the slots in the keyswitch housing and upper dash panel.
   - 2.3 Remove the driver's knee bolster from the dash.
3. Remove the lower dash console by removing the eight fasteners holding it in place.
4. Pull the console from under the dash.

LEFT-HAND DASH PANELS

1. Remove the left-hand dash trim panels. See **Fig. 6**.

   NOTE: Removing the left-hand dash trim allows access to the left-hand and right-hand accessory switch panels.
   - 1.1 Remove the four speed clips attaching the HVAC/radio trimplate to the upper dash panel. Remove the HVAC/radio trimplate from the dash.
   - 1.2 Remove the two speed clips attaching the keyswitch trimplate to the keyswitch hous-

UPPER DASH COMPONENTS

1. Remove the right-hand dash panels, using the instructions above.
2. Remove the keyswitch trimplate and left-hand dash endcap, using the instructions in "Left-Hand Dash Panels."
3. Remove the two screws attaching the dash panel trimtop to the upper dash assembly.
4. Remove the upper dash assembly. See **Fig. 8**.
   - 4.1 Remove the two screws attaching the upper dash panel to the inserts along the underside of the upper dash assembly (left-hand panel).
   - 4.2 Remove the two screws attaching the upper dash assembly (center panel) to the upper dash panel.
   - 4.3 Remove the screw attaching the dash brace to the upper dash assembly (center panel).
   - 4.4 Remove the two screws attaching the upper dash assembly (right-hand panel) to the HVAC unit.
   - 4.5 Remove the six screws located in the recessed areas around the louvers along the edge of the windshield.
   - 4.6 Remove the upper dash components from the vehicle.

Installation

NOTE: When the dash is completely assembled (see **Fig. 8**), all dash fasteners are hidden from view.

UPPER DASH COMPONENTS

1. Install the upper dash assembly. See **Fig. 8**.

   NOTE: The upper dash assembly consists of three panels (left-hand, center, and right-hand) molded together.
   - 1.1 Fit the dash assembly into place along the edge of the windshield and over the top of the instrument panels.
   - 1.2 Install the six T25 dog-point screws in the recessed areas around the louvers along the edge of the windshield.
   - 1.3 Install the two screws attaching the upper dash panel to the inserts along the underside of the upper dash assembly (left-hand panel).
   - 1.4 Install the screw attaching the dash brace to the upper dash assembly (center panel).
   - 1.5 Install the two screws attaching the upper dash assembly (center panel) to the upper dash panel.
   - 1.6 Install the two screws attaching the upper dash assembly (right-hand panel) to the HVAC unit.
2. Install the right-hand dash panels, using the instructions below.
3. Install the keyswitch trimplate and left-hand dash endcap, using the instructions in "Left-Hand Dash Panels."

4. Install the two screws attaching the dash panel trimtop to the upper dash assembly.

LEFT-HAND DASH PANELS

1. Install the instrument panel trim. See **Fig. 7**.
   - 1.1 Insert the top edge of the instrument panel trim into its mating surface on the upper dash assembly. Insert the bottom edge of the instrument panel center trim down into the slot in the upper dash panel until it snaps into place.
   - 1.2 If removed, install the steering column cover (clamshell cover). For more information, refer to **Section 46.06**.
   - 1.3 Install the two screws attaching the dash panel trimtop to the upper dash assembly (left-hand panel).
   - 1.4 Snap the dash message center bezel into place.
   - 1.5 Install the speed clip attaching the left-hand dash endcap to the dash panel upper trimtop. Install the screw attaching the left-hand dash endcap to the keyswitch housing.
2. Install the left-hand dash trim panels. See **Fig. 3**.
   - 2.1 Install the screw and the speed clip attaching the right-hand dash trimcap to the upper dash panel.
   - 2.2 Install the two speed clips attaching the keyswitch trimplate to the keyswitch housing. If needed, replace the left-hand accessory/switch panel.
   - 2.3 Install the four speed clips and two screws attaching the HVAC/radio trimplate to the

upper dash panel. If needed, replace the right-hand accessory/switch panel.

2.4 Rotate the driver's cupholder down and into place, covering the screws on the HVAC/radio trimplate.

LOWER DASH CONSOLE

1. Position the console under the dash.
2. Install the eight fasteners.
3. Install the knee bolster. See **Fig. 5**.

3.1 Install the hooks on the top of the knee bolster into the slots in the keyswitch housing and the upper dash panel.

3.2 Install the speed clips attaching the knee bolster to the keyswitch housing and the steering column bracket.

3.3 Press firmly against all four corners of the knee bolster to be sure all hooks and clips are firmly seated.

4. Install the transmission boot and the HVAC/radio assembly trimplate.

1. Upper Dash Assembly (left-hand panel)
2. T25 Dog-Point Screw
3. Upper Dash Assembly (right-hand panel)
4. Upper Dash Assembly (center panel)
5. Dash Brace
6. Upper Dash Panel
7. Dash Brace Screw

Fig. 8, Upper Dash Assembly, Argosy COE

RIGHT-HAND DASH PANELS

1. Connect the electrical connector (see **Fig. 2**) on the footwell light.
2. Place the HVAC cover (see **Fig. 4**) into position over the upper dash assembly and install the two screws into the holes at the top of the HVAC cover.
3. Install the two screws at the bottom of the HVAC cover.
4. Install the electrical cover on the dash.
5. Attach the four speed clips on the right-hand upper dash cover to the HVAC cover. See **Fig. 2**.

Exterior Sun Visor Removal and Installation

Sun Visor Removal

1. Park the vehicle, apply the parking brakes, then chock the tires.
2. Remove the front sun visor. See **Fig. 1** and **Fig. 2**.
   - 2.1 Remove the two 5/16–18 Torx®-head screws that hold both ends of the front sun visor to the side sun visors.
   - 2.2 Remove the 5/16–18 Torx-head screws and washers holding the front sun visor mounting brackets to the cab.
   - 2.3 Pull out the surplus wiring from the cab (where the right front mounting bracket was installed); then disconnect it.
   - 2.4 Remove the front sun visor, mounting brackets, and seals.
   - 2.5 If replacing the sun visor itself, remove the 5/16–18 hexnuts and washers that hold the three mounting brackets to the visor; then remove the brackets.
3. If replacing the marker lights, remove the wiring harness cover from the back of the sunvisor; then remove the two screws holding each marker light in place and remove the marker light.
4. Remove the side sun visors. See **Fig. 3**.
   - 4.1 Remove the remaining 5/16–18 hexnut and washer holding the left side sun visor to the forward outer mounting bracket.
   - 4.2 Remove the four 5/16–18 hexnuts and washers holding the left side sun visor to the rear outer mounting bracket.
   - 4.3 Remove the left side sun visor.
   - 4.4 Repeat the procedure for the right side sun visor.
5. If needed, remove the side sun visor mounting brackets. See **Fig. 4**.
   - 5.1 Remove the Torx-head screws and washers from the forward and rear outer mounting brackets.
   - 5.2 Remove the brackets and their seals from the side of the cab.

Sun Visor Installation

1. Install the side sun visors.
   - 1.1 If they were removed, install the forward and rear outer mounting brackets and their seals above the door frames.
   - 1.2 Align the left side sun visor with the forward and rear mounting brackets. Install the 5/16–18 hexnuts and washers. Tighten them firmly.
   - 1.3 Repeat the procedure for the right side sun visor.
2. Install the front sun visor.
   - 2.1 If they were removed, install the marker lights into the front sun visor. Install the wiring harness cover onto the back of the sun visor.
   - 2.2 If they were removed, install the three mounting brackets onto the front sun visor, using the 5/16–18 hexnuts and washers. Tighten the nuts firmly.
   - 2.3 Feed the wiring harness through the right mounting bracket
   - 2.4 Connect the marker light wiring to the cab harness, then push the extra length of wiring into the cab.
   - 2.5 Align the three mounting brackets with the holes in the cab roof. Make sure the holes on the ends of the front sun visor line up with those of the two side sun visors.
   - 2.6 Attach the front sun visor and mounting brackets to the cab roof, using 5/16–18 Torx-head screws. Tighten the screws firmly.
   - 2.7 Attach the ends of the front sun visor to the side sun visors, using the 5/16–18 Torx-head screws, hexnuts, and washers. Tighten the fasteners firmly.
3. Remove the chocks from the tires.

IMPORTANT: Interior components are varied and optional. The following generalized information is intended for broad use, and should not be considered as a guide for a specific vehicle.

Wrap-Around Storage Side Cabinets

See **Fig. 1**.

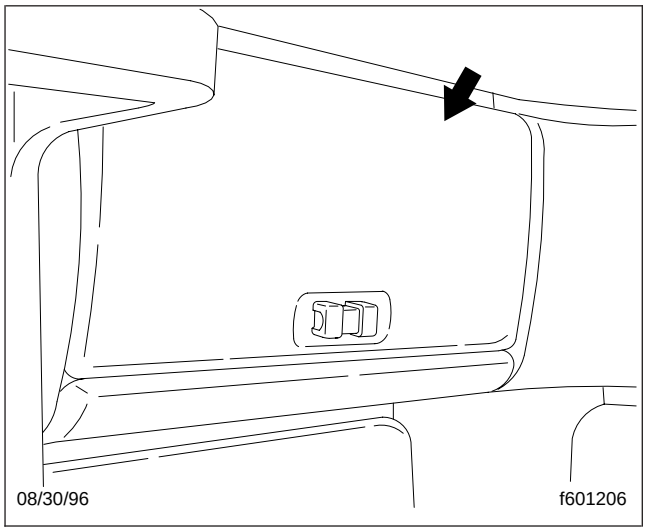

Fig. 1, Wrap-Around Storage Side Cabinet

Side Cabinet Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front tires.

IMPORTANT: The rear center cabinet must be removed before the side cabinets can be removed.

2. Remove the Torx® screws that hold the storage cabinet to the roof.

NOTE: The number of fasteners varies according to the type and style of interior components.

3. Lower the front edge of the cabinet, and disconnect the speaker wires behind it.
4. Lift up the rear of the cabinet so that the cabinet clears the edge of the side upholstery panel, then slide it out.
5. Repeat the procedure for the cabinet on the other side of the vehicle.

Side Cabinet Installation

IMPORTANT: The side cabinets must be installed before the rear center cabinet is installed.

NOTE: When installing the side cabinets, tip them in at the bottom so that the lips on the rear edge of the cabinets hook over the mounting channel behind the upholstery panels.

1. Slide the side cabinet in position, taking care to clear the side panel. Make sure the cabinet fully seats into the mounting channel.
2. Keeping the front edge of the cabinet lowered, connect the speaker wires behind it.
3. Attach the cabinet to the roof, using the Torx screws.
4. Repeat the procedure for the cabinet on the other side of the vehicle.

Wrap-Around Storage Rear Center Cabinet

See **Fig. 2**.

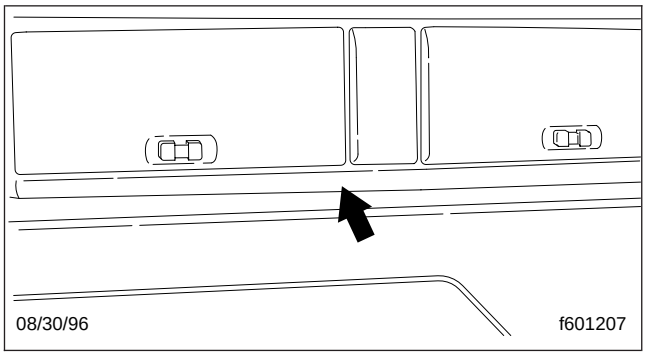

Fig. 2, Wrap-Around Storage Rear Center Cabinet

Rear Center Cabinet Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front tires.

Removal and Installation

IMPORTANT: The rear center cabinet must be removed before the side cabinets can be removed.

2. Remove the Torx screws that hold the storage cabinet to the rear headliner.

NOTE: The number of fasteners varies according to the type and style of interior components.

3. Maneuver the bottom of the storage cabinet to clear the rail above the rear wall upholstery panel. Allow the cabinet to drop down at the forward edge, then lift the rear of the cabinet.
4. Remove the storage cabinet from the vehicle.

Rear Center Cabinet Installation

IMPORTANT: The side cabinets must be installed before the rear center cabinet is installed.

NOTE: When installing the rear center cabinet, tip it in at the bottom so that the lip on the rear edge of the cabinet hooks over the mounting channel behind the upholstery panels. Make sure the cabinet fully seats into the rearwall extrusion.

1. Lift the storage cabinet into position.
2. Attach the cabinet in place using the Torx screws.

NOTE: The number of fasteners varies according to the type and style of interior components.

Upper Forward Side Storage Cabinet

See **Fig. 3**.

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front tires.
2. Remove the two fasteners that attach the storage cabinet to the headliner and the roof.
3. Remove the fasteners that attach the storage cabinet to the side wall. If the interior configuration features a lower cabinet below, remove the four fasteners (typically located under an upholstery panel) that attach the bottom of the upper cabinet to the top of the lower cabinet.

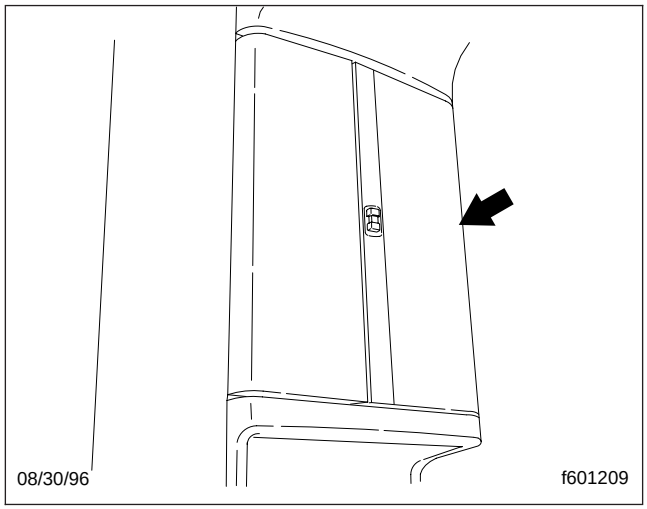

Fig. 3, Upper Forward Side Storage Cabinet

NOTE: The number of fasteners varies according to the type and style of interior components.

4. Remove the storage cabinet.

Installation

1. Position the side storage cabinet.
2. Attach the side storage cabinet to the side wall using the fasteners. Attach the upper cabinet to the lower cabinet, if so equipped, with the four fasteners.
3. Attach the side storage cabinet to the headliner and roof using the fasteners.

Front Overhead Side Consoles

See **Fig. 4**.

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front tires.
2. Remove the privacy curtain and the curtain rail from the forward headliner. The fasteners are in the top track.

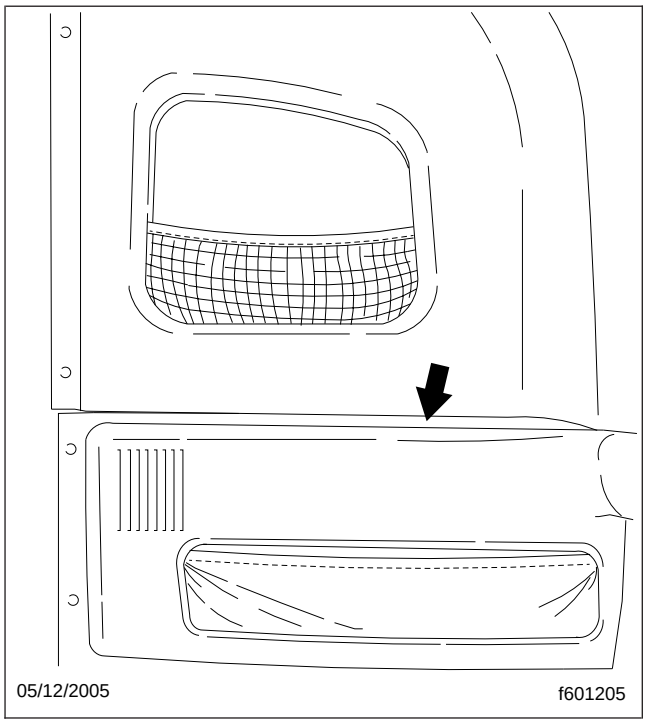

Fig. 4, Front Overhead Side Console

3. Remove the four fasteners that attach the side console in place.

Installation

1. Position the side console in place.
2. Attach the side console with the four fasteners.
3. Install the privacy curtain rail and the privacy curtain.

Front Overhead Center Storage Console

See **Fig. 5**.

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front tires.
2. Remove the A-pillar inner covers.
3. Remove the passenger-side grab handle.

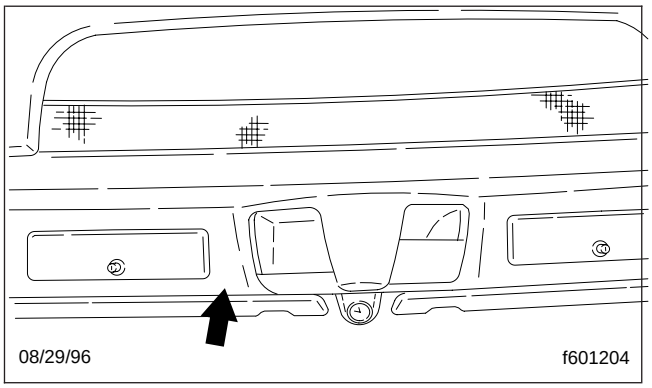

Fig. 5, Front Overhead Center Storage Console

4. Remove the privacy curtain and the curtain rail.
5. Remove the front overhead side consoles.
6. Remove the six fasteners that attach the center console to the windshield header.
7. Lower the center overhead console, then disconnect the wiring harness at the right-hand A-pillar.

Installation

1. Connect the wiring harness at the right-hand A-pillar.
2. Lift the center overhead console into position.
3. Attach the console with the six fasteners.
4. Install the front overhead side consoles.
5. Install the privacy curtain rail and the privacy curtain.
6. Install the upholstery panels on the A-pillar.
7. Install the passenger-side grab handle.

Side Wall Upholstery Panel

See **Fig. 6**.

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front tires.
2. Remove the upper and lower forward side storage cabinets.

Removal and Installation

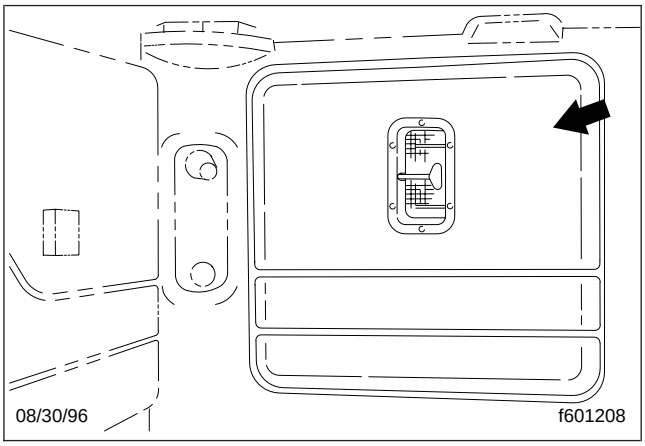

Fig. 6, Side Wall Upholstery Panel

3. Remove the upper rear side (wrap-around) storage cabinets.
4. Remove the trim from the sleeper vent.
5. On the left side, remove the HVAC control panel, and disconnect the wiring.
6. Remove the side panels, using care to keep the Christmas-tree fasteners attached to the panel.

Installation

1. Attach the side panels with the Christmas-tree fasteners.
2. Connect the wiring and install the HVAC control panel.
3. Install the sleeper vent trim.
4. Install the upper rear side (wrap-around) storage cabinets.
5. Install the upper and lower forward side storage cabinets.

Rear Headliner

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front tires.
2. Remove the side storage (wrap-around) cabinets. Then remove the rear upper center cabinets.
3. Remove the upper forward side storage cabinets.
4. Remove the dome light by popping off the lens, removing the screw, and disconnecting the wiring.
5. Remove the moldings along the front edge of the headliner.
6. Remove the four Christmas-tree fasteners, then pry free the headliner.

Installation

1. Install the headliner, using the Christmas-tree fasteners.
2. Install the dome light.
3. Install the upper forward side storage cabinets.
4. Install the rear upper side storage cabinets, then the rear upper center (wrap-around) cabinets.
5. Install the moldings along the front edge of the headliner.

Forward Headliner

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front tires.
2. Remove the privacy curtain and the privacy curtain rail.
3. Remove the sleeper curtain and the sleeper curtain rail.
4. Remove the dome light by popping off the lens, removing the screw, and disconnecting the wiring.
5. Remove the four Christmas-tree fasteners and pry free the forward headliner.

Installation

1. Install the forward headliner using the four Christmas-tree fasteners.
2. Install the dome light.
3. Install the privacy curtain rail and the privacy curtain.

4. Install the sleeper curtain rail and the sleeper curtain.

Day Cab Headliner

See **Fig. 7**.

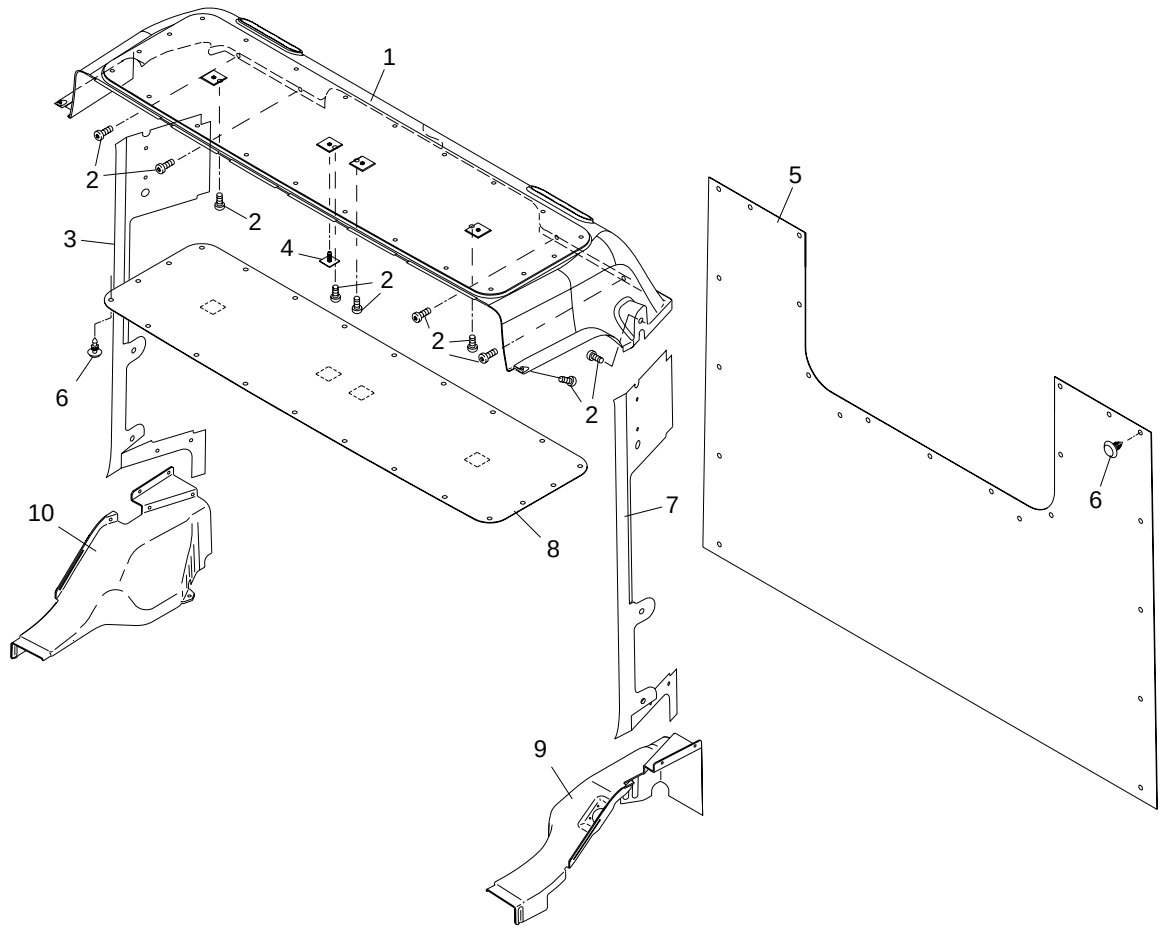
Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the passenger seat from the cab. For instructions, see **Group 91** in this manual. Slide the driver seat forward out of the way.
3. Remove the left and right door sill tread plates by removing the three T20 Torx screws in each.
4. Remove the left and right lower B-pillar covers.
   - 4.1 Remove the diagnostic connector trim plate on the driver-side cover by prying it up.
   - 4.2 Pry loose the door trim molding along the rear edge of the door frame, from bottom to top. The edges of the lower B-pillar cover and the B-pillar upholstery panel are now exposed.
   - 4.3 Remove the clip that holds the cover to the door frame.
   - 4.4 Remove the T25 Torx screw located at the back of the cover. Remove the cover.
5. Remove the left and right B-pillar upholstery panels.
   - 5.1 Remove the interior grab handle by removing the two T40 Torx capscrews that hold it to the cab.
   - 5.2 Remove the two T50 Torx capscrews that hold the upper seat-belt mount to the cab. See **Fig. 8**. Lower the seat-belt mount to the cab floor.
   - 5.3 Remove the panel.
6. Remove the coat hanger hooks (if so equipped), each of which is attached with two T20 Torx screws.
7. Remove the first-aid box (if so equipped), which is attached with two T20 Torx screws.
8. Remove the rear upholstery panel by carefully prying free the upholstery fasteners that attach the panel to the cab rear wall. Remove the panel from the cab.
9. Remove the headliner upholstery insert panel by carefully prying free the upholstery fasteners that attach the insert panel to the headliner trim panel. Pull the panel free of the Velcro® fasteners, and remove it from the cab.
10. Remove the headliner trim panel.
    - 10.1 Remove the six T20 Torx screws along the lower back edge and sides of the panel.
    - 10.2 Remove the four T20 Torx screws, located next to the Velcro fasteners, that attach the panel to the cab roof.
    - 10.3 Remove the two T20 Torx screws, located above each door, that hold the panel to the forward overhead console.
    - 10.4 Remove the panel from the cab.

Installation

1. Install the headliner trim panel using the Torx screws.
2. Attach the headliner upholstery insert panel to the headliner trim panel using the Velcro and upholstery fasteners.
3. Install the first-aid box, if so equipped.
4. Install the coat hanger hooks, if so equipped.
5. Install the left and right B-pillar upholstery panels.
   - 5.1 Position the panel on the B-pillar.
   - 5.2 Install the upper seat-belt mount to the B-pillar using the two T50 Torx capscrews. See **Fig. 8**.
   - 5.3 Install the interior grab handle, using the T40 Torx capscrews.
6. Install the left and right lower B-pillar covers.
   - 6.1 Attach the back of the cover to the B-pillar using the T25 Torx screw.
   - 6.2 Install the clip to hold the cover to the door frame.

Removal and Installation



1. Headliner Trim Panel
2. Torx Screw, T20
3. B-Pillar Upholstery Panel, Right Side
4. Velcro Fastener
5. Rear Upholstery Panel
6. Upholstery Fastener
7. B-Pillar Upholstery Panel, Left Side
8. Headliner Upholstery Insert Panel
9. Lower B-Pillar Cover, Left Side
10. Lower B-Pillar Cover, Right Side

Fig. 7, Upholstery Panels, Day Cab

6.3 Press the loosened door trim molding onto the door frame.

6.4 Install the diagnostic connector trim plate on the driver-side cover.

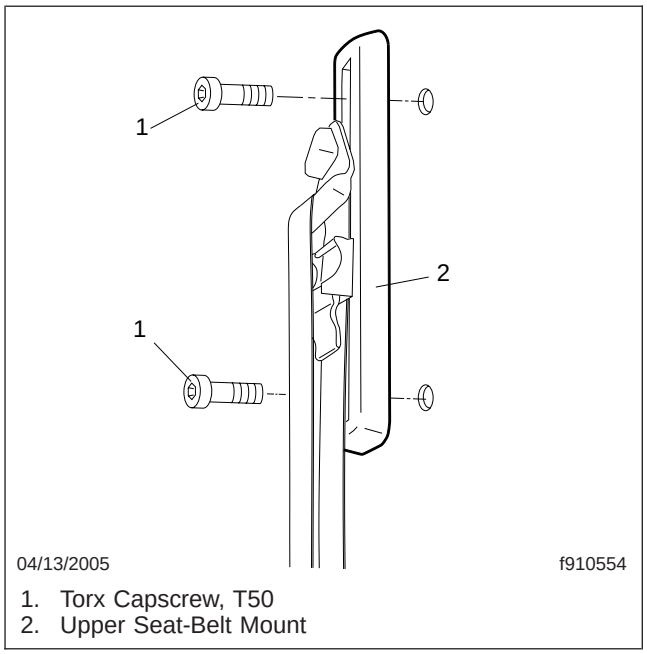
7. Install the left and right door sill plates using the T20 Torx screws.
8. Install the passenger seat in the cab. For instructions, see **Group 91** in this manual.

Back Wall Upholstery Panel

See **Fig. 9**.

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front tires.



1. Torx Capscrew, T50
2. Upper Seat-Belt Mount

Fig. 8, Upper Seat-Belt Mount Installation

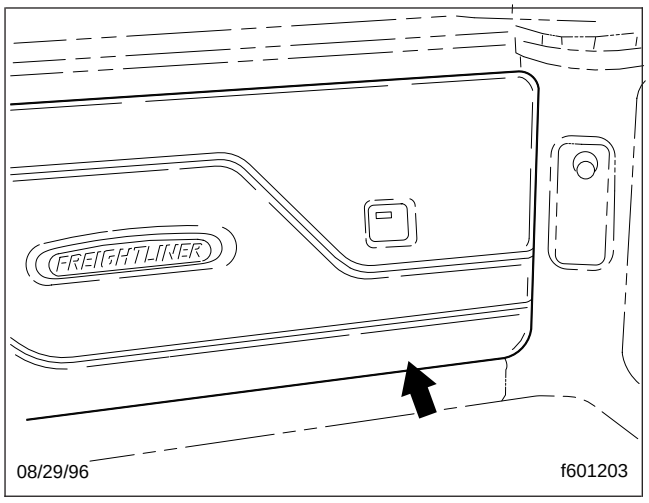


Fig. 9, Back Wall Upholstery Panel

2. Remove all of the upper (wrap-around) storage cabinets, beginning with the side storage cabinets.
3. Carefully pry free the Christmas-tree fasteners that attach the back wall upholstery panel.
4. Remove the back wall panel.

Installation

1. Position the back wall panel in place.
2. Install the back wall panel using the Christmas-tree fasteners.
3. Install the upper (wrap-around) storage cabinets.

General Description

BAGGAGE DOORS

On vehicles with sleeper compartments, baggage doors allow access to the storage compartments under the sleeper bunk.

The baggage doors have rounded corners, single-panel construction, a piano-style hinge, and a one-piece extruded aluminum door frame. A neoprene sponge bulb seal is set into the door frame. A door check cable limits opening the door beyond approximately 105 degrees.

Baggage doors have a keyed lock cylinder and a paddle handle. The same key used for the cab doors and the ignition is used for the baggage doors.

Baggage doors on Argosy COEs are opened by pulling a knob mounted inside the cab door. However, some Argosy COEs may be equipped with a keyed lock cylinder and paddle handle.

ACCESS DOOR

Access to sleeper compartments is provided by an access door, in addition to the walk-through opening at the back of the cab. The access door is on the passenger side of the vehicle. The access door is a rounded-corner, bulkhead-style door.

The door is flush with the outermost edge of the drip molding. A neoprene bulb seal fits into the inner flange of the door opening. There is a gas spring door check to prevent the door from opening too far.

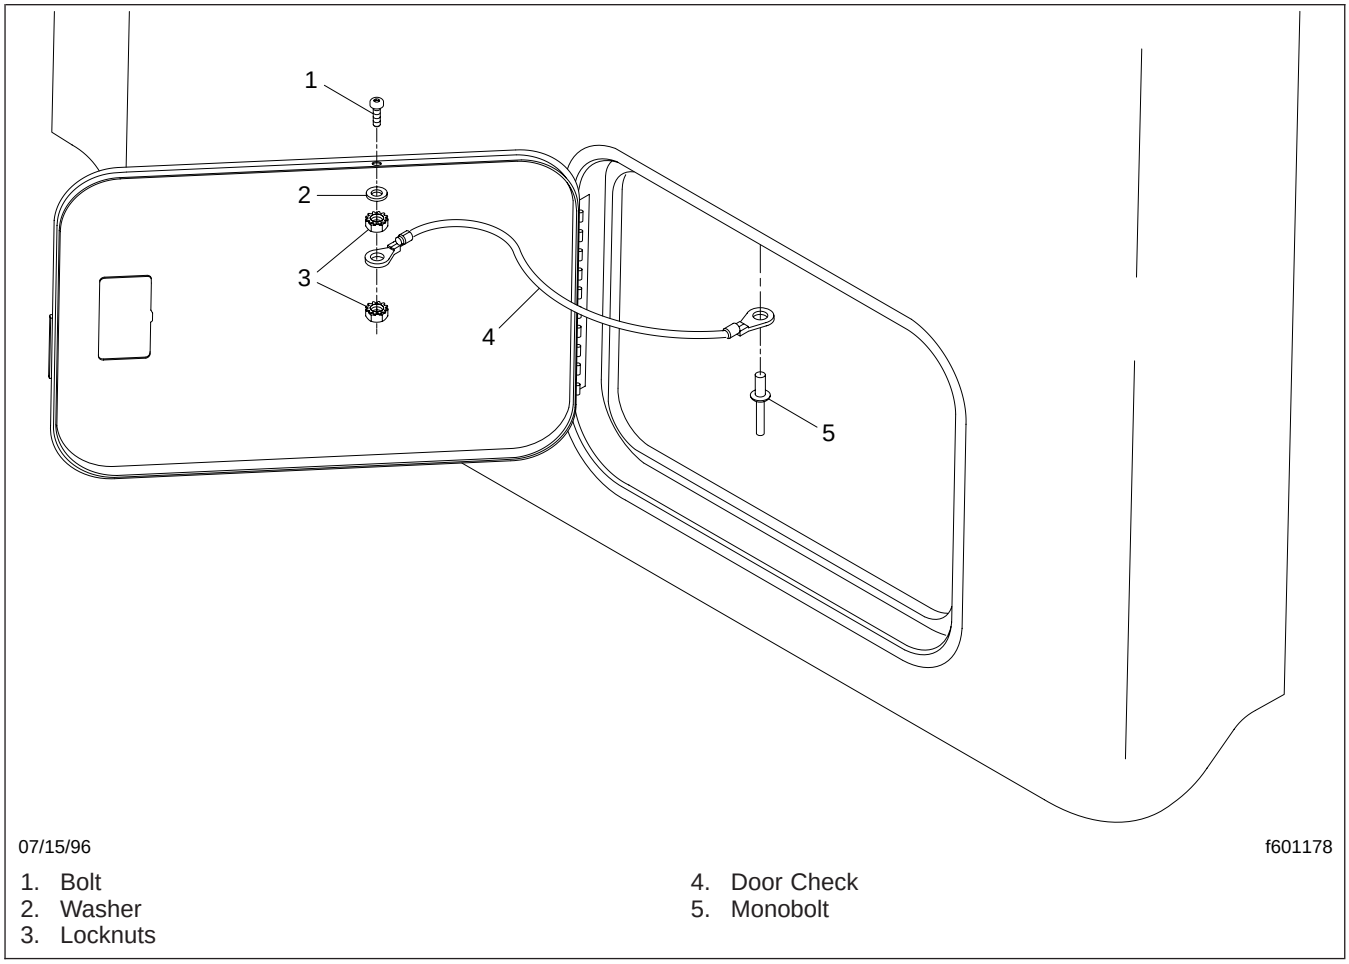
An optional lever handle releases the access door from inside the sleeper compartment.

Argosy COEs are not manufactured with access doors.

Baggage Door Replacement

Replacement

1. Park the vehicle on a flat surface. Shut down the engine. Set the parking brake. Chock the tires.
2. Open the baggage door.
3. Disconnect the door check cable. See **Fig. 1**.
8. Install the baggage door to the door hinge with fasteners, then buck rivet the door into place, removing the fasteners.
9. Attach the door check cable.
10. Install the baggage liner upholstery.



1. Bolt
2. Washer
3. Locknuts
4. Door Check
5. Monobolt

Fig. 1, Baggage Door

4. Partially remove the baggage liner upholstery.
5. Drill out the rivets attaching the door hinge to the door.
6. Remove the door from the vehicle.
7. Position the door to the vehicle.
11. Remove the chocks from the tires.

Replacement

1. At the seal seam located at the center of the bottom of the door frame, pull the entire length of the seal out of the door frame. See **Fig. 1**.
2. Clean and dry the seal area of the door frame. Remove any grease or dirt from the surface.
3. If not already done, cut a length of new door seal that is slightly longer than the total perimeter of the baggage door.
4. Using a soap-and-water solution, and beginning with one (squared off) end of the seal at the center of the bottom inside edge of the door frame, install the door seal, making sure that the contour of the seal is fitted to the curved lip of the door panel all the way around its perimeter. To avoid pulling the seal away from the corners of the door frame, do not stretch the seal.
5. Just prior to complete seating of the door seal, cut off (square) the excess length of the seal so that the two ends will form a hairline seam (butt joint) at the center of the bottom of the door panel. Press the seal ends together.
6. Test the door for ease of opening and closing.

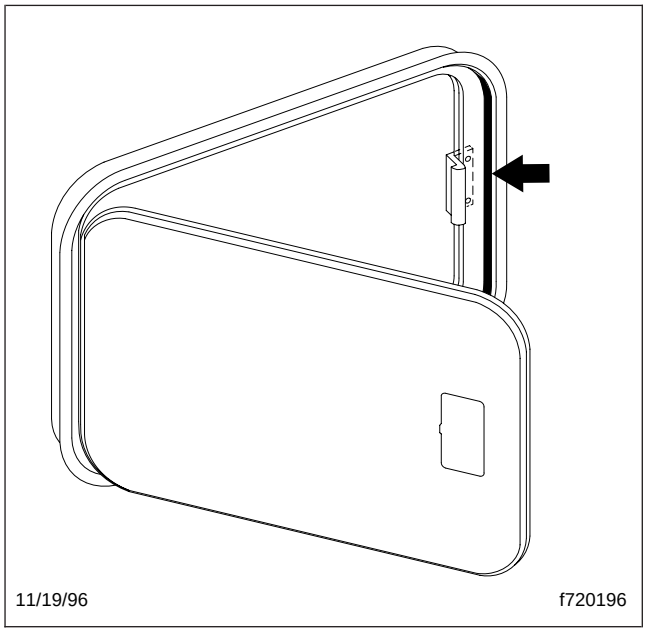


Fig. 1, Baggage Door Seal

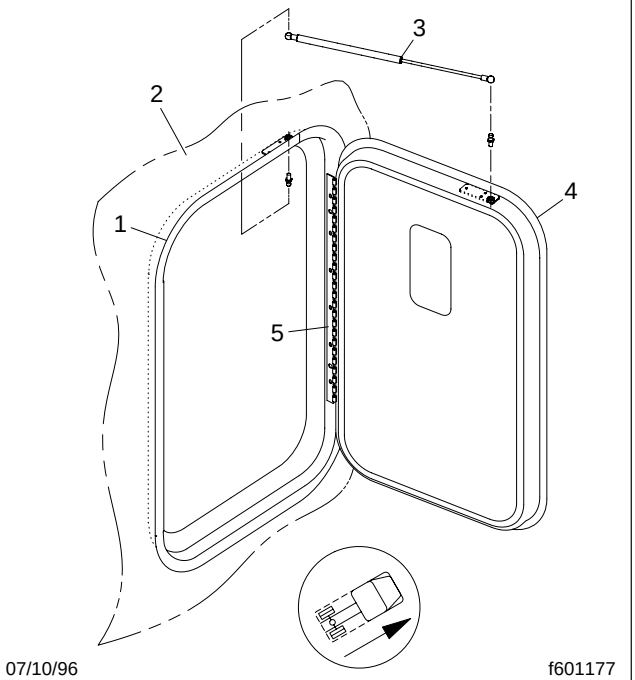
Removal

1. Park the vehicle on a flat surface. Shut down the engine. Set the parking brake. Chock the tires.
2. Disconnect the door check strut at the top of the door by removing the clip cover that attaches the strut end to the door. See **Fig. 1**.



1. Door Frame
2. Cab Wall
3. Door Check Strut
4. Access Door
5. Hinge

Fig. 1, Access Door

3. Remove the interior cab trim for access to the fasteners that attach the door hinge to the cab.
4. Remove the door by removing the rivets holding the door in place.
5. To install the door, position the door into place on the door frame, then rivet into place.
6. Attach the clip cover connecting the door strut to the top of the door.
7. Close the door, and test for proper closing.
8. Install the interior cab trim.

Replacement

1. Gripping the end of the door seal, pull the entire length of the seal away from the inner door frame.
2. Remove any grease or dirt from the seal flange.
3. Using a soap-and-water solution, install the new seal onto the inner door frame so the bulb-portion of the seal is facing the door when the door is open. The ends of the seal should be located at the bottom of the door frame. To avoid pulling the seal away from the corners of the inner door frame, do not stretch the seal.
4. Just prior to complete seating of the door seal, cut off (square) any excess length of the seal so that the two ends will form a hairline seam (butt joint).
5. Test the door for ease of opening and closing.

Specifications

Torque Values	
Description	**Torque lbf·in (N·m)**
Sleeper Box Access Door Striker Pin	50 (68)

Table 1, Torque Values

Air Horn Valve Removal and Installation

Removal

1. Park the vehicle. Set the parking brake. Shut down the engine and chock the tires.
2. Drain the air supply, and disconnect the batteries.
3. Remove the overhead console. See **Section 60.13** for instruction.
4. Disconnect the air hoses from the air horn valve. Mark the hoses for later reference.
5. Remove the fasteners that attach the air horn valve to the mounting bracket.
6. Disconnect the air horn control cable from the air horn valve.
7. Remove the air horn valve.

Installation

1. Position the air horn valve.
2. Connect the control cable to the air horn valve.
3. Mount the valve on its brackets and secure it with the fasteners.
4. Connect the air hoses to the air horn valve.

CAUTION

CAUTION: Do not overtighten the air hose fittings. Hand-tighten the fittings 1/2-turn after tightening begins. Overtightening the fittings could cause the hoses to leak, to malfunction, and to affect the vehicle air system.

5. Install the overhead console. See **Section 60.13** for instruction.
6. Connect the batteries.
7. Remove the chocks from the tires. Start the engine, and refill the air supply.
8. Test the horn.

Overhead Console Removal and Installation, Century Class Conventional

Removal

1. Park the vehicle. Set the parking brake. Shut down the engine and chock the tires.
2. Drain the air supply, and disconnect the batteries.
3. Remove the curtains from the curtain rails.
4. Remove the Torq-head fasteners attaching the curtain rails to the underside of the overhead console. Then, remove the curtain rails.
5. Remove all items from the overhead console compartments.
6. Peel the door moldings from the inner door frames.
7. Remove the grab handle from the right A-pillar cover. Then, remove both A-pillar covers. Do so by pulling back on the pillar cover, which is held in place by three tabs.
8. Set aside the VORAD sensor device (if equipped) from the right A-pillar.
9. Remove the fasteners attaching the side front console panels above the driver and passenger seats. Remove the panels.
10. Remove the six fasteners holding the overhead console in place.
11. Remove the overhead console by pulling it out and then swinging it downward.
12. Disconnect the electrical wiring connectors.
13. Remove the overhead console from the vehicle.

Installation

1. Position and then slide the overhead console into place.
2. Connect the electrical wiring connectors.
3. Install the six fasteners that attach the console to the cab structure.
4. Attach the side front console panels.
5. Attach the VORAD sensor to the right A-pillar cover, if it was removed.
6. Install the A-pillar covers by snapping them into place.
7. Install the grab handle on the rightside A-pillar.
8. Attach the door moldings to the inner door frames.
9. Install both curtain rails.
10. Attach each curtain to the curtain rails.
11. Connect the batteries.
12. Remove the chocks from the tires.

Overhead Console Removal and Installation, Argosy COE

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Drain the air supply, and disconnect the batteries.
3. Remove the curtains from the curtain rails.
   - 3.1 Remove the stopper at the aft ends of the curtain rails.
   - 3.2 Remove the curtains by pulling them out of the aft rail end.
4. Remove the eight Torq-head fasteners attaching the curtain rails to the underside of the overhead console. Then, remove the curtain rails.
5. Remove all items from the overhead console compartments.
6. Peel the door moldings from the inner door frames.
7. Remove the grab handle from the right A-pillar cover. Then, remove both A-pillar covers. Do so by pulling back on the pillar covers, which are held in place by three tabs.
8. Set aside the VORAD sensor device (if equipped) from the right A-pillar.
9. Remove the fasteners attaching the side front console panels above the driver and passenger seats.

NOTE: There is a Torx-head fastener in the bottom of the top shelf of the overhead console.

10. Remove each panel.
11. Remove the six fasteners holding the overhead console in place.
12. Remove the overhead console by pulling it out and then swinging it downward.
13. Disconnect the electrical wiring connectors.
14. Remove the overhead console from the vehicle.

Installation

1. Position and then slide the overhead console into place.

NOTE: It may be necessary to attach the overhead console beam cover.

2. Connect the electrical wiring connectors.
3. Install the six fasteners that attach the console to the cab structure.
4. Attach the side front console panels.
5. Attach the VORAD sensor to the right A-pillar cover, if necessary.
6. Install the A-pillar covers by snapping them into place.
7. Install the grab handle on the rightside A-pillar cover.
8. Attach the door moldings to the inner door frames.
9. Install both curtain rails.
10. Slide each curtain onto the curtain rails.
11. Attach the curtain stopper at the aft end of each curtain rail.
12. Connect the batteries.
13. Remove the chocks from the tires.

Safety Precautions

CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cable, and any electronic control units or similar devices installed on the vehicle. Electric currents produced during electric welding can damage various electrical components on the vehicle, which could result in malfunction of the components.

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake, and chock the front and rear tires.
2. Tilt the hood.
3. Disconnect the batteries. Attach the welding ground strap as close to the work being done as safely possible.
4. Disconnect the following ECUs and other electronic devices:

ENGINE ELECTRONIC CONTROL UNIT (ECU)

The location of the engine ECU differs with the engine manufacturer. See **Fig. 1**, **Fig. 2**, **Fig. 3**, and **Fig. 4**.

INSTRUMENT CLUSTER UNIT (ICU)

The ICU includes the driver's instrument panel, the ICU housing, and the dash message center (all installed as one unit). To disconnect the ICU, see **Section 54.03** in this manual.

DATA LOGGING UNIT (DLU)

The DLU is one of several electronic modules mounted inside a compartment on the lefthand B-pillar, behind the driver's seat. See **Fig. 5**. The data logging unit is the top unit, and is mounted above the auxiliary power distribution module. Disconnect the electrical connector from the bottom of the unit.

AIR CONDITIONING PROTECTION UNIT (ACPU)

The ACPU connector is located near the bottom of the righthand side of the firewall in the engine compartment.

ANTILOCK BRAKE SYSTEM (ABS)

The ABS ECU is mounted in the B-pillar compartment. See **Fig. 5**.

AUXILIARY POWER DISTRIBUTION MODULE (APD)

The APD module is mounted in the B-pillar compartment. See **Fig. 5**.

VORAD SYSTEM

The ECU for the VORAD system is mounted in a small compartment on the righthand B-pillar, behind the driver's seat.

DAYTIME RUNNING LIGHTS

The ECU for the Daytime Running Lights is located in a small compartment on the righthand B-pillar, behind the driver's seat.

RADIO

Disconnect the electrical connection to the radio.

ALTERNATOR

Disconnect the ground strap, as previously mentioned, and this should serve to remove any chance for damage to the alternator.

WINDOW EXPRESS MODULE

The Window Express module is located beneath the driver's step threshold plate. Remove the plate to disconnect the module connection.

VEHICLE SECURITY SYSTEM

The vehicle's security system ECU is mounted in the righthand B-pillar compartment.

Safety Precautions

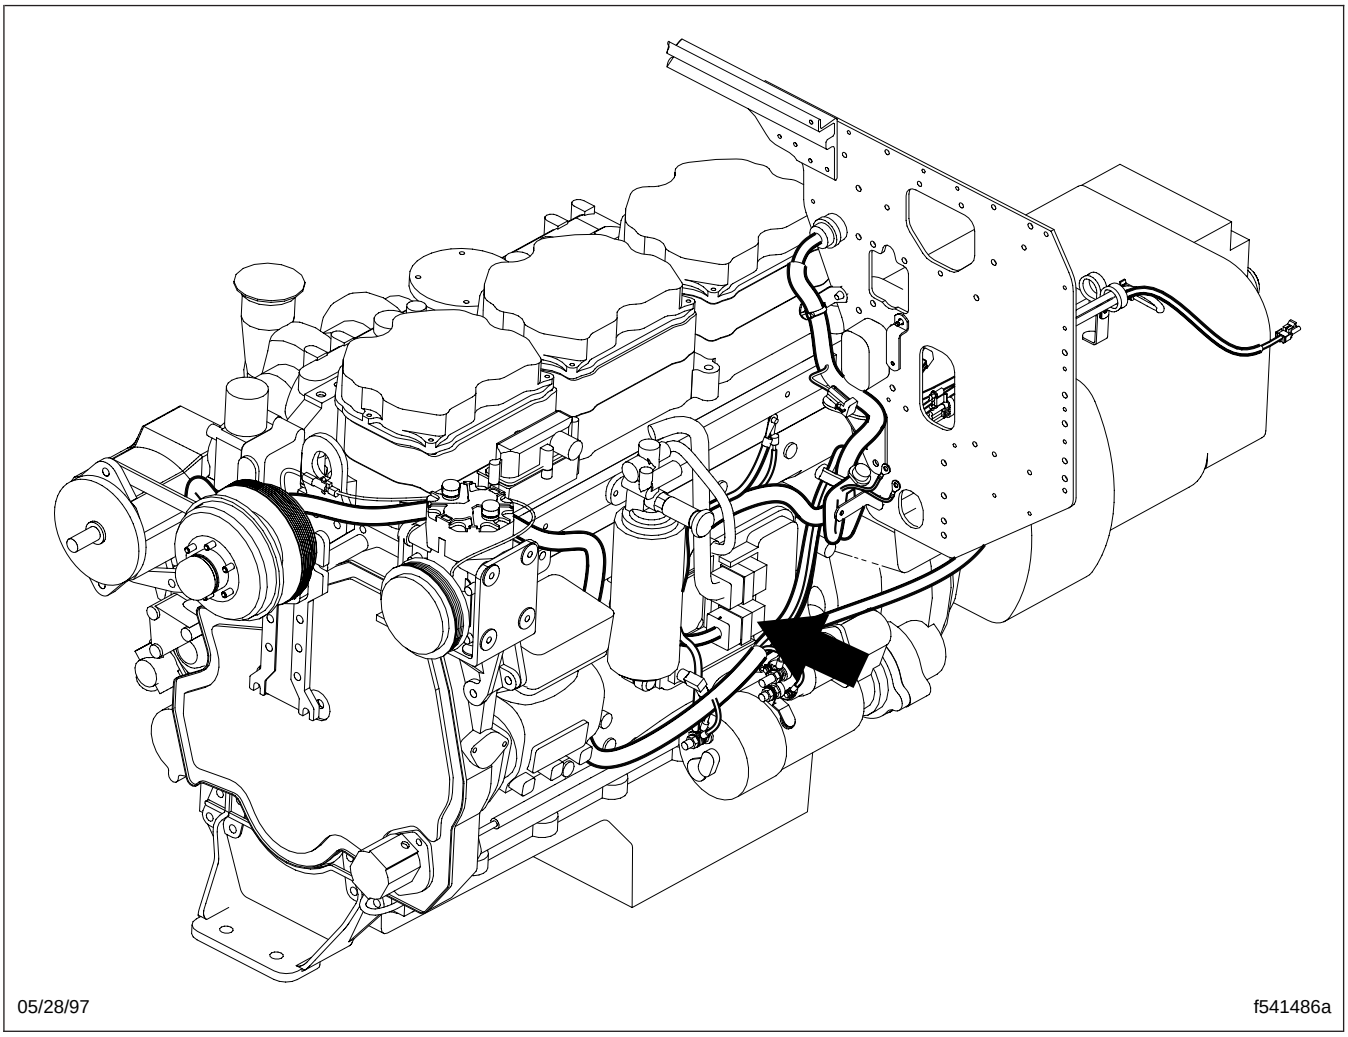


Fig. 1, Caterpillar C-10/C-12/3176 Engine ECU Location

SPACE SYSTEM

If the vehicle is so equipped, the SPACE system's ECU is disconnected by unplugging the wiring attached to the SPACE device mounted behind the operator's seat.

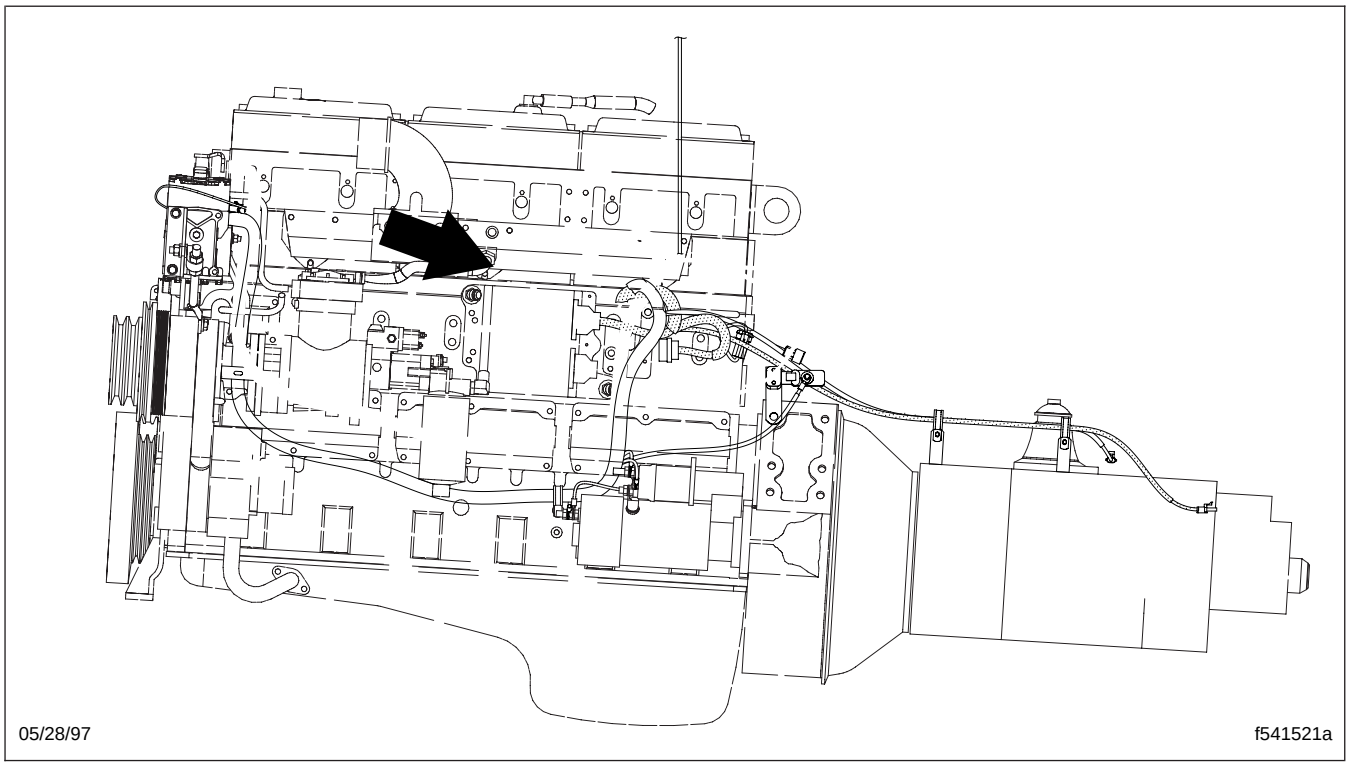

Fig. 2, Cummins N14 Engine ECU Location

Safety Precautions

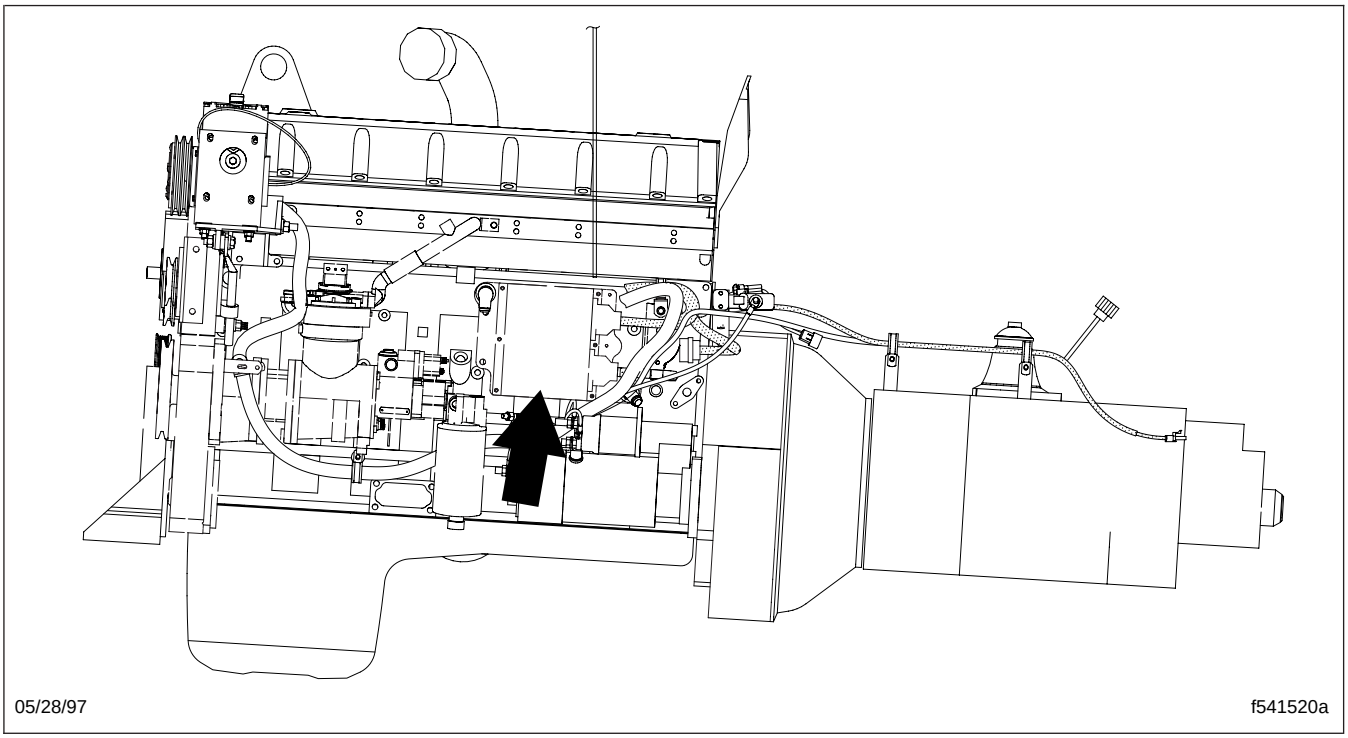

Fig. 3, Cummins M11 Engine ECU Location

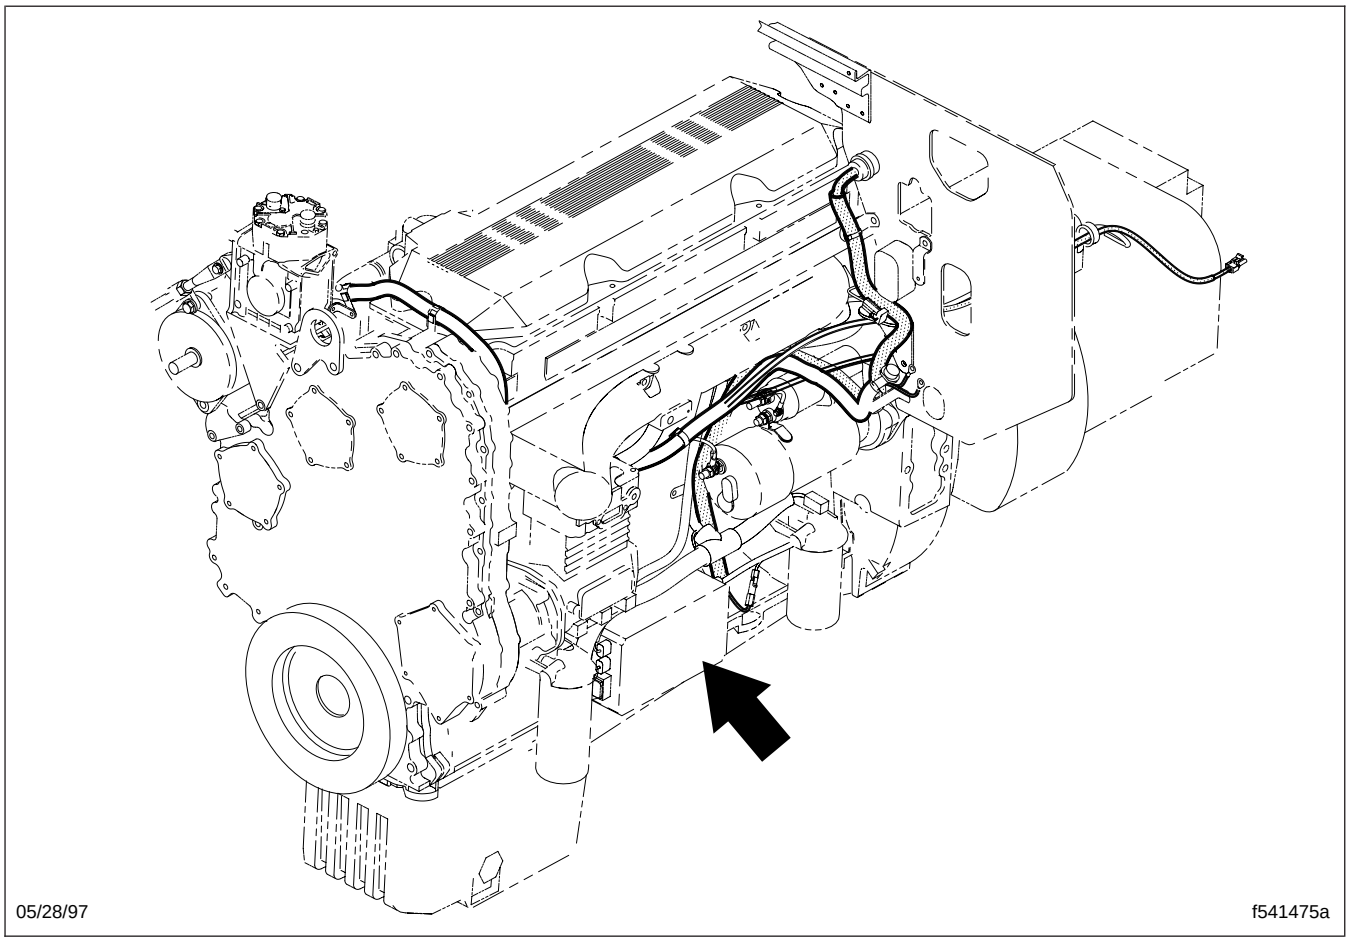

Fig. 4, Detroit Diesel Series 60 Engine ECU Location

Safety Precautions

2. Auxiliary Power Distribution Module
3. ABS ECU

Fig. 5, Lefthand B-Pillar Electrical Compartment

General Description

The Power-Packer® cab-tilt system has four major parts:

- a hydraulic pump consisting of a pump body, a reservoir, and a pump control lever
- two hydraulic tilt cylinders that raise and lower the cab
- a tilt safety stop on the right-side tilt cylinder, which must be used when working under a cab that has not been fully tilted
- two hydraulic cab latches

The optional electric/hydraulic system has the same major parts as the hydraulic-only system, but has an additional motor assembly attached to the tilt pump. See **Fig. 1**. The electric/hydraulic motor normally operates the tilt pump in place of the manual pump control lever. If for any reason the motor isn't working, the tilt pump can be operated with the manual pump lever.

The tilt cylinders are connected to the pump by flexible high-pressure lines. Velocity fuses are built into the tilt cylinder ports. They act as check valves to prevent the cab from free falling in case of hydraulic system damage, such as a ruptured line.

Principles of Operation

There are two hydraulic circuits in the Power-Packer system: the *push* circuit raises the cab from the lowered position to the desired tilt position, and the *pull* circuit brings the cab from a fully tilted position up and over center. See **Fig. 2**.

Placing the control lever in the "Tilt" position opens the *push* circuit in the hydraulic system. When the pump is operated, hydraulic pressure builds up in the tilt cylinders. If equipped with hydraulic cab latches, hydraulic pressure releases the latches. Then the tilt cylinder piston rods extend, raising the cab. When the cab goes over center, it falls at a controlled rate to the full-tilt position, automatically relieving hydraulic system pressure.

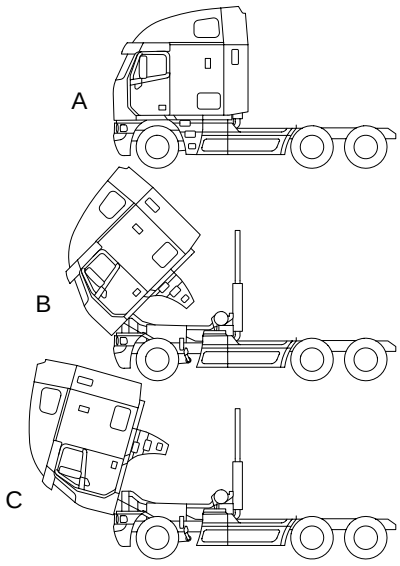
4. Sway Bar
5. Cab Air Spring
6. Hydraulic Line
7. Frame Rail
8. Tilt Cylinder
9. Tilt Safety Stop

Fig. 1, Cab-Tilt System (equipped with hydraulic cab latches and cab air suspension)

General Information



A. Upright or Operating Position
B. 45-Degree Tilted Position (balance position)
C. Full-Tilt Position

Fig. 2, Cab Positions

When the control lever is placed in the "Return" position, the *pull* circuit in the hydraulic system opens. When the pump is operated, hydraulic pressure forces the cab back up and over center. The cab then falls at a controlled rate until it settles onto the rear mounts.

NOTE: Whenever raising or lowering the cab, stop working the pump once the cab goes over center. The cab falls at a controlled rate and continued pumping could lock up the tilt cylinders. To slow the descent of the cab, reverse the lever.

Hydraulic Lockup

Hydraulic lockup can occur for the following reasons:

- very cold temperatures
- use of the wrong hydraulic fluid
- air in the system
- sudden cab movement
- a ruptured hydraulic line
- continued pumping after the cab goes over center
- tilt strut in locked position while lowering the cab

Any of the above situations will cause the velocity fuses to function as safety check valves, and lock up the tilt cylinders. To unlock the cylinders, the cab must be moved in the opposite direction of travel.

IMPORTANT: If the tilt cylinders lock up, check for a major problem (such as a ruptured line or leaking fitting) before trying to unlock the tilt cylinders. If such a problem is found, make any necessary repairs before unlocking the cylinder.

For example, if the cab is moving toward the full-tilt position when the lockup occurs, move the control lever to "Return," and work the pump a few strokes. This will unlock the cylinders. Move the control lever to "Tilt," and allow the cab to descend to a full-tilt position.

If the cab is moving toward the lowered (operating) position when the lockup occurs, move the control lever to "Tilt," and work the pump a few strokes. This will unlock the cylinders. Move the control lever to "Return," and allow the cab to descend to the operating position.

Tilting the Cab

⚠ WARNING

Before tilting the cab, make sure there is adequate clearance in front of the vehicle and that the area is free of people and objects.

Do not tilt the cab with the engine running. Tilting the cab could engage the transmission. If the engine is running, the vehicle could move, causing an accident that could result in personal injury or property damage.

The hydraulic tilt system is a cab-tilting, not a cab-holding device. Do not leave the vehicle unattended unless the cab is fully tilted or resting against the safety stop. Holding the cab in place with the hydraulic tilt system may result in personal injury or death and/or property damage.

NOTICE

Before tilting the cab, make sure the vehicle is parked on level ground, both side-to-side and front-to-rear. Tilting the cab while the vehicle is parked on unlevel ground (such as a sloping highway shoulder) may damage the cab mounts and prevent you from returning the cab to the operating position.

IMPORTANT: Before tilting or lowering the cab, read the warning label on the tilt pump and the tilt instructions label on the exhaust stack.

1. With the vehicle parked on a level surface, shut down the engine, apply the parking brake, and place the shift lever in the neutral position. Chock the tires.
2. Deploy the cab access stairs, if equipped.
3. Secure all loose articles in the cab and bunk, and make sure the doors are securely latched.

⚠ WARNING

Objects falling in the cab, or a door flying open, could damage the vehicle or cause personal injury.

4. On vehicles built from June 2011, fully open the grille (front access panel).

NOTICE

Make sure the grille is open before tilting the cab (vehicles built from June 2011). Leaving the grille closed while tilting the vehicle will cause damage to the vehicle.

IMPORTANT: Vehicles built February 2012 and later are equipped with a safety mechanism that prevents the tilt pump from operating when the grille is not open.

5. Activate the tilt system power switch on the dash.
6. Check the cab travel path for obstructions.
7. Move the pump control lever to the TILT position.
8. Stand clear of the cab travel path.
9. Using the electric motor control button or the pump handle (located in the baggage compartment), operate the tilt pump to disengage the hold-down latches.

IMPORTANT: Check the indicator pin on each cab latch. The latches have disengaged if the pins are out. See **Fig. 1**.

If air is present in the hydraulic tilt system, pump operation will seem "spongy" or ineffective. If this happens, bleed the air from the system. For instructions, see **Subject 100**.

If the cab stops moving while it is being raised, do not force it to move with the tilt pump. The velocity fuses have locked up the tilt cylinder. To unlock them, see **Subject 050**.

⚠ DANGER

Make sure the safety stop is engaged on the right tilt cylinder rod. If the safety stop isn't engaged, and the cab should drop, the result could be serious injury or death.

10. When the cab reaches a 30 degree angle, stop working the pump. Engage the safety stop on the right tilt cylinder rod. See **Fig. 2**. The safety stop prevents the cab from accidently dropping below this position.
11. To tilt the cab all the way, continue working the pump until the cab nears a 45 degree angle (the balance point). Reduce pumping speed. Once

Cab Tilting

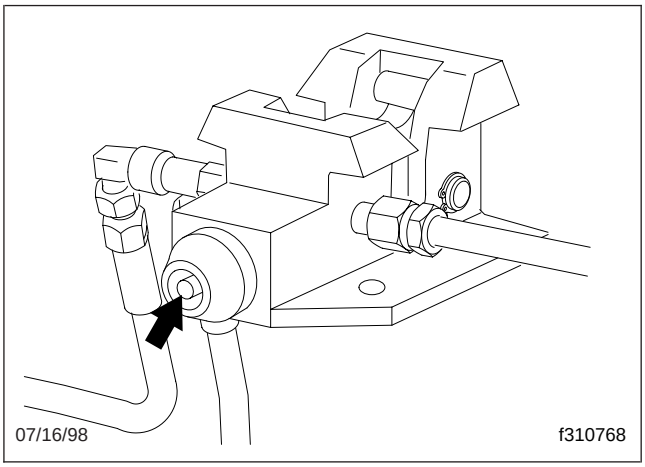


Fig. 1, Cab Latch Indicator Pin

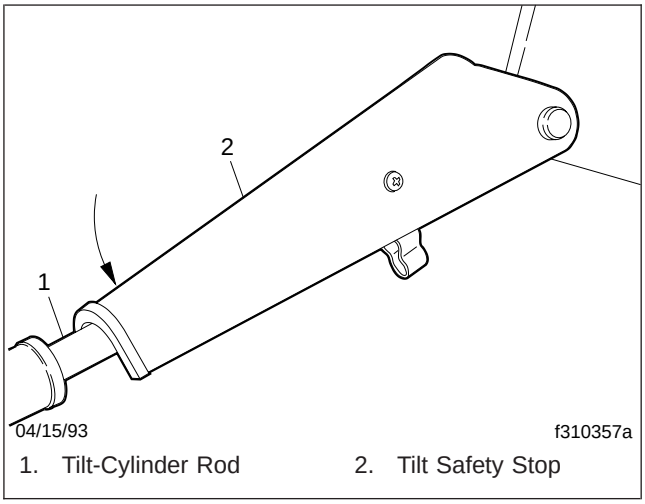

Fig. 2, Engaging the Tilt Safety Stop

the cab goes beyond 45 degrees, stop working the pump. The cab will gently descend to a full-tilt position. To slow cab descent, reverse the tilt pump lever after the cab passes the balance point.

IMPORTANT: If the cab stops after it has gone beyond 45 degrees, do not force it down with the tilt pump. The velocity fuses have locked the tilt cylinders. To unlock them, see **Subject 050**.

Returning the Cab From a Tilted Position

⚠ DANGER

Stay completely clear of the cab's travel path at all times. Once the tilt safety stop has been released, do not lean over the frame rails, the engine, or the transmission for any reason. To do so could result in serious injury or death.

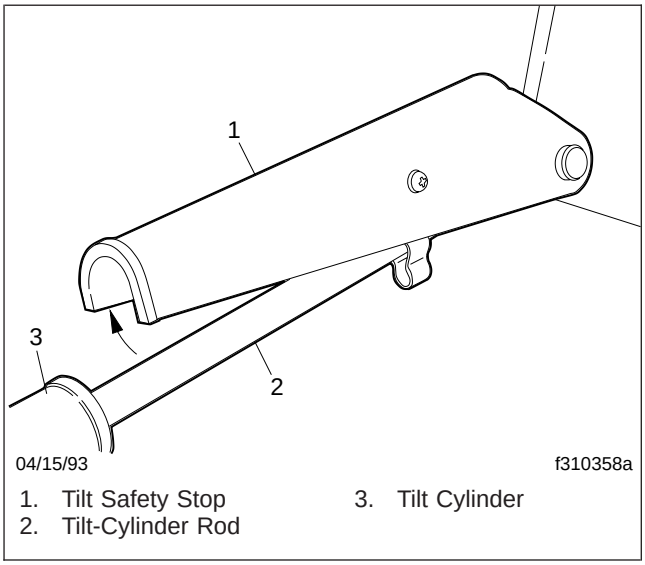
1. Secure all loose articles in the cab and bunk, and make sure the doors are securely latched.
2. Make sure the parking brakes are applied.
3. Move the pump lever to the RETURN position.
4. Make sure the tilt system power switch on the dash is activated.
5. Check the cab travel path for obstructions.
6. From full tilt, operate the cab tilt pump until the cab reaches the balance point. From that point, the cab will continue to lower.

NOTE: To slow the cab descent, reverse the tilt pump lever after the cab passes the balance point.

7. Allow the cab to lower to the safety stop.
8. Move the safety stop away from the right tilt cylinder rod (you may need to raise the cab slightly). See **Fig. 3**.
9. Lower the cab to the operating position and make sure the cab latches engage.

IMPORTANT: If the cab stops after it has gone beyond 45 degrees, don't force it down with the tilt pump. The safety stop is in the locked position or the velocity fuses have locked the tilt cylinders. Release the safety stop or, to unlock the fuses, see **Subject 050**.

10. Leave the pump lever in the RETURN position.
11. Switch off the tilt system dash switch.
12. Push the transmission shift lever forward to lock the shift tube latch mechanism.
13. Check the indicator pin on each cab latch. The latches are locked when the pins have moved back into the piston and cylinder spring assembly.



1. Tilt Safety Stop
2. Tilt-Cylinder Rod
3. Tilt Cylinder

Fig. 3, Releasing the Tilt Safety Stop

NOTE: Maintain the hydraulic fluid level at the oil fill plug. Add fluid only when the cab is in the operating position. Use only Freightliner-approved hydraulic fluid, as indicated in **Specifications 400**.

14. If applicable, close the grille.

Bleeding the System

A "spongy" feeling (cylinders do not move when the pump handle is operated) indicates air in the cab-tilt system. Use the following procedures to remove the air from the cab-tilt system.

IMPORTANT: With the exception of bleeding the *pull* port fittings on the tilt cylinders, and the hydraulic cab latches, never bleed any part of the system while the cab is tilted.

BLEEDING THE TILT CYLINDERS

DANGER

Before doing the work below, review the cab tilting information under Subject 060. Failure to read the warnings and to be aware of the dangers of tilting and returning the cab could result in serious injury or death.

1. With the cab completely returned and the tilt cylinders retracted, loosen the *push* port fitting on each tilt cylinder. Do not disconnect the hose from the fitting. Place the control lever in the "Tilt" position, and operate the tilt pump until a bubble-free stream of hydraulic fluid flows from the *push* ports on the tilt cylinders.
2. Tighten the *push* port fitting on each tilt cylinder.
3. Fill the tilt pump reservoir until hydraulic fluid appears in the fill port. Install and tighten the fill plug. Refer to **Specifications, 400** for the specified hydraulic fluid. Do not use engine oil, brake fluid, or automatic transmission fluid.
4. Tilt the cab to the full-tilt position. See **Subject 060** for cab tilting instructions.
5. Loosen the *pull* port fitting on each tilt cylinder. Place the control lever in the "Return" position, and operate the tilt pump until a bubble-free stream of hydraulic fluid flows from the *pull* port fitting on each cylinder.
6. Tighten the *pull* port fitting on each tilt cylinder.

DANGER

Stay completely clear of the cab's travel path at all times. Once the tilt safety stop has been released, do not lean over the frame rails, the engine, or the transmission for any reason. To do so could result in serious injury or death.

7. Return the cab to the operating position. For instructions, refer to **Subject 060**.
8. Fill the tilt pump reservoir until hydraulic fluid appears in the fill port. Install and tighten the fill plug. Refer to **Specifications, 400** for the specified hydraulic fluid. Do not use engine oil, brake fluid, or automatic transmission fluid.
9. Tilt the cab fully and return it to the lowered position. See **Subject 060** for instructions. Fill the tilt pump reservoir until hydraulic fluid appears in the fill port. Use only specified hydraulic fluid. Install and tighten the fill plug.

BLEEDING THE HYDRAULIC CAB LATCHES

DANGER

Before doing the work below, review the cab tilting information under Subject 060. Failure to read the warnings and to be aware of the dangers of tilting and lowering the cab could result in serious injury or death.

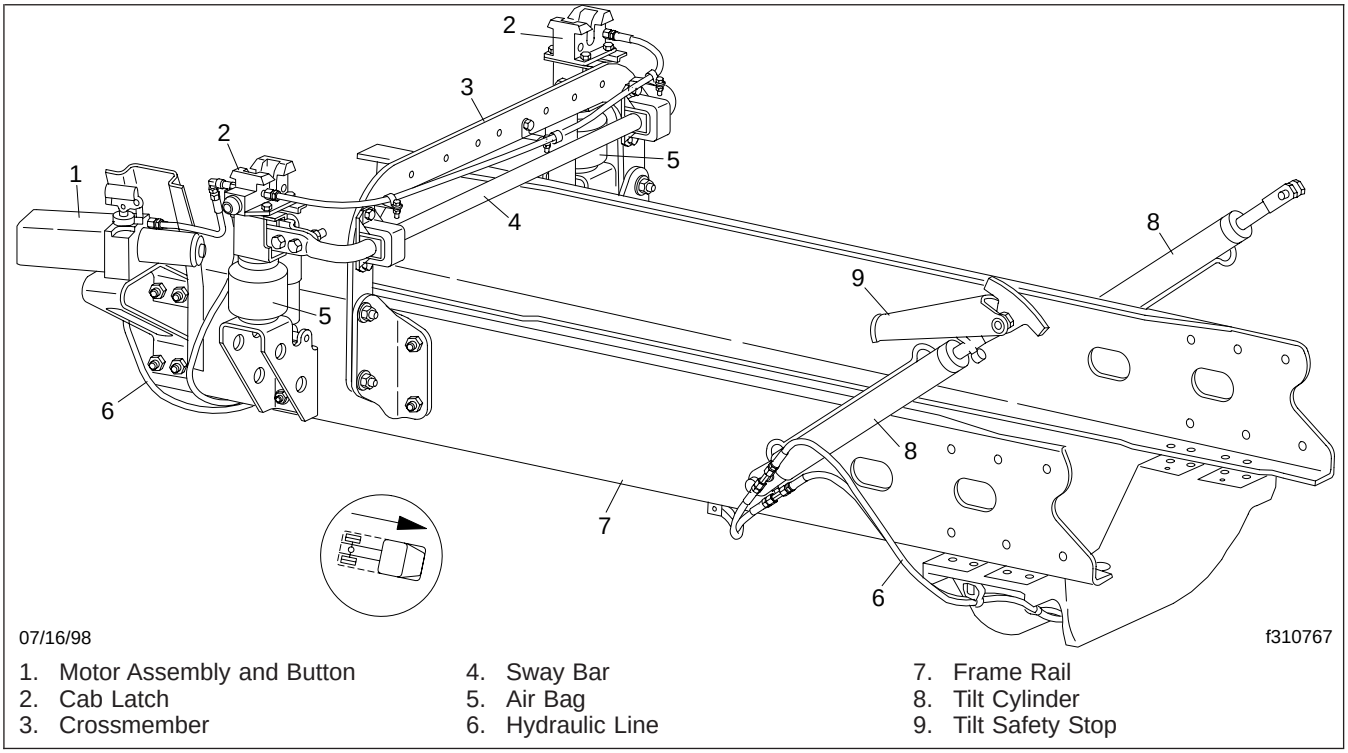
Since the hydraulic cab latches are mounted higher in the system than the tilt pump, air going to them will not discharge to the reservoir. See **Fig. 1**.

1. Tilt the cab to the full-tilt position. See **Subject 060** for cab tilting instructions.
2. Push the free end of the tilt safety stop down onto the rod of the right tilt cylinder.
3. Put the pump control lever into the "Return" position. Operate the tilt pump until the cab goes over-center. Let the cab settle onto the tilt safety stop.
4. Loosen the hydraulic fitting on the right cab latch.
5. Put the pump control lever in the "Tilt" position; then operate the tilt pump (using either the air motor or the pump lever) until a bubble-free stream of fluid flows from the fitting. Pump until

Bleeding the System

about 2 fl oz (60 mL) of fluid flows from the fitting to ensure the entire line is free of air.

6. Tighten the cab latch fitting.
7. Put the pump lever in the "Return" position.
8. Loosen the fitting on the left cab latch.
9. Put the pump control lever in the "Tilt" position; then operate the tilt pump (using either the air motor or the pump lever) until a bubble-free stream of fluid flows from the fitting. Pump until about 2 fl oz (60 mL) of fluid flows from the fitting to ensure the entire line is free of air.
10. Tighten the cab latch fitting.
11. With the pump control lever still in the "Tilt" position, operate the tilt pump just enough to take the weight off the tilt safety stop; then release the tilt safety stop, and lock it in the spring catch.
12. Return the cab. For instructions, refer to **Subject 060**.



1. Motor Assembly and Button
2. Cab Latch
3. Crossmember
4. Sway Bar
5. Air Bag
6. Hydraulic Line
7. Frame Rail
8. Tilt Cylinder
9. Tilt Safety Stop

Fig. 1, Cab Tilt System (equipped with hydraulic cab latches and cab air suspension)

13. Fill the tilt pump until hydraulic fluid appears in the fill port. See **Specifications 400** for specified hydraulic fluid. Don't use engine oil, brake fluid, or automatic transmission fluid.
14. Install the fill plug and tighten it firmly.

Tilt Cylinder Removal and Installation

Removal

NOTE: Remove the tilt cylinder assemblies from the vehicle only when the cab is in the lowered (operating) position.

1. Release the hydraulic pressure by alternately moving the control lever on the tilt pump to the "Tilt" and "Return" positions. Hold the control lever in each position for a few seconds. Return the control lever to the "Return" position before proceeding.
2. Disconnect the hydraulic lines from both tilt cylinders. Cover the ends of the lines to prevent dirt from entering the system.

If the hydraulic fluid is discolored, drain the cab-tilt system by placing a container under the tilt pump reservoir, then removing it. Install the reservoir; then add new, approved fluid. See **Specifications 400** for approved fluids.

3. Disconnect the right tilt cylinder at the clevis end by removing the cotter pin (**Fig. 1**, Ref. 5), and the clevis pin (Ref. 6).
4. Remove the tilt safety stop by removing the locknut (Ref. 3) and the machine screw (Ref. 1), then the tilt safety stop spring (Ref. 4).

   If the tilt-safety stop spring is installed with rivets and a retainer, squeeze the legs of the tilt-safety stop spring together; then remove the rivets from each side of the tilt safety stop. Remove the tilt safety stop spring and the tilt safety stop. Discard the rivets, and the retainer that is inside the tilt safety stop.
5. Loosen and remove the 5/8–11 bolt (Ref. 8) that holds the lower end of the tilt cylinder to the end spacer (Ref. 12) on the right-side frame rail.
6. Remove the right tilt cylinder from the vehicle.
7. Repeat the procedure for the left tilt cylinder.

NOTE: There is no tilt safety stop on the left tilt cylinder.

Installation

1. Install the right tilt cylinder assembly on the vehicle (see **Fig. 1**):

   1.1 Place the tilt safety stop (Ref. 2) over the clevis of the tilt cylinder, making sure the holes in both parts are aligned.

   1.2 Place the tilt cylinder clevis and tilt safety stop on the mounting flange of the cab, and insert the clevis pin through the aligned holes of all three parts.

   1.3 Place the washer over the end of the clevis pin, and install the cotter pin into the clevis pin hole. Lock the cotter pin.

   1.4 Install the tilt-safety stop spring (**Fig. 1**, Ref. 4).

   Place the tilt-safety stop spring (**Fig. 1**, Ref. 4) over the piston rod; then install it onto the tilt safety stop, using the machine screw and nylon locknut (Refs. 1 and 3).

   NOTE: If the tilt-safety stop spring was installed with rivets, replace them with two 10–24 machine screws (3/4-inch long) and nylon locknuts.

   1.5 Line up the mounting hole at the bottom end of the tilt cylinder with that on the right-side end spacer. See **Fig. 1**.

   1.6 Coat the outside of the mounting bushing (Ref. 10) with Never-Seez®; then install the 5/8–11 bolt and nut, and mounting bushing as shown in **Fig. 1**.

   1.7 Tighten the 5/8–11 bolt 135 lbf·ft (183 N·m).

   1.8 Check the end spacer mounting bolt (Ref. 16) for tightness, and tighten it 95 lbf·ft (129 N·m) if necessary.
2. Repeat the procedure for the left tilt cylinder. Note that there is no tilt safety stop on the left tilt cylinder.
3. Connect the hydraulic lines to the cylinder port fittings, but do not tighten them.
4. Bleed the hydraulic system as described in **Subject 100**.

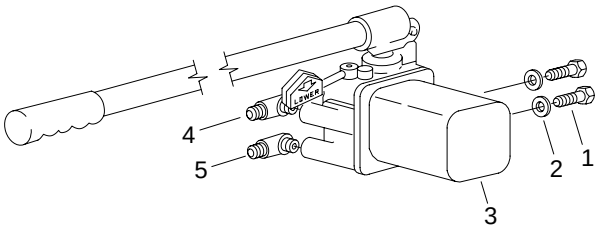
9. 5/8" Hardened Washer
10. Mounting Bushing
11. 5/8" Washer
12. End Spacer (2 qty.)
13. 5/8–11 Nut (2 qty.)
14. 1/2–13 Nut (2 qty.)
15. 1/2" Hardened Washer (4 qty.)
16. 1/2–13 Bolt (2 qty.)
17. Tilt Cycliner

Fig. 1, Tilt Cylinder Assembly, Exploded View

Removal

1. Release the hydraulic pressure in the lines and tilt cylinders by alternately moving the pump control lever to the "Tilt" and "Return" positions. Hold the control lever in each position for a few seconds. Return the control lever to the "Return" position.
2. On electric systems, disconnect the electrical connections, the two terminals at the bottom of the button assembly and the main electrical connector to the pump motor.
3. On air/hydraulic systems, drain the air tanks; then disconnect the air supply line from the air motor. Leave the air motor assembly attached to the tilt pump.
4. Mark the hydraulic lines and disconnect them at the *push* and *pull* ports on the tilt pump assembly. Place a container under the ends of the disconnected lines to catch any fluid remaining in them.
5. Cover the ends of the hydraulic lines to prevent the entry of dirt into the system.
6. Remove the two tilt pump mounting capscrews and washers. See **Fig. 1**.



06/30/97 f310035a

1. 3/8" Capscrew (2 qty.)
2. 3/8" Washer (2 qty.)
3. Tilt Pump Assembly
4. Push Port Fitting
5. Pull Port Fitting

Fig. 1, Hydraulic-Only System Shown

7. Remove the tilt pump assembly from the vehicle.

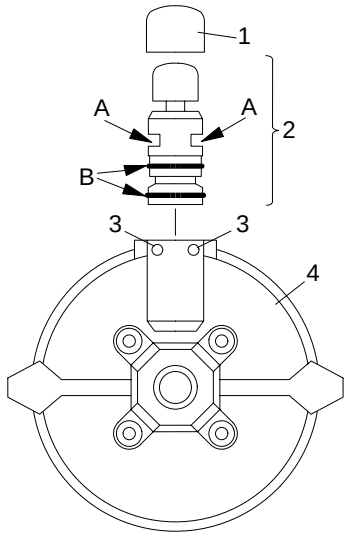
Installation

1. Using the two mounting capscrews and washers, install the assembled tilt pump on the vehicle. See **Fig. 1**, Refs. 2 and 3. Tighten the capscrews 23 lbf·ft (31 N·m).
2. Connect the hydraulic lines to the *push* and *pull* ports on the tilt pump assembly. Do not tighten the lines on the fittings until the system has been bled.
3. On electric systems, connect the electrical connections, the two terminals at the bottom of the button assembly and the main electrical connector to the pump motor.
4. On air/hydraulic systems, connect the air supply lines and fill the system with air.
5. Fill the reservoir with the specified hydraulic fluid, and install and tighten the fill plug. See **Specifications 400** for the specified hydraulic fluid. Do not use engine oil, brake fluid, or automatic transmission fluid.
6. Bleed the entire system. Refer to **Subject 100**. Tighten the hydraulic lines firmly.

Replacement

If the air button is sticking, and affecting the operation of the air motor, replace the air button assembly using this procedure.

1. Drain the air tanks.
2. Disconnect the air supply line from the air motor.
3. Remove the old air button assembly.
   - 3.1 Remove the rubber boot from the air button.
   - 3.2 Using a suitable punch, drive out the two roll pins holding the air button in place. See **Fig. 1.**



06/09/93 f310126

A. Roll pins fit into these grooves.
B. Lubricate these O-rings.
1. Rubber Boot
2. Air Button Assembly
3. Roll Pins
4. Air Motor Assembly

Fig. 1, Air Button Assembly

   - 3.3 Using a twisting motion, pull the old air button assembly out of the air motor housing.
4. Clean out the cavity in the air motor housing.
5. Install the new air button assembly.
   - 5.1 Using clean motor oil or Lubri-Plate®, lubricate the O-rings on the new air button assembly. See **Fig. 1**.
   - 5.2 Using a slight twisting motion, push the new air button assembly into the air motor housing. If it doesn't go in correctly, remove it and lubricate the O-rings again.
   - 5.3 Turn the air button assembly so that the grooves in it are lined up with the holes for the roll pins. See **Fig. 1**.
   - 5.4 Install the roll pins. Make sure they are flush with the air motor housing.
   - 5.5 Install a new rubber boot over the button.
6. Connect the air supply line to the air motor assembly.
7. Build up the system air pressure; then check for air leaks around the button and the supply line.
8. Test the operation of the new air button.

   If there are still problems with the operation of the air motor, replace the entire air motor assembly, following the instructions in **Subject 140**.

Replacement

⚠ DANGER

Before doing the work below, review the cab tilting information under Subject 060. Failure to read the warnings and to be aware of the dangers of tilting and lowering the cab could result in serious injury or death.

⚠ CAUTION

Drain the air tanks before removing the air motor. Failure to do so could result in damage to the vehicle or the tilt system parts.

NOTE: The air motor can be removed from the hydraulic tilt pump without removing the tilt pump from the vehicle.

1. Tilt the cab. Refer to **Subject 060** for instructions.
2. Drain the air tanks.

⚠ WARNING

Hold the air motor housing firmly while you are removing it from the tilt pump. The spring inside the air motor could eject the air motor housing and other parts from the tilt pump, which could cause personal injury or parts damage.

3. Remove the air motor from the tilt pump. See **Fig. 1**.
   - 3.1 Remove the retaining clip (Ref. 2) from the air inlet assembly (Ref. 1). It isn't necessary to disconnect the air line from the air inlet assembly.
   - 3.2 While holding the air motor housing (Ref. 3) firmly, loosen the mounting clamp (Ref. 9 or 11) holding the air motor to the tilt pump.
   - 3.3 Slowly and carefully remove the air motor from the tilt pump. Hold on to the piston, spring, spool, and washer (Refs. 5, 7, 6, and 8), and save them for the installation of the new air body.
4. Check the piston, spring, spool, and washer. If they're not damaged or worn, use them on the new air motor; otherwise, replace them.
5. Remove the rubber boot from the air button (Ref. 4). If the boot isn't damaged, use it on the new air motor; otherwise, replace it.
6. Clean all the parts.
7. Install the new air motor onto the tilt pump.
   - 7.1 Install the rubber boot on the air button.
   - 7.2 Place the piston, spool, spring, and washer inside the new air motor housing, as shown in **Fig. 1**.
   - 7.3 Align the new air motor with the tilt pump, then push it in place.
   - 7.4 While holding the air motor in place, install and tighten the mounting clamp. Make sure the clamp is securely tightened before you let go of the air motor.
   - 7.5 Push the air inlet assembly onto the end of the air motor; then install the retaining clip.
8. Start the engine to build the air pressure.
9. When the air pressure is 120 psi (827 kPa), test the air motor by lowering the cab to the operating position. Refer to **Subject 060** for complete instructions on lowering the cab.

Troubleshooting Tables

Problem—Cab Fails to Tilt or Fails to Return from Tilt When Using Manual Pump Lever, but Hydraulic Pressure Builds In System

Problem—Cab Fails to Tilt or Fails to Return from Tilt When Using Manual Pump Lever, but Hydraulic Pressure Builds In System	
Possible Cause	**Remedy**
Cab latch binding or failing to unlatch.	Check the cab latch release mechanism (either mechanical or hydraulic latches).
Plugged orifice at the bottom of the spool in the tilt pump.	Replace or rebuild the tilt pump.
Control lever in the wrong position.	Put the control lever in the correct position.
Worn seals or O-rings in the tilt pump.	Replace or rebuild the tilt pump.
Hoses blocked.	Replace the hoses.
Push and *pull* lines crossed.	Check for correct installation.
Internal leak in tilt pump.	Repair or replace the tilt pump.
Internal leak in tilt cylinder.	Repair or replace the tilt cylinder.
External leak.	Repair or replace the leaking part.
Air in hydraulic system.	Bleed the hydraulic system.

Problem—Cab Fails to Tilt or Fails to Return from Tilt When Using Electric or Air/Hydraulic Motor, but System Works When Using Manual Pump Lever

Problem—Cab Fails to Tilt or Fails to Return from Tilt When Using Electric or Air/Hydraulic Motor, but System Works When Using Manual Pump Lever	
Possible Cause	**Remedy**
The grille (front access panel) is closed.	Open the grille.
Insufficient air supply to motor.	Build air system pressure, or repair/replace air or electric system parts as needed.
The motor is not working.	Repair or replace the motor.
The button assembly is not working.	Replace the air button assembly.

Problem—Cab Stops Moving When in Controlled Fall

Problem—Cab Stops Moving When in Controlled Fall	
Possible Cause	**Remedy**
Velocity fuses locked up.	Reverse the pump direction with the control lever, and operate the pump to unlock.
Plugged orifice.	Inspect, and clean or replace.
Tilt strut left engaged.	Disengage the tilt strut.

Troubleshooting

Problem—Cylinder Velocity Fuses Are Locked Up

Problem—Cylinder Velocity Fuses Are Locked Up	
Possible Cause	**Remedy**
Controlled fall rate is too fast.	Inspect the orifice in bottom of spool valve; replace or rebuild the tilt pump, if needed.
Air in the system.	Bleed the system.
Ruptured hydraulic line.	Replace the hydraulic line.

Problem—Hydraulic Fluid Leaking at Hand Pump Plunger or Around Spool Valve

Problem—Hydraulic Fluid Leaking at Hand Pump Plunger or Around Spool Valve	
Possible Cause	**Remedy**
Worn seals and O-rings.	Replace or rebuild the tilt pump.

Problem—Hydraulic Fluid Leaking at Air Motor Exhaust, and/or Between Air Motor and Tilt Pump

Problem—Hydraulic Fluid Leaking at Air Motor Exhaust, and/or Between Air Motor and Tilt Pump	
Possible Cause	**Remedy**
Seals between air motor and tilt pump leaking.	Replace the tilt pump, and the air motor plunger, spring and spool, if needed.

Problem—Hydraulic Fluid Leak at the Tilt-Cylinder Gland

Problem—Hydraulic Fluid Leak at the Tilt-Cylinder Gland	
Possible Cause	**Remedy**
Worn seal on the gland.	Replace or rebuild the tilt cylinder.

Problem—Tilt Pump Leaks Between the Pump Base and the Reservoir

Problem—Tilt Pump Leaks Between the Pump Base and the Reservoir	
Possible Cause	**Remedy**
Worn O-ring on the reservoir.	Replace the O-ring on the reservoir.
O-ring on the reservoir pinched.	Replace the O-ring, making sure it is properly positioned.

Problem—Cab Drifts When in the Half-Raised Position

Problem—Cab Drifts When in the Half-Raised Position	
Possible Cause	**Remedy**
Worn spool valve seals.	Replace the spool valve seals or rebuild the tilt pump.
Worn piston seals inside the tilt cylinders.	Replace the piston seals or rebuild the tilt cylinders.
Control lever not all the way in the correct position.	Place the control lever in the correct position.

Specifications

Torque Values				
Description	Size	Grade	Torque	
			lbf·in (N·cm)	lbf·ft (N·m)

* The following vendor lubricants are approved: Texaco 1537 Aircraft Hydraulic Oil 15; Union Arctic Low Pour (-65) Hydraulic Fluid 04617; Filmite 530 Hydraulic Oil

Table 2, Hydraulic Fluid Types

CAUTION

When directed to open the front-wall access panel in the procedures below, stand away from the panel when opening it. The access panel can open quickly and could hit a person, possibly resulting in personal injury.

Removal

NOTE: Argosy front fascia components are often mounted such that removal of one component is needed to permit removal of another; see **Fig. 1**.

Before performing these procedures, apply the parking brakes and chock the tires.

A-Pillar Interior and Exterior Covers

1. Remove the A-pillar interior cover by loosening the door seal, then pulling free the molded plastic panel.
2. Remove the A-pillar exterior cover, as follows.
   - 2.1 Inside the cab, remove the three nuts in the access holes through the A-pillar structure. Be careful not to drop the nuts inside the A-pillar during removal.
   - 2.2 Remove the capscrew from the top of the upper door frame.
   - 2.3 Remove the wiper arm, if necessary, then remove the capscrew that attaches the exterior cover to the cab near the wiper arm.
   - 2.4 Remove the exterior cover.

Cowl Side Panels

1. Open the front-wall access panel.
2. Remove the six fasteners that attach each cowl side panel to the cab.

Lower Grille Panel

Remove the lower grille panel by removing the six fasteners that attach it to the cab.

Headlight Fascias

1. With the front-wall access panel open, disconnect the electrical connections to the headlights and parking lights.
2. Remove the five fasteners that attach the headlight fascia to the cab.

Front-Wall Access Panel

1. Open the front-wall access panel.

WARNING

Support the front-wall access panel when disconnecting the gas struts. The front-wall access panel is supported by the gas struts and disconnecting them may cause the panel to swing downward, which could result in the panel hitting a person, possibly resulting in serious injury.

2. Disconnect the gas struts at the lower connection points.
3. Remove the roll pins from the panel hinges.
4. Remove the front-wall access panel.

Wiper/Handle Panel

1. Remove the wiper arms.
2. Disconnect the fluid hoses behind the wiper/handle panel.
3. Remove the hinge handles.
4. Remove the A-pillar exterior cover fasteners.
5. Remove the wiper/handle panel.

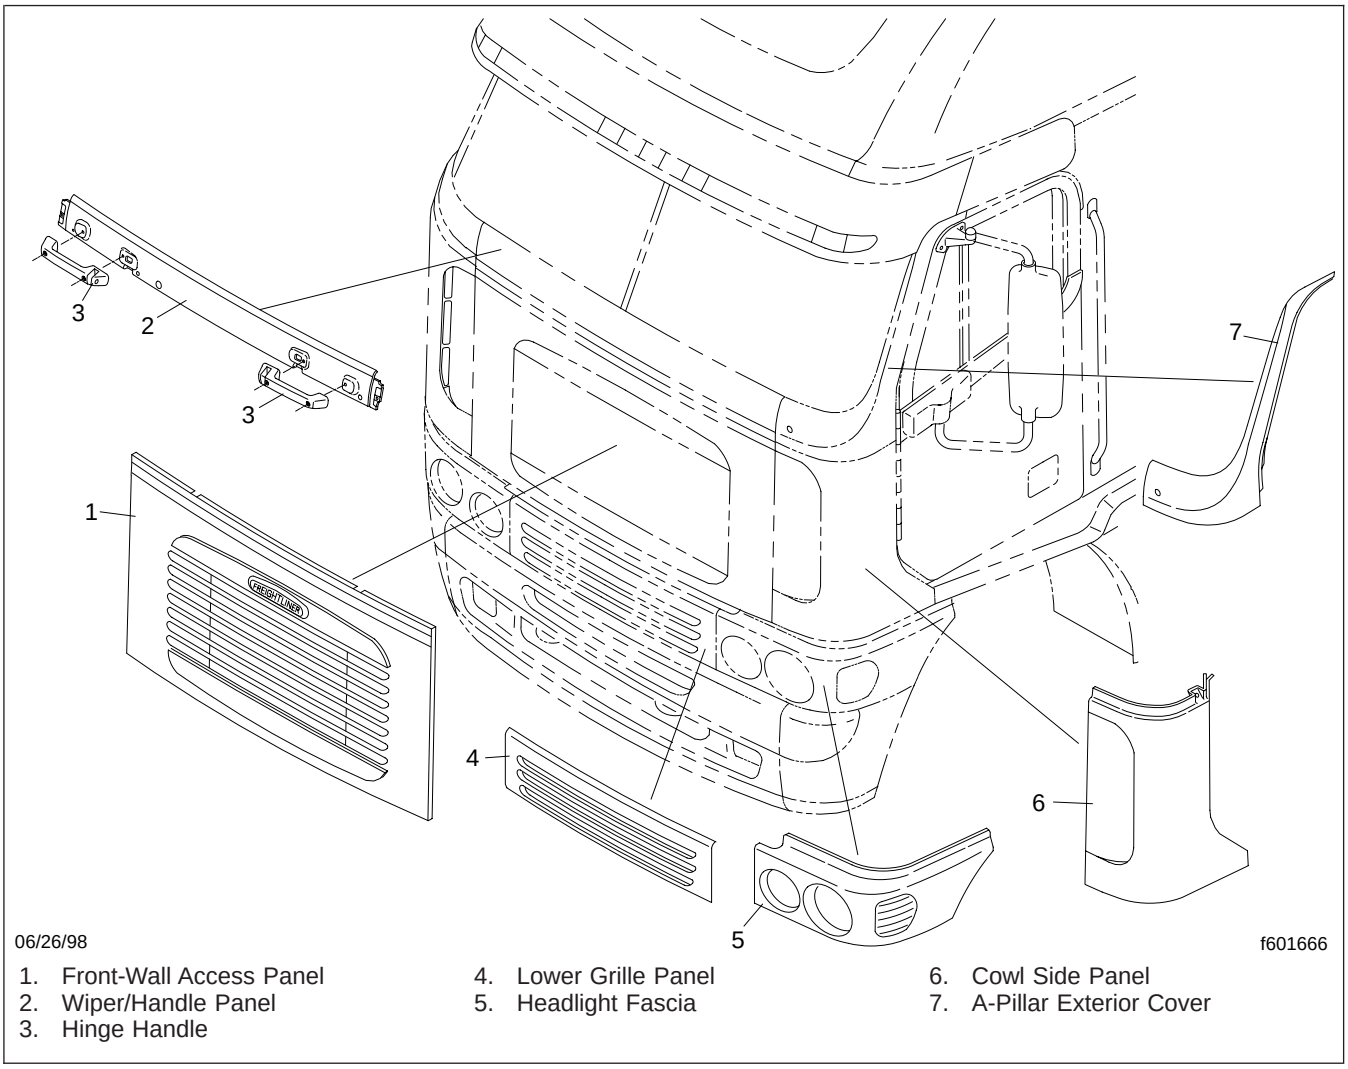
Installation

Make sure that the vehicle tires are chocked while performing the procedures described below.

Wiper/Handle Panel

1. Install the wiper/handle panel.
2. Install the A-pillar exterior cover fasteners.
3. Install the hinge handles.
4. Connect the fluid hoses behind the wiper/handle panel.
5. Attach the wiper arms.

Fascia Panels Removal and Installation



1. Front-Wall Access Panel
2. Wiper/Handle Panel
3. Hinge Handle
4. Lower Grille Panel
5. Headlight Fascia
6. Cowl Side Panel
7. A-Pillar Exterior Cover

Fig. 1, Front Fascia Assembly, Argosy COE

Front-Wall Access Panel

⚠ WARNING

Support the front-wall access panel during installation. The front-wall access panel is large and heavy; lifting it over your head could cause it to become unsteady, and hit a person or knock a person down, possibly resulting in serious injury.

1. Position the front-wall access panel in place.
2. Install the roll pins in the panel hinges.
3. Connect the gas struts at the lower connection points.
4. Close the front-wall access panel.

Headlight Fascias

1. With the front-wall access panel open, attach the headlight fascia on the cab with five fasteners.
2. Connect the electrical connections to the headlights and parking lights.

Lower Grille Panel

Position the lower grille panel, then install it using the six fasteners.

Cowl Side Panels

With the front-wall access panel open, attach each cowl side panel to the cab.

A-Pillar Interior and Exterior Covers

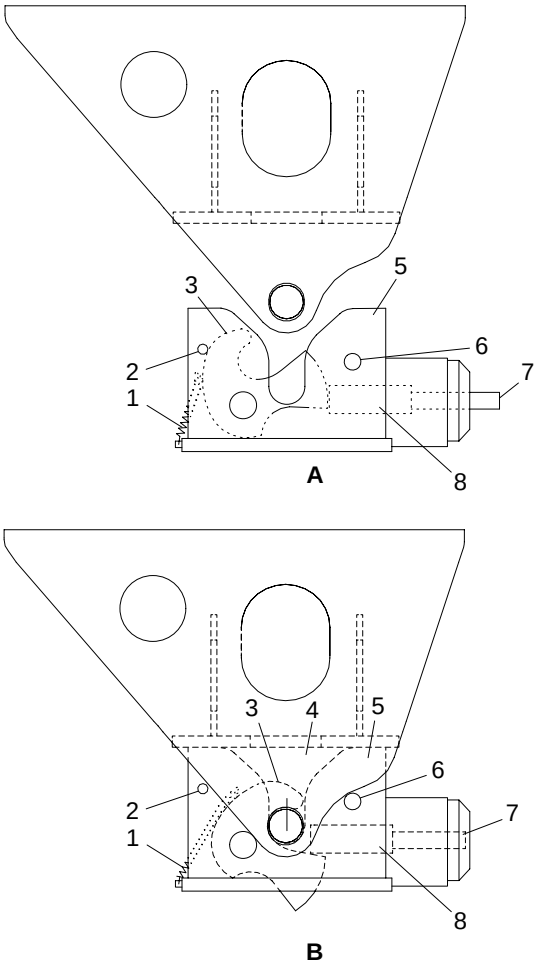
1. Install the A-pillar exterior cover, as follows.
    1.1 Position the exterior cover in place.
    1.2 Install the capscrew that attaches the exterior cover to the cab near the wiper arm. Then install the wiper arm.
    1.3 Install the capscrew that attaches the exterior cover to the top of the upper door frame.
    1.4 Inside the cab, attach the three nuts in the access holes, to secure the exterior cover to the A-pillar structure.
2. Install the A-pillar interior cover.
3. Install the door seal.

General Information

A hydraulic cab latch assembly (**Fig. 1**) is located on each side of the cab, and is mounted on the cab suspension. The latches keep the cab secured to the frame and prevent any shifting or unwanted movement. When the latches are released (unlocked) the cab can be tilted. A latch pin assembly, mounted to the underside of the cab, fits into each cab latch assembly. The latch assembly consists of a body, a latch, a return spring, a piston, a piston spring (not shown), and an indicator pin.

The cab latches are plumbed into the cab-tilt hydraulic system. They automatically open when the cab is tilted, and close and lock when the cab is lowered.

When the cab is latched, a spring inside the housing keeps the piston pushed up against the cam part of the latch, preventing the latch from releasing. When the cab is tilted, hydraulic pressure moves the piston outward, which allows the latch to be pulled up by the return spring, releasing the latch pin assembly. The cab is then free to tilt. As the cab is lowered, hydraulic pressure is released, and the latch pin assembly pushes on the cam part of the latch. The latch swings around, captures the pin, and the spring inside the housing pushes the cylinder back out and against the cam part of the latch. This locks the latch in place, securing the cab. Indicator pins let the driver know whether or not the latches are locked. If the pins are flush with the latch housing ends, the latches are locked; if they're sticking out, the latches are not locked. See **Fig. 1**.

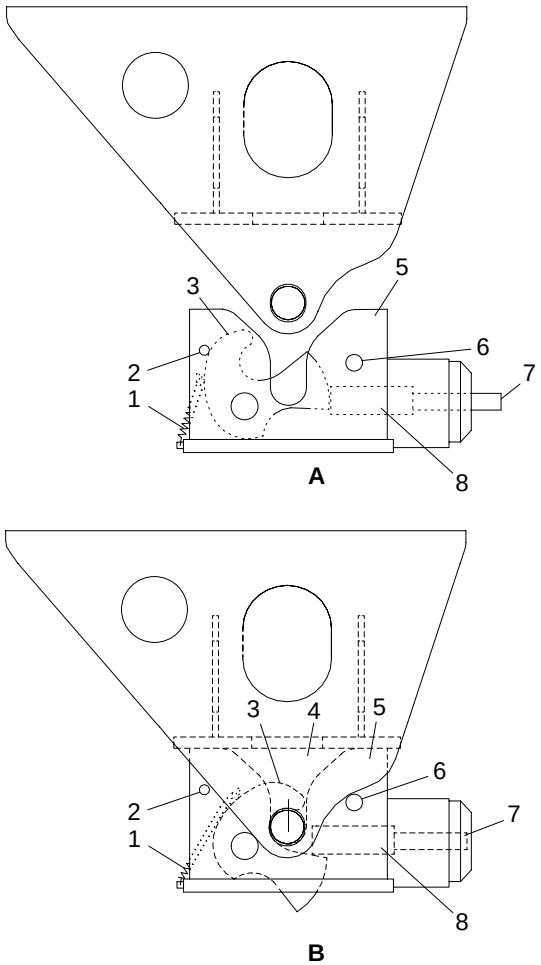


A. Unlocked
B. Locked
1. Return Spring
2. Pin
3. Latch
4. Latch Pin Assembly
5. Cab Latch Body
6. Hydraulic Port
7. Indicator Pin
8. Piston

Fig. 1, Cab Latch Assembly

Replacement (See Fig. 1)

1. Tilt the cab. For instructions, refer to **Section 60.15** in this workshop manual.



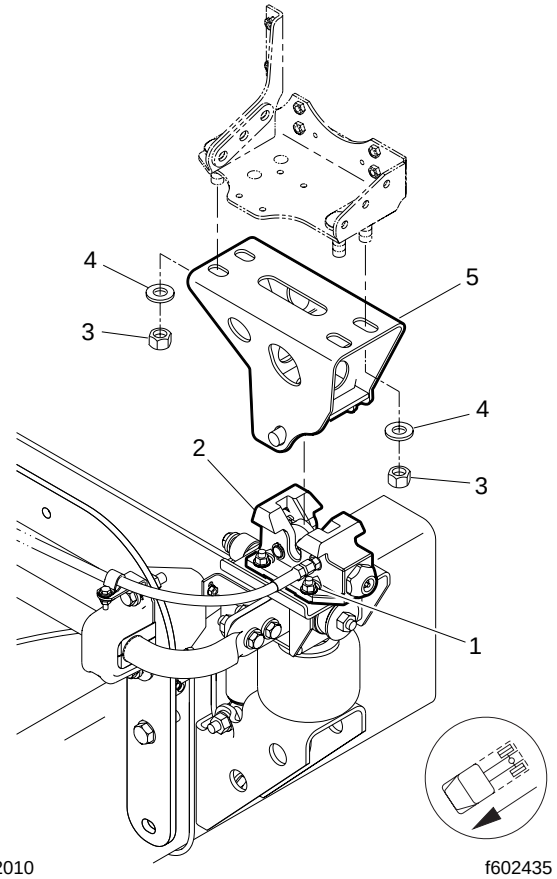
A. Unlocked
B. Locked
1. Return Spring
2. Pin
3. Latch
4. Latch Pin Assembly
5. Cab Latch Body
6. Hydraulic Port
7. Indicator Pin
8. Piston

Fig. 1, Cab Latch Assembly

2. Disconnect the batteries.
3. Loosen and remove the 3/8–16 capscrews, washers, and locknuts that attach the latches to the cab suspension.
4. Using a container to catch any hydraulic fluid, disconnect the hydraulic lines from the lower cab latch assemblies.
5. Remove the hydraulic cab latch from the vehicle.
6. Position the hydraulic cab latch in place on the cab suspension bracket.
7. Install the 3/8–16 capscrews, hardened washers, and locknuts. Tighten the nuts finger tight.
8. Connect the hydraulic lines to the cab latch.
9. Connect the batteries.
10. Bleed the cab-tilt system, following the instructions in **Section 60.15** of this workshop manual.
11. To align the cab latch in the proper location, lower the cab until the cab latch pins engage. For cab lowering instructions, refer to **Section 60.15** in this workshop manual.
12. Tilt the cab until the latch pins disengage. Make sure the tilt strut is pushed down over the right tilt-cylinder rod.
13. Tighten the nuts on the cab latch 28 lbf·ft (38 N·m).
14. Return the cab to the operating position. For instructions, refer to **Section 60.15** in this workshop manual.
15. Remove the chocks from the tires.

Replacement

1. Apply the parking brake and chock the tires.
2. Disconnect the batteries.
3. Tilt the cab; see **Section 60.15, Subject 060**.
4. Remove the four hexnuts and lockwashers that attach the latch pin assembly to the underside of the cab. Remove the latch pin assembly. See **Fig. 1**.
5. Install the new latch pin assembly on the studs on the underside of the cab.
6. Loosely install the locknuts on the studs. Make sure that the latch pin assembly is free to move side to side in its slots.
7. Loosen the four fasteners (**Fig. 1**, item 1) that attach the latch to the air spring upper support bracket. Loosen the fasteners just enough to allow the latch to move in a fore-and-aft direction in the slots.
8. Lower the cab slowly and and allow the mount to self-align and latch.
9. Tighten the fasteners 25 to 31 lbf·ft (35 to 41 N·m).
10. Raise the cab slightly to separate the latch pin assembly and latch body, then lower it to ensure alignment of the latch pin and the hydraulic latch jaw when the cab is completely lowered. If misalignment exists, repeat the procedure for any components that require adjustment.
11. Connect the batteries.



1. Latch Body Mounting Fastener
2. Latch Body
3. Hexnut
4. Lockwasher
5. Latch Pin Assembly

Fig. 1, Latch Pin Assembly Installation

Roof Fairing Removal and Installation

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Place some padding, such as a blanket, on the roof to avoid damaging the surface.
3. Remove the bolts, nuts, and washers that attach the fairing to the fairing front brackets. See **Fig. 1**. Lower the front of the fairing onto the padding.
4. Remove the bolts, nuts, and washers that attach the roof fairing to the back-of-cab brackets.

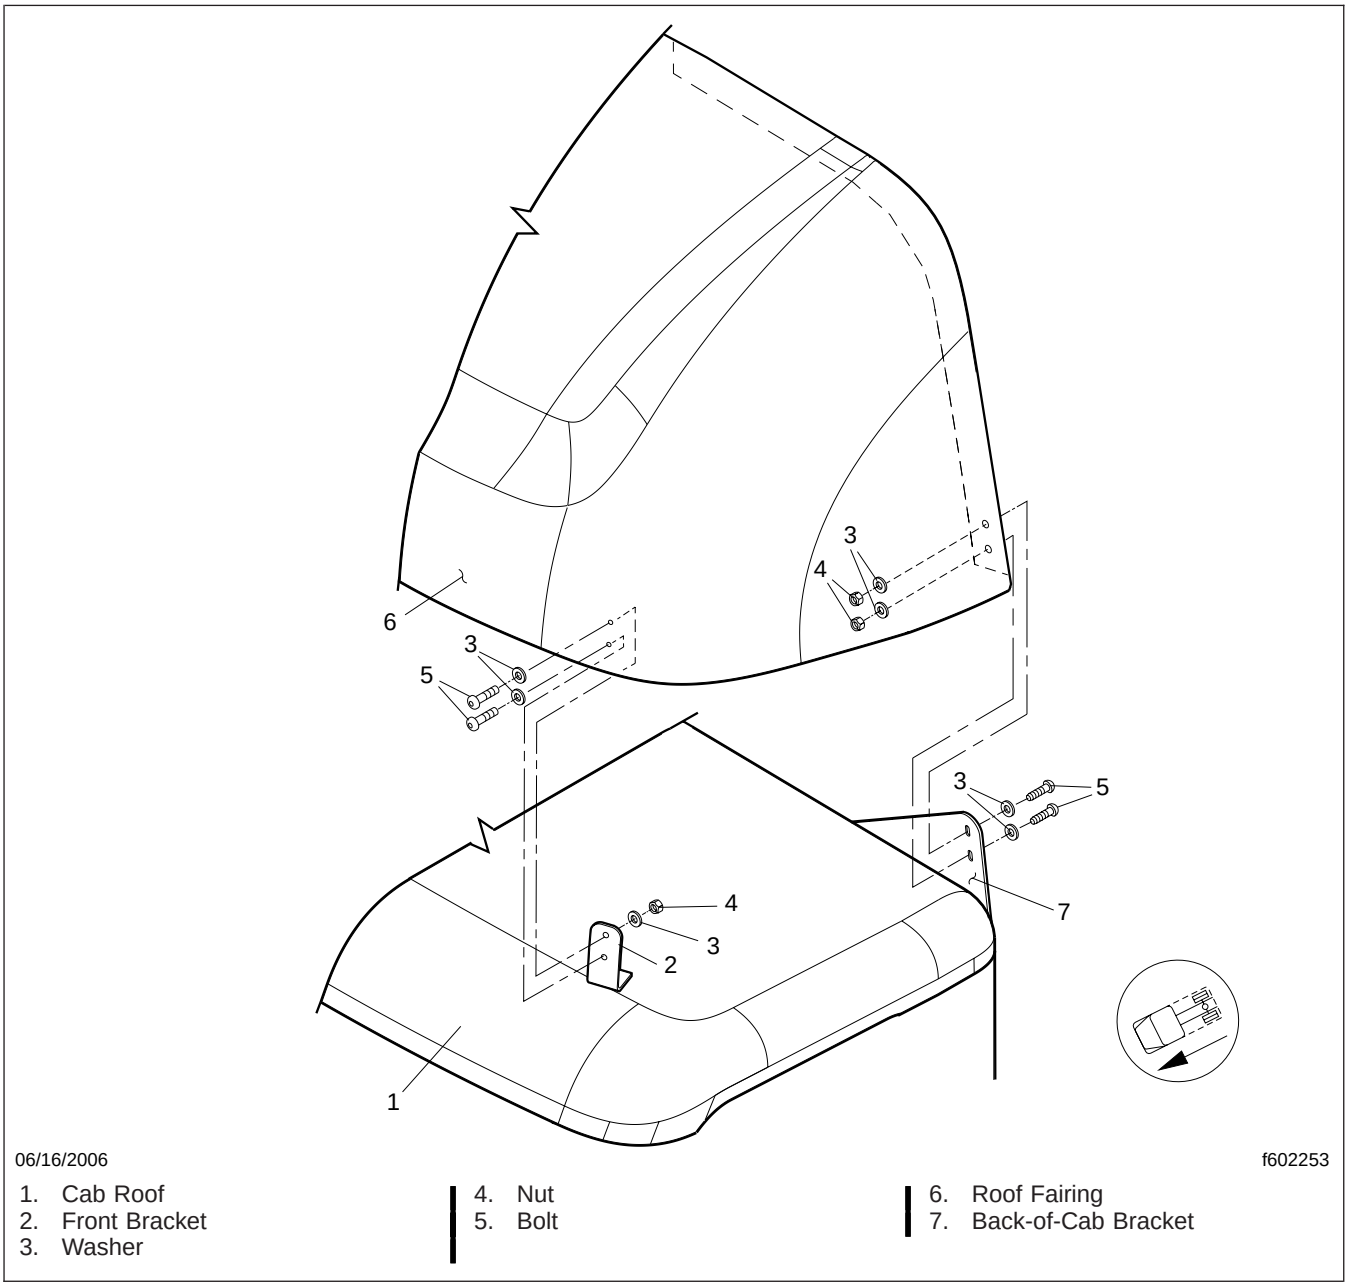


Fig. 1, Roof Fairing Installation

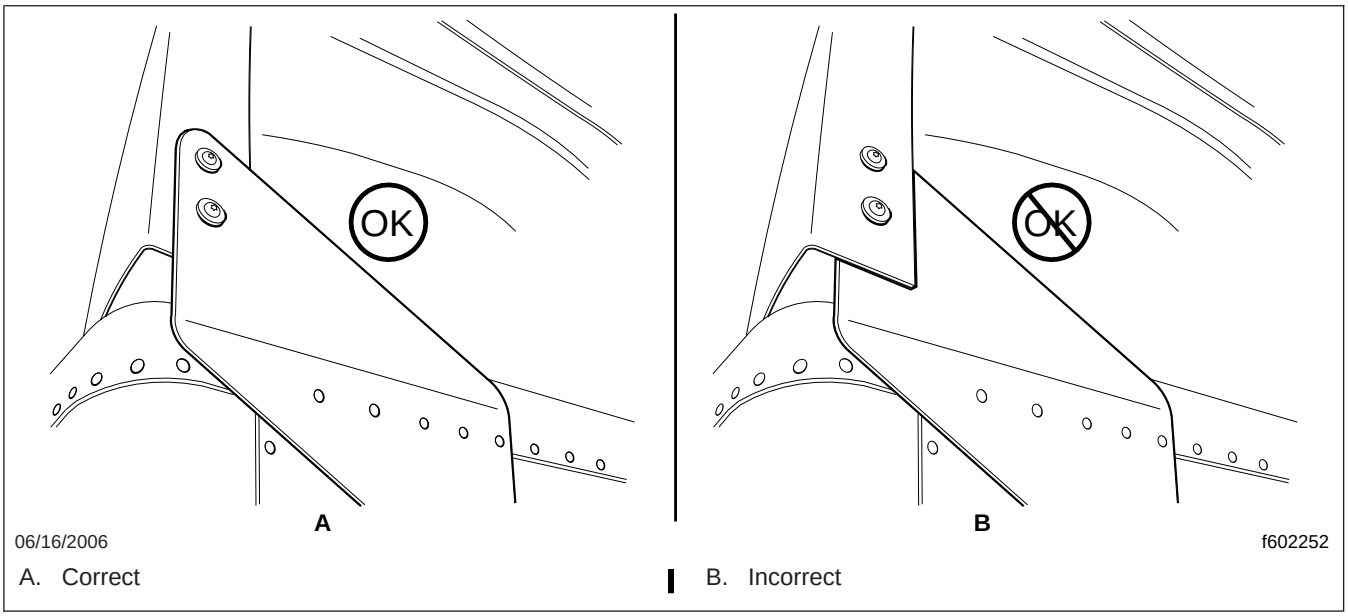
Roof Fairing Removal and Installation

5. Remove the fairing and the padding.

Installation

1. With the tires chocked, place some padding, such as a blanket, on the roof to avoid damaging the surface.
2. Place the fairing on the padding, taking care not to damage the roof surface. Position the fairing forward of both the front and back-of-cab brackets. See **Fig. 2**.
5. Install a washer and nut on each bolt that attaches the fairing to the brackets. Do not tighten the nuts.
6. Check the alignment of the fairing, adjusting it if necessary.
7. Tighten all the bolts.
8. Remove the chocks from the tires.



A. Correct

B. Incorrect

Fig. 2, Fairing Back-of-Cab Installation

⚠ CAUTION

Do not attach a roof fairing to the rearward sides of the back-of-cab brackets. Roof fairings should always be attached to the forward sides of the back-of-cab brackets. Attaching a roof fairing to the rearward sides of the brackets can result in damage to the fairing.

3. Start two bolts with washers through the back-of-cab brackets and the fairing. See **Fig. 1**.
4. While supporting the front of the fairing, remove the padding from the roof, and start two bolts with washers through the fairing into each of the fairing front brackets.

Driver's Lounge Under-Bunk Storage Bin

REMOVAL

NOTE: The Driver's Lounge consists of the driver's lounge lower bunk, the fold-down table, the under-bunk storage bin, and the side cushion chairs. See **Fig. 1** and **Fig. 2**.

1. Park the vehicle on a level surface.
2. Shut down the engine.
3. Set the parking brake and chock the front and rear tires.
4. With the driver's lounge table in the stowed position (latched to the underside of the lower bunk) raise and latch the lower bunk in its vertical position. See **Fig. 1**.
5. Press the push-button latch on the storage bin (**Fig. 2**, Ref. 2) and pull forward to gain access to the storage area.
6. Remove the shoulder bolt (Ref. 3) at each end of the storage bin and remove the bin.

INSTALLATION

1. With the driver's lounge table in the stowed position, raise and latch the lower bunk in its vertical position.
2. Place the storage bin into position between the side cushion chairs.
3. Install and tighten the passenger-side shoulder bolt and then the driver's side shoulder bolt.

NOTE: The shoulder bolts thread into mating clinch nuts in the seat box assemblies at each side.

4. Open and close the storage bin to ensure proper alignment of the bin and proper latch engagement.
5. Remove the chocks from the tires.

Driver's Lounge Table

REMOVAL

1. Park the vehicle on a level surface.
2. Shut down the engine.
3. Set the parking brake and chock the front and rear tires.
4. With the driver's lounge table in the stowed position, raise and latch the lower bunk in its vertical position. See **Fig. 1**.

NOTE: The next step is best performed with the aid of an assistant. Take note of the positions of the nylon bushing and flatwasher (Refs. 13 and 14) before removing them.

5. Have the assistant hold the table in position and remove the table link-to-table mounting bolts (Ref. 3) on both sides of the table.

NOTE: When the bolts are removed, the table will drop slightly as the table pins and nylon spacers (Ref. 12) come to rest in the bottoms of the table support casting (Ref. 9) guides.

6. Have the assistant hold the table. Then unlatch and place the table leg into position to support the table.

NOTE: Doing this will unlatch the table from the striker (Ref. 7) on the underside of the bunk, if it is still engaged.

7. Carefully lift and maneuver the table away from the bunk. Use care to disengage the table pins and nylon spacers from the table support casting guides at the same time.

INSTALLATION

1. With the driver's lounge table in the stowed position, raise and latch the lower bunk in its vertical position.

NOTE: The next step is best performed with the aid of an assistant.

2. Carefully lift and maneuver the table (Ref. 10) into position. Use care to engage the table pins and nylon spacers into the table support casting guides at the same time. As the table pins and spacers enter the guides, carefully lower the

table to allow the pins to rest in the bottoms of the guides.

3. Carefully raise one lower corner of the table and align the table link (Ref. 11) with its mounting hole in the table.
4. Ensure that the nylon bushing and flatwasher (Refs. 13 and 14) are in the same position as when removed. Then, install the mounting bolt through the flatwasher, table link, and bushing, into the table mounting hole.
5. On the opposite side, install the mounting bolt through the flatwasher, table link, and bushing, into the table mounting hole. Tighten both bolts securely.
6. While holding the table, unlatch and place the table leg into position to support the table.
7. Push the top of the table fully against the bunk striker and lower and latch the table leg to latch the table to the striker on the underside of the bunk.

Removal and Installation

8. Place the table in position for use and then in the stowed position several times to confirm proper operation.
9. Remove the chocks from the tires.

General Description

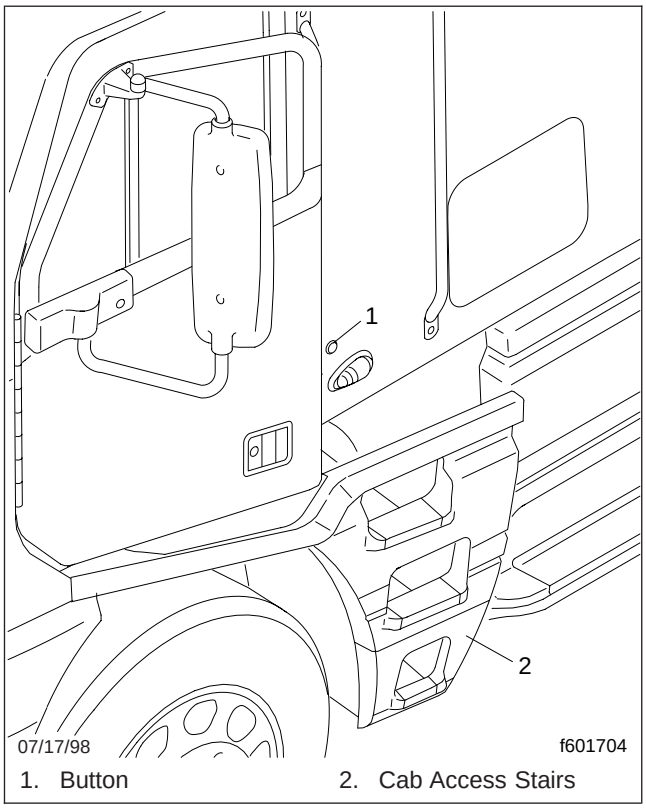
The optional cab access stairs will pivot outward from the cab when the cab door is opened from the inside or the outside, and will retract back under the cab when the door is closed from the inside or the outside. As the stairs move, an alarm outside the vehicle will sound. The stairs will stop moving if they come in contact with an obstruction. If an obstruction occurs, an interior buzzer will sound, and a light on the dash panel will activate.

The cab door can be opened without activating the stairs. From outside the cab, press the button on the side of the cab between the grab handles before opening the door. See **Fig. 1**. From inside the cab, press the rocker switch on the dash labeled RH STEP or LH STEP while opening the door.

NOTE: The button must be pressed each time the stairs are to be deactivated. Pressing the button will deactivate the stairs for one cycle of opening and closing the door. The next time the door is opened, the stairs will pivot outward unless the button is pressed again.

The cab access stairs will not move or will stop moving in the following conditions:

- The parking brake is not set.
- The vehicle is in motion. The stairs will automatically retract if the vehicle begins to move.
- There is weight on the stairs.
- The cab is tilted.
- The stairs come in contact with an obstruction.
- The button or rocker switch is pressed.



1. Button
2. Cab Access Stairs

Fig. 1, Cab Access Stairs

Cab Access Stairs Removal and Installation

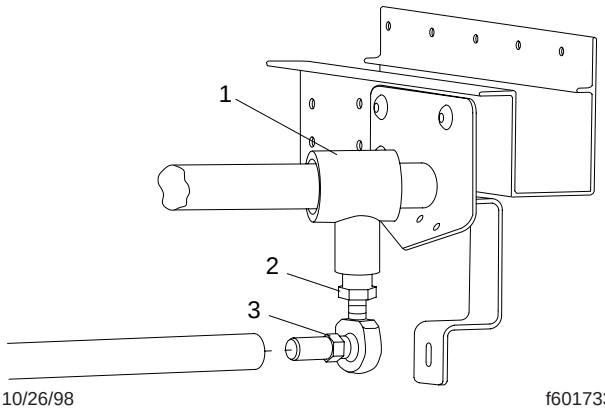
Removal

1. Turn off the engine, apply the parking brakes, disconnect the batteries, and chock the tires.
2. Remove the actuator pin.
   - 2.1 From under the front of the cab access stairs, open the quick-release access cover on the splash shield.
   - 2.2 Pull the handle on the actuator pin down, then turn the handle and remove the actuator pin from the access cover.

   NOTE: The stairs are now disconnected from the actuator.
3. Pull the step assembly out.

NOTE: Have an assistant support the steps before removing the linear bearing support bolt.

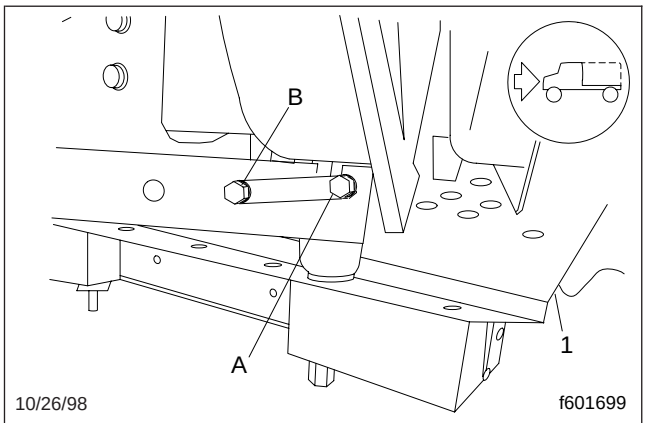
4. On the inboard side of the stairs, disconnect the ball stud of the rod end. See **Fig. 1**.



1. Linear Bearing
2. Adjusting Nut
3. Rod End with Ball Stud

Fig. 1, Linear Bearing

5. At the front of the stairs, remove the bolt on the outboard side of the vehicle, and loosen the bolt on the inboard side of the vehicle. See **Fig. 2**.
6. Remove the stairs.
   - 6.1 Support the back end of the stairs.
   - 6.2 At the front of the stairs, remove the bolt that was loosened earlier. See **Fig. 1**.



A. Remove this bolt.
B. Loosen this bolt.
1. Stair Platform

Fig. 2, Front End of Stairs

   - 6.3 Lower the front of the stairs, and remove the stairs.

Installation

1. Install the stairs.
   - 1.1 At the front of the vehicle, align the pivot bracket on the stairs with the pivot mounting bracket on the cab. Install the washers and the two bolts. See **Fig. 3**. Tighten the two bolts.
   - 1.2 On the inboard side of the stairs, connect the ball stud at the rod end. See **Fig. 1**.
   - 1.3 Move the actuator arm into the actuator mount. Install the actuator pin through the access cutout under the stairs. See **Fig. 4**.

   NOTE: After installing the actuator pin, push the handle back up to be sure the actuator pin remains in place. See **Fig. 4**.
2. Close the access cover, and connect the batteries.
3. Calibrate the cab access stairs. Refer to **Subject 150** for instructions.
4. Remove the chocks from the tires.

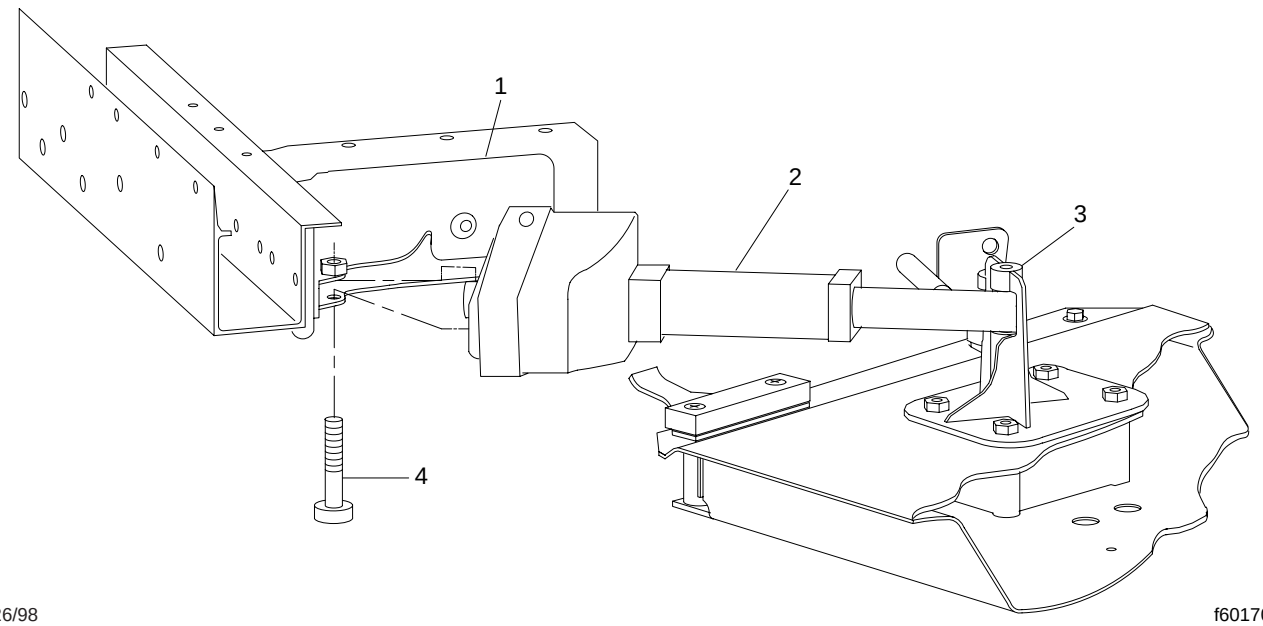
Fig. 4, Actuator Pin Installation

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the actuator pin.
   - 3.1 From under the front of the cab access stairs, open the quick-release access cover on the splash shield.
   - 3.2 From the access cover, remove the actuator pin by pulling down, then turning, the actuator pin handle.

   NOTE: The stairs are now disconnected from the actuator.
4. Pull the stairs out.
5. Move the actuator arm out of the actuator mount. See **Fig. 1**.
6. Disconnect the two electrical connectors from the actuator.
7. Remove the bolt that attaches the actuator to the mounting bracket. See **Fig. 1**.
8. Install the new actuator.

   IMPORTANT: The actuator arm needs to be extended about 3 inches (75 mm) out before being installed. Use a jumper wire and 12-volt battery to extend the actuator arm.
   - 8.1 Place the washer between the actuator and the lower shelf of the mounting bracket. Using the bolt and washer, attach the actuator to the mounting bracket.
   - 8.2 Move the actuator arm into the actuator mount. Reaching through the access cut-out under the stairs, install the actuator pin through the actuator arm and actuator mount.
9. After installing the actuator pin, push the handle up to secure the actuator pin. See **Fig. 2**.
10. Attach the two electrical connectors to the actuator.
11. Close the access cover on the splash shield.
12. Connect the batteries.



1. Mounting Bracket
2. Actuator Arm
3. Actuator Mount
4. Bolt

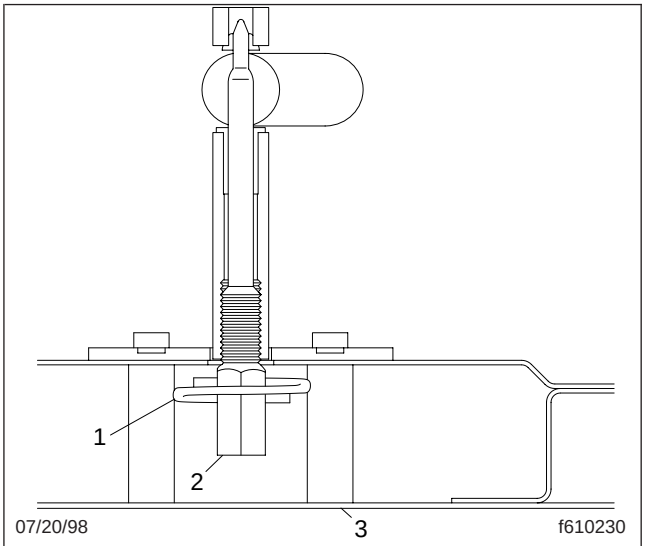
Actuator Replacement



1. Actuator Pin Handle
2. Actuator Pin
3. Underside of Cab Access Stairs

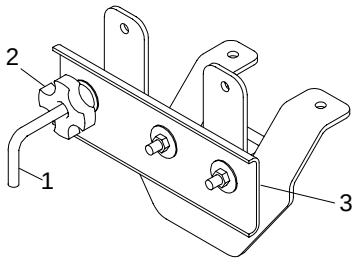
Fig. 2, Actuator Pin

13. Calibrate the cab access stairs. Refer to **Subject 150** in this section for instructions.
14. Remove the chocks from the tires.

Manual Storage

The cab access stairs can be manually stored under the cab if the stairs are open and cannot be moved.

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Remove the actuator pin. For instructions, see **Subject 100**.
3. Push the stairs under the cab.
4. Reach in through the top step to loosen the knob around the L-bar. See **Fig. 1**.



07/16/98 f601706

1. L-Bar
2. Knob
3. Retainer Bracket

Fig. 1, Retainer Bracket

5. Turn the L-bar until the threads on the L-bar have engaged the stairs.
6. Tighten the knob to hold the L-bar in place.
7. Remove the chocks from the tires.

Step Deployment Unit Removal and Installation

Removal

There is an electronic control unit for each set of cab access stairs. The electronic control unit is mounted under the cab deck, directly above the cab access stairs.

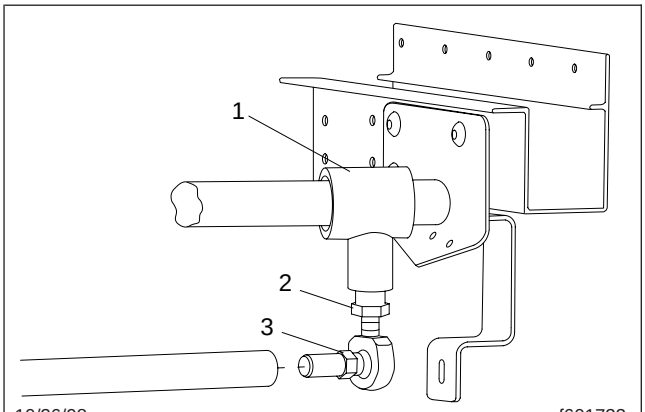
1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Deploy the steps.
3. Disconnect the batteries.
4. Remove the fastener that attaches the connector to the electronic control unit.
5. Remove the four washers and bolts that attach the electronic control unit to the mounting bracket. Remove the electronic control unit.

Installation

1. Using four washers and bolts, attach the electronic control unit to the mounting bracket. Tighten the bolts 96 lbf·in (1080 N·cm).
2. Using the fastener, install the connector on the electronic control unit.
3. Connect the batteries.
4. Calibrate the cab access stairs. Refer to **Subject 150** for instructions.
5. Remove the chocks from the tires.

Removal (See Fig. 1)

1. Park the vehicle, apply the parking brakes, and chock the tires.



1. Adjusting Nut
2. Linear Bearing
3. Rod End with Ball Stud

Fig. 1, Linear Bearing

NOTE: Have an assistant support the access steps before removing the linear bearing.

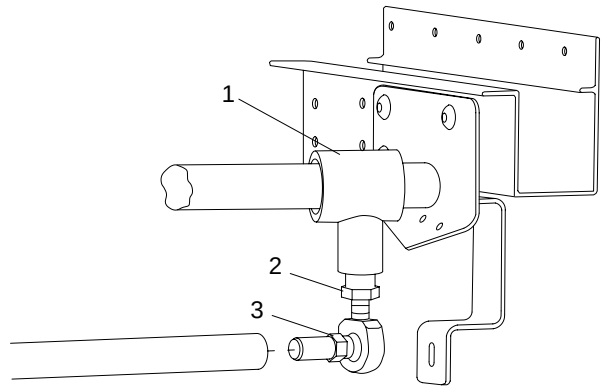
2. Remove the two fasteners on the inboard side of the linear bearing rod assembly.
3. Remove the three fasteners on the outboard side of the linear bearing rod assembly.
4. Loosen the nut at the base of the linear bearing.
5. Remove the support bar from the access step assembly, and remove the linear bearing.

Installation

1. Slide the linear bearing on to the support bar.
2. Position the linear bearing rod assembly on the access step assembly.
3. Attach the two fasteners on the inboard side of the linear bearing rod assembly, and tighten securely.
4. Attach the three fasteners on the outboard side of the linear bearing rod assembly, and tighten securely.
5. Tighten the nut at the base of the linear bearing.
6. Adjust the assembly as necessary. Refer to **Subject 150** for instructions.

Adjustment

1. Using the door frame as reference, verify that the cab access steps are parallel with the door frame, and maintain a constant gap.
2. Adjust the front to back level of the step by turning the adjusting nut on the linear bearing. See **Fig. 1**.



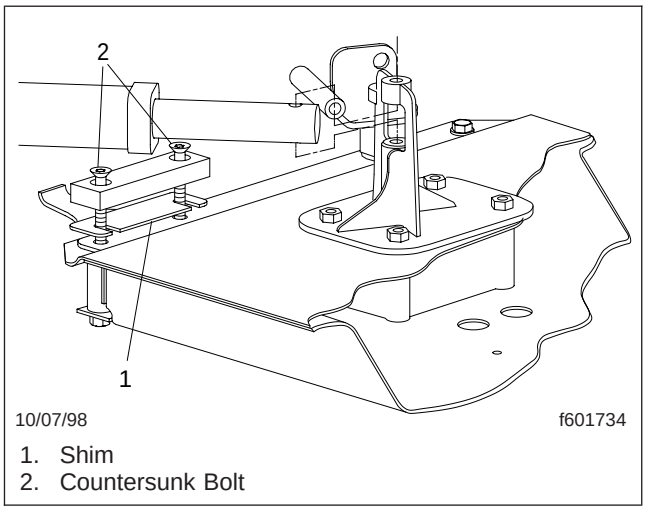
1. Linear Bearing
2. Adjusting Nut
3. Rod End with Ball Stud

Fig. 1, Linear Bearing

3. Adjust the side to side level of the step by loosening the bolts on the step retainer plate at the front of the access steps. See **Fig. 2**. Insert shims as necessary under the slider block to properly adjust the height. When the height is properly adjusted, tighten the bolts securely.

Calibrating the Cab Access Stairs Module

1. Calibrate the stairs using the DataLink Monitor.
   - 1.1 Open ServiceLink and connect to the vehicle.
   - 1.2 Click on the "Templates" icon on the ServiceLink menu.
   - 1.3 Under the J1708 heading, select "Recalibrate SDU" from the drop-down menu.
   - 1.4 Click the button for the side of the vehicle that requires calibration.



1. Shim
2. Countersunk Bolt

Fig. 2, Retainer Plate and Slider Block

2. Turn the ignition off and close the driver and passenger doors.
3. Press and hold for fifteen seconds the exterior disable switch on the side that is being recalibrated. Release the switch when the alarm sounds.

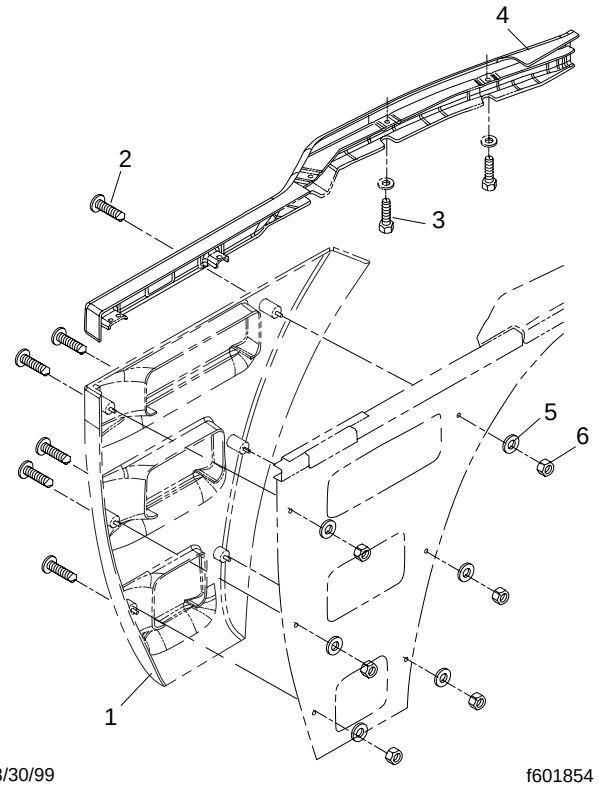
NOTE: The alarm will chirp while the SDU is in calibration mode.

4. Open the door to deploy the stairs. If the stairs do not completely deploy, press and release the exterior disable switch until the stairs are fully deployed.
5. Close the door. If the stairs do not stow completely, press and release the exterior disable switch until the stairs are fully stowed.
6. Repeat steps 4 and 5 two additional times, allowing the stairs to fully deploy and stow each time.
7. Open the door. The alarm will sound for several seconds and the stairs will not deploy.
8. Close and open the door. The stairs should deploy. The external alarm will no longer chirp.
9. Press and hold the interior disable switch for approximately fifteen seconds until the exterior alarm sounds.

Step Fairing Removal and Installation

Removal (See Fig. 1)

1. Park the vehicle, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.



08/30/99 f601854

1. Bottom Fairing
2. Bolt, 1/4–20, Grade 5
3. Capscrew, 1/4–20, Grade 5
4. Top Fairing
5. Flatwasher
6. Hexnut

Fig. 1, Cab Access Stairs Fairing

3. Deploy the stairs manually.
   - 3.1 Remove the actuator pin. For instructions, see **Subject 100**.
   - 3.2 Pull the stairs out to the deployed position.
4. Remove the three capscrews that secure the top fairing to the step assembly. Remove the fairing.
5. Remove the tread plates.
6. Remove the six bolts that secure the bottom fairing to the step assembly. Remove the fairing.

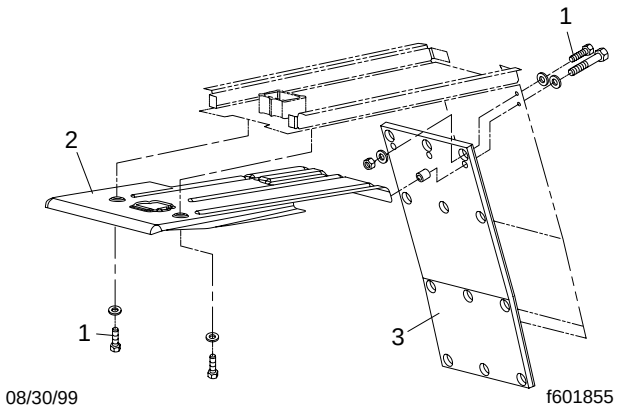
Installation

1. Install the bottom fairing on the step assembly.
   - 1.1 Install the three bolts on the left side of the bottom fairing, and tighten them securely.
   - 1.2 Install the three bolts on the right side of the bottom fairing, and tighten them securely.
   - 1.3 Tighten the bolts 15 lbf·ft (20 N·m).
2. Position the tread plates on the step assembly, and tighten the bolts 15 lbf·ft (20 N·m).
3. Position the top fairing on the step assembly. Install and tighten the capscrews 15 lbf·ft (20 N·m).
4. Push the stairs to the stowed position.
5. Install the actuator pin. For instructions, see **Subject 100**.
6. Connect the batteries.
7. Remove the chocks from the tires.

Mud Flap Removal and Installation

Removal (See Fig. 1)

1. Park the vehicle, apply the parking brakes, and chock the tires.



1. Bolt, 1/4–20, Grade 5
2. Splash Shield
3. Mud Flap

Fig. 1, Cab Access Stairs Mud Flap

2. Disconnect the batteries.
3. Deploy the stairs manually.
   - 3.1 Remove the actuator pin. For instructions, see **Subject 100**.
   - 3.2 Pull the stairs out to the deployed position.
4. Remove the two underdeck bolts and the top three step-mounted bolts that secure the splash shield to the step assembly. Remove the splash shield.
5. Remove the bolts that secure the mud flap to the step assembly. Remove the mud flap.

Installation

1. Position the mud flap on the step assembly, and install the nine lower bolts. Tighten the bolts 84 lbf·in (960 N·cm).
2. Position the splash shield on the step assembly. Install the two underdeck bolts and tighten 15 lbf·ft (20 N·m).

NOTE: Use an alignment tool, if necessary, to align the top three holes before installing the step-mounted bolts.

3. Install the top three step-mounted bolts. Tighten the bolts 84 lbf·in (960 N·cm).
4. Push the stairs to the stowed position.
5. Install the actuator pin. For instructions, see **Subject 100**.
6. Connect the batteries.
7. Remove the chocks from the tires.

See **Fig. 1** for a full view of the cab access stairs wiring diagram. See **Fig. 2** and **Fig. 3** for partial (detailed) views of the cab access stairs wiring diagrams.

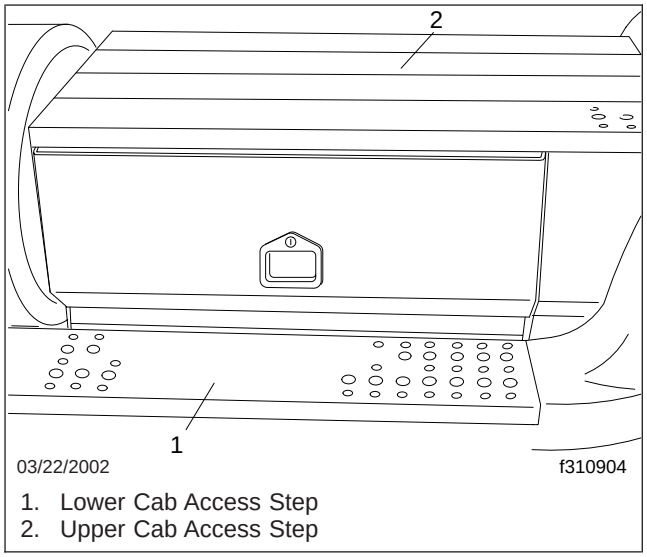
Lower Cab Access Step, Coronado

Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.

NOTE: The lower cab access step is positioned below the tool box. See **Fig. 1**.

2. Remove the bolts from the intermediate brace between the two lower step frame sections, and remove the brace.



1. Lower Cab Access Step
2. Upper Cab Access Step

Fig. 1, Cab Steps

3. Remove the bolts that attach the step to the step frame.
4. Remove the bolts attaching the rear section of the step to the internal frame.
5. Remove the step from the step risers.

Installation

1. Position the step on the quarter fender and rear tool box risers.
2. Install the rear mounting bolts on the internal frame.
3. Position the intermediate brace on the step frame and install the bolts.
4. Install the mounting bolts on the step frame.
5. Tighten all bolts securely.
6. Remove the chocks from the tires.

General Information

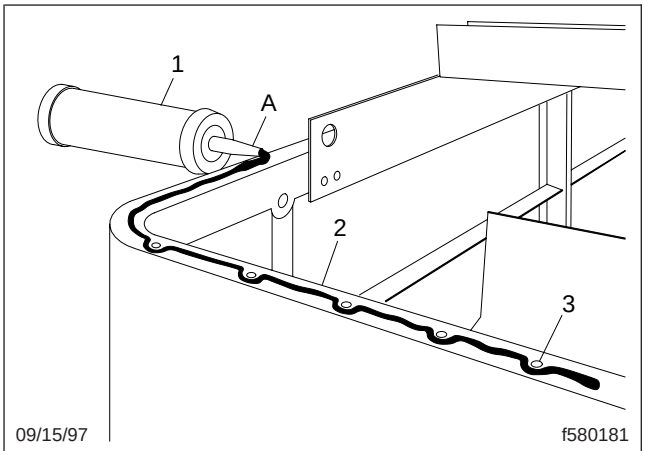
The installation of the coach joint and the roof cap changed in production on March 21, 2002. The revisions to the installation are as follows:

- The 58-inch and 70-inch raised roof assemblies are now bonded to the cabs.
- The quantity of roof cap joint fasteners is reduced from 46 to 20 (70-inch raised roof) and from 44 to 18 (58-inch raised roof).
- Seven 0.08-inch thick aluminum shims are removed.
- 19 countersunk rivets are removed.
- Four 18-gauge steel (adhesive backed) shims are removed.
- The roof cap near the corner headers and transition headers are removed.
- Side and rear roof cap headers are replaced with revised headers.
- The existing foam seating tape (.250-inch x .375-inch) is replaced with (0.188-inch by .312-inch) tape.
- The adhesive is replaced with blind rivets for attaching the window surround flange to the side headers.

Installation

The installation of the coach joint and the roof cap changed on March 21, 2002. Use the instructions in this section to install a new roof cap.

1. Park the vehicle, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Remove the roof cap. Refer to Section 60.07 of the *Century Class Trucks Workshop Manual* for instructions.
3. Fill the transitions around the top of the cab with Sika® 252 adhesive (48-25136-008) and smooth it out with a putty knife.
4. Use a glove and a lint-free rag to apply Sika Aktivator (48-25529-000). Use a quick single pass that fully wets the surface.
5. Apply a line of foam around the rim of the cab roof. See **Fig. 1**.



A. Apply adhesive around the top of the cab.
1. Adhesive Applicator
2. Cab Roof Rim
3. Fastener Hole

Fig. 1, Foam Application

NOTE: Apply adhesive 10 minutes after applying the foam, and no more than two hours after applying the Sika Aktivator.

6. Using the foam dam as a guide, apply Sika 252 adhesive. The bead should be 0.31-inch (8-mm) wide by 0.12-inch (3-mm) high.

NOTE: The adhesive should be inboard of the foam and should not spill over the top. If excess adhesive is applied, use a popsicle stick to spread it out.

7. Use bolts to align the back wall flanges.

IMPORTANT: The roof must be placed within 30 minutes after the adhesive bead is applied.

8. Install the roof cap. Refer to Section 60.07 of the *Century Class Trucks Workshop Manual* for instructions.
9. Make sure that the trim tabs and side extenders do not space out of the cap or the cab.

NOTE: Tighten the extenders only after the roof cap is bolted down.

10. Tighten the side extenders.
11. Before fully tightening all fasteners, inspect the roof cap to cab fit.
12. Remove the chocks from the tires.

General Description

The bulkhead-style cab door is an aluminum extrusion upper frame and a stamp-formed lower section with two aluminum billets inserted into the extrusion and lower section. The cab seal is mounted on the door.

The "bulkhead" description refers to the manner in which the door, when closed, seats inside the door opening; the outer panel surface of the door is then flush with the outermost edge of the stamped door opening frame.

The door opening frame has a small drip molding riveted to the cab skin above the door. Both the door opening and the drip molding are painted the predominant color of the cab exterior.

The door frame is the foundation of the door assembly (**Fig. 1**), serving as:

- the mount for the outer panel of the door
- the channel support for the window glass
- the hinge support
- the wing window mount
- the door latch mount

A cable-driven window regulator assembly raises and lowers the window on standard door assemblies. Some vehicles feature optional electric windows.

⚠ CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables and the window express module harness connectors behind the inner door panels. See Subject 110 in this section. Electric currents produced during electric welding can damage various electronic components on the vehicle.

The wiring harness for the turn signals, heated mirrors, and CB/radio antenna is routed inside the mirror support, and is not visible with the door closed.

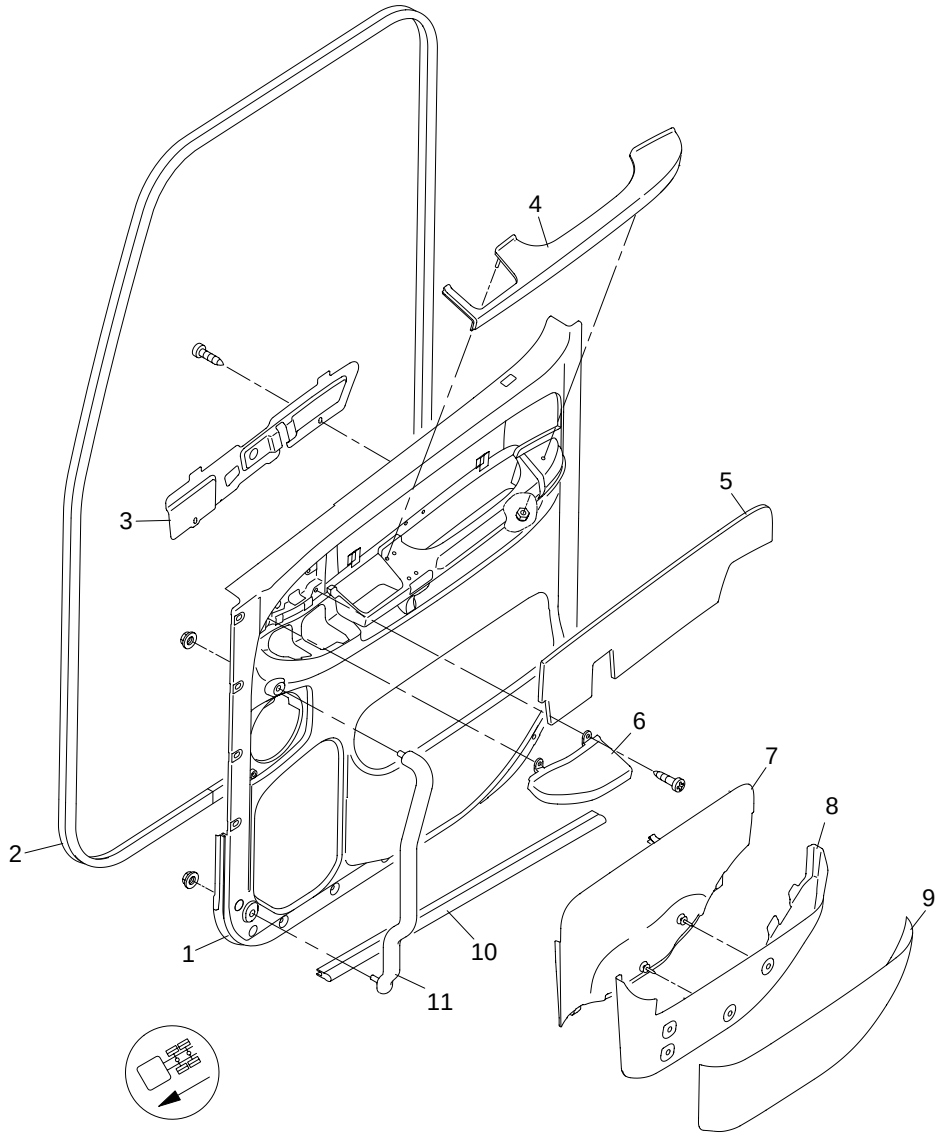
Most of the door parts are replaceable, with the exception of the outer panel (the exterior door skin). The outer panel is crimped to and bonded with structural adhesive to the door frame flange. If damaged, the outer panel and door frame assembly must be replaced as one assembly.

⚠ CAUTION

Do not attempt to replace the outer panel if it is structurally damaged. The entire portion of the panel that is crimped around the door frame is also bonded with a high-strength structural adhesive. In order to weaken this adhesive, a temperature of 400°F (204°C) is needed. If the aluminum door frame is heated to temperatures approaching 400°F (204°C), the door frame can crack or warp; accelerated aging of the metal may also occur.

Unless otherwise noted, all service operations can be done with the door attached to the vehicle. To reduce work time, don't remove the door unless told to do so.

General Description



09/26/95 f720175

1. Inner Door Panel
2. Door Mounted Seal
3. Closure Panel
4. Arm Rest
5. Upholstery
6. Window Control Panel
7. Lower Door Trim Panel
8. Door Pocket Liner
9. Carpet
10. Weatherstrip
11. Grab Handle

Fig. 1, Cab Door Assembly, Exploded View

Removal

1. Apply the parking brakes, and chock the tires.
2. Lower the window.
3. Disconnect the batteries.
4. Disconnect the wiring connectors and harness leads.

IMPORTANT: As a safety precaution, bundle the loose wires, then temporarily tape them to the door.

5. Remove the door check, taking care to ensure the door does not swing out and damage the vehicle or the door. Also, do not allow the portion of the door check assembly mounted to the door opening to drop into the A-pillar.
6. Remove the inner A-pillar cover, the outer upper A-pillar cover, and the outer lower cowl A-pillar cover to provide access to the cabside of the door.

⚠ WARNING

WARNING: Do not attempt to lift the door. The door weighs approximately 110 pounds (50 kg). Lifting or dropping the door could result in personal injury or damage to the door assembly and other components.

7. Using a door support or another person, support the door frame from its bottom to prevent it from falling or tipping during removal. With the door open and supported, loosen the allen-bolts and hexhead fasteners that attach the door hinge to the cab.

Installation

1. If the door seal has been damaged or is weathered, replace it. For instructions, refer to **Subject 190**.

⚠ WARNING

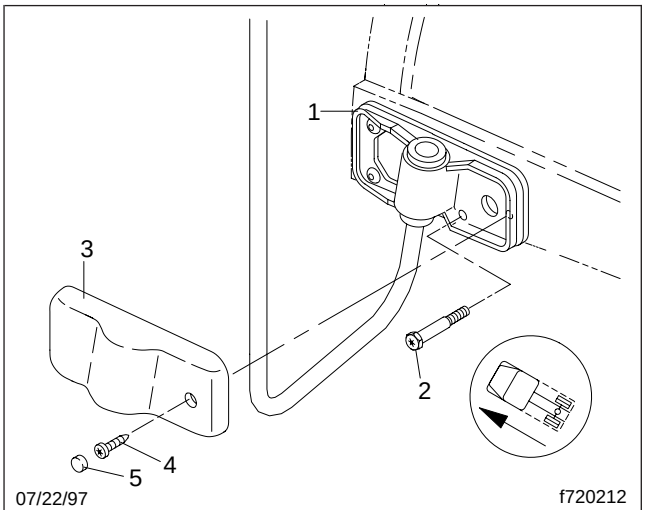
WARNING: Do not attempt to lift the door. The door weighs approximately 110 pounds (50 kg). Lifting or dropping the door could result in personal injury or damage to the door assembly and other components.

2. Using a door support or another person, support the door from its bottom to prevent it from falling or tipping during installation.
3. Insert and tighten the allen-bolts and hex head fasteners that attach the door hinge to the cab.
4. Unfasten the previously tied and bundled wires. Thread the wires through the bottom portion of the door opening frame and into the cab.
5. Install the door check, again taking care to keep the part mounted inside of the door opening from falling into the A-pillar.
6. As marked earlier, connect all electrical wiring to the door. The wires should be connected at the butt splices located just inside the cab, near the door opening frame.
7. Connect the batteries.
8. Check to be sure the door electrical components are operating correctly.
9. Install the outer lower cowl A-pillar cover, the outer upper A-pillar cover, and the inner A-pillar cover.

Inner Door Panel Removal and Installation

Removal

1. Apply the parking brakes and chock the tires.
2. Remove the mirror lower bracket cover; see **Fig. 1**. Using a T40 Torx® screwdriver, remove the door-panel retainer capscrew through the mirror bracket from outside of the cab; see **Section 60.06, Subject 110**.

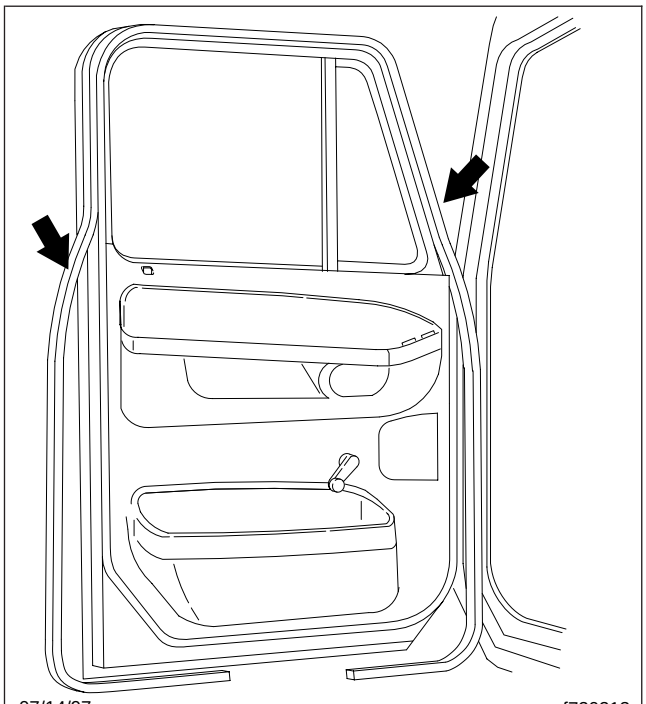


07/22/97 f720212

1. Mirror Lower Bracket
2. Door-Panel Retainer Capscrew
3. Mirror Bracket Cover
4. Bracket Mounting Screw
5. Plastic Plug

Fig. 1, Door-Panel Retainer Capscrew Removal

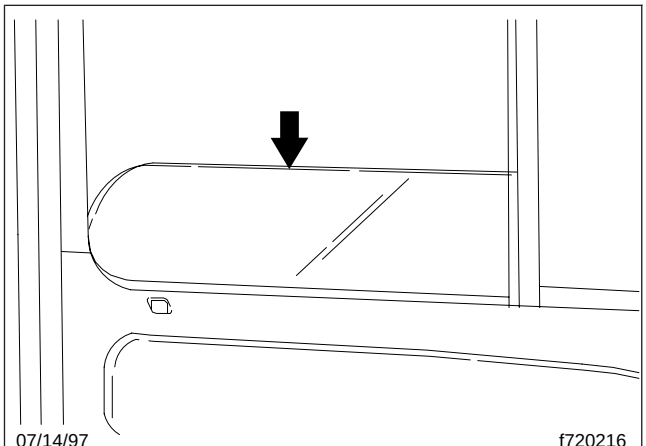
3. Starting at the bottom, partially remove the door seal to a point higher than the top of the inner panel. Leave the ends of the seal hanging down; see **Fig. 2**. Take care not to bend the seal in tight radius.
4. Remove the lower door trim panel (door pocket panel).
5. Roll down the window part way to expose the two window lift channel nuts through the opening in the inner door panel; see **Fig. 3**.
6. Remove the window crank, if installed (manual windows only).
7. Support the window glass.



07/14/97 f720213

On both sides of the door, remove the seal to a point higher than the top of the inner door panel.

Fig. 2, Door Seal Partially Removed



07/14/97 f720216

Lower the window glass about 2/3 of the way down; enough to expose the window lift channel nuts through the door pocket.

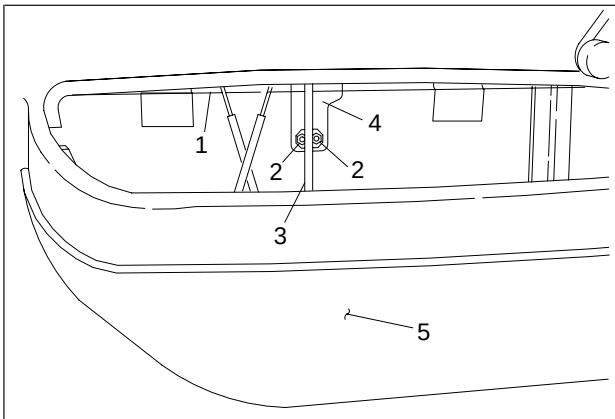
Fig. 3, Window Glass Lowered

Inner Door Panel Removal and Installation

NOTICE

To avoid damaging the window glass, make sure the window is rolled down and the window glass is supported from underneath.

8. Remove the two 1/4–20 window lift channel nuts; see **Fig. 4**.



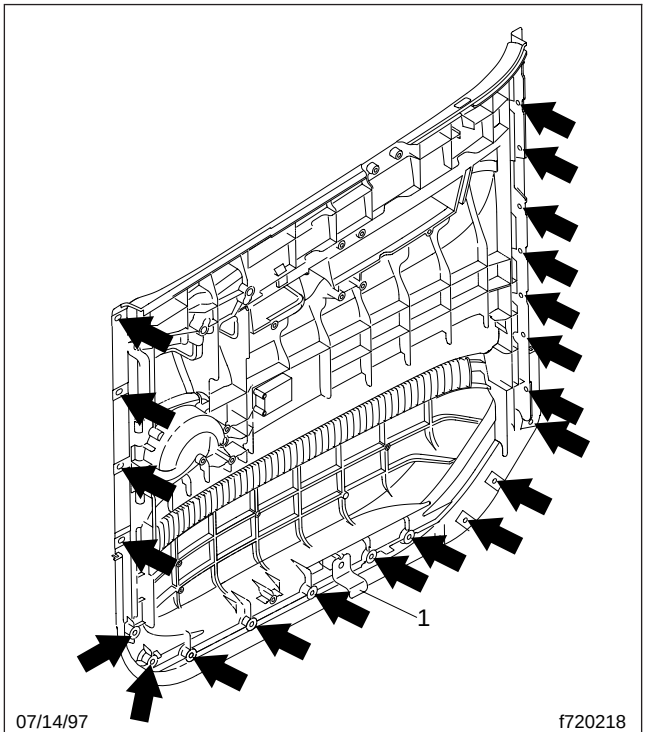
10/19/99 f720214a

1. Window Glass
2. Lift Channel Nut
3. Regulator Shaft
4. Window Lift Channel
5. Inner Door Panel

Fig. 4, Lower Opening in Inner Door Panel

NOTE: Save all fasteners, plugs, and covers for later installation, when removing the inner door panel. Note that the screws are not all the same length. For ease of installation, keep the screws and other fasteners in a line in order of removal, so that each one can be installed in the correct hole.

9. Remove the inner door panel with the regulator and window glass installed, as follows; see **Fig. 5**.
   - 9.1 Remove the four plastic plugs on the rear door edge. Remove the four T25 screws, with washers, one underneath each plug; see **Fig. 6**.
   - 9.2 Remove the T40 Torx screw that holds the plastic cover on the rear door edge. Remove the T25 screw, with washer, underneath it.
   - 9.3 Remove the two exposed T25 Torx machine screws located on the door edge.



07/14/97 f720218

The arrows indicate the location of T25 Torx screws (there are 21 in all).

1. Zee Bracket

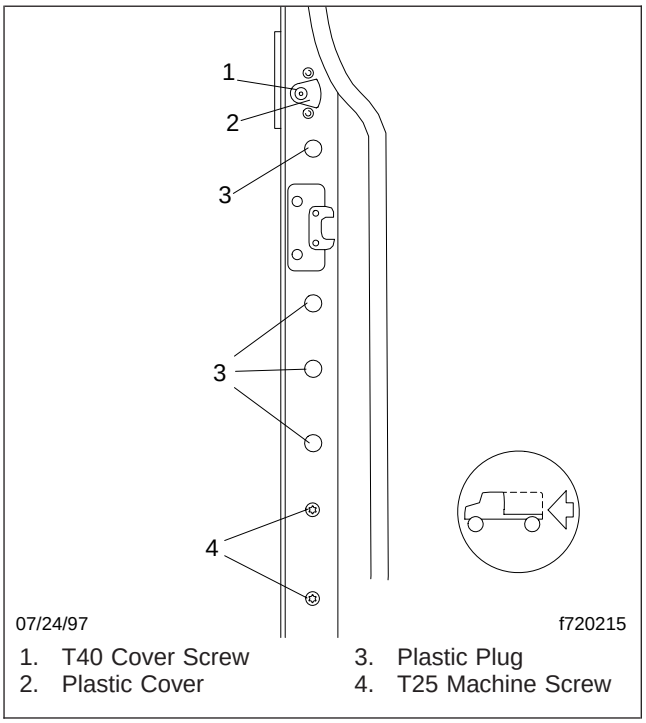
Fig. 5, Inner Door Panel Fasteners

   - 9.4 Remove all exposed screws on the front and rear of the door.
10. Lift the inner door panel up and over the door-lock button. Rest the panel on the edge of the door frame, using the zee bracket at the bottom of the panel.
11. Disconnect the door handle assembly. On manual door locks, tie the interior handle rod up and out of the way; see **Fig. 7**.
12. Disconnect the door electrical connectors (door harness, speakers, mirror switch harness, as installed). Loosen cables as necessary; see **Fig. 8**.
13. Lift the inner door panel out and remove it from the door.

Installation

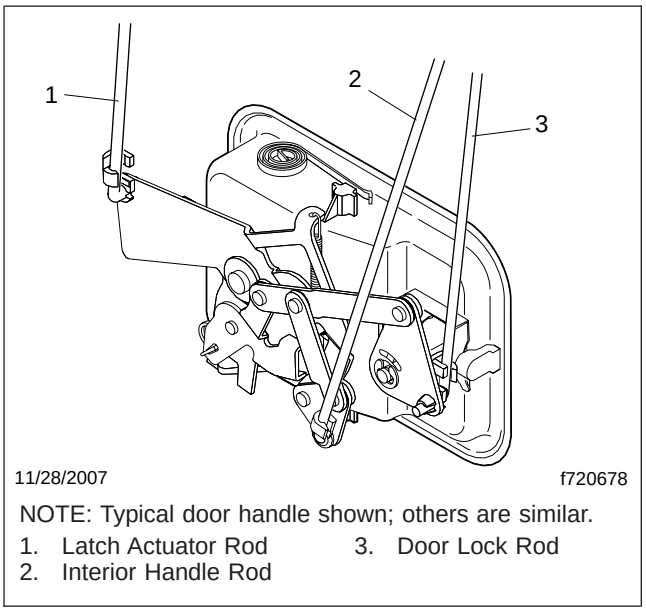
IMPORTANT: Make sure the interior handle rod is up and out of the way.

Inner Door Panel Removal and Installation



1. T40 Cover Screw
2. Plastic Cover
3. Plastic Plug
4. T25 Machine Screw

Fig. 6, Fasteners on Rear Edge of Door



NOTE: Typical door handle shown; others are similar.

3. Window Switches
4. Express Module
5. Mounting Bracket
6. Mid-Range Speaker
7. Inner Door Panel
8. Tweeter Speaker
9. Mirror Switch Harness

Fig. 8, Door Electrical Wiring (typical)

2. Connect the door handle assembly.
3. Attach all electrical connectors, as removed.
   - 3.1 Wrap tape on exposed connectors as needed.
   - 3.2 Feed any loosened cables into the door panel.
   - 3.3 Pack no-rattle foam into any empty spaces around the connectors.

CAUTION

It is possible to pinch fingers when moving the power window up and down.

- 3.4 Briefly press down the window switch and check that the window moves up and down easily, with no binding or slippage.

4. Install the inner door panel on the door as follows.

Inner Door Panel Removal and Installation

4.1 Attach two machine screws finger-tight, to loosely attach the inner door panel.

4.2 Check the panel all the way around the door for good seating and proper alignment.

NOTE: It may be helpful to use a magnetic screwdriver bit when installing these screws.

4.3 Install the five recessed machine screws on the door edge.

4.4 Install the rest of the machine screws and washers, as removed.

4.5 Tighten all machine screws 60 lbf·in (680 N·cm).

4.6 Install the plastic plugs and cover, as removed.

5. Install the lift channel nuts on the studs on the window lift channel. Tighten them 70 lbf·in (800 N·cm).
6. Install the window crank, if equipped with manual windows. Tighten the window crank screw 60 lbf·in (680 N·cm).
7. Install the door seal as removed; see **Subject 190**. Take care not to bend the seal in a tight radius.
8. Install the lower door trim panel (door pocket panel). Make sure it is firmly attached and not loose on either side.
9. Install the long door-panel retainer bolt through the mirror bracket from the outside of the cab. Tighten it 15 lbf·ft (20 N·m). Install the mirror bracket cover; see **Section 60.06, Subject 110**.

General Information

A newly installed door assembly must be adjusted for correct up-and-down, fore-and-aft, and in-and-out position relative to the door frame. The door assembly should also be adjusted whenever one or more of the following conditions exist (providing the door seal is correctly installed and is in good condition):

- wind or water leaks at the door frame
- premature wear of the door seal
- hard closing or opening of the door

The cab portion of the hinge has oversized holes. When the bolts that attach the hinge to the cab are loosened, the door can be adjusted forward or aft, and up and down within the door frame. The slotted holes along the door portion of the hinge area allow for in-and-out adjustment of the door.

Up-and-Down, Fore-and-Aft Adjustment

From outside the cab, check the alignment of the door with the cab door frame. The spaces around the top of the door should be uniform. If they are not, adjust the door.

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Remove three A-pillar covers (inner, outer upper, and outer lower-cowl) to provide access to the cab side of the door hinge.
3. Mark both the vertical and horizontal positions of the latch striker pin and the hinge before loosening them for adjustment. This will greatly simplify the procedure.
4. Using a no. 50 Torx® recess driver, loosen the striker pin, then tighten it finger-tight.
5. Loosen the bolts that attach the hinge to the cab door frame, but keep them tight enough to prevent unintentional hinge movement.
6. Carefully close the door, then raise or lower it until the space across the top is uniform.
    - The gap across the top should be about 3/8 inch (10 mm).
    - The gap at both the front and rear vertical edges of the door should be within 5/16 inch (8 mm).
7. Without disturbing the position of the hinge or striker pin, carefully open and support the door, then tighten the hinge bolts. Tighten the striker pin enough to hold it in place temporarily.
8. Install the three A-pillar covers, (outer lower-cowl, outer upper, and inner).
9. Follow the instructions in "Striker Pin Adjustment" below to correctly align and torque the striker pin.

In-and-Out Adjustment

The outer surface of the door should be flush with the surface of the cab skin at *both* its front and rear edges. If either edge is offset from the cab skin by more than ±5/64 inch (±2 mm), adjust the door.

Door Front Edge Adjustment

1. If the front edge of the door needs adjusting, with the tires chocked, mark the vertical and horizontal positions of the hinge before loosening them for adjustment. This will greatly simplify the procedure.
2. Loosen the bolts that attach the hinge to the door frame, but keep them tight enough to prevent unintentional hinge movement.
3. Carefully close the door. Move the front edge of the door in or out until its outer surface is flush, within ±5/64 inch (±2 mm), with the surface of the cab skin. Be careful not to disturb the up-and-down adjustment.
4. Without disturbing the positions of the hinge, carefully open and support the door, then tighten the hinge bolts.

Door Rear Edge Adjustment

1. If the rear edge of the door needs adjusting, with the tires chocked, mark the vertical and horizontal positions of the latch striker pin before loosening it for adjustment.
2. Loosen the striker pin, then tighten it finger-tight.
3. Carefully close the door. Move the rear edge of the door in or out until its outer surface is flush,

Door Adjustment

within ±5/64 inch (±2 mm), with the surface of the cab skin. Be careful not to disturb the up-and-down adjustment.

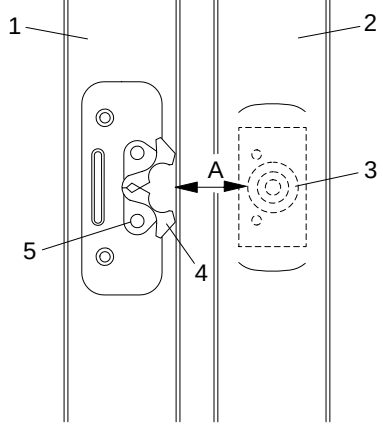
4. Without disturbing the position of the striker pin, carefully open the door and tighten the striker pin enough to hold it in place temporarily.
5. Follow the instructions in "Striker Pin Adjustment" below to correctly align and torque the striker pin.

Striker Pin Adjustment

For secure door closure, check the alignment of the latch jaws and striker pin even if the striker pin was not loosened.

1. With the tires chocked, from outside the cab, partially close the door until the latch jaws are about 1 to 2 inches (25 to 50 mm) from the striker pin. See **Fig. 1**. Check the alignment of the latch jaws and the striker pin.
   - In the up-and-down direction, the center of the latch must be level with the horizontal centerline of the striker pin.
   - Side-to-side, the latch jaws must contact the shaft of the striker pin so that when the door is closed, no part of the latch contacts the striker pin's outer flange or the conical washer. See **Fig. 2**.
2. As you close the door, check the movement of the door. It should not move up or down when the latch jaws engage the striker pin.
3. If the door latch does not engage correctly, adjust the striker pin. Using a no. 50 Torx® recess driver, loosen the striker pin and reposition it as required. If the striker pin needs to extend farther out from the door frame, add additional conical washers between the striker pin and the door frame.

   Add only enough conical washers to allow correct engagement of the latch jaws around the striker pin shaft. Too many washers create interference between the striker pin washers and the capscrews on the latch assembly.
4. Repeat the above steps, as needed, until the striker pin contacts the middle of the latch rotors (jaws). When the striker pin is positioned correctly, tighten it 18 to 32 lbf·ft (24 to 43 N·m).



A. Check alignment with door latch jaws about 1–2 inches (25–50 mm) from striker pin.

1. Door Edge
2. Door Frame

2. Door Latch Jaws
3. Striker Pin Shaft
4. Door Frame
5. Striker Pin Inner Flange
6. Conical Washer(s)

Fig. 2, Correct Latch Jaw Position on Striker Pin

5. Carefully close the door to the fully latched position (second click). From outside the cab, check the in-and-out, fore-and-aft, and up-and-down position of the door.
6. Remove the chocks from the tires.

Door Window Removal and Installation

Removal

WARNING

WARNING: Use care when working around or handling glass. Wear protective gloves and protective eyewear to eliminate the possibility of personal injury resulting from accidentally breaking or splintering the glass.

1. Apply the parking brakes. Lower the window glass.
2. For hand crank windows, remove the crank arm from the regulator assembly mounting spindle by removing the screw and carefully pulling the crank straight off the shaft.
3. Remove the inner door panel. See **Fig. 1**. For instructions, see **Subject 110**.
4. Remove the lower glass guide by removing two screws at the base of the guide and a bolt at the top.

IMPORTANT: Wear rubber gripper gloves during the removal of the window glass to ensure a secure grip on the glass.

5. If the window glass is not shattered, carefully remove the window glass and window lift channel assembly.

   Lean the window glass so that it is outside the window channel of the wing window mounting bracket, then carefully lift out the window glass assembly. If the window is broken, go to the next step.
6. Wearing protective gloves, remove all accessible shattered glass. Then, remove the window lift channel.

   Using a narrow extension accessory, vacuum out small glass fragments that may have fallen to the bottom of the door frame through the space behind the exterior door handle access cover attached to the inner panel. Failure to remove the glass fragments could cause plugged drain holes at the bottom of the door frame.
7. If necessary, remove the window glass-run channels. If the window glass was shattered, inspect the glass-run channels for cuts. Replace the glass-run channels, if damaged.
8. If the wing window assembly must be replaced, remove the fasteners that attach the window assembly to the door frame. Remove the window glass-run channel from the wing window.Remove the wing window assembly.

Installation

IMPORTANT: If the wing window assembly has been removed, carefully follow the first two steps below. Proper installation of the wing window seal will prevent water leaks from occurring when the vehicle is later placed in service.

If the wing window assembly has not been removed, skip the first two steps below.

1. Seat the wing window assembly in the door frame. Tilt the lower wing window guide toward the hinge. Make sure that the bottom seal flap on the outside of the door overlaps the belt rail (**Fig. 2**). The flap does not go under the belt rail.
2. Make sure that the flaps of the wing window side seal overlap onto the outside and inside surfaces of the door frame. If the seal flaps come between the door frame and the ventilator window mounting bracket, the holes for the panhead screws will not line up.

   Check the position (squareness) of the wing window in the door frame. The window channels should be parallel to one another, or binding of the window glass will occur as the window is raised. If necessary, adjust the position of the wing window. Tighten the panhead screws securely.
3. Carefully place the window glass assembly inside the door.

CAUTION

CAUTION: Failure to wear rubber gripper gloves while installing the window glass in the door could result in the glass slipping out of your hands and breaking.

IMPORTANT: Wear rubber gripper gloves when installing the window glass. Usually, service operations performed on the door will be done while the door is in a vertical position (that is,

11. Grab Handle

Fig. 1, Cab Door Assembly, Exploded View

attached to the vehicle). Because of this, you will need a secure grip when handling the glass.

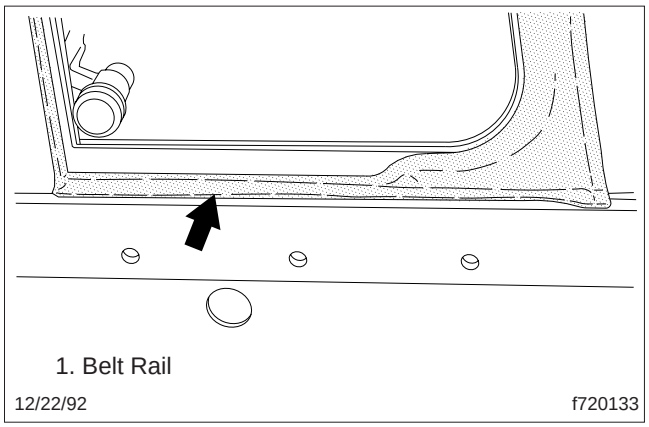
4. Install the window glass assembly in the window channel as follows:

4.1 Position the bottom (hinge side) corner of the window glass on the window stop block.

4.2 Position the top (hinge side) area of the window glass so that it is inside the win-

dow channel of the wing window mounting bracket. **See Fig. 2.**

4.3 Pull up on the top (latch side) corner of the window glass. As the top edge of the window is pulled up into a horizontal position, the bottom (latch side) corner of the window lift assembly will seat in the channel. See **Fig. 3**.



1. Belt Rail

12/22/92 f720133

B. Pull up
1. Window Glass
2. Glass Run Channel

Fig. 3, Window Glass Installation

4.4 Tilt the lower wing window guide back to the vertical position. *Make sure that the guide remains in the vertical position.*

5. Install the lower glass guide by installing the two screws at the base and the bolt at the top.
6. Install the inner door panel. See **Fig. 1**. For instructions, see **Subject 110**.
7. Attach the crank arm to the regulator assembly mounting spindle. Test the window for up-and-down movement. Hard rolling usually means the window glass-run channels are not seated properly. Inspect the glass-run channels for seating.

Replacement

NOTE: The wing window glass can be replaced without disassembling the wing window mounting assembly.

IMPORTANT: Replacing the wing window mounting assembly requires the disassembly of most of the door assembly and mechanisms. See **Subject 120** for instructions.

1. Unlatch and open the wing window. **See Fig. 1.**

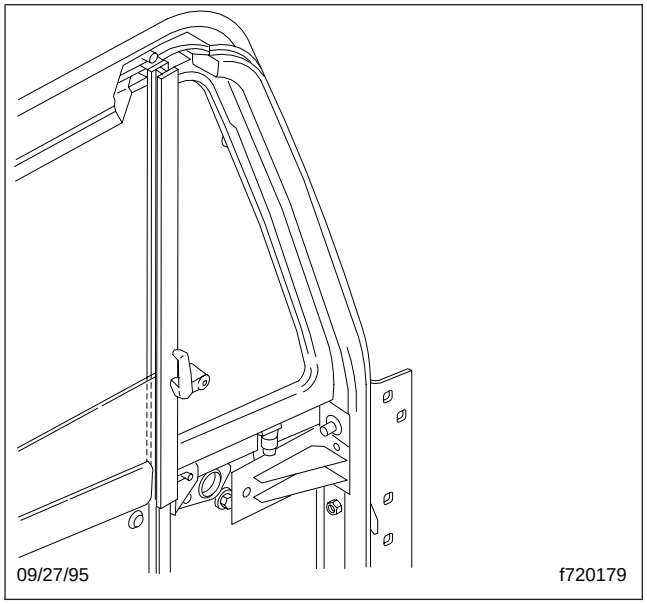

Fig. 1, Wing Window

2. Remove the window glass from the wing window assembly that is located inside of the wing window bracket.
3. Remove the window latch mounted to the glass by removing the roll pin, and then removing the nut.
4. Mount the window latch to the replacement glass.
5. Seat the window glass in the glass-run channel with rubber extrusion and adhesive.
6. Close the wing window and relatch.

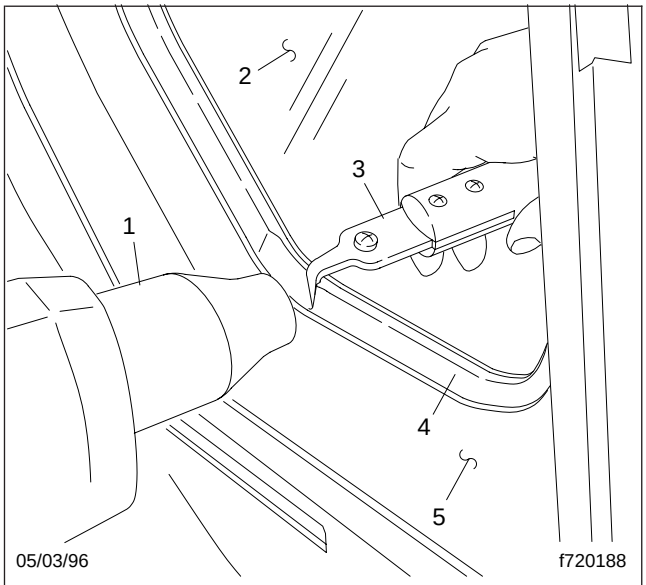
Lower Door Window Glass Replacement

Replacement

WARNING

WARNING: Use care when working around or handling glass. Wear protective gloves to eliminate the possibility of personal injury resulting from accidentally breaking or splintering the glass.

1. Park the vehicle on a flat surface. Shut down the engine, set the parking brake, and chock the tires.
2. Disconnect the batteries.
3. Remove the inner door panel. See "Inner Door Panel Removal and Installation" in **Subject 110** for instructions.
4. Loosen the window guide, if necessary.
5. Disconnect and move aside all electrical connections.
6. Remove the window (rubber) trim edge from between the window glass and the outer door panel.
7. Using a pull knife and a hand-held heat gun, loosen the window glass adhesive. From the inside of the door, heat the adhesive attaching the window glass to the inside of the outer door panel while simultaneously loosening the adhesive with the pull knife. See **Fig. 1**.
8. Remove the window glass.
9. Clean the surfaces of the window glass and the window opening in the door.
10. Mount double-sided tape to the edges of the replacement window glass.
11. Position the glass correctly, remove the tape covering, and then press the glass firmly around the edges to "set" the tape.
12. Insert the window (rubber) trim edge between the window and the door.
13. Connect all electrical connections, if necessary.
14. Install the inner door panel. See "Inner Door Panel Removal and Installation" in **Subject 110** for instructions.
15. Connect the batteries.



1. Heat Gun
2. Window Glass
3. Pull Knife
4. Adhesive
5. Door

16. Remove the chocks from the tires.

Power Window Regulator

Removal

1. Apply the parking brakes and chock the tires.
2. Remove the interior door panel, with the regulator and window glass installed; see **Subject 110**.
3. Disconnect the door harness from the pigtail connector on the regulator motor; see **Fig. 1**.
4. Remove the cable clip from the pigtail connector.
5. Remove the two 10–24 machine screws from the upper mounting bracket.
6. Remove the regulator from the interior door panel, taking care not to bend the regulator shaft.

Installation

IMPORTANT: Before attempting to install the regulator, make sure the window glass is still supported from underneath and the window is rolled down.

1. With the tires chocked, position the regulator body, the regulator shaft, and upper mounting bracket on the interior door panel; see **Fig. 1**. Make sure all the fastener holes line up properly. Take care not to bend the regulator shaft.

IMPORTANT: Make sure the interior handle rod, if installed, is up and out of the way, and between the trim panel and the regulator shaft.

2. Install the upper mounting bracket on the inner door panel, using the two 10–24 machine screws, as removed.
3. Connect the door harness to the pigtail connector on the regulator motor.
4. Attach the cable clip to the pigtail connector.
5. Install the interior door panel, with the regulator and window glass, on the door; see **Subject 110**.

Manual Window Regulator

Removal

1. Apply the parking brakes and chock the tires.
2. Remove the interior door panel, with the regulator and window glass installed; see **Subject 110**.
3. Remove the two 10–24 machine screws from the face plate on the window crank; see **Fig. 2**.
4. Remove the spring clip from the regulator body.
5. Remove the two 10–24 machine screws from the upper mounting bracket.
6. Remove the regulator from the interior door panel, taking care not to bend the regulator shaft.

Installation

IMPORTANT: Before attempting to install the regulator, make sure the window glass is still supported from underneath and the window is rolled down.

1. With the vehicle tires chocked, position the regulator body, regulator shaft, upper mounting bracket, worm gear, and face plate on the interior door panel; see **Fig. 2**. Make sure all the fastener holes line up properly. Take care not to bend the regulator shaft.

IMPORTANT: Make sure the interior release rod, if installed, is up and out of the way.

2. Install the spring clip on the regulator body.
3. Install the face plate on the interior door panel using the two 10–24 machine screws, as removed.
4. Install the upper mounting bracket on the interior door panel using the two 10–24 machine screws, as removed.
5. Install the interior door panel, with the regulator and window glass, on the door; see **Subject 110**.
6. Install the window crank and check that the window moves up and down easily, without binding or slippage.

Window Regulator Removal and Installation

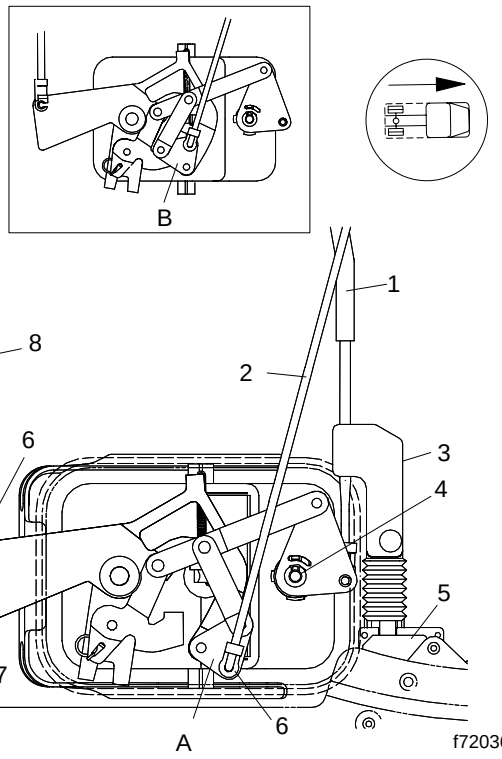
Exterior Door Handle and Rods Replacement

General Information

Century Class vehicles may have either of two different exterior door handle assemblies installed: one assembly is designed for a nonadjustable, one-piece interior handle rod (see **Fig. 1**), the other for an adjustable rod (see **Fig. 2**).



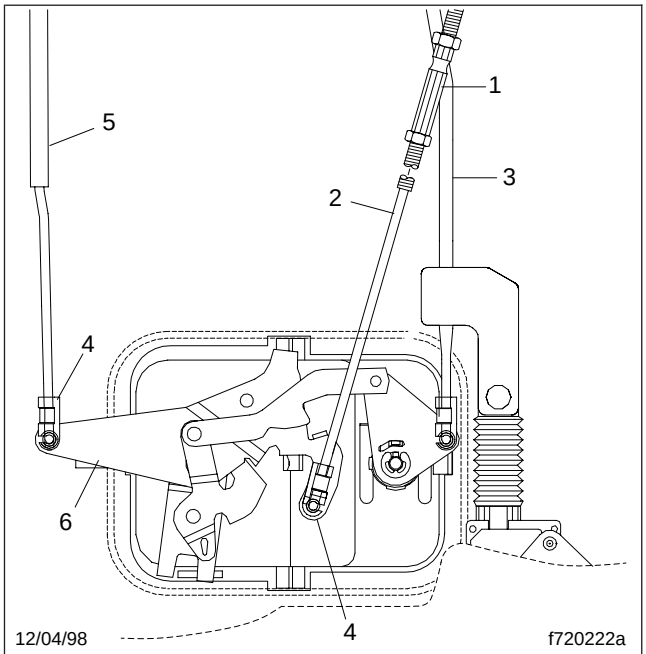
IMPORTANT: Rotate the top of the triangular link away from the paddle arm (interior handle rod in lowest position), as in A. Position B (interior handle rod in highest position) is incorrect.

NOTE: Inside view, LH door.

A. Correct orientation of triangular link.
B. Wrong orientation of triangular link.

1. Door Lock Rod
2. Interior Handle Rod
3. Electric Lock Actuator Bracket (option)
4. Snap Ring
5. Electric Lock Actuator (option)
6. Rod End Clip
7. Paddle Arm
8. Latch Actuator Rod

Fig. 1, Exterior Door Release Mechanism, Nonadjustable Rod



NOTE: Inside view, LH door.

1. Threaded Coupler with Jam Nuts
2. Interior Handle Rod
3. Door Lock Rod
4. Rod End Clip
5. Latch Actuator Rod
6. Paddle Arm

Fig. 2, Exterior Door Release Mechanism, Adjustable Rod

All new replacement door handle assemblies require a one-piece rod. A service kit is available for converting to the new design.

Control rods connect the latch, interior handle, and lock button to the door handle assembly. To avoid confusion, the names of the rods are listed below with other commonly used names shown in parentheses.

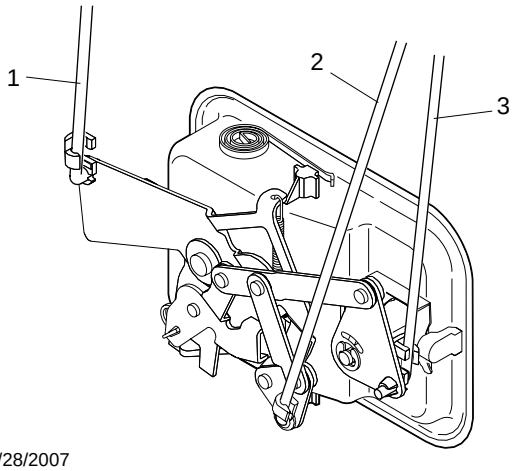
- Latch actuator rod (release latch rod)
- Interior handle rod (inner release rod)
- Door lock rod (lock button rod)

Handle Replacement

1. Apply the parking brakes and chock the tires.
2. Remove the window crank, if so equipped.
3. Remove the interior door panel; see **Subject 110**.

Exterior Door Handle and Rods Replacement

4. Reference the interior handle rod, latch actuator rod, and door lock rod attached to the door handle assembly. Release the lower ends of the rods from the clips on the door handle assembly; see **Fig. 3**.



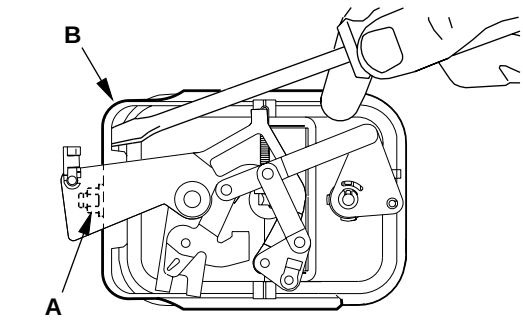
11/28/2007 f720678

NOTE: Typical door handle shown; others are similar.

1. Latch Actuator Rod
2. Interior Handle Rod
3. Door Lock Rod

Fig. 3, Door Handle (inside view)

5. Remove the retaining nut that secures the fastening clip to the door handle assembly; see **Fig. 4**.



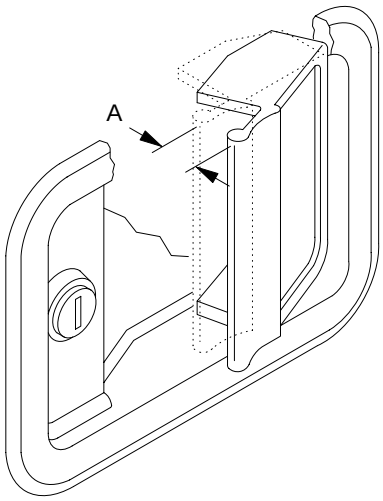
11/30/2007 f720679

NOTE: Typical door handle shown; others are similar.

A. Remove retaining nut from bolt.
B. Push the fastening clip free.

Fig. 4, Removing Exterior Door Handle Fastening Clip

6. Using a pry tool, such as a screwdriver, push the fastening clip to the side until it clears the door handle bolt; see **Fig. 4**. Be careful not to let the door handle assembly drop as the fastening clip is pushed out of place. Remove the door handle assembly. It may be necessary to remove the lock cylinder (two clips) to fit the handle assembly through the door cutout.
7. Position the new door handle assembly in the door, then slide the fastening clip in place (reverse the procedure used to remove it).
8. Install the lock cylinder, if necessary.
9. Install the retaining nut that secures the fastening clip to the door handle assembly; see **Fig. 4**. Tighten the nut securely.
10. As referenced earlier, attach the lower ends of the interior handle rod, latch actuator rod, and door lock rod to the door handle assembly. Make sure the clips are locked in place.
11. With the cab door closed and unlocked, gradually pull on the paddle of the exterior door handle while measuring its travel. The paddle should move at least 3/8 inch (10 mm) before the door latch opens; see **Fig. 5**.



09/28/95 f720099a

A. Measurement: 3/8 inch (10 mm)

Fig. 5, Measurement of Paddle Travel

12. Make sure that the rod has been correctly installed by doing the following tests: Close the

latch jaws until they lock in place. Depress the lock button on the interior side of the door. Attempt to open the locked jaws using the exterior door handle. The jaws should not open. Attempt to open the locked jaws using the interior door handle. The jaws should open and the lock button should release. If adjustment is necessary, see **Subject 200**.

13. Attach the interior door panel; see **Subject 110**.
14. Install the window crank, if so equipped. Tighten the screw 60 lbf·in (680 N·cm).

Door Lock Rod Replacement

1. Apply the parking brakes and chock the tires.
2. Remove the window crank, if so equipped.
3. Remove the interior door panel; see **Subject 110**.
4. Release the lower end of the door lock rod from the clip on the door handle assembly; see **Fig. 3**.
5. Remove the lock rod from the door panel by pulling the bottom end down and out through the button hole, together with the door lock button, which is attached at the top end.
6. Install the door lock button on the new lock rod.
7. Install the lock rod in the interior door panel by inserting the end of the lock rod with the door lock button through the hole in the top of the interior door panel. Make sure the door lock rod is on the outboard side of the interior handle rod.
8. Attach the door lock rod to the door handle assembly; see **Fig. 3**. Make sure the clip is locked in place.
9. Install the interior door panel; see **Subject 110**.
10. Install the window crank, if so equipped. Tighten the screw 60 lbf·in (680 N·cm).

Interior Handle Rod and Latch Actuator Rod Replacement

NOTE: If you are replacing an adjustable interior handle rod with a nonadjustable, one-piece rod, you must also replace the door handle assembly and related components. The one-piece rod is not compatible with the old-style door handle assembly. A service kit is available for converting to the new design.

Use the following procedure only to replace an existing one-piece interior handle rod with a new one. To replace an adjustable rod, follow the service kit instructions.

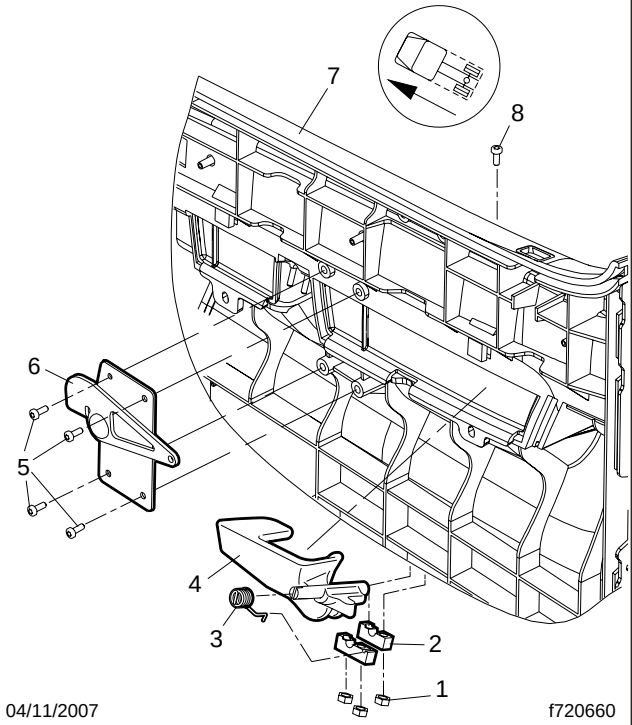
1. Apply the parking brakes and chock the tires.
2. Remove the window crank, if so equipped.
3. Remove the interior door panel; see **Subject 110**.
4. Remove the lower end of the interior handle rod by releasing the lower end from the clip on the door handle assembly; see **Fig. 3**. Remove the upper end from the clip on the bellcrank arm.
5. Remove the lower end of the latch actuator rod by releasing the lower end from the clip on the door handle assembly. Remove the upper end from the clip on the door latch.
6. Connect the upper end of the new latch actuator rod to the clip on the door latch, and the lower end to the clip on the door handle assembly; see **Fig. 3**.
7. Position the new interior handle rod between the door panel and the window regulator shaft. Make sure the interior handle rod is on the inboard side of the door lock rod. Connect the upper end of the rod to the clip on the bellcrank arm, and the lower end to the clip on the door handle assembly. Make sure that the clips are securely snapped on the the rod.
8. Install the interior door panel; see **Subject 110**.
9. Install the window crank, if so equipped. Tighten the screw 60 lbf·in (680 N·cm).

Inner Door Handle Replacement

Replacement

NOTE: Tighten all fasteners 35 lbf·in (400 N·cm).

1. Apply the parking brakes and chock the tires.
2. Remove the interior door panel; see **Subject 110**.
3. Lay the door panel on a clean, smooth work surface, with the inner side up.
4. Remove the four screws that secure the bell crank assembly to the interior door panel; see **Fig. 1**. Remove the bell crank assembly and interior release rod.
5. Remove the three interior door handle nuts; see **Fig. 2**.

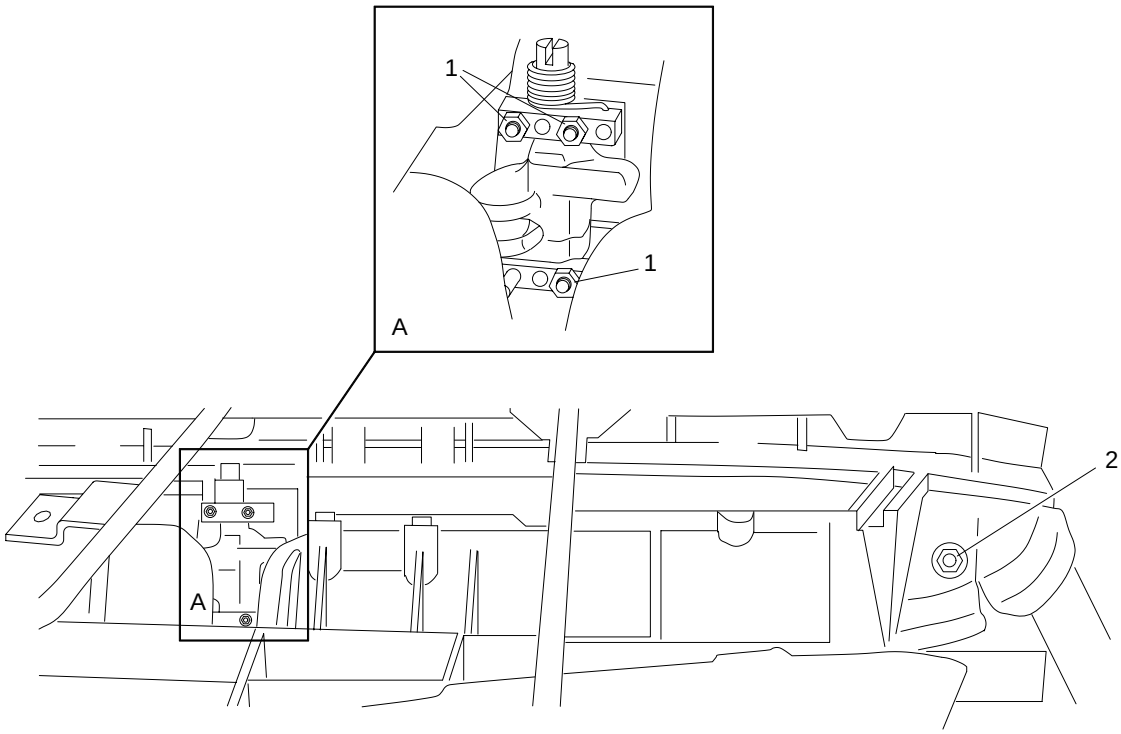


1. Nut
2. Handle Retainers
3. Door Handle Return Spring
4. Inner Door Handle
5. Screws
6. Bell Crank Assembly
7. Inner Door Panel
8. Retainer Screw

Fig. 1, Bell Crank Assembly and Inner Door Handle Installation

6. Remove the armrest support nut. Remove the arm rest.
7. Remove the interior door handle return spring.
8. From the outer side of the panel, remove the Torx® screw that secures the handle to the door panel; see **Fig. 3**. Remove the door handle.
9. Position a new handle on the door panel, and install the Torx screw on the outer side of the door panel; see **Fig. 3**.
10. Install the interior door handle return spring.
11. Install the armrest support nut; see **Fig. 2**. Install the armrest.
12. Install the interior door handle nuts.
13. Install the four screws that secure the bell crank assembly to the interior door panel; see **Fig. 1**. Install the bell crank assembly and interior release rod.
14. Install the interior door panel; see **Subject 110**.

Inner Door Handle Replacement



01/14/99 f720330

1. Interior Door Handle Nuts
2. Armrest Support Nut

Fig. 2, Door Handle and Armrest Fasteners

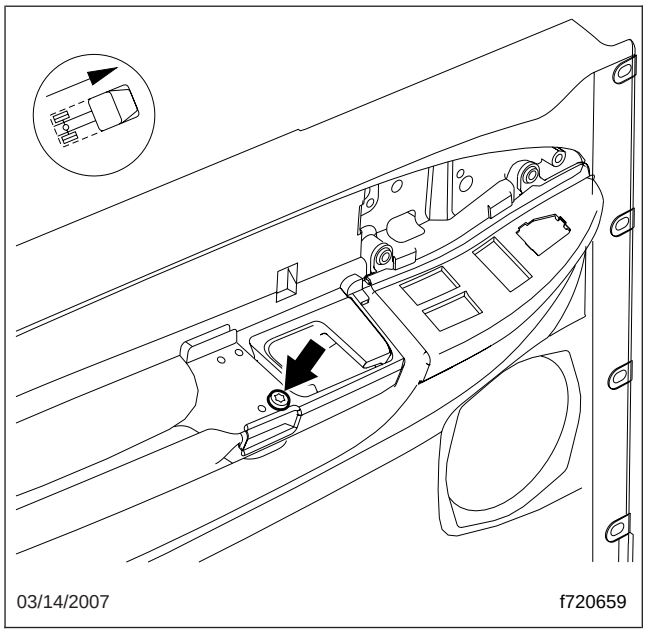


Fig. 3, Inner Door Handle Retainer Screw

Door Hinge Removal and Installation

Removal

1. Remove the door from the vehicle. For instructions, see **Subject 100**.
2. Remove the hinge from the door assembly.

Installation

1. Attach the hinge to the door assembly.
2. Install the door on the vehicle. For instructions, see **Subject 100**.
3. Adjust the door. For instructions, see **Subject 120**.
4. Some types of door hinges should not be lubricated. See **Group 72** of the *Century Class Trucks Maintenance Manual* to determine whether the hinge should be lubricated.

Replacement

1. Apply the parking brakes and chock the tires.
2. Remove the entire length of the seal from the channel that surrounds the upper door structure, as well as from the outer edge of the inner door panel.

NOTICE

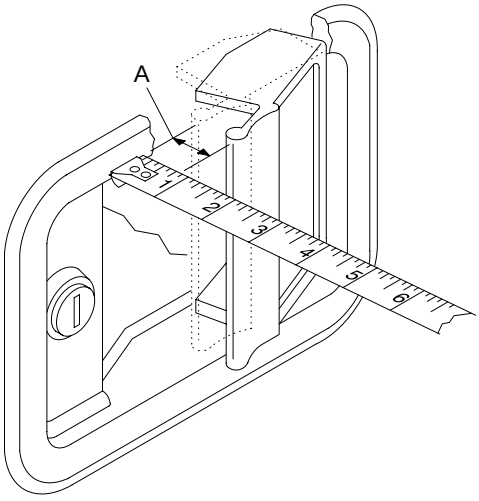
Do not stretch or bend the door seal in a tight radius during installation. To do so may reduce its sealing ability, which could result in water leaks.

3. Install the new door seal by pushing it firmly onto the channel, with the ends of the seal meeting at the bottom of the door, toward the front. Trim the seal to length as needed. Make sure the seal is pushed completely onto the channel all around the door. If necessary, use a rubber hammer to tap the seal into place. There should be no creases or buckles on the sealing surface.

Exterior Door Release Adjustment

1. Apply the parking brakes and chock the tires.
2. From outside the cab (with the cab entry door closed), place a tape measure or scale on the paddle handle chrome surround. Slowly pull the paddle handle. The horizontal measurement from the handle surround ridge to the inner finger-hold ridge on the inside of the paddle handle must be 3/8 to 13/16 inch (10 to 20 mm); see **Fig. 1**.

   If the movement of the exterior paddle handle is less than 3/8 inch (10 mm) before the door opens, the primary door latch releases too easily. If the measurement is more than 13/16 inch (20 mm), the primary door latch will be difficult to release from outside the cab. If the measurements are not within the specifications, adjust the linkage for the exterior release handle, as follows.

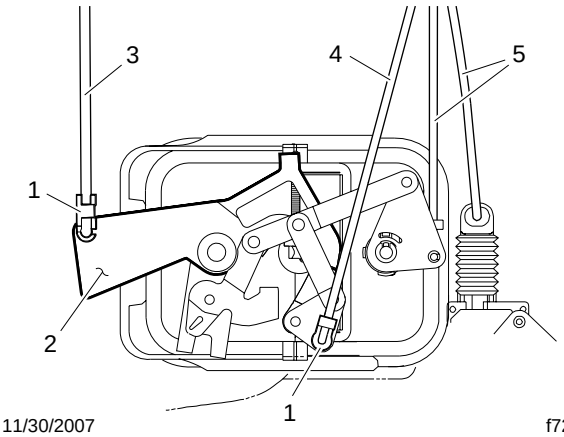


08/01/97 f720219

A. Door must open when handle is opened 3/8 to 13/16 inch (10 to 20 mm).

Fig. 1, Exterior Release Handle Measurement

3. Remove the interior door panel; see **Subject 110**.
4. Release the plastic clip and pull the latch actuator rod from the plastic bushing in the paddle arm of the exterior release handle; see **Fig. 2** or **Fig. 3**. Allow the latch actuator rod to hang freely near the paddle arm.



11/30/2007 f720677

1. Plastic Bushing with Clip
2. Paddle Arm
3. Latch Actuator Rod
4. Interior Handle Rod
5. Door Lock Rod

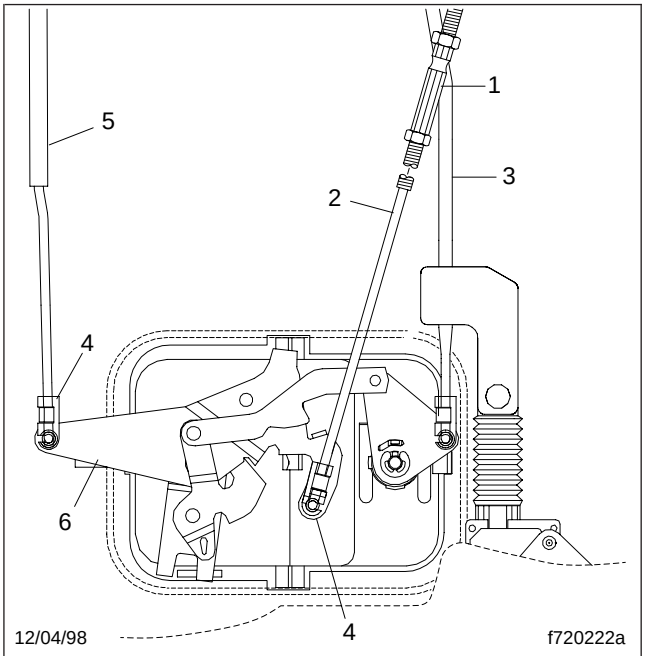
Fig. 2, Exterior Door Release Mechanism (vehicles with a non-adjustable interior door release)

5. The end of the latch actuator rod must be slightly below the hole in the plastic bushing in the paddle arm. Bend or straighten the latch actuator rod until the end is 1/8 inch (3 mm) below the hole. Make sure that the rod is aligned so that the door structure or the inner panel cannot interfere with the operation of the latch actuator rod.
6. Insert the latch actuator rod into the plastic bushing and rotate the plastic bushing to snap the clip onto the rod.
7. Make sure that the cab door opens correctly when the exterior paddle handle is pulled.
8. Install the interior door panel; see **Subject 110**.
9. Check that the rod does not rub or rattle against the inner door panel or door structure.

Interior Door Release Adjustment

NOTE: The following procedure applies to pre-2002 vehicles that are equipped with an adjustable interior release rod. If the interior release

Door Handle Adjustment



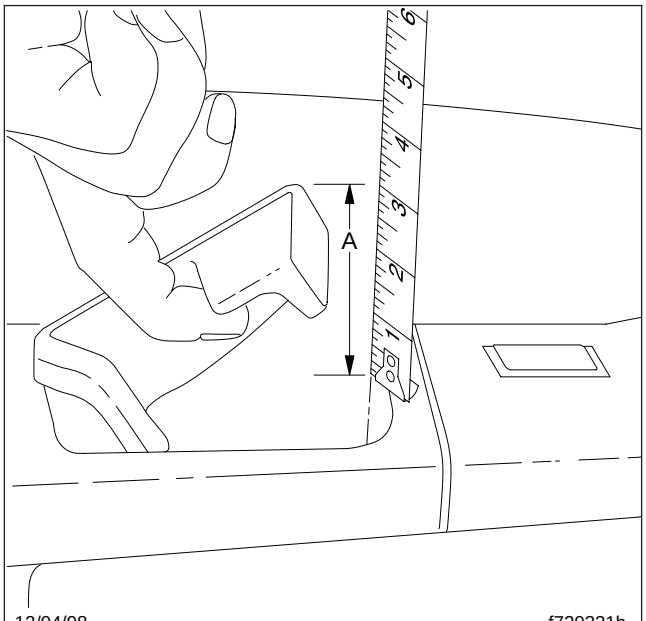
1. Threaded Coupler with Jam Nuts
2. Interior Handle Rod
3. Door Lock Rod
4. Plastic Bushing with Clip
5. Latch Actuator Rod
6. Paddle Arm

Fig. 3, Exterior Door Release Mechanism (vehicles with an adjustable interior door release)

rod does not have a threaded coupler, it is not adjustable; see **Fig. 2** (non-adjustable interior release rod) and **Fig. 3** (adjustable interior release rod).

IMPORTANT: Before checking the interior release handle adjustment, make sure that the exterior handle releases within the specified range, as described in the above procedure.

1. Apply the parking brakes and chock the tires.
2. With the cab entry door open, manually close the striker jaws to a fully closed position.
3. Place a tape measure vertically on the armrest, just forward of the interior release handle. Slowly pull up on the interior handle. The vertical measurement from the surface of the armrest to the top of the handle forward edge radius should be between 1-1/2 and 3 inches (38 and 76 mm) when the striker jaws snap open; see **Fig. 4**.



A. Door must open when handle is lifted 1-1/2 to 3 inches (38 to 76 mm).

Fig. 4, Interior Release Handle Measurement

4. If the striker jaws open with less than 1-1/2 inches (38 mm) of interior handle movement, the primary door latch releases too easily. If the measurement is more than 3 inches (76 mm), the primary latch will be difficult to release from inside the cab. This maladjustment could also cause the door lock to unlock if there is an impact to the outside of the door. Adjust the linkage for the interior release handle as follows if the measurements are not within the specifications.
5. If the interior release mechanism is out of adjustment, open the door and remove the cover located on the inner surface of the map pocket. This cover is retained by Velcro pads and can be removed by pulling at the top edge of the cover.
6. Lift the interior release handle and place a wood block under it, so that the handle is held up at the height specified in **Fig. 4**.
7. Loosen the two jam nuts on the threaded coupler for the interior release rod; see **Fig. 5**. Note that the lower jam nut has left-hand threads.
8. Close the latch striker jaws with your fingers; see **Fig. 6**. If the striker jaws will not stay closed with the wood block in place, turn the threaded cou-

2. Threaded Coupler
3. Inner Door Panel

Fig. 5, Threaded Coupler for Interior Handle Adjustment

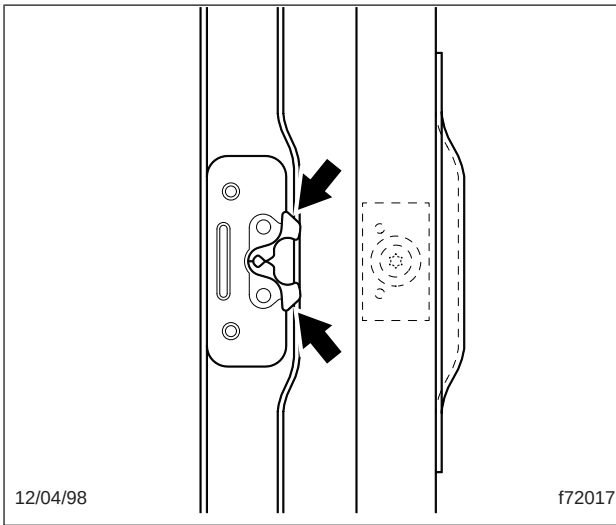

Fig. 6, Latch Striker Jaws

pler clockwise (looking from the top) to lengthen the rod. Manually close the latch jaws.

9. Turn the threaded coupler counterclockwise (looking from the top) until the striker jaws just open. Use your fingers to tighten the jam nuts with the threaded coupler in this position.
10. Tighten the jam nuts on the threaded coupler to 35 lbf·in (400 N·cm). Remove the wood block from underneath the interior handle, then check that the door releases when the handle is lifted between 1-1/2 and 3 inches (38 and 76 mm).
11. Install the trim cover in the map pocket of the door.

Specifications

For fastener torque values, see **Table 1**.

For a schematic of the electric windows on vehicles built before January 10, 1997, see **Fig. 1**. For a schematic of the electric windows on vehicles built from January 10, 1997, see **Fig. 2**.

For a schematic of the power door locks, see **Fig. 3**.

For a drawing of the main cab overlay harness, see **Fig. 4**.

For a drawing of the left-hand door harness, see **Fig. 5**.

For a drawing of the right-hand door harness, see **Fig. 6**.

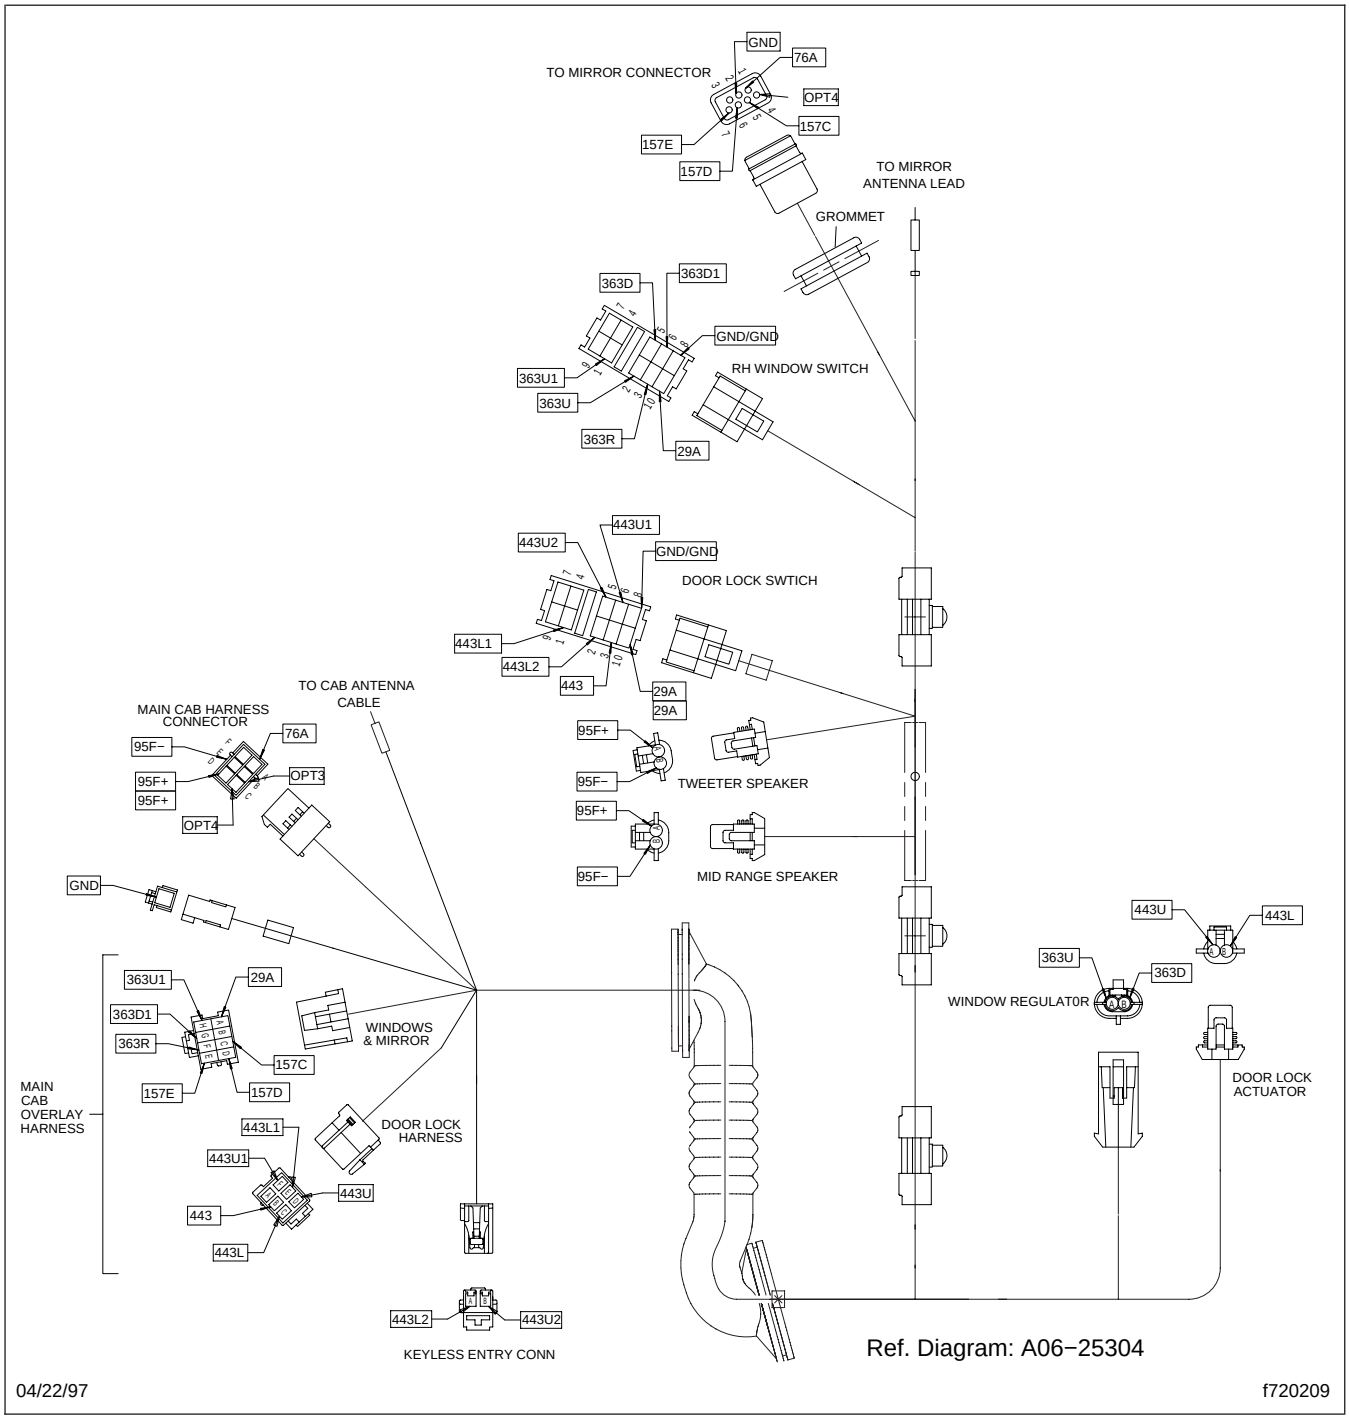

Fig. 6, Right-Hand Door Harness

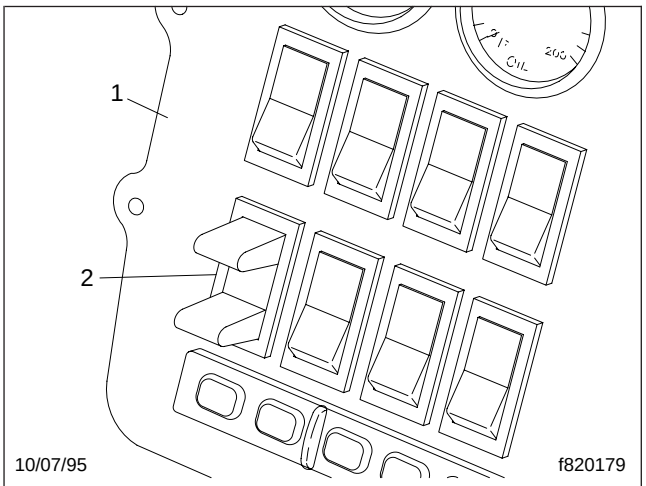
This information applies only to a Century Class Conventional built before March 2000.

General Information

The windshield wipers and washers are operated by a double-paddle switch mounted on the auxiliary instrument panel; see **Fig. 1**. Each paddle can be pushed in, up, or down, for three different functions. For wiper switch functions and operation, see **Fig. 2**.



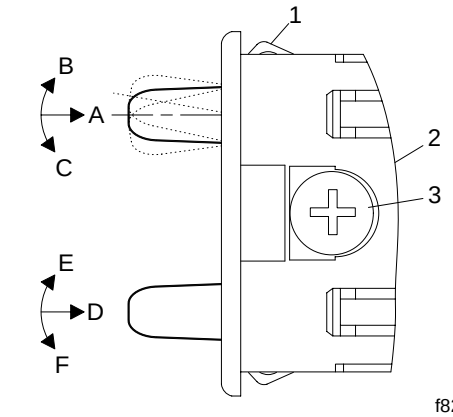
1. Auxiliary Instrument Panel
2. Wiper/Washer Switch

Fig. 1, Wiper/Washer Switch

The wipers have five cycles: fast, slow, mist, wash, and delay. There are six delay intervals, 3 seconds, 5 seconds (default fast), 8 seconds, 12 seconds, 17 seconds (default slow), and 23 seconds.

The top paddle, when pushed in, turns the wipers on (if they are off) or off (if they are on). When pushed up, the top paddle switches the wipers to high speed; when pushed down, it switches them to low speed.

The bottom paddle, when pushed in momentarily (for less than 1/2 second), turns the wipers on mist (one dry cycle at low speed). When pushed in and held in (for at least 1/2 second), the bottom paddle turns on the washers for a minimum of three cycles after release. For more wash cycles, hold the bottom paddle in longer (but it will always cycle three more times after release).



A. Push in to turn wipers on (low speed) or off.
B. Push up for high speed.
C. Push down for low speed.
D. Push in momentarily for mist cycle. Push in and hold in for wash cycle.
E. Push up for fast delay. If already in delay, push up for the next faster delay.
F. Push down for slow delay. If already in delay, push down for the next slower delay.

1. Locking Clip
2. Wiper/Washer Switch
3. Light Bulb Screw

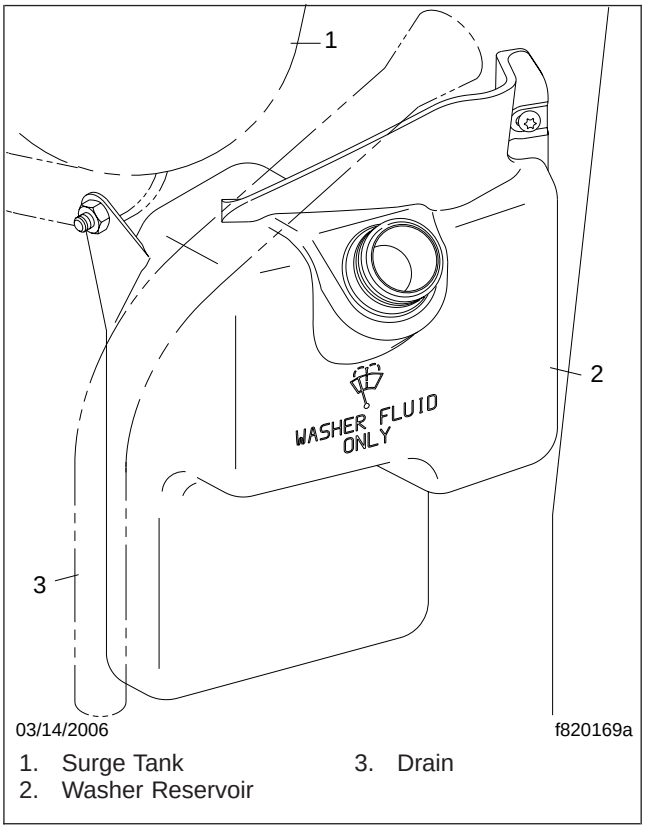
Fig. 2, Wiper/Washer Switch Operation

Pushing **the bottom paddle** up or down controls the delay cycle of the intermittent wipers. If the wipers are not in delay, push up for default fast delay (5 seconds) or down for default slow delay (17 seconds). If the wipers are already in delay, push up for the next faster delay or push down for the next slower delay.

A single wiper motor powers both wipers. It is mounted on the left-hand side of the firewall underneath the washer reservoir. The electric wiper motor is a sealed unit packaged together with a weather seal and drive crank. It is not serviceable. If a wiper motor does not work because of internal problems, replace it.

The windshield washer reservoir (**Fig. 3**) is located on the left-hand side of the firewall between the surge tank and the hood. A pump located in a recess in the bottom of the reservoir supplies washer fluid to each wiper arm. A purge mechanism empties the lines after use to prevent fluid from freezing in the lines during cold weather.

General Information



1. Surge Tank
2. Washer Reservoir
3. Drain

Fig. 3, Windshield Washer Reservoir

Wiper Linkage Removal and Installation

This procedure applies only to a Century Class Conventional built before March 2000.

Removal

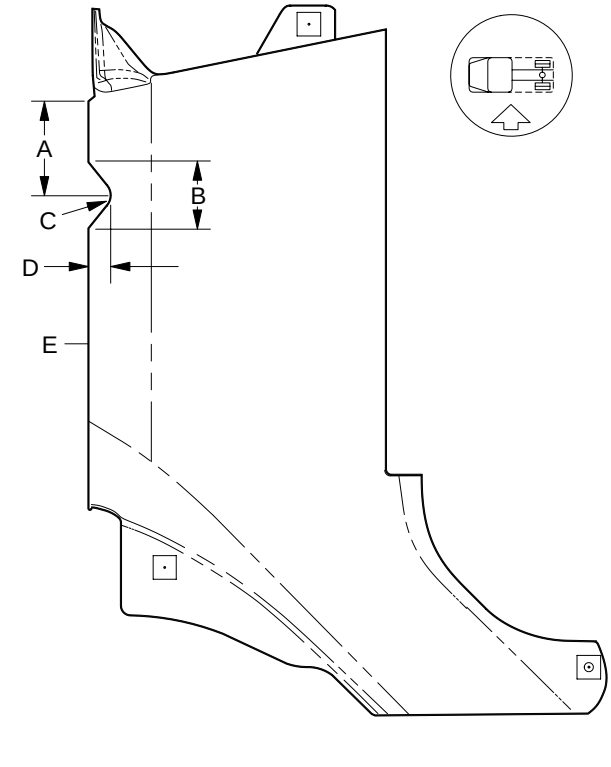
1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Check that the wiper blades are parked. If necessary, park them by turning the wipers on and then off.
3. Tilt the hood.
4. Disconnect the wiper motor electrical connector.

⚠ WARNING

Disconnect the wiper motor electrical connector before working on the wiper linkage. This will keep the windshield wiper motor from cycling. The motor could cycle if the wiper linkage driveshaft is forced out of the parked position, which could result in personal injury.

NOTE: Before performing this procedure, check for a small notch in the left-hand cowl side cover. If the notch is not there, remove the cover and cut a notch in it, as shown in **Fig. 1**.

5. Remove the hood guide bracket, as follows. See **Fig. 2**.
   - 5.1 Remove the 5/16–18 capscrew located in the notch in the cowl side cover.
   - 5.2 Remove the 3/8–16 bolt, nut, and two washers that attach the hood guide to the rain tray.
   - 5.3 Remove the 3/8–16 locknut that attaches the hood guide to the surge tank upper mounting bracket.
6. Remove the 3/8–16 locknut that attaches the fan switch to the surge tank lower bracket located on the outboard side of the tank. See **Fig. 3**.
7. Using a T40 Torx® screwdriver, remove the 5/16–18 machine screw at the bottom of the washer reservoir. Loosen the washer reservoir, but do not remove it.
8. Remove the surge tank upper bracket, and loosen (do not remove) the surge tank, as follows. See **Fig. 4**.



Notch the left-hand cowl side cover only.
A. 3-7/16 inch (87 mm)
B. 3-5/32 inch (80 mm)
C. 1-inch (25-mm) Radius
D. 1 inch (25 mm)
E. LH Cowl Side Cover

Fig. 1, Cowl Cover Modification, with Measurements

   - 8.1 Remove the two 5/16–18 machine screws that attach the aft end of the upper bracket to the cab front wall.
   - 8.2 Remove the two 3/8–16 locknuts that attach the surge tank to the forward end of the upper bracket.
   - 8.3 Partially remove the rain tray seal, then pull the studs on the forward end of the upper bracket out of the mounting holes in the surge tank, and remove the upper bracket from the vehicle.
9. Remove both wiper arms and washer hoses, as follows. See **Fig. 5**. For detail of the wiper arm lock, see **Fig. 6**.

Wiper Linkage Removal and Installation

side cover, and one screw is mounted near each of the two wiper mounting posts.

10.3 If so equipped, remove the surge tank hose mounting clip from the center of the rain tray.

10.4 Disconnect the washer fluid hose from the rain tray.

10.5 Slip the rain tray off the wiper posts and remove it from the vehicle.

11. Disconnect the conlink from the idler bar (see **Fig. 8**) and the drive pivot bracket (see **Fig. 9**), as follows.

11.1 Carefully separate the conlink from the idler bar ball stud. Remove the rubber bellows.

11.2 Carefully separate the conlink from the drive pivot bracket front ball stud. Remove the rubber bellows.

12. Separate the drive pivot bar from the drive pivot bracket rear ball stud. Remove the rubber bellows.

13. Remove the drive pivot bar from the drive crank by carefully separating the drive pivot bar from the drive crank ball stud. Remove the rubber bellows.

Installation

1. With the tires chocked, connect the drive pivot bar to the drive crank and drive pivot bracket, and line it up correctly, with the flange facing the wiper motor.

1.1 Fill a rubber bellows with grease and install it onto the drive crank ball stud.

1.2 Line up the drive pivot bar in a straight line with the drive crank (see **Fig. 9**), and snap it onto the drive crank ball stud.

1.3 Using the same procedure, install a rubber bellows filled with grease and snap the other end of the drive pivot bar onto the drive pivot bracket rear ball stud.

IMPORTANT: Be sure to install the linkage with the drive pivot bar and drive crank lined up correctly as shown in **Fig. 9**. Otherwise, the wipers will not park properly.

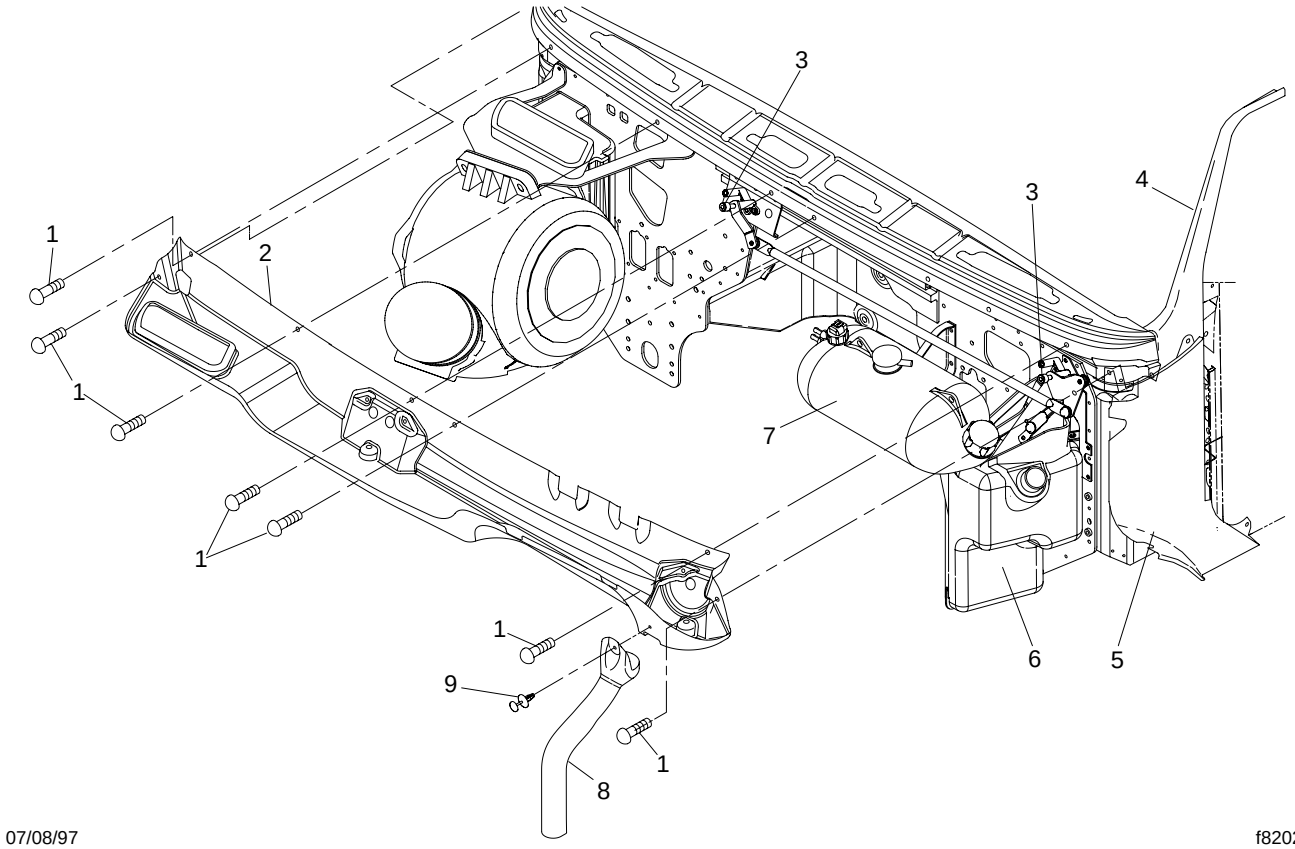
2. Connect the conlink to the idler bar (see **Fig. 8**) and drive pivot bracket (see **Fig. 9**), as follows.

2.1 Fill a rubber bellows with grease and install it onto the drive pivot bracket front ball stud.

2.2 Hold the conlink in place in front of the drive pivot bracket and snap it onto the drive pivot bracket front ball stud.

2.3 Using the same procedure, install a rubber bellows filled with grease and snap the other end of the conlink onto the idler bar ball stud.

Wiper Linkage Removal and Installation



The RH A-pillar and cowl side covers are not shown. They are similar to the LH side, but the RH cowl side cover has no notch in it.

1. Capscrew

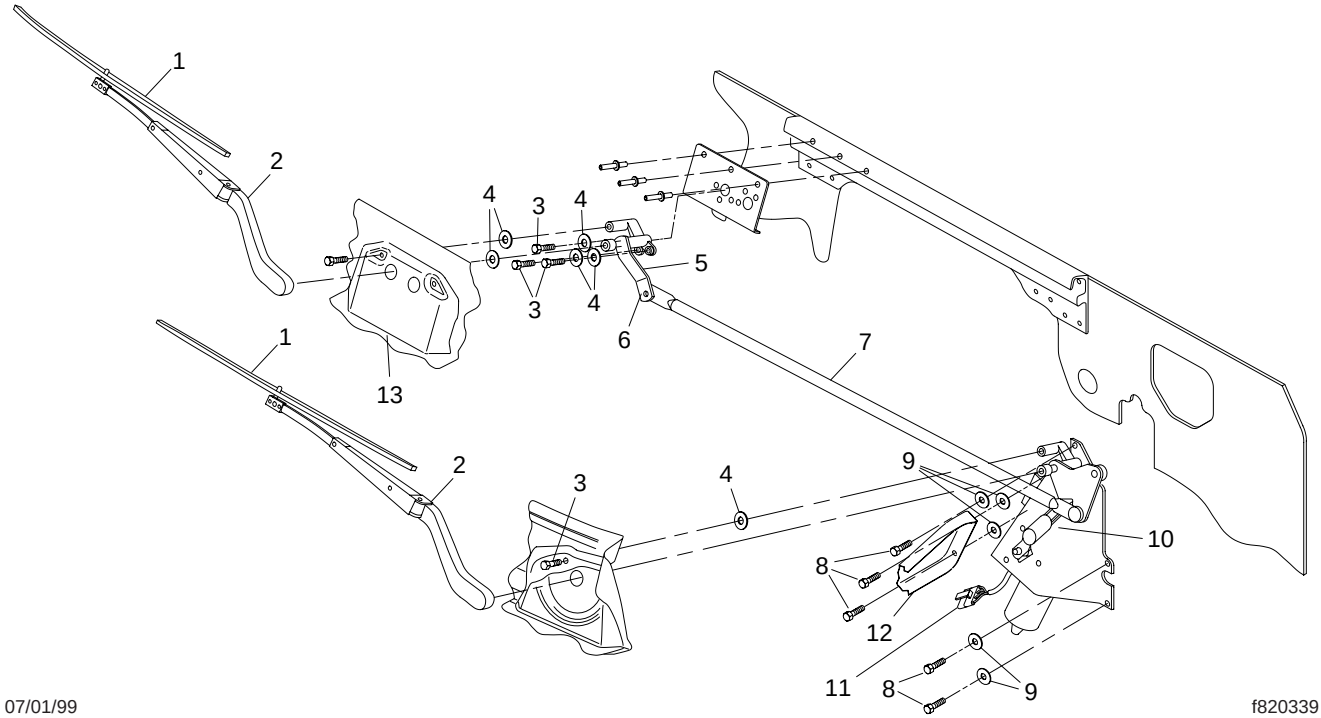
3. Wiper Post
4. A-Pillar Cover
5. Cowl Side Cover
6. Washer Reservoir
7. Surge Tank
8. Drain Tube
9. Plastic Rivet

Fig. 7, Rain Tray Removal

3. Install the rain tray and tighten the machine screws finger-tight. If necessary, insert a screwdriver under the window glass lower molding and pry it up and over the edge of the rain tray. See **Fig. 10**. Install the drain tube, using a new plastic rivet, if necessary.
4. Install the upper surge tank bracket over the rain tray and insert the studs on the forward end of the bracket into the holes at the top of the surge tank. Install all the fasteners and tighten them finger-tight.
5. Install the rain tray seal. If removed, install the fasteners and tighten them until firm.
6. Install the fan switch onto the stud on the surge tank lower bracket. Install the locknut and tighten it finger-tight.
7. Install the machine screw on the bottom of the washer fluid reservoir, as removed, and reposition the reservoir. Tighten all the fasteners finger-tight.
8. Install the hood guide, as follows.
   - 8.1 On the outboard side of the surge tank upper bracket, remove the 3/8–16 locknut and insert the hood guide onto the stud. Install the locknut over the hood guide and tighten it finger-tight.



1. Wiper Blade
2. Wiper Arm
3. Capscrew, 1/4–20
4. Washer, 1/4-Inch
5. Idler Bar
6. Idler Bar Ball Stud
7. Conlink
8. Capscrew, 5/16–18
9. Washer, 5/16-Inch
10. Wiper Drive Linkage Assembly
11. Electrical Connector
12. Surge Tank Lower Bracket (outboard)
13. Rain Tray (partial view)

Fig. 8, Wiper Linkage

8.2 Install the 3/8–16 bolt, nut, and washers that attach the hood guide to the rain tray, and tighten them finger-tight.

8.3 Install the 5/16–18 capscrew that attaches the hood guide to the A-pillar cover and cowl side cover. Tighten it finger-tight.

9. Tighten all the assembly fasteners to specifications, as follows.

9.1 Tighten the uncoated 5/16–18 machine screws on the rain tray and surge tank upper bracket 13 lbf·ft (18 N·m).

9.2 Tighten the 3/8–16 locknuts on the surge tank upper and lower brackets 23 lbf·ft (31 N·m).

9.3 Tighten the three fasteners on the washer reservoir 15 lbf·ft (20 N·m).

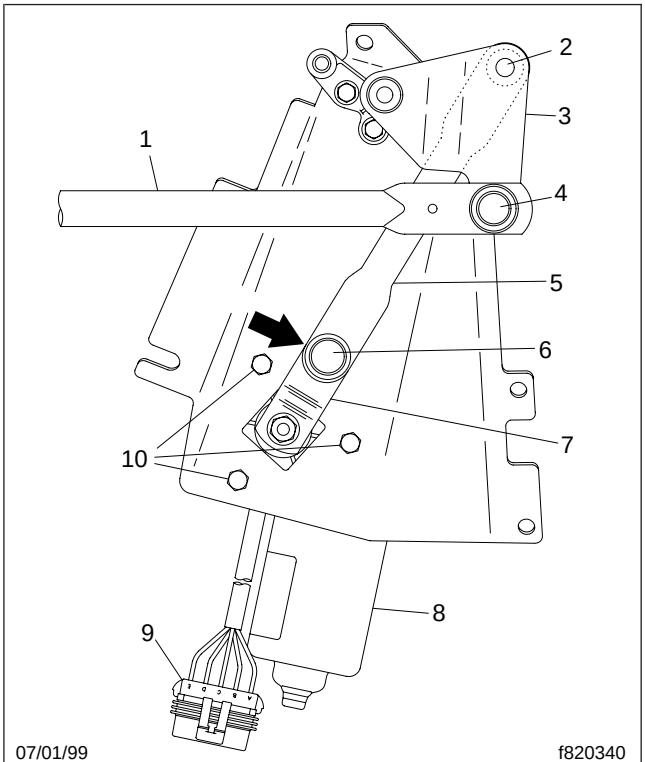
9.4 Tighten the 3/8–16 capscrew that attaches the hood guide to the rain tray 23 lbf·ft (31 N·m). Tighten the 5/16–18 capscrew that attaches the hood guide to the A-pillar cover and cowl side cover 15 lbf·ft (20 N·m).

9.5 If present, attach the surge tank hose mounting clip to the center of the rain tray.

10. Install both wiper arms and washer hoses, as follows.

10.1 Make sure each wiper arm is in the correct park position, at or near the edge of the darkened (tinted) area at the bottom of the windshield glass and far enough above the molding so as not to slap against it during normal low-speed operation. See **Fig. 11** for the correct wiper park position. If the wiper blades park incor-

Wiper Linkage Removal and Installation



Line up the drive pivot bar with the drive crank as shown (note arrow).

1. Conlink
2. Drive Pivot Bracket Rear Ball Stud
3. Drive Pivot Bracket
4. Drive Pivot Bracket Front Ball Stud
5. Drive Pivot Bar
6. Drive Crank Ball Stud
7. Drive Crank
8. Wiper Motor
9. Electrical Connector
10. M6 Capscrews

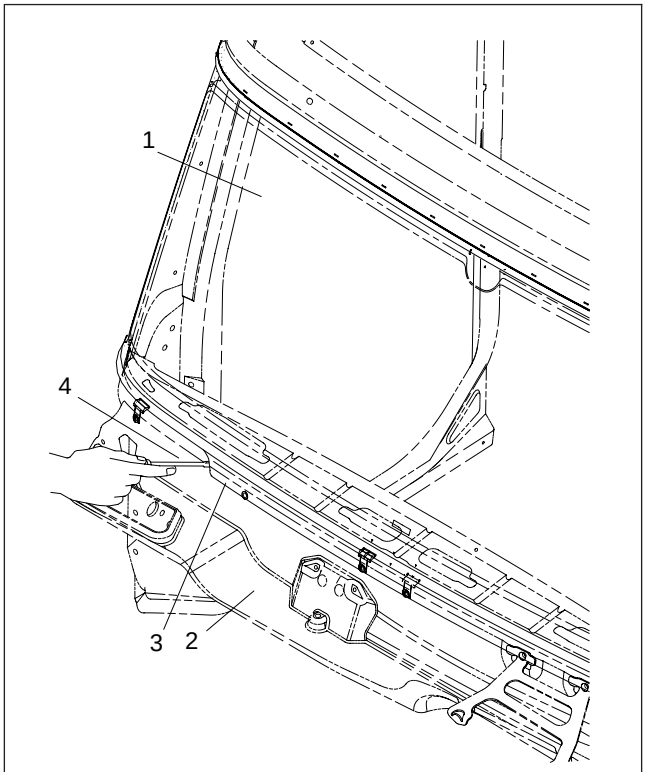
Fig. 9, Drive Linkage Assembly

rectly as in **Fig. 12**, remove the wiper arm and install it again.

10.2 Make sure each wiper arm fits snugly on the knurled drive knob. Pull gently against each wiper arm to make sure it is properly seated with the locking clip in place.

10.3 Connect a washer hose to each wiper arm.

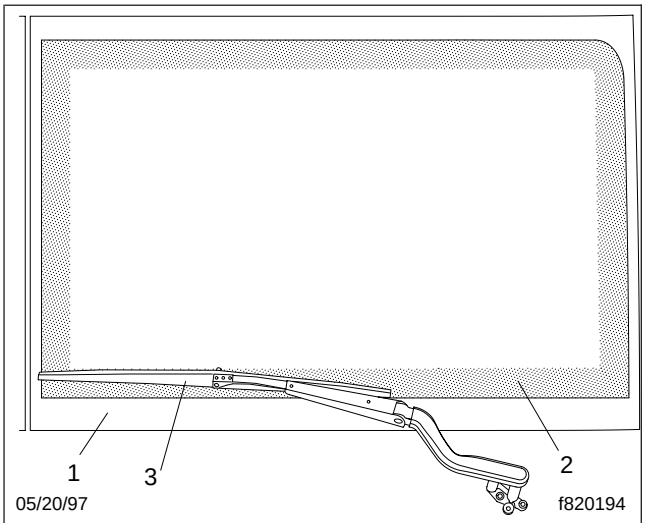
11. Connect the wiper motor electrical connector.



1. Windshield Glass
2. Rain Tray
3. Molding
4. Screwdriver

Fig. 10, Overlap the Molding onto the Rain Tray

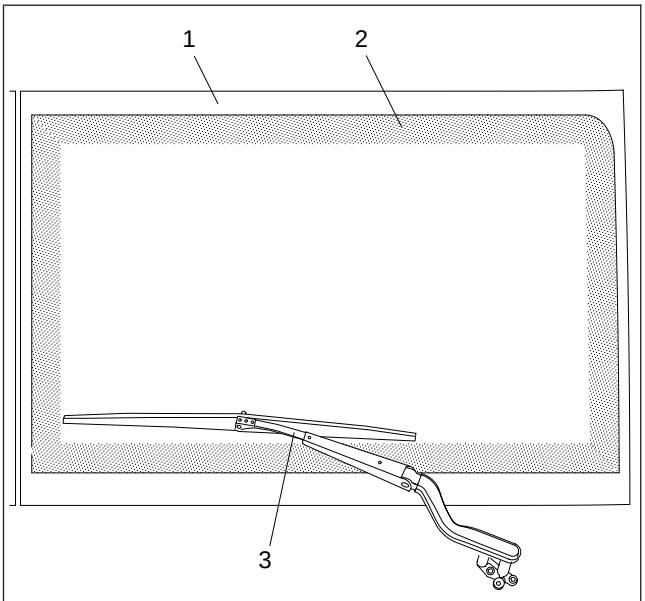
12. Test the wiper motor and washers. Operate the wipers at low speed and check that the blades do not slap against the molding around the edge of the window.
13. Close the hood.
14. Remove the chocks.



Rotate the arm on the shaft so that the blade parks in the darkened area at the bottom of the windshield.

1. Molding
2. Darkened Area of Glass
3. Wiper Blade

Fig. 11, Correct Windshield Wiper Park Position



If any part of the blade parks in the clear area of the windshield, adjust the wiper arm.

1. Molding
2. Darkened Area of Glass
3. Wiper Blade

Fig. 12, Incorrect Windshield Wiper Park Position

Wiper Motor Removal and Installation

This procedure applies only to a Century Class Conventional built before March 2000.

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Check that the wiper blades are parked. If necessary, park them by turning the wipers on and then off.
3. Tilt the hood.
4. Disconnect the wiper motor electrical connector.

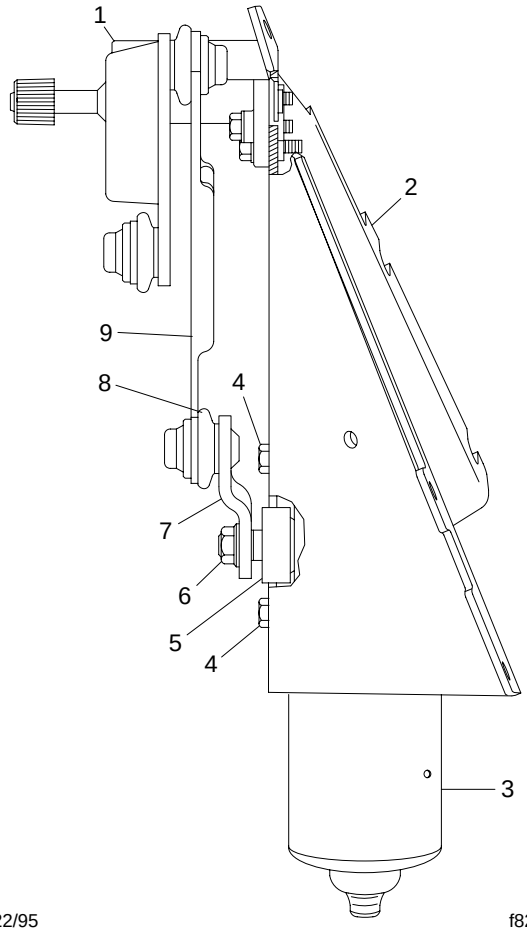
⚠ WARNING

Disconnect the wiper motor electrical connector before working on the wiper motor. Otherwise, the motor could cycle if the driveshaft is forced out of the parked position, which could result in personal injury.

5. Remove the hood guide bracket, fan switch, surge tank upper bracket, rain tray seal, rain tray, and wiper linkage. For detailed instructions, see **Subject 100**.
6. Remove the wiper motor and drive crank, as follows.
   - 6.1 Remove the M8 flanged locknut that attaches the drive crank to the wiper motor (see **Fig. 1**). Remove the drive crank from the vehicle.
   - 6.2 Remove the three M6 capscrews that hold the wiper motor to the mounting bracket.
   - 6.3 Remove the wiper motor from the motor mounting bracket.

Installation

1. With the tires chocked, install the wiper motor, as follows.
   - 1.1 Apply one drop of Loctite® 242 sealant, or an equivalent, to the threads of each of the three M6 mounting capscrews. Install them on the motor through the mounting bracket and tighten them 95 lbf·in (1080 N·cm).

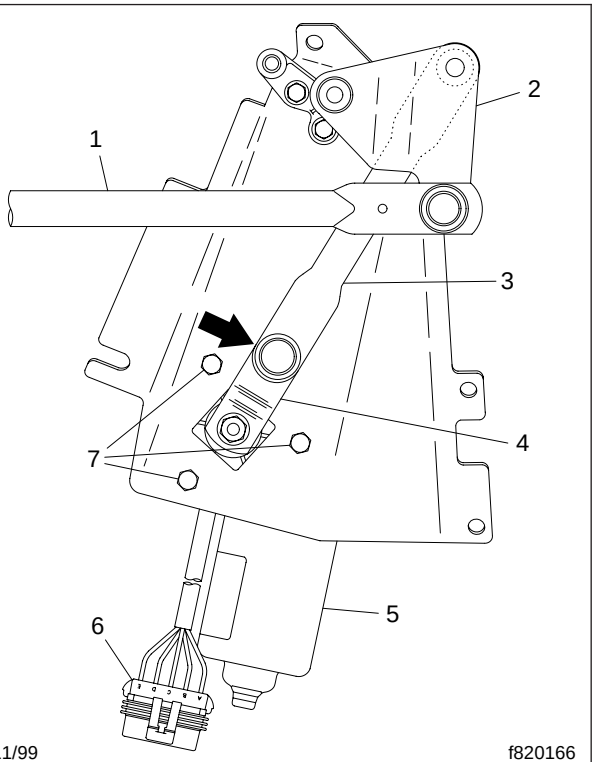


1. Drive Pivot Bracket
2. Motor Mounting Bracket
3. Wiper Motor
4. M6 Capscrews
5. Weather Seal
6. M8 Flanged Locknut
7. Drive Crank
8. Rubber Bellows
9. Drive Pivot Bar

Fig. 1, Wiper Motor Installation

   - 1.2 Install the drive crank on the motor drive shaft. Position the drive crank pointing up and to the right, roughly centered between the two upper mounting capscrews. See **Fig. 2**. Tighten the M8 flanged locknut 17 lbf·ft (23 N·m).

Wiper Motor Removal and Installation



Line up the drive pivot bar with the drive crank as shown (note arrow).

1. Conlink
2. Drive Pivot Bracket
3. Drive Pivot Bar
4. Drive Crank
5. Wiper Motor
6. Electrical Connector
7. M6 Capscrews

Fig. 2, Drive Linkage Assembly

2. For corrosion protection, pack the exposed ends of the connectors with pumpable dielectric grease, part number 48–02439–000.
3. Install the hood guide bracket, fan switch, surge tank upper bracket, rain tray seal, rain tray, and wiper linkage. For detailed instructions, see **Subject 100**.
4. Connect the wiper motor electrical connector.
5. Test the wiper motor and washers. Make sure the wiper blades park correctly. For instructions, see **Subject 100**.
6. Close the hood.
7. Remove the chocks.

Washer Reservoir Removal and Installation

This procedure applies only to a Century Class Conventional built before March 2000.

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Tilt the hood.
3. Remove the fasteners indicated by the arrows in **Fig. 1**, as follows.

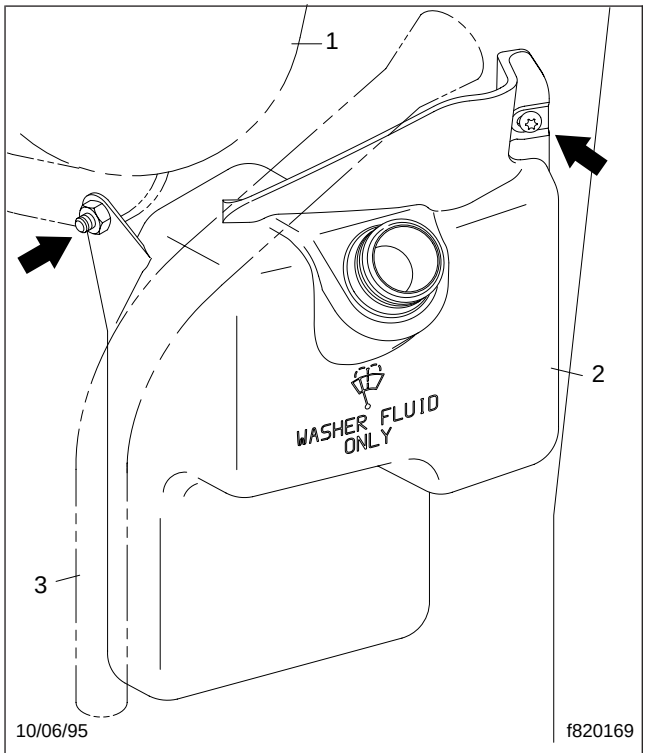


Fig. 1, Windshield Washer Reservoir

3.1 Remove the 5/16–18 Torx® screw that attaches the reservoir to the motor mounting bracket.

3.2 Remove the nut that attaches the reservoir and the surge tank to the lower left-hand surge tank bracket.

4. Remove the 5/16–18 Torx screw at the bottom of the reservoir. See **Fig. 2**.

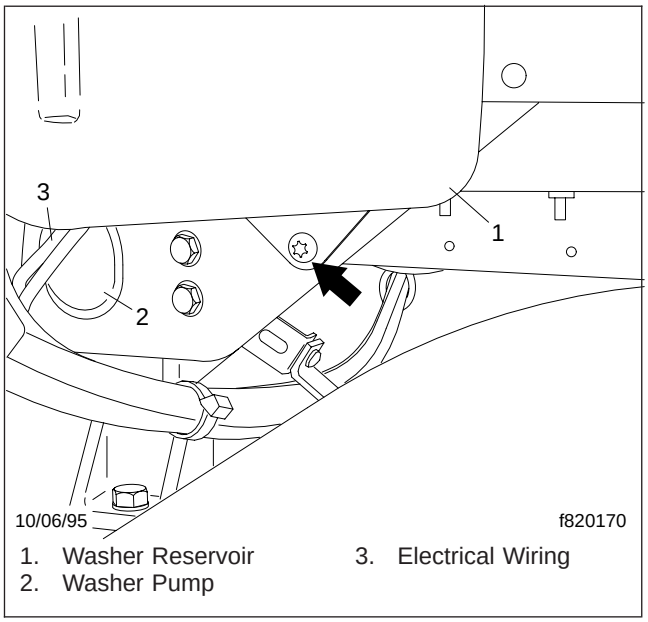

Fig. 2, Washer Reservoir Bottom Screw (arrow)

5. Pull the reservoir free of its mountings to expose the washer pump. Disconnect the electrical connector attached to the washer pump. Remove the washer fluid delivery line. To free the reservoir, remove the drain alongside it.

NOTE: If the reservoir contains washer fluid, removing the delivery line will cause washer fluid to flow out of the washer pump outlet.

6. Remove the washer reservoir from the vehicle.

Installation

1. With the tires chocked, connect the electrical connector to the washer pump. For corrosion protection, pack the exposed ends of the connectors with pumpable dielectric grease, part number 48-02439-000.
2. Attach the washer fluid delivery line to the washer pump.
3. Install the 5/16–18 Torx screw at the bottom of the reservoir. See **Fig. 2**.
4. Install the fasteners indicated by the arrows in **Fig. 1**, as follows.

4.1 Install the 5/16–18 Torx screw that attaches the reservoir to the motor mounting bracket.

Washer Reservoir Removal and Installation

4.2 Install the nut that attaches the reservoir and the surge tank to the lower left-hand surge tank bracket.

5. Tighten all the fasteners 15 lbf·ft (20 N·m) and install the drain.
6. Lower the hood.
7. Remove the chocks.

Troubleshooting

WARNING

Use caution when working on or near the wiper linkage, arms, and motor. An intermittent wiper system may swipe without warning, posing a risk of personal injury.

NOTICE

Make sure the ignition switch is off before disconnecting any wiper/washer harness connectors. Removing connectors with the ignition switch on may cause electrical arcing, which will damage the pins.

Preliminary Checks

Before beginning the troubleshooting procedures, verify the driver's complaint by checking the system components, and operating the wiper and washer to duplicate the problem.

1. Check the wiper arms, blades, and linkage for wear and damage.
2. Check the washer fluid level in the reservoir.
3. Turn the ignition switch to the ON position without starting the engine.
4. Test the wipers on low speed, high speed, and several intermittent speeds.
5. Test the windshield washers.
6. Turn the ignition switch to the OFF position.
7. Check the washer hoses for leaks and damage.

Diagnostic Procedures

Symptoms

The diagnostic procedures listed in **Table 1** are described in detail in the succeeding tables. When performing the diagnostic procedures, refer to the wiring diagram (**Fig. 1**) and the tables in this subject.

NOTICE

Use caution when backprobing sealed connectors. If the seal is damaged, water could intrude into the connection, resulting in corrosion and electrical failure.

IMPORTANT: The following wiper and washer diagnostic procedures are performed with the ignition switch in the ON position, and the engine NOT running.

Troubleshooting Procedures	
Symptom	**Table Number**
Wipers are inoperative in all modes.	**Table 2**
High-speed mode only is inoperative.	**Table 3**
Low-speed and all intermittent speed modes are inoperative, high-speed mode is OK.	**Table 4**
Wipers do not park in the proper position.	**Table 5**
Wipers stay on until ignition is turned off.	**Table 6**
Washers are inoperative.	**Table 7**
Washer spray does not correctly cover wipe area.	**Table 8**

Table 1, Troubleshooting Procedures

Wipers Are Inoperative In All Modes			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—

Troubleshooting

Wipers Are Inoperative In All Modes			
Step	**Test Procedure**	**Test Result**	**Action**
2	With the connector remaining connected, backprobe the wiper motor connector on pins A and C to measure for battery voltage; see **Table 9**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 110**.
		Low or at zero	Go to **step 3**.
3	Verify that pin A of the wiper motor connector is at ground potential; see **Table 9**. Is pin A at ground potential?	Yes	Go to **step 4**.
		No	Repair the ground circuit.
4	Access the wiper switch (**Fig. 2**) connector, and backprobe pin 1 to measure the voltage, with the connector remaining connected to the module; see **Table 10**. Is battery voltage present on pin 1?	Yes	Go to **step 5**.
		Low or at zero	Check circuit breaker CB49 in the PDM. If the circuit breaker is open, determine if there is a shorted wire or component on circuit 315 that is drawing excess current.
5	With the ignition set to the ON position and the wipers switched to low speed, measure the voltage on pin 3 of the wiper switch connector. Is the measured voltage at or within a few tenths of a volt to ground?	Yes	Test for an open circuit through the speed switching relays R35 and R36. Troubleshoot circuits 315L and 315H from the PDM to the wiper motor.
		No	Replace the wiper switch.

Table 2, Wipers Are Inoperative In All Modes

High-Speed Mode Only Is Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to high speed.	—	—
2	With the connector remaining connected, backprobe the wiper motor connector on pins A and B to measure for battery voltage; see **Table 9**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 110**.
		Low or at zero	Go to **step 3**.
3	Access the wiper switch (**Fig. 2**) connector, and backprobe pin 4 to measure the voltage, with the connector remaining connected to the module, the ignition switch in the ON position, and the wipers set to high speed; see **Table 10**. Is the measured voltage at or within a few tenths of a volt to ground?	Yes	Test for an open circuit through relay R35 and its interconnecting wiring, including circuit 315H from the PDM to the wiper motor.
		No	Replace the wiper switch.

Table 3, High-Speed Mode Only Is Inoperative

Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—

Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK			
Step	**Test Procedure**	**Test Result**	**Action**
2	With the connector remaining connected, backprobe the wiper motor connector on pins A and C to measure for battery voltage; see **Table 9**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 110**.
		Low or at zero	Go to **step 3**.
3	Verify the voltage at pin A of the wiper motor connector. Is it at ground potential?	Yes	Go to **step 4**.
		No	Repair the ground circuit 320.
4	With the wiper switch (**Fig. 2**) remaining connected to the connector, the ignition switch in the ON position, and the wipers set to low speed, backprobe the wiper switch connector on pin 3 to measure for battery voltage; see **Table 10**. Is the measured voltage at or within a few tenths of a volt to ground?	Yes	Test for an open circuit through the speed switching relays R35 and R36, and the interconnected wiring. Troubleshoot circuit 315L from the PDM to the wiper motor.
		No	Replace the wiper switch.

Table 4, Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK

Wipers Do Not Park in Proper Position			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—
2	Turn the wiper switch off when the wipers are in mid-swipe. Do the wipers stop immediately, or continue traveling, then stop?	Immediately	Go to **step 3**.
		Continue traveling, then stop	Note the stopped position. Repeat the test to make sure that the wipers always stop in the same position. If the wipers always stop in the same position, regardless of where the switch was turned off, the linkage is improperly adjusted. Turn the ignition switch to OFF, disconnect the batteries, then adjust the wiper linkage to the correct position.
3	With the ignition switch in the ON position and the wipers switched off, measure the voltage on pin D of the wiper motor connector; see **Table 9**. Is battery voltage present?	Yes	Go to **step 4**.
		No	Locate and repair the open circuit on circuit 315C between the wiper motor and the PDM.
4	With the ignition in the ON position and the wipers switched to low speed, measure the voltage on pin F of the wiper motor connector; see **Table 9**. Battery voltage should be present except when the wipers travel through the park position and the circuit is momentarily at ground. Is battery voltage present?	Yes	Go to **step 5**.
		No	Replace the wiper motor; see **Subject 110**.

Troubleshooting

Wipers Do Not Park in Proper Position			
Step	**Test Procedure**	**Test Result**	**Action**
5	With the wipers switched on, measure the voltage at terminal 87A of relay R36. Is battery voltage present?	Yes	Test for an open R36 relay.
		No	Locate and repair the open circuit between relay R36 and the wiper motor in circuit 315P.

Table 5, Wipers Do Not Park in Proper Position

Wipers Stay On Until Ignition Is Turned Off			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position. Leave the wiper switch in the OFF position. Do the wipers stay on at high speed or low speed?	High speed	Troubleshoot for circuit 315B shorted to ground, and for relay R35 shorted between terminals 87 and 30.
		Low speed	Go to **step 2**.
2	Backprobe pin F of the wiper motor connector to check the voltage through the wiper motor's internal park switch; see **Table 9**. When the wipers travel through the park position, pin F should be momentarily at ground. Most volt meters respond quickly enough to show this momentary voltage transition. Is the momentary voltage transition to ground present?	Yes	Troubleshoot and repair for circuit 315B shorted to ground, and for relay R36 shorted between terminals 87 and 30.
		No	The wiper motor internal park switch is not working. Replace the wiper motor; see **Subject 110**.

Table 6, Wipers Stay On Until Ignition Is Turned Off

Washers Are Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed. Do the wipers work?	Yes	Turn the wipers off. Go to **step 2**.
		No	Follow the troubleshooting procedure under "Wipers Are Inoperative In All Modes"; see **Table 2**.
2	Check the washer reservoir fluid level. Add fluid if needed, then test the washer operation. Hold the washer switch on for at least 5 seconds in case the hoses are leaking, or the system has lost its prime. Is the pump running?	Yes	Check the system for leaks. Also follow the troubleshooting procedure under "Washer Spray Does Not Correctly Cover Wipe Area"; see **Table 8**.
		No	Go to **step 3**.
3	If the system is not leaking, backprobe the connections at the washer pump, and test for battery voltage when the washer switch is activated; see **Table 11**. Is battery voltage present?	Yes	Replace the washer pump.
		No	Go to **step 4**.

Washers Are Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
4	With the wiper switch (**Fig. 2**) remaining connected to the connector, and the ignition switch in the ON position, backprobe pin 5 of the wiper switch to measure voltage; see **Table 10**. When the washers are activated, is the measured voltage at or within a few tenths of a volt to ground?	Yes	Troubleshoot for a wiring fault on circuit 320 between the wiper switch and the washer pump. Also troubleshoot circuit 315C to the washer pump.
		No	Replace the wiper switch.

Table 7, Washers Are Inoperative

Washer Spray Does Not Correctly Cover Wipe Area			
Step	**Test Procedure**	**Test Result**	**Action**
1	Make sure that the fluid level in the washer fluid reservoir is adequate. If needed, add fluid.	—	—
2	Test the washer operation. Hold the washer switch in the ON position for at least 5 seconds. Is the fluid flow adequate?	Yes	Troubleshooting is completed.
		No	Check the nozzles for damage, plugging, or improper installation. Check the hoses for kinks, or wire ties that may be too tight. Make sure that there are no breaks or disconnected fittings. Go to **step 3**.
3	Test the washer operation. Does the washer work properly?	Yes	Troubleshooting is completed.
		No	Replace the washer pump.

Table 8, Washer Spray Does Not Correctly Cover Wipe Area

Terminal Identification of the Wiper Motor Harness Connector			
Wiper Motor Harness Connector	**Pin**	**Circuit Number**	**Circuit Description**
 f545385	A	GND	Ground
	B	315H	Wiper Motor High Speed
	C	315L	Wiper Motor Low Speed
	D	315C	Ignition Power
	E	—	Not used
	F	315P	Park Switch Signal

Table 9, Terminal Identification of the Wiper Motor Harness Connector

Fig. 2, Location of Dash-Mounted Wiper/Washer Switch

Specifications

Unless listed in **Table 1**, tighten all fasteners using the torque specifications found in **Section 00.05**.

Description	Size	Torque	
		lbf·ft (N·m)	lbf·in (N·cm)
Hood Guide Mounting Capscrew (to body)	5/16–18	15 (20)	—
Hood Guide Mounting Capscrew (to rain tray)	3/8–16	23 (31)	—
Machine Screws (Grade 5—uncoated)	5/16–18	13 (18)	—
Motor Mounting Capscrews	M6	—	95 (1080)
Pivot Bracket Mounting Capscrews (Grade 5)	5/16–18	15 (20)	—
Surge Tank Mounting Locknuts	3/8–16	23 (31)	—
Wiper Drive Flanged Locknut	M8	17 (23)	—
Washer Reservoir Mounting Screws (Grade 5)	5/16–18	15 (20)	—

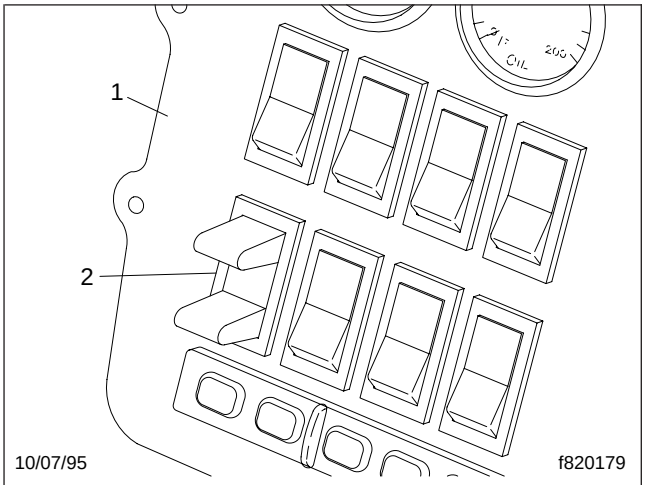
Table 1, Fastener Torque Values

This information applies to the following vehicle models, as specified:

- Century Class Conventional built during or after March 2000
- Argosy COE

General Information

The windshield wipers and washers are operated by a double-paddle switch mounted on the auxiliary instrument panel. See **Fig. 1**. Each paddle can be pushed in, up, or down, for three different functions. For wiper switch functions and operation, see **Fig. 2**.



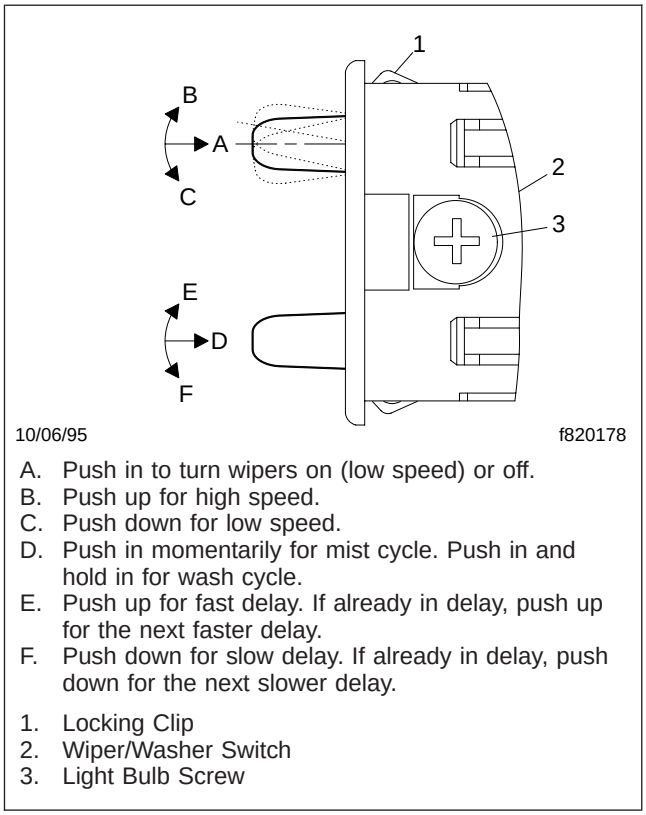
1. Auxiliary Instrument Panel
2. Wiper/Washer Switch

Fig. 1, Wiper/Washer Switch

The wipers have five cycles: fast, slow, mist, wash, and delay. There are six delay intervals, 3 seconds, 5 seconds (default fast), 8 seconds, 12 seconds, 17 seconds (default slow), and 23 seconds.

The top paddle, when pushed in, turns the wipers on (if they are off) or off (if they are on). When pushed up, the top paddle switches the wipers to high speed; when pushed down, it switches them to low speed.

The bottom paddle, when pushed in momentarily (for less than 1/2 second), turns the wipers on mist (one dry cycle at low speed). When pushed in and held in (for at least 1/2 second), the bottom paddle turns on the washers for a minimum of three cycles after release. For more wash cycles, hold the bottom paddle in longer (but it will always cycle three more times after release).



A. Push in to turn wipers on (low speed) or off.
B. Push up for high speed.
C. Push down for low speed.
D. Push in momentarily for mist cycle. Push in and hold in for wash cycle.
E. Push up for fast delay. If already in delay, push up for the next faster delay.
F. Push down for slow delay. If already in delay, push down for the next slower delay.

1. Locking Clip
2. Wiper/Washer Switch
3. Light Bulb Screw

Fig. 2, Wiper/Washer Switch Operation

Pushing **the bottom paddle** up or down controls the delay cycle of the intermittent wipers. If the wipers are not in delay, push up for default fast delay (5 seconds) or down for default slow delay (17 seconds). If the wipers are already in delay, push up for the next faster delay or push down for the next slower delay.

Vehicles may have a one-piece or two-piece windshield. All two-piece and most one-piece windshields are installed with two-pivot wiper systems. Argosy one-piece windshields are installed with three-pivot wipers.

A single wiper motor powers both wipers. It is mounted in the top center area of the cab front wall (behind the surge tank on vehicles with a front-wall mounted surge tank). The electric wiper motor is a sealed unit packaged together with a weather seal

General Information

and drive crank. It is not serviceable. If a wiper motor does not work because of internal problems, replace it.

The windshield washer reservoir (see **Fig. 3** for a Century Class Conventional and **Fig. 4** for an Argosy COE) is located on the left-hand side of the cab front wall. A pump located in a recess in the bottom of the reservoir supplies washer fluid to each wiper arm. A purge mechanism empties the lines after use to prevent fluid from freezing in the lines during cold weather.

3. Support Clamp
4. Screw, 5/16–18
5. Plated Steel Washer

Fig. 4, Windshield Washer Reservoir (Argosy COE)

Procedures under these headings apply to the following vehicle models, as specified:

- Century Class Conventional with a radiator-mounted surge tank
- Century Class Conventional built during or after March 2000, with a cab front-wall mounted surge tank
- Argosy COE

Century Class Conventional with a Radiator-Mounted Surge Tank

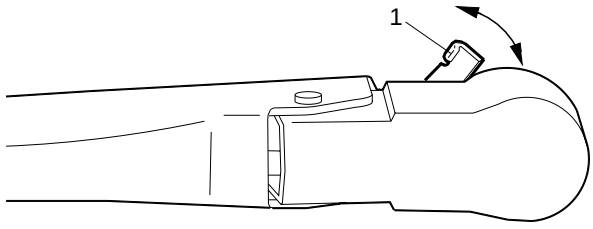
Removal

1. Apply the parking brakes and chock the tires.
2. Check that the wiper blades are parked. If necessary, park them by turning the wipers on and then off.
3. Open the hood.
4. Disconnect the wiper motor electrical connector.

⚠ WARNING

Disconnect the wiper motor electrical connector before working on the wiper linkage. This will prevent the windshield wiper motor from cycling. The motor could cycle if the wiper linkage driveshaft is forced out of the parked position, which could result in personal injury.

5. Remove each wiper arm and disconnect the washer hoses as follows.
   - 5.1 Disconnect the windshield washer hose from the rain tray.
   - 5.2 With the wiper blade pulled away from the windshield, pull up the locking tab near the pivot end of the wiper arm; see **Fig. 1**. Remove the wiper arm from the wiper shaft.
6. Remove the nut and washer that attach the fan switch mounting bracket to the washer reservoir mounting stud; see **Fig. 2**. Remove the fan switch mounting bracket.
7. Detach any wiring and hoses from the bottom of the rain tray.



02/01/2006 f820423

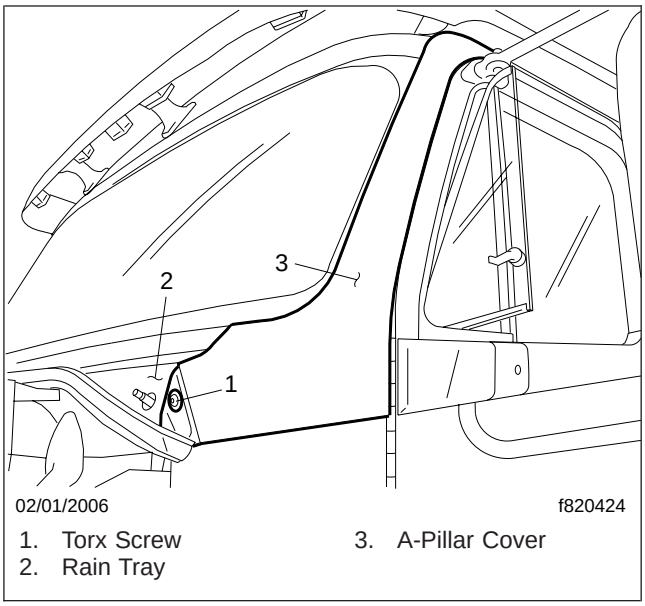
Fig. 2, Fan Switch Installation

8. Remove the outboard drain tube from the rain tray. Remove the fastener that attaches the inboard drain tube to the rain tray, but leave the inboard drain tube in place.

Wiper Linkage Removal and Installation

9. Remove the T27 Torx® screws that attach the rain tray to the A-pillar covers on both sides of the vehicle; see **Fig. 3**.



1. Torx Screw
2. Rain Tray
3. A-Pillar Cover

Fig. 3, A-Pillar Cover/Rain Tray Installation

10. Remove the T40 Torx capscrews that attach the rain tray to the cab front wall. Remove the rain tray.
11. Remove any hoses or wires that are attached to the wiper linkage assembly.
12. Remove the wiper linkage assembly from the cab front wall as follows; see **Fig. 4**.
    - 12.1 On the left side of the vehicle, remove the nut and washer that attach the wiper linkage mounting bracket to the front wall.
    - 12.2 On the right side of the vehicle, remove the capscrew and washer that attach the wiper linkage mounting bracket to the front wall.
    - 12.3 Remove the nut and washer that attach the wiper motor mounting bracket to the front wall. Remove the wiper linkage assembly.

Installation

1. Install the wiper linkage assembly on the cab front wall as follows; see **Fig. 4**.
    - 1.1 Using a nut and washer, attach the left-side mounting bracket of the wiper linkage assembly to the front wall.
    - 1.2 Using a capscrew and washer, attach the right-side mounting bracket of the wiper linkage assembly to the front wall.
    - 1.3 Using a nut and washer, attach the wiper motor bracket to the front wall.
2. Attach any hoses or wires that were disconnected from the wiper linkage assembly.
3. Using six T40 Torx capscrews, attach the rain tray to the cab front wall.
4. Attach any wiring or hoses that were detached from the bottom of the rain tray.
5. Install the outboard drain tube; hook the bottom of the drain tube on the washer reservoir. Install the fastener for the inboard drain tube.
6. Using T27 Torx screws, attach the rain tray to the A-pillar covers on both sides of the vehicle; see **Fig. 3**.
7. Using a nut and washer, attach the fan switch mounting bracket to the upper washer reservoir mounting stud; see **Fig. 2**.
8. Install each wiper arm as follows. For the correct wiper park position, see **Fig. 5**.
    - 8.1 Install the wiper arm on the wiper driveshaft, then hold it in place while pulling the wiper blade away from the windshield. The locking tab will snap into the locked position.
    - 8.2 Check that the wiper arm is securely attached by pulling gently on it.
    - 8.3 Connect the washer hose to the rain tray.
9. Connect the wiper motor electrical connector.
10. Test the wiper motor and washers. Operate the wipers at low speed and check that the blades do not slap against the mask around the edge of the window.

8. Rain Tray

Fig. 4, Wiper Linkage Installation

Century Class Conventional Built during or after March 2000, with a Cab Front-Wall Mounted Surge Tank

Removal

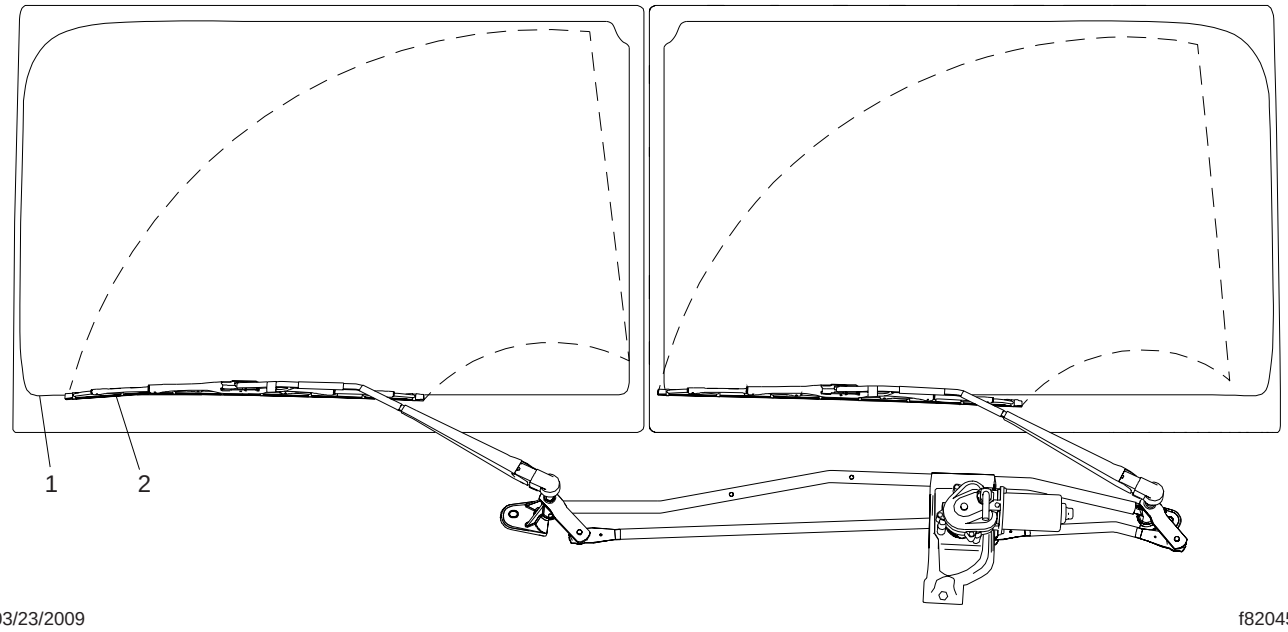
1. Apply the parking brakes and chock the tires.
2. Check that the wiper blades are parked. If necessary, park them by turning the wipers on and then off.
3. Open the hood.
4. Disconnect the wiper motor electrical connector.

⚠ WARNING

Disconnect the wiper motor electrical connector before working on the wiper linkage. This will prevent the windshield wiper motor from cycling. The motor could cycle if the wiper linkage driveshaft is forced out of the parked position, which could result in personal injury.

5. Remove each wiper arm and disconnect the washer hoses as follows.
   - 5.1 Disconnect the windshield washer hose from the rain tray.
   - 5.2 With the wiper blade pulled away from the windshield, pull up the locking tab near

Wiper Linkage Removal and Installation



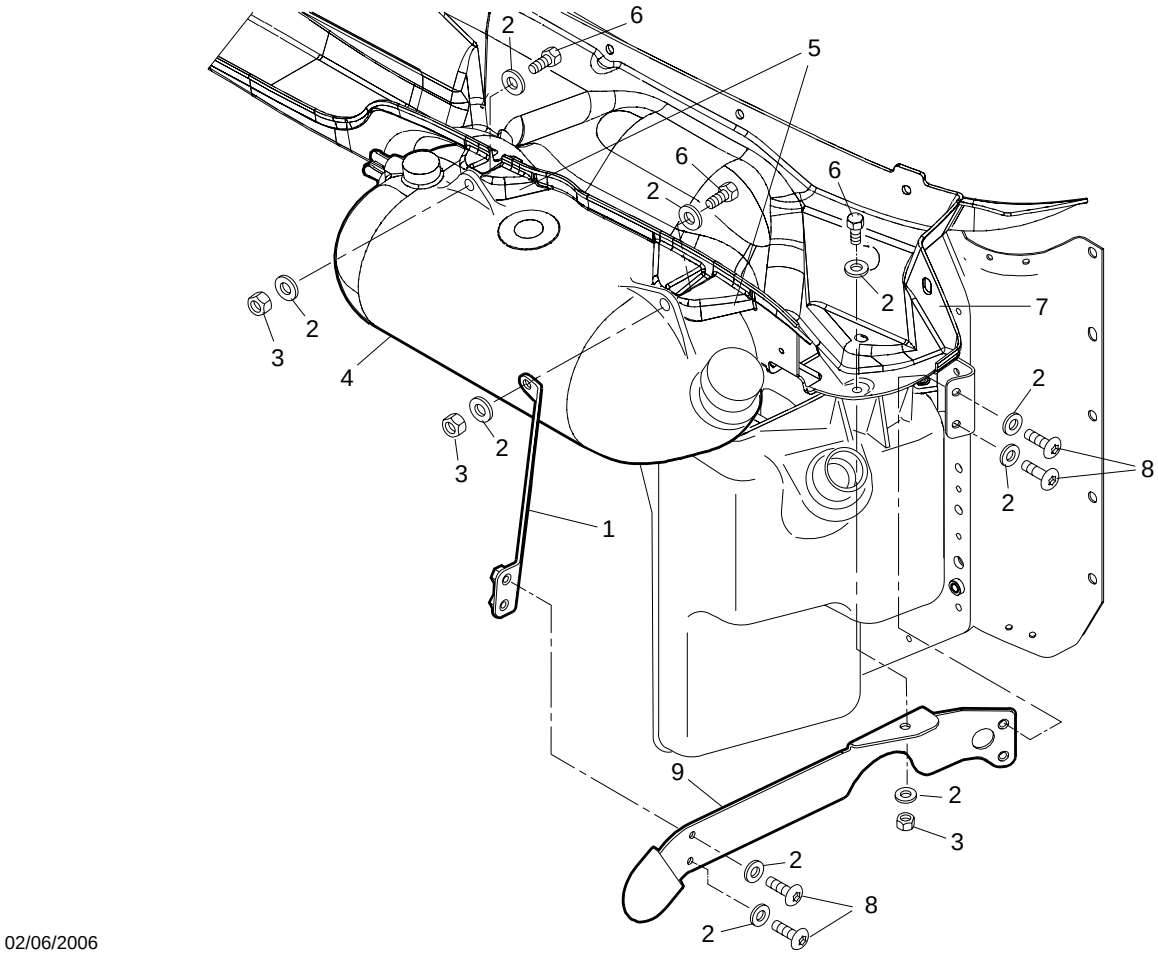
Park the blades within one spline's width of the edge of the dark band.

1. Edge of Dark Band
2. Wiper Blade

Fig. 5, Windshield Wiper Park Position, Two-Pivot Models

the pivot end of the wiper arm; see **Fig. 1**. Remove the wiper arm from the wiper shaft.

6. On vehicles with a hood guide mounted above the washer reservoir, remove the hood guide as follows; see **Fig. 6**.
   - 6.1 Remove the four T40 Torx capscrews and washers that attach the hood guide to the mounting brackets.
   - 6.2 Remove the bolt, nut, and washers that attach the hood guide to the rain tray.
7. Remove the surge tank and the fan switch as follows.
   - 7.1 Remove the bolts, nuts, and washers that attach the surge tank and the hood guide mounting bracket (if so equipped) to the surge tank upper mounting brackets; see **Fig. 6**.
   - 7.2 Remove the nut that attaches the hose clamp to the surge tank lower mounting stud; see **Fig. 7**. Remove the hose clamp. Remove the second nut and washer that attach the surge tank to the same mounting stud.
   - 7.3 Remove the nut and washer that attach the fan switch mounting bracket to the surge tank lower left-side mounting stud; see **Fig. 7**. Remove the fan switch mounting bracket.
   - 7.4 Remove the surge tank.
8. Detach any wiring and hoses from the bottom of the rain tray.
9. Remove the outboard drain tube from the rain tray. Remove the fastener that attaches the inboard drain tube to the rain tray, but leave the inboard drain tube in place.
10. Remove the T27 Torx screws that attach the rain tray to the A-pillar covers on both sides of the vehicle; see **Fig. 3**.
11. On the driver side only, remove the exterior covers from the upper A-pillar and the side cowl.



1. Hood Guide Mounting Bracket
2. Washer
3. Nut
4. Surge Tank
5. Surge Tank Mounting Brackets
6. Bolt
7. Rain Tray
8. T40 Torx Capscrew
9. Hood Guide

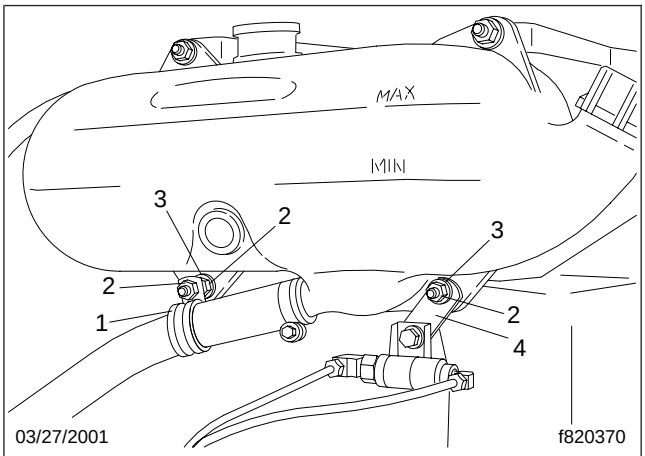
Fig. 6, Hood Guide Installation

12. Remove the T40 Torx capscrews that attach the rain tray to the cab front wall. Remove the rain tray.
13. Remove any hoses or wires that are attached to the wiper linkage assembly.
14. Remove the wiper linkage assembly from the cab front wall as follows; see **Fig. 4**.
    - 14.1 On the left side of the vehicle, remove the nut and washer that attach the wiper linkage mounting bracket to the cab front wall.
    - 14.2 On the right side of the vehicle, remove the capscrew and washer that attach the wiper linkage mounting bracket to the cab front wall.
    - 14.3 Remove the nut and washer that attach the wiper motor mounting bracket to the cab front wall. Remove the wiper linkage assembly.

Installation

1. Install the wiper linkage assembly on the cab front wall as follows; see **Fig. 4**.

Wiper Linkage Removal and Installation



1. Hose Clamp
2. Nut
3. Washer
4. Fan Switch Mounting Bracket

Fig. 7, Surge Tank Installation

1.1 Using a nut and washer, attach the left-side mounting bracket of the wiper linkage assembly to the cab front wall.

1.2 Using a capscrew and washer, attach the right-side mounting bracket of the wiper linkage assembly to the cab front wall.

1.3 Using a nut and washer, attach the wiper motor bracket to the cab front wall.

2. Attach any hoses or wires that were disconnected from the wiper linkage assembly.
3. Using six T40 Torx capscrews, attach the rain tray to the cab front wall.
4. Attach any wiring or hoses that were detached from the bottom of the rain tray.
5. Install the outboard drain tube; hook the bottom of the drain tube on the washer reservoir. Install the fastener for the inboard drain tube.
6. Install the driver-side upper A-pillar exterior cover and the side cowl exterior cover.
7. Using T27 Torx screws, attach the rain tray to the A-pillar covers on both sides of the vehicle; see **Fig. 3**.
8. Install the surge tank and the fan switch as follows.

8.1 Position the surge tank on the mounting brackets and studs. Using a bolt, nut, and washer, install the hood guide mounting bracket (if so equipped) on the left-side upper mounting bracket; see **Fig. 6**.

8.2 Using a bolt, nut, and washer, secure the surge tank to the right-side upper mounting bracket.

8.3 Using a nut and washer, secure the surge tank to the lower right-side mounting stud. Install the hose clamp on the same mounting stud and secure the hose clamp with a nut; see **Fig. 7**.

8.4 Using a nut and washer, attach the fan switch mounting bracket to the lower left-side mounting stud.

9. On vehicles with a hood guide mounted above the washer reservoir, install the hood guide as follows; see **Fig. 6**.

9.1 Using a bolt, nut, and washer, attach the hood guide to the rain tray.

9.2 Using four T40 Torx capscrews, attach the hood guide to the mounting brackets.

10. Install each wiper arm as follows. For the correct wiper park position, see **Fig. 5**.

10.1 Install the wiper arm on the wiper driveshaft, then hold it in place while pulling the wiper blade away from the windshield. The locking tab will snap into the locked position.

10.2 Check that the wiper arm is securely attached by pulling gently on it.

10.3 Connect the washer hose to the rain tray.

11. Connect the wiper motor electrical connector.
12. Test the wiper motor and washers. Operate the wipers at low speed and check that the blades do not slap against the mask around the edge of the window.

Argosy COE

NOTE: If an Argosy COE one-piece windshield is replaced with a two-piece windshield, replace the existing three-pivot wiper linkage with a two-pivot linkage.

Wiper Linkage Removal and Installation

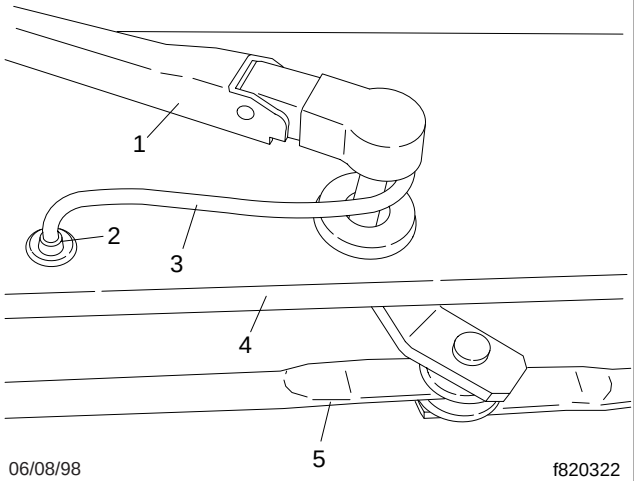
Removal

1. Apply the parking brakes and chock the tires.
2. Check that the wiper blades are parked. If necessary, park them by turning the wipers on and then off.
3. Open the grille.
4. Disconnect the wiper motor electrical connector.

⚠ WARNING

Disconnect the wiper motor electrical connector before working on the wiper linkage. This will prevent the windshield wiper motor from cycling. The motor could cycle if the wiper linkage driveshaft is forced out of the parked position, which could result in personal injury.

5. Remove each wiper arm (three on vehicles with one-piece windshields, two on vehicles with two-piece windshields) and disconnect the washer hoses as follows; see **Fig. 8**.



1. Wiper Arm
2. Nipple
3. Washer Hose
4. Wiper/Handle Panel
5. Wiper Linkage

Fig. 8, Wiper Arm and Washer Hose

5.1 Disconnect the windshield washer hose from the nipple on the wiper/handle panel.

5.2 With the wiper blade pulled away from the windshield, pull up the locking tab near the pivot end of the wiper arm; see **Fig. 1**. Remove the wiper arm from the wiper shaft.

6. Remove the wiper/handle panel from the front of the vehicle; see **Section 60.16, Subject 100**.
7. Disconnect the drive link from the ball stud on the motor crank (see **Fig. 9** for two-pivot wipers and **Fig. 10** for three-pivot wipers).
8. Remove the pivot brackets, one for each wiper pivot as follows.

8.1 Remove the three 5/16–18 capscrews, with washers, that hold each wiper pivot bracket in place.

8.2 Remove the drive link assembly from the vehicle.

NOTE: To remove the drive crank and wiper motor, see **Subject 110**.

Installation

1. With the wiper motor and drive crank installed, install each wiper pivot bracket on the wiper motor mounting bracket, using the fasteners previously removed. Using a 1/2-inch wrench, tighten the 5/16–18 capscrews 15 lbf·ft (20 N·m).
2. Apply a small amount of water-resistant grease to both the ball stud and the drive link socket. Connect the drive link to the ball stud on the end of the drive crank.
3. Install the wiper/handle panel, as removed; see **Section 60.16, Subject 100**.
4. Install each wiper arm as follows. For the correct wiper park position, see **Fig. 5** for two-pivot models, and **Fig. 11** for three-pivot models.

4.1 Install the wiper arm on the wiper driveshaft, then hold it in place while pulling the wiper blade away from the windshield. The locking tab will snap into the locked position.

4.2 Check that the wiper arm is securely attached by pulling gently on it.

4.3 Connect the washer hose to the nipple on the wiper/handle panel.

5. Test the wiper motor and washers. Operate the wipers at low speed and check that the blades do not slap against the mask around the edge of

Park the blades within one spline's width of the edge of the dark band.

1. Edge of Dark Band
2. Wiper Blade

Fig. 11, Windshield Wiper Park Position, Three-Pivot Models

Procedures under these headings apply to the following vehicle models, as specified:

- Century Class Conventional built during or after March 2000
- Argosy COE

Century Class Conventional Built during or after March 2000

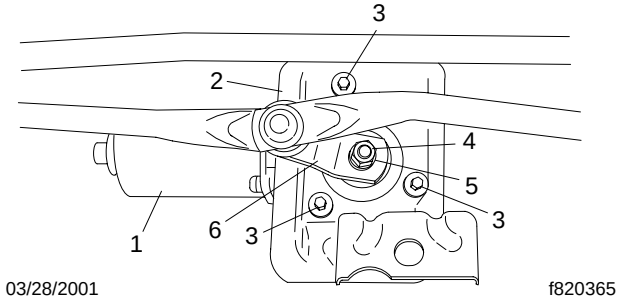
Replacement

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Check that the wiper blades are parked. If necessary, park them by turning the wipers on and then off.
3. Open the hood.
4. Disconnect the wiper motor electrical connector.

⚠ WARNING

Disconnect the wiper motor electrical connector before working on the wiper motor. Otherwise, the motor could cycle if the driveshaft is forced out of the parked position, which could result in personal injury.

5. Remove the wiper linkage assembly. For instructions, see **Subject 100**.
6. Remove the nut and lockwasher that attach the motor lever to the driveshaft. See **Fig. 1**.



1. Wiper Motor

3. Capscrew
4. Nut
5. Lockwasher
6. Motor Lever

Fig. 1, Wiper Motor Assembly

7. Remove the three capscrews that attach the motor to the mounting bracket.
8. Using three capscrews, attach a new motor to the mounting bracket.
9. Using a nut and lockwasher, attach the motor lever to the drive shaft.
10. Install the wiper linkage assembly. For instructions, see **Subject 100**.
11. Connect the wiper motor electrical connector.
12. Test the wiper motor and washers.
13. Close and latch the hood.
14. Remove the chocks.

Argosy COE

Replacement

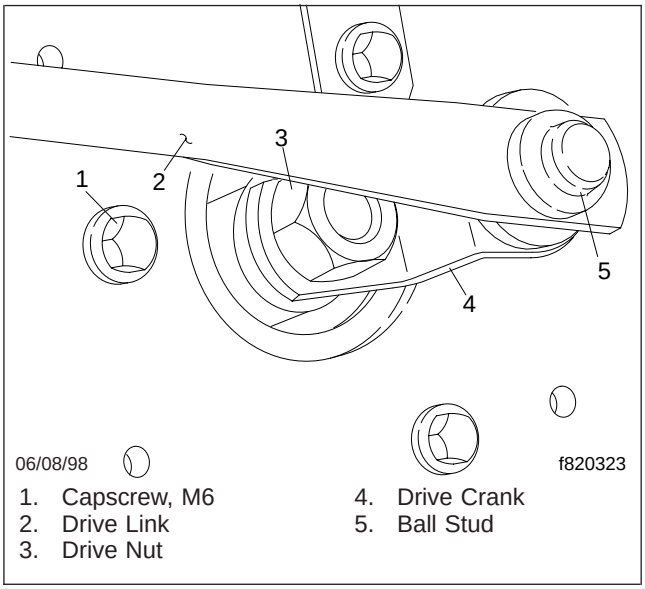
1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Make sure the wiper blades are parked. If needed, park them by turning them on, then off.
3. Open the grille.
4. Disconnect the batteries.

⚠ WARNING

Disconnect the batteries before working on the wiper motor. Otherwise, the motor could cycle if the driveshaft is forced out of the parked position, which could result in personal injury.

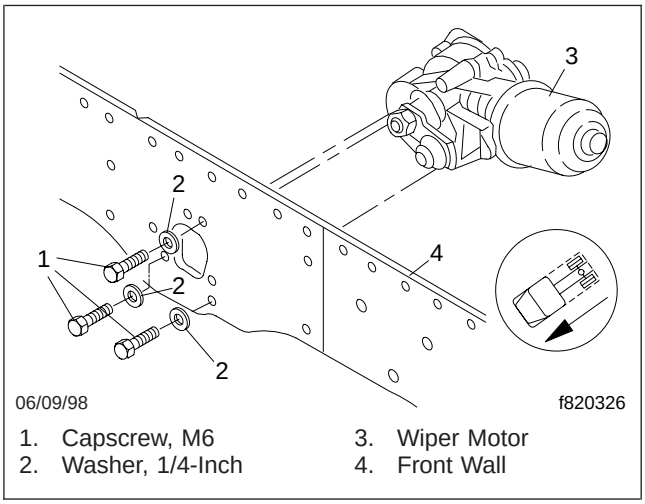
5. Gently pry the plastic end of the drive link off the ball stud. See **Fig. 2**.
6. Remove the three M6 capscrews and 1/4-inch plated steel washers that attach the motor to the front wall. See **Fig. 3**.
7. Remove the electrical connector from the back of the wiper motor.
8. To remove the motor from the vehicle, twist it around until it fits through the opening between the surge tank and the front wall.
9. Install the new wiper motor, as follows.

Wiper Motor Replacement



1. Capscrew, M6
2. Drive Link
3. Drive Nut
4. Drive Crank
5. Ball Stud

Fig. 2, Wiper Drive



1. Capscrew, M6
2. Washer, 1/4-Inch
3. Wiper Motor
4. Front Wall

Fig. 3, Wiper Motor

9.1 Position the new wiper motor so that the threaded holes in the motor housing line up with the mounting holes in the front wall.

9.2 Install the three M6 mounting capscrews and tighten them 88 lbf·in (1000 N·cm).

9.3 Use your finger to apply a small amount of water-resistant grease to both the ball stud and the drive link socket. Position the drive link on the ball stud.

9.4 Snap the plastic end of the drive link onto the ball stud.

10. Connect the wiper motor electrical connector.
11. For corrosion protection, pack the exposed ends of the connectors with pumpable dielectric grease, part number 48–02439–000.
12. Connect the batteries.
13. Test the wiper motor and washers. Make sure the wiper blades park correctly. For instructions, see **Subject 100**.
14. Close and latch the grille.
15. Remove the chocks.

Washer Reservoir Removal and Installation

Procedures under these headings apply to the following vehicle models, as specified:

- Century Class Conventional with a radiator-mounted surge tank
- Century Class Conventional built during or after March 2000, with a cab front-wall mounted surge tank
- Argosy COE

Century Class Conventional with a Radiator-Mounted Surge Tank

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Open the hood.
3. Remove the nut and washer that attach the fan switch mounting bracket and washer reservoir to the mounting stud. See **Fig. 1**. Remove the fan switch mounting bracket.
4. Remove the outboard drain tube from the rain tray.
5. Disconnect the electrical connector from the washer pump.
6. Disconnect the washer fluid hose from the washer pump.

NOTE: Washer fluid will flow out of the washer pump outlet if the reservoir contains washer fluid.

7. Remove the two T40 Torx capscrews and washers that attach the washer reservoir to the mounting bracket and front wall. See **Fig. 1**.
8. Remove the washer reservoir.

Installation

1. With the tires chocked, using two T40 Torx capscrews and washers, attach the washer reservoir to the mounting bracket and front wall. See **Fig. 1**.
2. Attach the washer fluid hose to the washer pump.
3. Attach the electrical connector to the washer pump.
4. Install the fan switch mounting bracket on the mounting stud. Using a nut and washer, secure the fan switch bracket and the washer reservoir to the mounting stud. See **Fig. 1**.
5. Install the outboard drain tube on the rain tray; hook the drain tube on the washer reservoir.
6. Close and latch the hood.
7. Remove the chocks.

Century Class Conventional Built during or after March 2000, with a Cab Front-Wall Mounted Surge Tank

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Open the hood.
3. On vehicles with a hood guide mounted above the washer reservoir, remove the hood guide, as follows. See **Fig. 2**.
   - 3.1 Remove the four T40 Torx capscrews and washers that attach the hood guide to the mounting brackets.
   - 3.2 Remove the bolt, nut, and washers that attach the hood guide to the rain tray.
4. Remove the surge tank and the fan switch, as follows.
   - 4.1 Remove the bolts, nuts, and washers that attach the surge tank and the hood guide mounting bracket (if so equipped) to the upper surge tank mounting brackets. See **Fig. 2**.
   - 4.2 Remove the nut that attaches the hose clamp to the lower surge tank mounting stud. See **Fig. 3**. Remove the hose clamp. Remove the second nut and washer that attach the surge tank to the same mounting stud.
   - 4.3 Remove the nut and washer that attach the fan switch mounting bracket to the

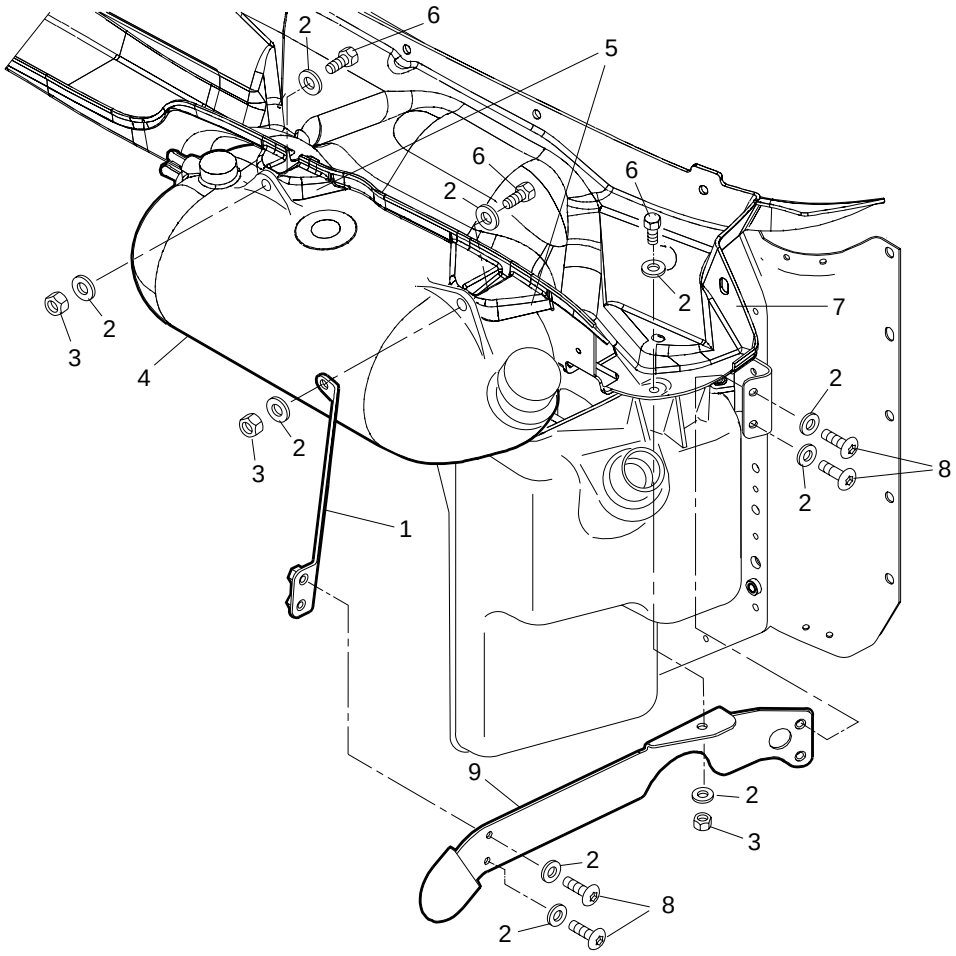
lower surge tank mounting stud. See **Fig. 3**. Remove the fan switch mounting bracket.

4.4 Remove the surge tank.

5. Remove the outboard drain tube from the rain tray.
6. Disconnect the electrical connector from the washer pump.
7. Disconnect the washer fluid hose from the washer pump.

NOTE: Washer fluid will flow out of the washer pump outlet if the reservoir contains washer fluid.

8. Move the surge tank off of the lower mounting stud and upper mounting brackets.



1. Hood Guide Mounting Bracket
2. Washer
3. Nut
4. Surge Tank
5. Surge Tank Mounting Brackets
6. Bolt
7. Rain Tray
8. T40 Torx Capscrew
9. Hood Guide

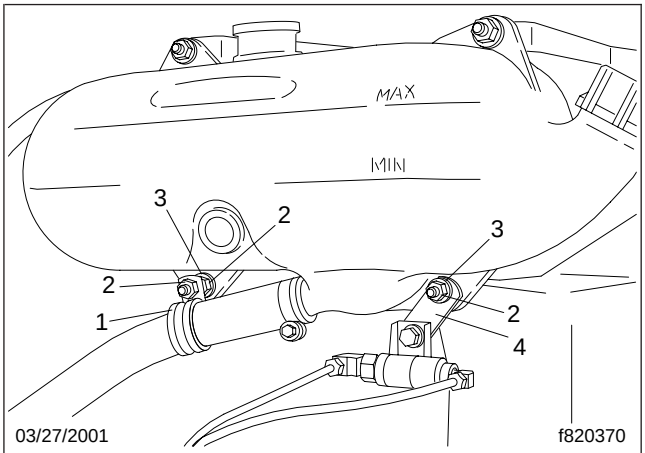
Fig. 2, Hood Guide Installation

9. Remove the two T40 Torx capscrews and washers that attach the washer reservoir to the mounting bracket and front wall. See **Fig. 4**.
10. Remove the washer reservoir.

Installation

1. With the tires chocked, position the washer reservoir in place on the mounting stud. Using two T40 Torx capscrews and washers, attach the reservoir to the mounting bracket and front wall. See **Fig. 4**.
2. Attach the washer fluid hose to the washer pump.
3. Attach the electrical connector to the washer pump.
4. Install the surge tank and the fan switch, as follows.
   - 4.1 Position the surge tank on the mounting brackets and studs. Using a bolt, nut, and washer, install the hood guide mounting bracket (if so equipped) on the upper right-side mounting bracket. See **Fig. 2**.

Washer Reservoir Removal and Installation



1. Hose Clamp
2. Nut
3. Washer
4. Fan Switch Mounting Bracket

Fig. 3, Surge Tank Installation

4.2 Using a bolt, nut, and washer, secure the surge tank to the upper left-side mounting bracket.

4.3 Using a nut and washer, secure the surge tank to the lower right-side mounting stud. Install the hose clamp on the same mounting stud and secure the hose clamp with a nut. See **Fig. 3**.

4.4 Using a nut and washer, attach the fan switch mounting bracket to the left-side mounting stud.

5. On vehicles with a hood guide mounted above the washer reservoir, install the hood guide, as follows. See **Fig. 2**.

5.1 Using a bolt, nut, and washer, attach the hood guide to the rain tray.

5.2 Using four T40 Torx capscrews, attach the hood guide to the mounting brackets.

6. Install the outboard drain tube; hook the bottom of the drain tube on the washer reservoir. Install the fastener for the inboard drain tube.
7. Close and latch the hood.
8. Remove the chocks.

Argosy COE

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Open the grille.
3. Remove the A-pillar side panel. For detailed instructions, see **Section 60.16, Subject 100**.
4. Remove the left-hand cowl side panel. For detailed instructions, see **Section 60.16, Section 100**.
5. Remove the four fasteners that attach the washer reservoir to the front wall. See **Fig. 5**.
6. Disconnect the pump, as follows. See **Fig. 6**.

6.1 Pull the reservoir free of its mountings and turn it over to expose the washer pump.

6.2 Disconnect the electrical connector attached to the washer pump and cut the tie strap that attaches the electrical conduit to the strap holder on the back of the reservoir.

6.3 Remove the washer fluid delivery line from the pump.

NOTE: Washer fluid will flow out of the washer pump outlet if the reservoir contains washer fluid.

Installation

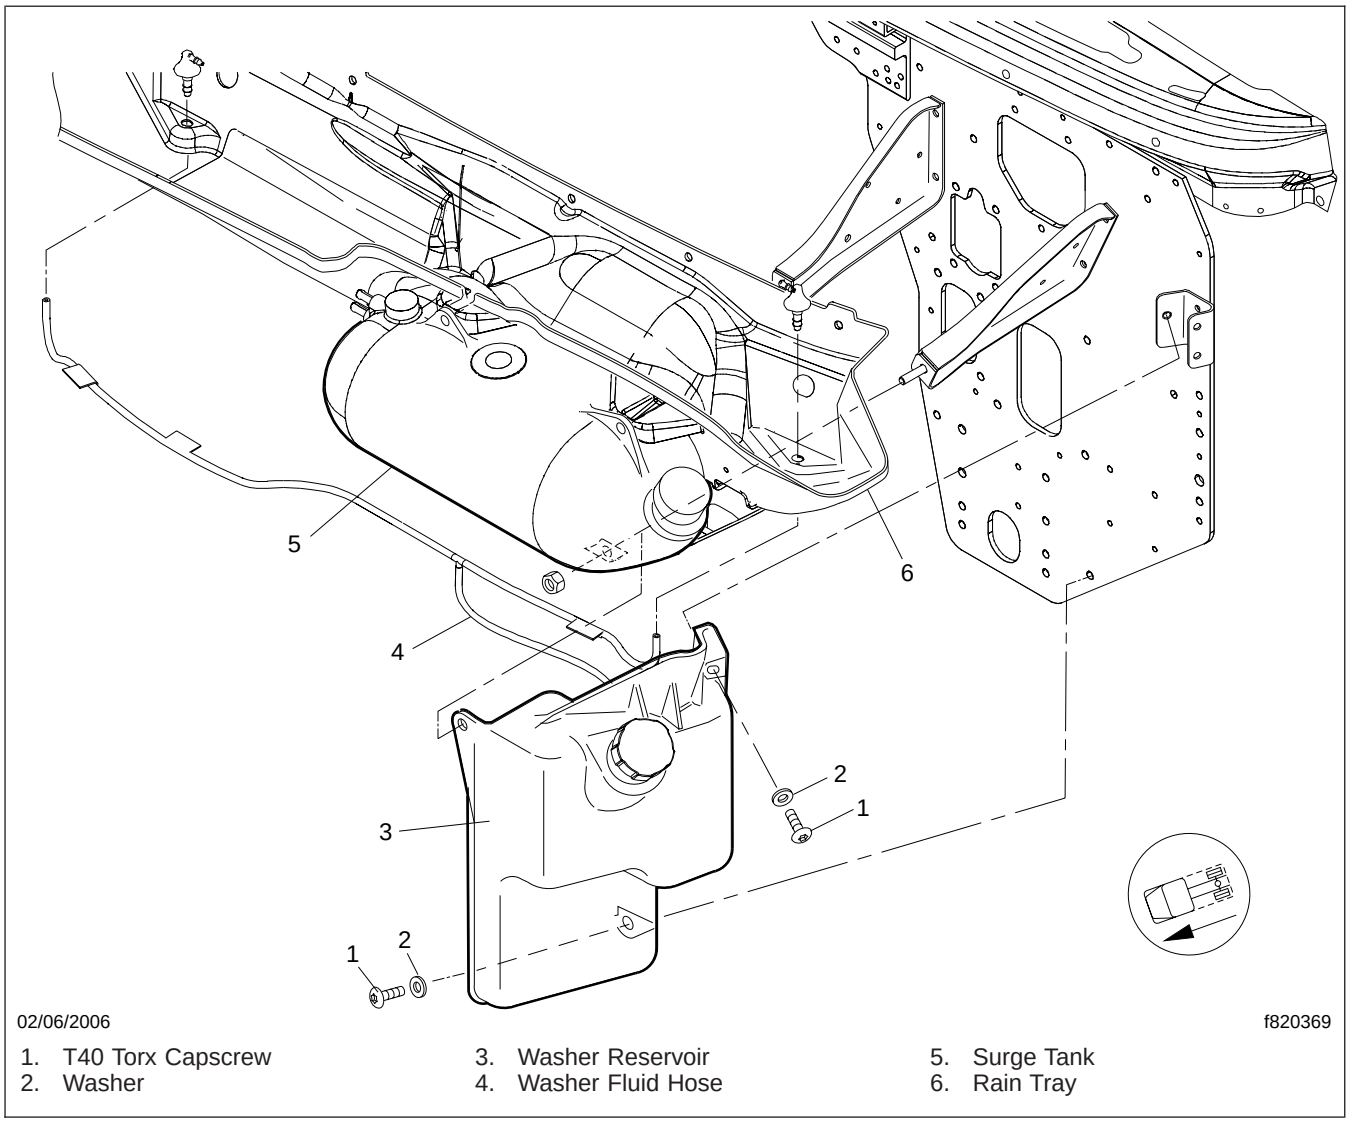
1. With the tires chocked, connect the pump to its electrical connector and fluid line, as follows. See **Fig. 6**.

1.1 Connect the electrical connector to the washer pump. For corrosion protection, pack the exposed ends of the connector with pumpable dielectric grease, part number 48–02439–000.

1.2 Insert a new tie strap through the tie strap holder and around the electrical conduit.

1.3 Attach the washer fluid delivery line to the washer pump.

2. Install the washer fluid reservoir onto the front-wall, as follows. See **Fig. 5**.



1. T40 Torx Capscrew
2. Washer
3. Washer Reservoir
4. Washer Fluid Hose
5. Surge Tank
6. Rain Tray

Fig. 4, Washer Reservoir Installation (Century Class Conventional with Front-Wall Mounted Surge Tank)

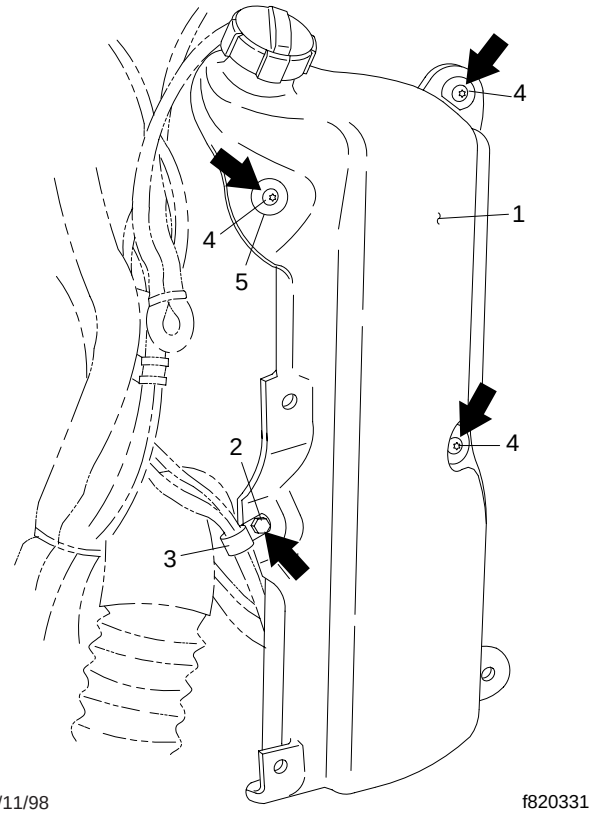
2.1 Position the reservoir on the front wall and line up the mounting holes.

2.2 Install the 5/16–18 hexnut and the two washers on the upper right-hand corner of the reservoir, as removed.

2.3 Install the three 5/16–18 screws, as removed.

3. Tighten all the fasteners 15 lbf·ft (20 N·m).
4. Install the left-hand cowl side panel. For detailed instructions, see **Section 60.16, Subject 100**.
5. Install the A-pillar side panel. For detailed instructions, see **Section 60.16, Subject 100**.
6. Close and latch the grille.
7. Remove the chocks.

Washer Reservoir Removal and Installation



Remove the fasteners shown by the arrows.

1. Washer Reservoir
2. Hexnut, 5/16–18
3. Support Clamp
4. Screw, 5/16–18
5. Plated Steel Washer

Troubleshooting

WARNING

Use caution when working on or near the wiper linkage, arms, and motor. An intermittent wiper system may swipe without warning, posing a risk of personal injury.

NOTICE

Make sure the ignition switch is off before disconnecting any wiper/washer harness connectors. Removing connectors with the ignition switch on may cause electrical arcing, which will damage the pins.

Preliminary Checks

Before beginning the troubleshooting procedures, verify the driver's complaint by checking the system components, and operating the wiper and washer to duplicate the problem.

1. Check the wiper arms, blades, and linkage for wear and damage.
2. Check the washer fluid level in the reservoir.
3. Turn the ignition switch to the ON position without starting the engine.
4. Test the wipers on low speed, high speed, and several intermittent speeds.
5. Test the windshield washers.
6. Turn the ignition switch to the OFF position.
7. Check the washer hoses for leaks and damage.

Diagnostic Procedures

Symptoms

The diagnostic procedures listed in **Table 1** are described in detail in the succeeding tables. When performing the diagnostic procedures, refer to the wiring diagram (**Fig. 1**) and the tables in this subject.

NOTICE

Use caution when backprobing sealed connectors. If the seal is damaged, water could intrude into the connection, resulting in corrosion and electrical failure.

IMPORTANT: The following wiper and washer diagnostic procedures are performed with the ignition switch in the ON position, and the engine NOT running.

Troubleshooting Procedures	
Symptom	**Table Number**
Wipers are inoperative in all modes.	**Table 2**
High-speed mode only is inoperative.	**Table 3**
Low-speed and all intermittent speed modes are inoperative, high-speed mode is OK.	**Table 4**
Wipers do not park in the proper position.	**Table 5**
Wipers stay on until ignition is turned off.	**Table 6**
Washers are inoperative.	**Table 7**
Washer spray does not correctly cover wipe area.	**Table 8**

Table 1, Troubleshooting Procedures

Wipers Are Inoperative In All Modes			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—

Troubleshooting

Wipers Are Inoperative In All Modes			
Step	**Test Procedure**	**Test Result**	**Action**
2	With the connector remaining connected, backprobe the wiper motor connector on pins A and C to measure for battery voltage; see **Table 9**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 110**.
		Low or at zero	Go to **step 3**.
3	Verify that pin A of the wiper motor connector is at ground potential; see **Table 9**. Is pin A at ground potential?	Yes	Go to **step 4**.
		No	Repair the ground circuit.
4	Access the wiper switch (**Fig. 2**) connector, and backprobe pin 1 to measure the voltage, with the connector remaining connected to the module; see **Table 10**. Is battery voltage present on pin 1?	Yes	Go to **step 5**.
		Low or at zero	Check circuit breaker CB49 in the PDM. If the circuit breaker is open, determine if there is a shorted wire or component on circuit 315 that is drawing excess current.
5	With the ignition set to the ON position and the wipers switched to low speed, measure the voltage on pin 3 of the wiper switch connector. Is the measured voltage at or within a few tenths of a volt to ground?	Yes	Test for an open circuit through the speed switching relays R35 and R36. Troubleshoot circuits 315L and 315H from the PDM to the wiper motor.
		No	Replace the wiper switch.

Table 2, Wipers Are Inoperative In All Modes

High-Speed Mode Only Is Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to high speed.	—	—
2	With the connector remaining connected, backprobe the wiper motor connector on pins A and B to measure for battery voltage; see **Table 9**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 110**.
		Low or at zero	Go to **step 3**.
3	Access the wiper switch (**Fig. 2**) connector, and backprobe pin 4 to measure the voltage, with the connector remaining connected to the module, the ignition switch in the ON position, and the wipers set to high speed; see **Table 10**. Is the measured voltage at or within a few tenths of a volt to ground?	Yes	Test for an open circuit through relay R35 and its interconnecting wiring, including circuit 315H from the PDM to the wiper motor.
		No	Replace the wiper switch.

Table 3, High-Speed Mode Only Is Inoperative

Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—

Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK			
Step	**Test Procedure**	**Test Result**	**Action**
2	With the connector remaining connected, backprobe the wiper motor connector on pins A and C to measure for battery voltage; see **Table 9**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 110**.
		Low or at zero	Go to **step 3**.
3	Verify the voltage at pin A of the wiper motor connector. Is it at ground potential?	Yes	Go to **step 4**.
		No	Repair the ground circuit 320.
4	With the wiper switch (**Fig. 2**) remaining connected to the connector, the ignition switch in the ON position, and the wipers set to low speed, backprobe the wiper switch connector on pin 3 to measure for battery voltage; see **Table 10**. Is the measured voltage at or within a few tenths of a volt to ground?	Yes	Test for an open circuit through the speed switching relays R35 and R36, and the interconnected wiring. Troubleshoot circuit 315L from the PDM to the wiper motor.
		No	Replace the wiper switch.

Table 4, Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK

Wipers Do Not Park in Proper Position			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—
2	Turn the wiper switch off when the wipers are in mid-swipe. Do the wipers stop immediately, or continue traveling, then stop?	Immediately	Go to **step 3**.
		Continue traveling, then stop	Note the stopped position. Repeat the test to make sure that the wipers always stop in the same position. If the wipers always stop in the same position, regardless of where the switch was turned off, the linkage is improperly adjusted. Turn the ignition switch to OFF, disconnect the batteries, then adjust the wiper linkage to the correct position.
3	With the ignition switch in the ON position and the wipers switched off, measure the voltage on pin D of the wiper motor connector; see **Table 9**. Is battery voltage present?	Yes	Go to **step 4**.
		No	Locate and repair the open circuit on circuit 315C between the wiper motor and the PDM.
4	With the ignition in the ON position and the wipers switched to low speed, measure the voltage on pin F of the wiper motor connector; see **Table 9**. Battery voltage should be present except when the wipers travel through the park position and the circuit is momentarily at ground. Is battery voltage present?	Yes	Go to **step 5**.
		No	Replace the wiper motor; see **Subject 110**.

Troubleshooting

Wipers Do Not Park in Proper Position			
Step	**Test Procedure**	**Test Result**	**Action**
5	With the wipers switched on, measure the voltage at terminal 87A of relay R36. Is battery voltage present?	Yes	Test for an open R36 relay.
		No	Locate and repair the open circuit between relay R36 and the wiper motor in circuit 315P.

Table 5, Wipers Do Not Park in Proper Position

Wipers Stay On Until Ignition Is Turned Off			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position. Leave the wiper switch in the OFF position. Do the wipers stay on at high speed or low speed?	High speed	Troubleshoot for circuit 315B shorted to ground, and for relay R35 shorted between terminals 87 and 30.
		Low speed	Go to **step 2**.
2	Backprobe pin F of the wiper motor connector to check the voltage through the wiper motor's internal park switch; see **Table 9**. When the wipers travel through the park position, pin F should be momentarily at ground. Most volt meters respond quickly enough to show this momentary voltage transition. Is the momentary voltage transition to ground present?	Yes	Troubleshoot and repair for circuit 315B shorted to ground, and for relay R36 shorted between terminals 87 and 30.
		No	The wiper motor internal park switch is not working. Replace the wiper motor; see **Subject 110**.

Table 6, Wipers Stay On Until Ignition Is Turned Off

Washers Are Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed. Do the wipers work?	Yes	Turn the wipers off. Go to **step 2**.
		No	Follow the troubleshooting procedure under "Wipers Are Inoperative In All Modes"; see **Table 2**.
2	Check the washer reservoir fluid level. Add fluid if needed, then test the washer operation. Hold the washer switch on for at least 5 seconds in case the hoses are leaking, or the system has lost its prime. Is the pump running?	Yes	Check the system for leaks. Also follow the troubleshooting procedure under "Washer Spray Does Not Correctly Cover Wipe Area"; see **Table 8**.
		No	Go to **step 3**.
3	If the system is not leaking, backprobe the connections at the washer pump, and test for battery voltage when the washer switch is activated; see **Table 11**. Is battery voltage present?	Yes	Replace the washer pump.
		No	Go to **step 4**.

Washers Are Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
4	With the wiper switch (**Fig. 2**) remaining connected to the connector, and the ignition switch in the ON position, backprobe pin 5 of the wiper switch to measure voltage; see **Table 10**. When the washers are activated, is the measured voltage at or within a few tenths of a volt to ground?	Yes	Troubleshoot for a wiring fault on circuit 320 between the wiper switch and the washer pump. Also troubleshoot circuit 315C to the washer pump.
		No	Replace the wiper switch.

Table 7, Washers Are Inoperative

Washer Spray Does Not Correctly Cover Wipe Area			
Step	**Test Procedure**	**Test Result**	**Action**
1	Make sure that the fluid level in the washer fluid reservoir is adequate. If needed, add fluid.	—	—
2	Test the washer operation. Hold the washer switch in the ON position for at least 5 seconds. Is the fluid flow adequate?	Yes	Troubleshooting is completed.
		No	Check the nozzles for damage, plugging, or improper installation. Check the hoses for kinks, or wire ties that may be too tight. Make sure that there are no breaks or disconnected fittings. Go to **step 3**.
3	Test the washer operation. Does the washer work properly?	Yes	Troubleshooting is completed.
		No	Replace the washer pump.

Table 8, Washer Spray Does Not Correctly Cover Wipe Area

Terminal Identification of the Wiper Motor Harness Connector			
Wiper Motor Harness Connector	**Pin**	**Circuit Number**	**Circuit Description**
 f545385	A	GND	Ground
	B	315H	Wiper Motor High Speed
	C	315L	Wiper Motor Low Speed
	D	315C	Ignition Power
	E	—	Not used

Washer Reservoir Mounting Screws (Grade 5)	5/16–18	15 (20)	—

Table 1, Fastener Torque Values

General Information

The main purpose of the refrigerant compressor is to draw refrigerant gas from the evaporator and squeeze it into high-pressure gas. High pressure raises the condensation point of refrigerant gas, which allows the condenser to change it to a liquid so that it can be used for cooling again. A second purpose of the compressor is to move refrigerant through the air conditioner system.

The Climate Control compressor is a two-piston design. The pistons are driven by a crankshaft and connecting rods.

The compressor is monitored by the Air Conditioning Protection Unit (ACPU) which consists of an electronic control module, high and low pressure switches, and the thermostatic switch. During operation, the clutch is engaged, transmitting the rotation of the pulley to the compressor. When the cab temperature drops sufficiently, the ACPU system breaks the circuit to the compressor clutch, disengaging the clutch, and allowing the pulley to rotate without turning the compressor.

Refer to the heater and air conditioning section in this group for more information on the ACPU system. Additionally, the control module registers fault codes that warn of existing or impending problems with the compressor and the air conditioning system. For further information on system fault codes, refer to the section in **Group 54** in the vehicle service manual which discusses the Instrumentation Control Unit. Additionally, if ServicePro is available, consult the technician diagnostic routine covering the ACPU system.

Safety Precautions

Whenever repairs are made to any air conditioner parts that hold R–134a refrigerant, you must recover, purge or flush (if contaminated), evacuate, charge, and leak test the system. In a good system, refrigerant lines are always under pressure and you should disconnect them only after the refrigerant charge has been recovered (discharged) at the service valves.

Refrigerant R–134a is safe when used under the right conditions. Always wear safety goggles and non-leather gloves while recovering, evacuating, charging, and leak testing the system. Do not wear leather gloves; when refrigerant gas or liquid contacts leather, the leather will stick to your skin.

⚠ WARNING

WARNING: Use care to prevent refrigerant from touching your skin or eyes, because liquid refrigerant, when exposed to the air, quickly evaporates and will freeze skin or eye tissue. Serious injury or blindness could result if you come into contact with liquid refrigerant.

Refrigerant splashed in the eyes should be rinsed with lukewarm water, not hot or cold. Do not rub the eyes. Apply a light bandage and contact a physician right away.

Refrigerant splashed on the skin should be rinsed with lukewarm water, not hot or cold. Do not rub the skin. Apply a light coat of a nonmedicated ointment, such as petroleum jelly. Contact a physician right away.

R–134a refrigerant does not burn at ambient temperatures and atmospheric pressure. However, it can be combustible at pressures as low as 5.5 psig (139 kPa absolute) at 350°F (177°C) when mixed with air concentrations that are greater than 60 percent.

⚠ WARNING

R–134a air conditioning systems should not be pressure tested or leak tested with compressed air. Combustible mixtures of air and R–134a may form, resulting in a fire or explosion that could cause personal injury or property damage.

You must work in an area where there is a constant flow of fresh air when the system is recovered, evacuated, charged, and leak tested. R–134a vapors have a slightly sweet odor that is difficult to detect. Frequent leak checks and air monitoring equipment are recommended to ensure a safe working environment.

IMPORTANT: When servicing an R–134a air conditioning system, use only service equipment certified to meet the requirements of SAE J2210 (R–134a recycling equipment). The equipment should be operated only by qualified personnel who are familiar with the recycling station manufacturer's instructions.

Because of its very low boiling point, refrigerant must be stored under pressure. To prevent the refrigerant containers from exploding, never expose them to temperatures higher than 125°F (52°C).

On R–134a refrigerant systems, polyol ester (POE) refrigerant oil or polyalkylene glycol (PAG) refrigerant oil is used in the compressor. When handling refrigerant oil, observe the following guidelines:

- Keep the oil free of contaminants.
- Do not expose the air conditioning system or the refrigerant oil container to air for long periods of time. Refrigerant oil absorbs moisture quickly.
- Use care when handling. Spilled oil could damage painted surfaces, plastic parts, and other components such as drive belts.
- Never mix refrigerant oil types.

Pre-Service Checks

⚠ WARNING

WARNING: Before doing any work, read the information under Safety Precautions, 100. Failure to read the safety precautions, and to be aware of the dangers involved when working with refrigerant, could lead to serious personal injury.

Some special tools are needed for doing repair work on the compressor. Refer to the special tools table in **Specifications, 400.** Tool kits can be bought from the distributor listed under the special tools table in **Specifications, 400.**

NOTE: Compressor problems usually show in one of four ways: abnormal noise; seizure; leakage; or low suction and discharge pressures. Resonant compressor noises are not causes for alarm; irregular noise or rattles are likely to be caused by broken parts. To check for seizure, de-energize the magnetic clutch and see if the drive plate can be turned. If it won't turn, the compressor has seized.

Do the following checks whenever the air conditioner system is not cooling enough and the causes are unknown.

1. Be sure to check the moisture indicator, to see if moisture is the cause of the problems. The air conditioner should be on when checking the indicator; it is better to check it at the end of a day's run.
2. Check the drive belt and mounting:
   - 2.1 On the drive belt, look for wear, damage, or oil. If worn, oil-soaked, or damaged, remove it and install a new one. Refer to the drive belt section in **Group 01** of this manual for instructions.
   - 2.2 Check the compressor mounting parts for loose fasteners, cracks, or other damage. Tighten loose fasteners to the torque value in the torque specifications table under **Specifications, 400.** Repair or replace cracked or damaged brackets.
   - 2.3 Check the tension of the compressor drive belt. Refer to the drive belt section in **Group 01** of this manual for instructions.
   - 2.4 Check the compressor oil level. Refer to **Subject 130** for instructions.
3. Check the wiring and connections to the compressor clutch. Replace damaged wiring and tighten loose connections.
4. Check for road debris build-up on the condenser coil fins. Using air pressure and a whiskbroom or a solution of soap and water, carefully clean the condenser; be careful not to bend the fins.
5. Check the refrigerant charge in the air conditioner system; for instructions, refer to the heater and air conditioner section in this group.
6. Check the valve plate and cylinder gasket **(Subject 160),** and the shaft seal **(Subject 150)** for damage. Replace as needed.

NOTE: For other possible causes of air conditioner problems, refer to the heater and air conditioner section in this group and to the applicable fan clutch section in **Group 20** of this manual.

Removal

⚠ WARNING

Before doing any of the work below, read the information under Safety Precautions 100. Failure to read the safety precautions and to be aware of the dangers involved when working with refrigerant, could lead to serious personal injury.

1. Turn off the engine, apply the brakes, and chock the tires.
2. Recover the refrigerant from the air conditioning system. For instructions, refer to Section 83.02, **Subject 250**.
3. On Argosy COEs, tilt the cab. For cab tilt instructions, see **Group 60** in this manual.
4. Disconnect the discharge and suction lines from the compressor. Quickly cap the discharge and suction ports and plug the fittings.

IMPORTANT: Under no circumstances should the ports on the compressor remain uncapped or the fittings remain unplugged for longer than five minutes total. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

5. Disconnect the clutch cable connector.
6. On Century Class Conventionals with a V-belt, remove the V-belt. If equipped with a serpentine belt, see the next step.
   - 6.1 On vehicles with Detroit Diesel Series 50 and 60 engines, loosen the adjusting rod jam nut, back off the adjustment nut, and loosen the compressor mounting bolts. See **Fig. 1**. Move the compressor towards the alternator until the belt can be removed from the compressor.
   - 6.2 On vehicles with Cummins and Caterpillar engines, loosen the compressor pivot bolt. See **Fig. 2** and **Fig. 3**. Loosen the adjusting rod jam nut, then back off the adjustment nut until the belt can be removed.
   - 6.3 Remove the V-belt. Don't pry or roll it off the pulleys.

3. Compressor Mounting Bolt and Nut
4. Refrigerant Compressor
5. Pivot Bolt
6. Adjustment Nut
7. Jam Nut

Fig. 2, Compressor Mounted on a Cummins M11 Engine, Century Class Conventional

attachment bolt. Remove the compressor mounting bolts and the compressor.

9.2 On vehicles with Cummins and Caterpillar engines, pivot the compressor mounting bracket as needed to access the compressor mounting bolts. Remove the compressor mounting bolts and the compressor.

10. On Argosy COEs with Detroit Diesel Series 60 engines, remove the compressor.

10.1 Remove the bolt, washer, and nut that attach the bracket on the radiator inlet hose to the bracket on the compressor.

10.2 Remove the capscrew and washer that attach the cushion clamp that holds two lines and an electrical cable to the compressor.

10.3 Remove the compressor mounting capscrews and washers and remove the compressor. See **Fig. 4**.

Installation

IMPORTANT: A new compressor is filled with refrigerant oil and nitrogen gas. The quantity is printed on a label attached to the compressor. When installing a new compressor on the vehicle, do all of the steps below. If installing a used compressor, don't do the first step.

1. Prepare a new compressor.

1.1 Gently release the nitrogen gas from the discharge side of the compressor. Be careful not to let the oil flow out.

1.2 Turn the compressor shaft several times by hand to distribute oil which has settled in the cylinder.

2. On Century Class Conventionals, place the compressor on the mounting bracket. Loosely install the mounting bolts to hold the compressor in place. On Detroit Diesel Series 50 and 60 engines, install the adjusting rod attachment bolt.

3. On Argosy COEs, install the compressor.

3.1 Place the compressor on the mounting bracket. Install the washers and capscrews on the bottom of the bracket and tighten 20 to 25 lbf·ft (27 to 34 N·m). Install the washers and capscrews on the side of the bracket and tighten 20 to 25 lbf·ft (27 to 34 N·m).

3.2 Install the washer and capscrew that attach the cushion clamp to the compressor.

3.3 Install the bolt, washer, and nut that attach the radiator inlet hose bracket to the bracket on the compressor.

5. Compressor Mounting Bolt
6. Refrigerant Compressor
7. Pivot Bolt
8. V-Belt
9. Adjustment Link Bracket

Fig. 3, Compressor Mounted on a Caterpillar 3176 Engine, Century Class Conventional

4. On Century Class Conventionals, install the V-belt or the serpentine belt. Refer to **Group 01** for V-belt installation and adjustment procedures.

   4.1 On vehicles with Detroit Diesel Series 50 and 60 engines, tighten the bottom mounting bolts 20 to 25 lbf·ft (27 to 34 N·m). Then, tighten the side mounting bolts 20 to 25 lbf·ft (27 to 34 N·m). Tighten the adjusting rod attachment bolt 20 to 25 lbf·ft (27 to 34 N·m).

   4.2 On vehicles with Cummins and Caterpillar engines, tighten the mounting bolts 20 to 25 lbf·ft (27 to 34 N·m). Tighten the pivot bolt 68 lbf·ft (92 N·m). Tighten the adjusting rod jam nut 155 lbf·ft (210 N·m).

5. On Argosy COEs, install the belt.

6. Uncap the discharge and suction ports. Unplug the fittings. Check the fittings and the discharge and suction ports. They must be clean and free of nicks, gasket residue, and other foreign material.

7. On hose connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

   On hose connections that have a SlimLine seal assembly (**Fig. 5**), replace the seals. **Do not** lubricate SlimLine seals prior to installation. Use **only** a SlimLine seal on a SlimLine seal assembly.

8. Connect the refrigerant hoses to the compressor.

   On hose connections that have threaded fittings, torque the fittings 21 to 27 lbf·ft (28 to 37 N·m).

   On hose connections that have a SlimLine seal assembly, torque the bolt on the SlimLine seal assembly 11 to 15 lbf·ft (15 to 20 N·m).

9. Connect the clutch cable connector to the clutch.

10. Replace the receiver-drier. For instructions, refer to Section 83.02, **Subject 200**.

11. Check the oil in the compressor, as specified in **Subject 130**.

Oil Check and Adding Oil to the Refrigerant Compressor

General Information

IMPORTANT: On R–134a air conditioning systems, new compressors are factory-charged with about 14 fl oz (414 mL) of refrigerant oil. Some refrigerant oil is circulated through the system with the refrigerant, and cannot leave the system except through a leak, when the system is discharged or recovered, or when a system part is replaced.

Oil must be from a container that has not been opened, or that has been tightly sealed since its last use. Refer to the applicable refrigerant oils table in **Specifications, 400** for recommended oils. Tubing, funnels, or other equipment used to transfer the oil should be very clean and dry.

IMPORTANT: Add the same amount of oil that is removed when the system is discharged or recovered, or when a system part is replaced. The list below provides approximate refill amounts for the R–134a air conditioning system.

A. Oil charge—the entire system should have *about* 14 fl oz (414 mL) of refrigerant oil. There should be 10 fl oz (296 mL) in the compressor. Each major component has *about* 2.0 fl oz (59 mL) of oil (this amount has been rounded off for ease of adding oil to the compressor). Therefore, additional oil must be added to the compressor when a major component is replaced.

NOTE: As an example, if the condenser and the receiver-drier are to be replaced, first check the oil level of the compressor. The compressor should have 10 fl oz (296 mL). Add oil if needed. Then, after replacing the condenser and the receiver-drier, add an additional 4.0 fl oz (118 mL) of oil to the compressor. The entire system should then have about 14 fl oz (414 mL).

When handling refrigerant oil:

- The oil should be free of water, dust, metal powder, and other foreign substances.
- Don't mix refrigerant oil with other types or viscosities of oil.
- Refrigerant oil absorbs moisture when exposed to the air for any period of time. After use, quickly seal the oil container.

IMPORTANT: Replacing only the amount of oil that is removed during evacuation may result in the wrong oil charge because the oil charge may have been incorrect prior to evacuation. The only way to ensure the proper oil charge is to check the oil level of the compressor with a dipstick.

B. Receiver-drier—when the receiver-drier is replaced, *about* 2.0 fl oz (59 mL) must be added to the compressor in addition to the 10 fl oz (296 mL) that the compressor requires.

IMPORTANT: A new receiver-drier does not contain any refrigerant oil.

C. Condenser—when the condenser is replaced, *about* 2.0 fl oz (59 mL) must be added to the compressor in addition to the 10 fl oz (296 mL) that the compressor requires.

D. Evaporator coil—when the evaporator coil is replaced, *about* 2.0 fl oz (59 mL) must be added to the compressor in addition to the 10 fl oz (296 mL) that the compressor requires.

IMPORTANT: Check the compressor oil level whenever the system has been opened.

⚠ WARNING

Don't remove the oil fill plug without first recovering the system. Failure to recover the system could cause uncontrolled release of high-pressure refrigerant, which can freeze skin and eye tissue causing serious injury or blindness.

1. Recover the refrigerant from the air conditioner system. For instructions, refer to the cab heater and air conditioner section in this group.
2. Remove the oil fill plug and O-ring.
3. Check the oil level with the dipstick. When the compressor is mounted vertically, use either plug; when mounted in any other orientation, use the upper plug. **Figure 1** shows the oil level with the refrigerant compressor mounted at 22 degrees. **Figure 2** shows the oil level with the refrigerant compressor mounted at 45 degrees.

   If the dipstick bottoms out before going in more than 3 inches (75 mm), it is hitting the compressor crankshaft. Rotate the drive plate by hand and insert the dipstick again until it contacts the

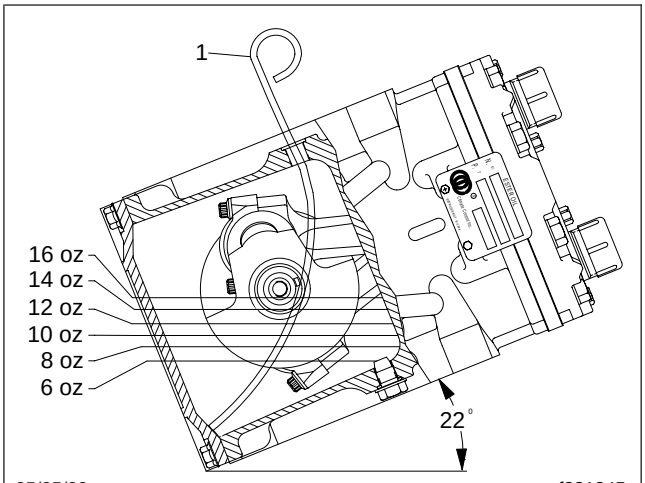
Oil Check and Adding Oil to the Refrigerant Compressor

bottom of the sump. See **Table 1** to determine the oil quantity. Add or remove oil from the compressor so that the oil charge is 10 fl oz (296 mL).

Oil Quantity at Various Dipstick Depths				
Dipstick Depth				Oil Quantity fl oz (mL)
0-Degree Mount (horizontal) inches (mm)	22-Degree Mount inches (mm)	45-Degree Mount inches (mm)	90-Degree Mount (vertical) inches (mm)	
13/16 (20.6)	1-3/4 (44.5)	1-5/8 (41.3)	7/8 (22.2)	6 (177)
1 (25.4)	2-1/16 (52.4)	1-13/16 (46)	1 (25.4)	8 (237)
1-13/16 (30.2)	2-5/16 (58.7)	2 (50.8)	1-1/8 (28.6)	10 (296)
1-5/8 (41.3)	2-9/16 (65.1)	2-1/4 (57.2)	1-7/16 (36.5)	12 (355)
1-13/16 (46)	2-7/8 (73)	2-7/16 (61.9)	1-11/16 (43)	14 (414)
1-15/16 (49.2)	3-1/8 (79.4)	2-5/8 (66.7)	1-7/8 (47.6)	16 (473)

Table 1, Oil Quantity at Various Dipstick Depths

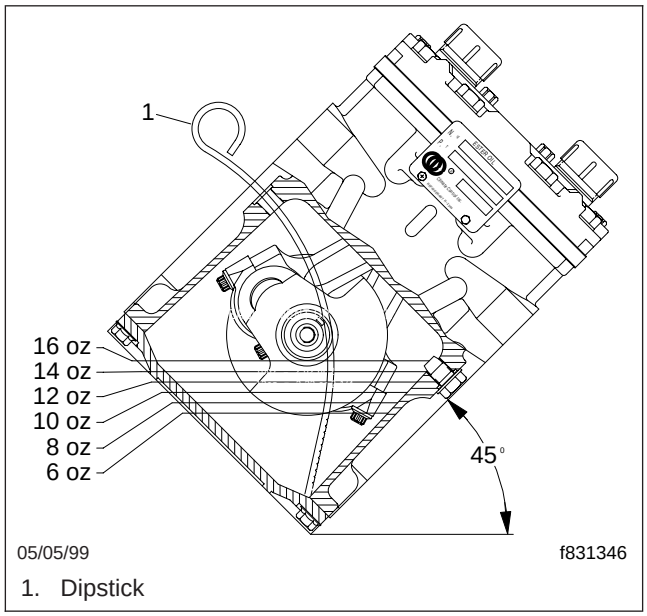
NOTE: A dipstick can be made locally or pur-



1. Dipstick

Fig. 1, Oil Level With Refrigerant Compressor Mounted at 22 Degrees

chased from a special tools supplier. Refer to the special tools table in **Specifications, 400**. If made locally, it can be formed from 1/8-inch diameter by 8-5/16 inch long stock. See **Fig. 3**. Use a nonferrous material that is not subject to corrosion. Notching the end makes it easier to see the oil depth.

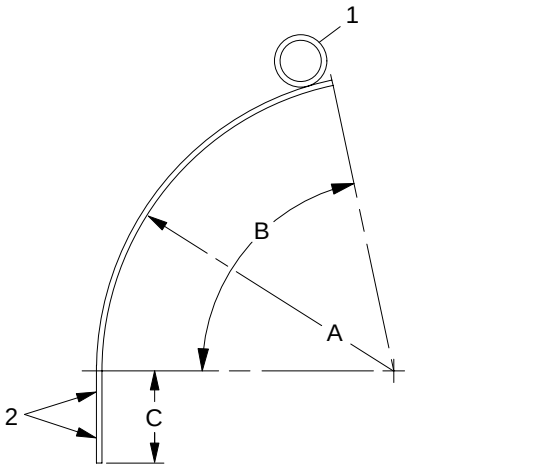


1. Dipstick

Fig. 2, Oil Level With Refrigerant Compressor Mounted at 45 Degrees

4. Being careful not to twist the O-ring, slip it over the oil fill plug threads. Insert the plug in the oil fill opening and tighten it until snug. If the plug leaks, don't attempt to stop the leak by overtightening. Leaks may be caused by dirt under the O-ring, dirt on the seat, a broken O-ring, or a

damaged seat on the oil fill plug or opening. Correct the problem and install a new O-ring.



NOTE: Left-Hand Mounting: Check oil when shaft key is down. Right-Hand Mounting: Check oil when shaft key is up.

A. 4-3/4 Inches (121 mm) Radius
B. 78°
C. 1-1/2 Inches (38 mm)
1. Finger Ring
2. 12 Notches, 1/8 Inch (3.2 mm) Apart

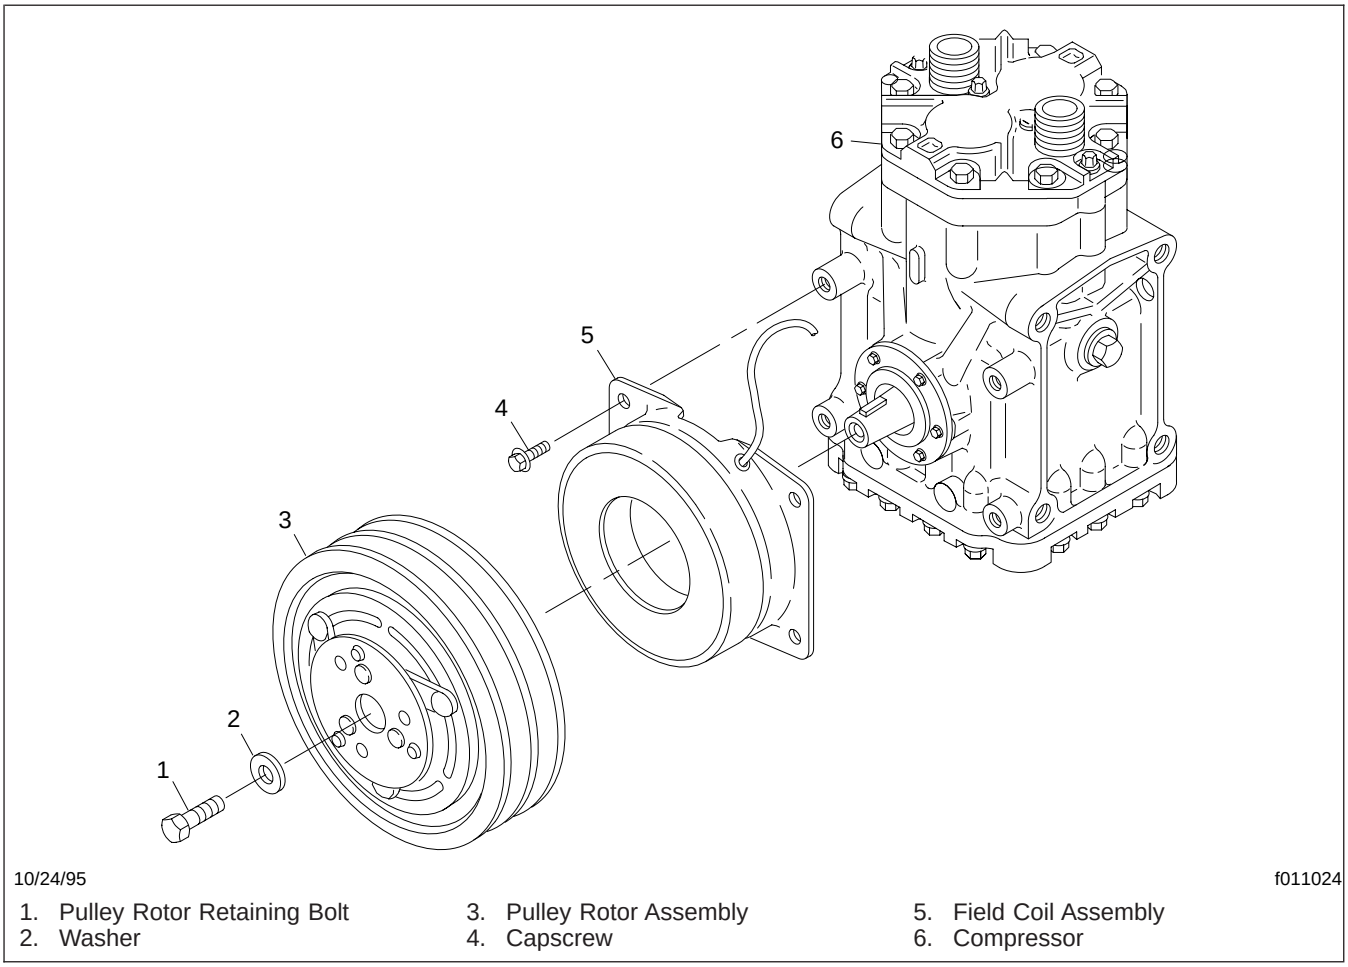
Fig. 3, Dipstick Specifications

5. Evacuate, charge, and leak test the refrigerant system. For instructions, refer to the cab heater and air conditioner section in this group.

Refrigerant Compressor Magnetic Clutch Assembly Removal, Inspection, and Installation

Removal

1. Remove the 5/16-inch pulley rotor retaining bolt from the center of the pulley rotor. See **Fig. 1**.
5. Remove the four 1/4–20 capscrews holding the field coil assembly to the compressor housing.
6. Remove the field coil assembly.



1. Pulley Rotor Retaining Bolt
2. Washer
3. Pulley Rotor Assembly
4. Capscrew
5. Field Coil Assembly
6. Compressor

Fig. 1, Pulley Rotor and Field Coil Assemblies

2. Install a 5/8–11 capscrew in the hub of the pulley rotor assembly.
3. Tighten the screw to pull the pulley rotor assembly off the compressor shaft.

⚠ CAUTION

CAUTION: Do not try to remove the pulley rotor assembly by prying or hammering. This can damage the assembly.

4. Disconnect the field coil electrical lead wire.

Inspection

1. Inspect the drive plate. If the friction surface shows signs of damage due to too much heat, replace the drive plate and pulley assembly.
2. Check the appearance of the pulley assembly. If the frictional surface of the pulley shows signs of too much grooving due to slippage, replace both the pulley and drive plate. Clean the friction surfaces of the pulley assembly before installing it.

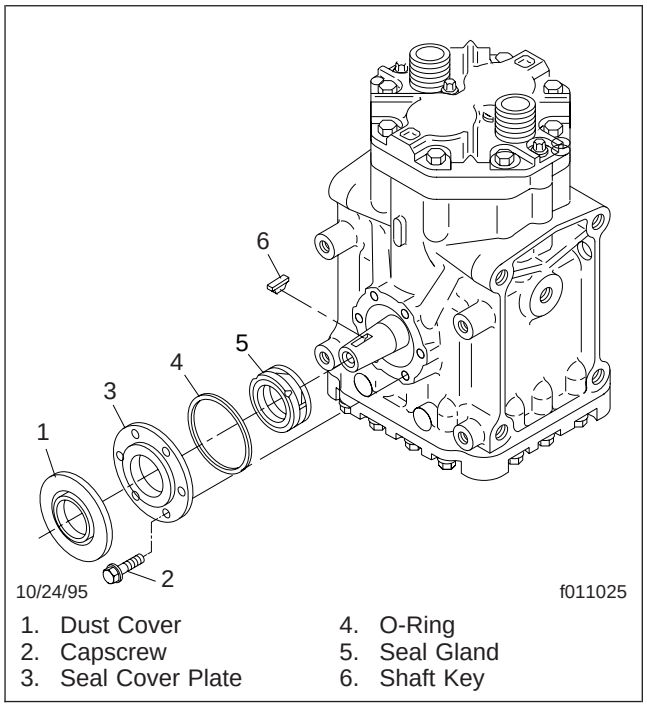
Refrigerant Compressor Magnetic Clutch Assembly Removal, Inspection, and Installation

3. Check the coil for a loose connector and for cracked insulation. Replace it, if necessary.

Installation

1. Position the field coil assembly on the compressor housing with the four screw mounting holes aligned with the bosses on the housing.
2. Apply Loctite® 262 or 680 to the four 1/4–20 capscrews (on those threads that do not already have dry Loctite on them).
3. Install the capscrews and gradually tighten them to align the coil assembly. Final torque should be 15 lbf·ft (20 N·m).
4. Taking care to properly align and seat the shaft and hub keyways, attach the pulley rotor assembly to the compressor shaft.
5. Install the 5/16–24 center bolt and washer. Tighten the bolt about 20 lbf·ft (27 N·m).
6. Turn the pulley rotor assembly by hand to make sure it moves freely without interference with the field coil assembly.
7. Connect the lead wire from the field coil to the vehicle electrical circuit.
8. Engage and disengage the clutch several times to check for correct operation.

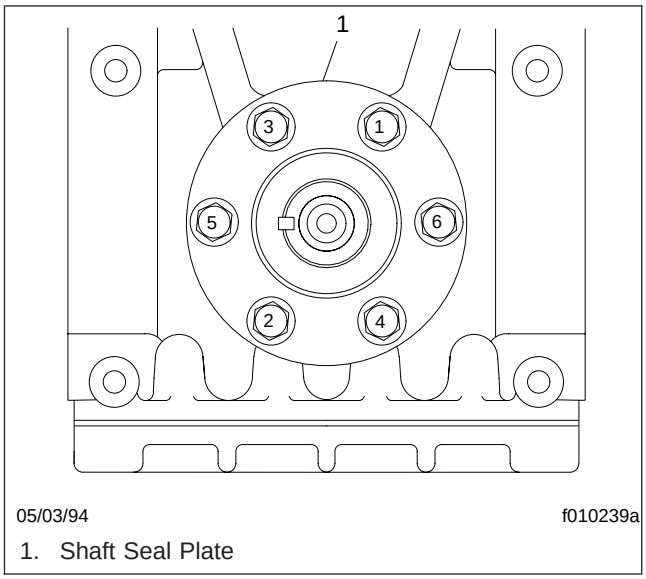
Replacement (See Fig. 1)



1. Dust Cover
2. Capscrew
3. Seal Cover Plate
4. O-Ring
5. Seal Gland
6. Shaft Key

Fig. 1, Shaft Seal Replacement

1. Remove the compressor from the vehicle. For instructions refer to **Subject 120.**
2. Using the clutch center jacking bolt, remove the clutch.
3. Remove the dust cover if present.
4. Remove the seal cover plate. Using the seal puller, pull out and discard the seal gland. Do not use a screwdriver to pry the seal gland from the compressor shaft; this could damage the shaft. Discard all seal parts including the O-ring.
5. Clean the shaft and seal cavity with a clean lint-free cloth.
6. Dip the new seal gland in mineral oil.
7. Push the seal assembly **(Fig. 1),** minus the carbon ring (inside the seal gland), over the end of the shaft with the carbon ring retainer facing out. Use the seal installer tool to move the seal assembly into position on the shaft.
8. Place the carbon ring in the ring retainer so the lapped surface is facing out. The notches in the outside edge of the carbon ring must engage the driving lugs and be firmly seated in the retainer.
9. Coat a new O-ring with mineral oil so it will stick; then, install it in the seal cover plate groove.
10. Install the seal cover plate so there is equal clearance around the shaft. Install the capscrews, and tighten them 60 to 84 lbf·in (680 to 940 N·cm) in sequence. **See Fig. 2.**



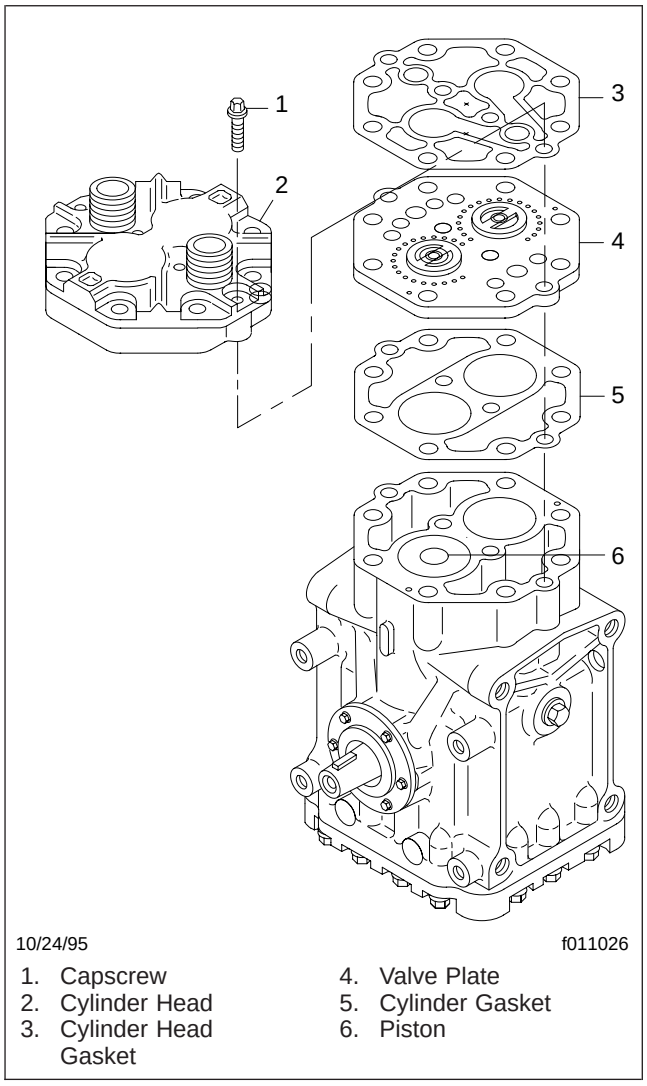
1. Shaft Seal Plate

Fig. 2, Tightening Sequence

11. Place the dust cover on the shaft before inserting the shaft key. As the clutch bolt is tightened, the dust cover will be drawn into the proper position.

Refrigerant Compressor Head and Valve Plate Removal and Installation

Removal (See Fig. 1)



1. Capscrew
2. Cylinder Head
3. Cylinder Head Gasket
4. Valve Plate
5. Cylinder Gasket
6. Piston

Fig. 1, Head and Valve Plate Removal

NOTE: Before doing any work on the head and valve plate, open both service valves to release any gas pressure in the compressor. The cylinder head is made of aluminum; be careful when removing it not to damage the sealing surfaces.

1. Remove the screws from the cylinder head. **See Fig. 2.**
2. Remove the valve plate and head from the cylinder by prying or tapping under the ears extending from the valve plate. If the head and valve plate adhere, hold the head and tap the valve plate ears away from the head with a soft hammer.

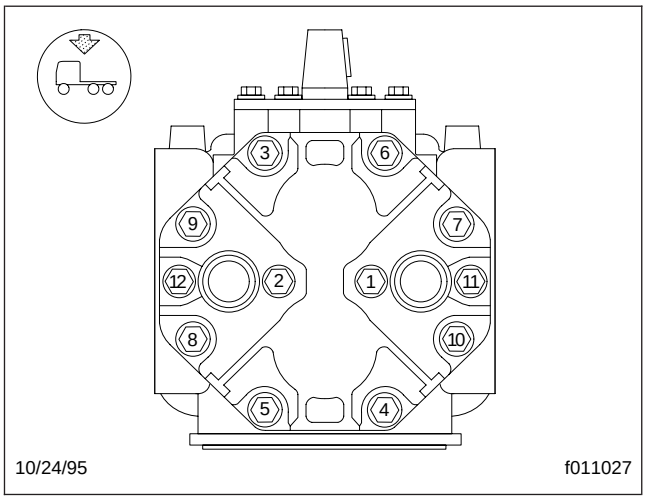


Fig. 2, Head and Service Valve Screws Tightening Sequence

CAUTION

CAUTION: Do not hit or tap the head to separate it from the valve plate. Damage to the head may result.

3. Being careful not to scratch or nick the machined sealing surfaces, remove all gasket material adhering to the head, valve plate, or cylinder.

Installation

NOTE: Valves and valve plates are furnished only as a complete assembly.

1. Apply a thin film of clean mineral oil to the area of the crankcase to be covered by the cylinder gasket. Place the cylinder gasket in position on the cylinder so the dowel pins in the crankcase pass through the dowel pin holes in the cylinder gasket.
2. Apply a thin film of clean mineral oil to the top and bottom valve plate areas to be covered by gaskets. Place the valve plate in position on the cylinder gasket so the discharge valve assemblies are facing up and the locating dowel pins go through the dowel pin holes in the valve plate.

Refrigerant Compressor Head and Valve Plate Removal and Installation

The discharge valve assemblies are the smaller diameter ones with the restrainer over the valve reed.

3. Place the head gasket in position on the valve plate so the dowel pins go through the dowel pin holes in the gasket.
4. Apply a light film of clean mineral oil to the machined surface of the cylinder head which contacts the head gasket. Place the head on the cylinder head gasket so the dowel pins go into the dowel pin holes in the head.
5. Insert the head screws and tighten all the screws until the heads make contact.
6. Tighten the head screws 17 to 25 lbf·ft (23 to 34 N·m) in sequence. **See Fig. 2.**

Refrigerant Compressor Pistons, Connecting Rods, Crankshaft, and Bearing Removal and Installation

Piston and Connecting Rod Removal

The pistons and connecting rods are easily accessible after removing the head, valve plate assembly, and base plate. If the connecting rods will be reused, mark the rod, cap and crankshaft throw so the rod can be installed in exactly the same position on the crank pin.

Crankshaft and Bearing Removal

NOTE: When replacing the crankshaft, both the front (seal end) and rear main bearings should also be replaced since they may be damaged during removal.

1. Remove the four screws from the rear bearing cover plate.
2. Remove the cover plate by gently prying it loose from the crankcase, being careful that the housing is pulled parallel to the bearing surface.
3. Remove all components down to the crankcase, crankshaft, and seal end main bearing assembly.
4. Wash this assembly in a solvent, that meets or exceeds OSHA guidelines, to remove all traces of oil and grease. Allow it to dry.
5. Heat the assembly in an oven set to 300°F (150°C).

CAUTION

CAUTION: Heat the complete assembly evenly in an oven. Localized heating may crack the crankcase.

6. Remove the crankshaft and ball bearing assembly from the crankcase.
7. If the crankshaft is reusable, remove the ball bearing assembly. Hold the crankshaft vertically in a vise with the flywheel end up, gripping the shaft at the unmachined center throw. Using two large screwdrivers as a pry under the bearing race, force the bearing upward and remove it from the shaft.

Crankshaft and Bearing Installation

1. Press the rear ball bearing onto the crankshaft by exerting pressure on the bearing inner race.
2. Make sure that the shaft, bearing, and recess in the crankcase are clean and free of burrs.
3. Heat the crankcase in an oven set to 300°F (150°C).

CAUTION

CAUTION: Heat the complete assembly evenly in an oven. Localized heating may crack the crankcase.

4. Using the opening in the bottom of the crankcase as a point of entry, place the seal end bearing in the recess. If necessary, apply force to the outer race to be sure that it is seated in the bottom of the recess.
5. Allow the crankcase to cool. Install the crankshaft through the rear bearing cover plate opening, and guide the flywheel end through the inner race of the ball bearing.
6. Place the crankcase so that it is completely supported on the ball bearing inner race. Then, press the shaft into place until the shaft boss contacts the inner bearing race.

CAUTION

CAUTION:If the housing is not completely supported by the inner bearing race, the bearing may be destroyed.

7. Install the rear bearing cover plate with the O-ring in the crankcase. A slight force may be required due to the small clearances between the outer race of the ball bearing and the bearing cover plate recess.
8. Install the four capscrews and tighten them 10 to 16 lbf·ft (14 to 22 N·m) in sequence. **See Fig. 1.**

Refrigerant Compressor Pistons, Connecting Rods, Crankshaft, and Bearing Removal and Installation

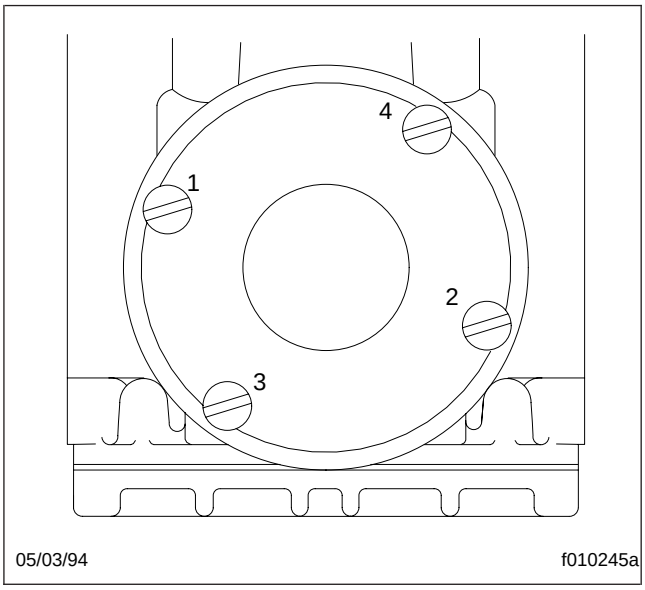

Fig. 1, Rear Bearing Cover Plate Capscrew Tightening Sequence

Piston and Connecting Rod Installation

NOTE: When installing either the original or a new piston and connecting rod assembly, coat all bearing surfaces with clean oil of the same brand used in the crankcase.

When installing the assembly into the cylinder, the wrist pin roll pin must be positioned toward the center of the compressor. If positioned toward the outside, the roll pin may hit the crankshaft when the piston is at bottom dead center.

When installing a used connecting rod, match up the marks made during removal. When installing a new connecting rod, the dowel pins in the bearing cap must be positioned to enter the holes in the rod.

1. Install the piston and connecting rod assemblies.
2. Install the connecting rod capscrews and tighten them 12 to 16 lbf·ft (16 to 22 N·m).
3. Wipe all parts with a lint free cloth to make sure they are clean.
4. Install the base plate. Tighten the capscrews 10 to 16 lbf·ft (14 to 22 N·m) in sequence. **See Fig. 2.**

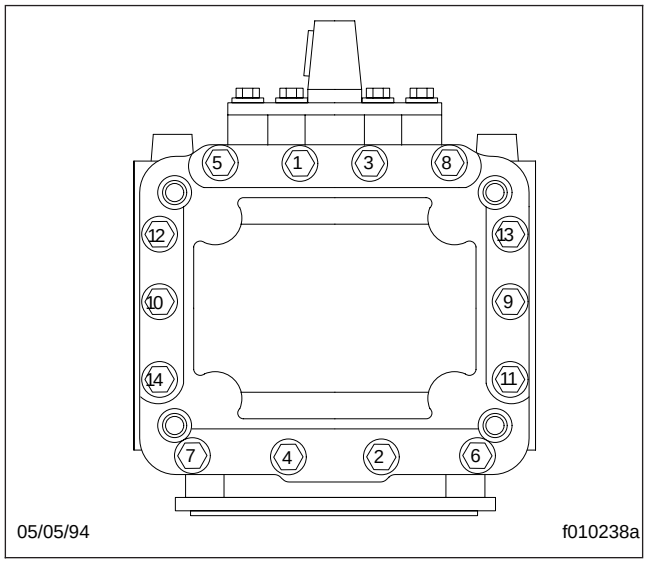

Fig. 2, Baseplate Capscrew Tightening Sequence

5. Install the head and valve plate assembly. For instructions, refer to **Subject 160.**
6. Fill the crankcase with the recommended oil. Refer to the refrigerant oil table in **Specifications 400.**
7. Close all openings to prevent the entrance of foreign material.

Special tools can be ordered from your local tool supplier.

Torque Specifications

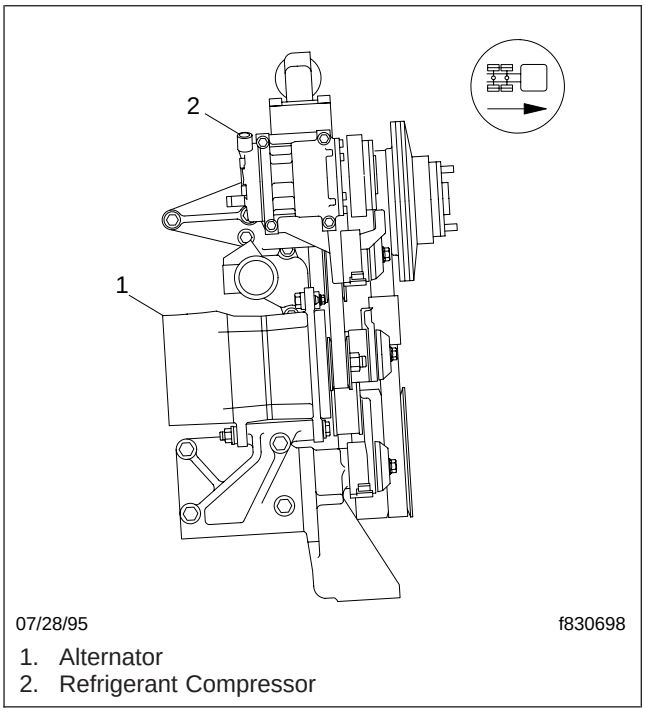
Specifications

Recommended Refrigerant Oils, R-134a Systems*		
Description	**Part Number**	**Compressor Manufacture Date**
Polyalkylene Glycol (PAG)	ABP N83 326055	Prior to May 5, 1995, and from July 2002
Polyol Ester (POE)	ABP N83 326008	May 5, 1995, through July 2002

* Look at the identification tag on the refrigerant compressor to determine the type of refrigerant oil that should be used in the air conditioning system. If the type of oil is not specified on the identification tag, use the compressor manufacture date to determine the type of oil to use.

Table 4, Recommended Refrigerant Oils, R-134a Systems

General Information



1. Alternator
2. Refrigerant Compressor

Fig. 1, Compressor Mounting

The Sanden SD7 Series compressor is installed on vehicles equipped with Detroit Diesel Series 55, Caterpillar C10 and C12, and Cummins ISX engines. See **Fig. 1**.

The main purpose of the refrigerant compressor is to draw refrigerant gas from the evaporator and squeeze it into high-pressure gas. High pressure raises the condensation point of refrigerant gas, which allows the condenser to change it to a liquid so that it can be used for cooling again. A second purpose of the compressor is to move refrigerant through the air conditioning system.

On vehicles built before April 16, 1999, the compressor is monitored by the Air Conditioning Protection Unit (ACPU), which consists of an electronic control module, high- and low-pressure switches, and a thermostatic switch.

During operation, the clutch is energized, engaging the compressor. When the cab temperature drops sufficiently, the ACPU system breaks the circuit to the compressor clutch, disengaging the clutch. See **Section 83.02** in this manual for more information on the ACPU system.

The control module registers fault codes that warn of existing or impending problems with the compressor and the air-conditioning system. For further information on system fault codes, see **Section 54.03** in this manual, which discusses the Instrumentation Control Unit. If ServicePro is available, consult the technician diagnostic routine covering the ACPU system.

Safety Precautions

Whenever repairs are made to any air conditioner parts that hold R–134a refrigerant, you must recover, purge or flush (if contaminated), evacuate, charge, and leak test the system. In a good system, refrigerant lines are always under pressure and you should disconnect them only after the refrigerant charge has been recovered (discharged) at the service valves.

Refrigerant R–134a is safe when used under the right conditions. Always wear safety goggles and non-leather gloves while recovering, evacuating, charging, and leak testing the system. Do not wear leather gloves; when refrigerant gas or liquid contacts leather, the leather will stick to your skin.

⚠ WARNING

WARNING: Use care to prevent refrigerant from touching your skin or eyes, because liquid refrigerant, when exposed to the air, quickly evaporates and will freeze skin or eye tissue. Serious injury or blindness could result if you come into contact with liquid refrigerant.

Refrigerant splashed in the eyes should be rinsed with lukewarm water, not hot or cold. Do not rub the eyes. Apply a light bandage and contact a physician right away.

Refrigerant splashed on the skin should be rinsed with lukewarm water, not hot or cold. Do not rub the skin. Apply a light coat of a nonmedicated ointment, such as petroleum jelly. Contact a physician right away.

R–134a refrigerant does not burn at ambient temperatures and atmospheric pressure. However, it can be combustible at pressures as low as 5.5 psig (139 kPa absolute) at 350°F (177°C) when mixed with air concentrations that are greater than 60 percent.

⚠ WARNING

R–134a air conditioning systems should not be pressure tested or leak tested with compressed air. Combustible mixtures of air and R–134a may form, resulting in a fire or explosion that could cause personal injury or property damage.

Always work in an area where there is a constant flow of fresh air when the system is recovered, evacuated, charged, and leak tested. R–134a vapors have a slightly sweet odor that is difficult to detect. Frequent leak checks and air monitoring equipment are recommended to ensure a safe working environment.

IMPORTANT: When servicing an R–134a air conditioning system, use only service equipment certified to meet the requirements of SAE J2210 (R–134a recycling equipment). The equipment should be operated only by qualified personnel who are familiar with the recycling station manufacturer's instructions.

Because of its very low boiling point, refrigerant must be stored under pressure. To prevent the refrigerant containers from exploding, never expose them to temperatures higher than 125°F (52°C).

On R–134a refrigerant systems, polyalkylene glycol (PAG) oil is used in the compressor. When handling PAG oil, observe the following:

- keep the oil free of contaminants
- do not expose the air conditioning system or the PAG oil container to air for long periods of time; PAG oil has a high moisture absorption capacity and the oil container should be immediately sealed after each use
- use care when handling: spilled oil could damage painted surfaces, plastic parts, and other components (drive belts)
- never mix PAG oil with other types of refrigerant oil

Pre-Service Checks

WARNING

WARNING: Before doing any work, read the information under Safety Precautions, 100. Failure to read the safety precautions, and to be aware of the dangers involved when working with refrigerant, could lead to serious personal injury.

Some special tools are needed for doing repair work on the compressor. Refer to the special tools table in **Specifications, 400.** Tool kits can be bought from the distributor listed under the special tools table in **Specifications, 400.**

NOTE: Compressor problems usually show in one of four ways: abnormal noise; seizure; leakage; or low suction and discharge pressures. Resonant compressor noises are not causes for alarm; irregular noise or rattles are likely to be caused by broken parts. To check for seizure, de-energize the magnetic clutch and see if the drive plate can be turned. If it won't turn, the compressor has seized.

Do the following checks whenever the air conditioner system is not cooling enough and the causes are unknown.

IMPORTANT: The Air Conditioning Protection Unit (APADS™) registers fault codes that warn of existing or impending problems with the compressor and the air conditioning system. For further information on system fault codes, refer to the section in **Group 54** in the vehicle service manual which discusses the Instrument Cluster Unit.

1. Be sure to check the moisture indicator, to see if moisture is the cause of the problems. The air conditioner should be on when checking the indicator; it is better to check it at the end of a day's run.
2. Check the drive belt and mounting:
   - 2.1 On the drive belt, look for wear, damage, or oil. If worn, oil-soaked, or damaged, remove it and install a new one. Refer to the drive belt section in **Group 01** of this manual for instructions.
   - 2.2 Check the compressor mounting parts for loose fasteners, cracks, or other damage. Tighten loose fasteners to the torque value in the torque specifications table under **Specifications, 400.** Repair or replace cracked or damaged brackets.
   - 2.3 Check the tension of the compressor drive belt. Refer to the drive belt section in **Group 01** of this manual for instructions.
   - 2.4 Check the compressor oil level. Refer to **Subject 130** for instructions.
3. Check the wiring and connections to the compressor clutch. Replace damaged wiring and tighten loose connections.
4. Check for road debris build-up on the condenser coil fins. Using air pressure and a whiskbroom or a solution of soap and water, carefully clean the condenser; be careful not to bend the fins.
5. Check the refrigerant charge in the air conditioner system; for instructions, refer to the section on the cab heater and air conditioner system in this group.
6. Check the valve plate and cylinder gasket **(Subject 160),** and the shaft seal **(Subject 150)** for damage. Replace as needed.

NOTE: For other possible causes of air conditioner problems, refer to the heater and air conditioner section in this group and to the applicable fan clutch section in **Group 20** of this manual.

Refrigerant Compressor Removal and Installation

Removal

WARNING

Before doing any of the work below, read the information under Safety Precautions 100. Failure to read the safety precautions and to be aware of the dangers involved when working with refrigerant, could lead to serious personal injury.

1. Park the vehicle on a level surface, turn off the engine, apply the parking brakes, and chock the tires.
2. Raise the hood, or on Argosy COEs, tilt the cab. For cab tilt instructions, see **Group 60**.
3. Begin recovery of the refrigerant from the air conditioning system; for instructions, see **Section 83.02, Subject 250**.
4. Remove the drive belt. Do not pry or roll the belt off the pulleys.
5. Disconnect the wiring harness from the compressor.
6. After the refrigerant has been fully recovered, disconnect the discharge and suction lines from the compressor. Cap the discharge and suctions ports and the refrigerant lines.

IMPORTANT: Under no circumstances should the ports on the compressor or the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

7. Being careful not to spill any refrigerant oil, remove the capscrews and washers that attach the refrigerant compressor to the engine and remove the compressor.

Installation

IMPORTANT: A new compressor is filled with refrigerant oil and nitrogen gas. The oil quantity is printed on a label attached to the compressor.

When installing a new compressor on the vehicle, gently release the nitrogen gas from the discharge side of the compressor.

1. Adjust the refrigerant oil level in the compressor; for instructions, see **Subject 130**.
2. Install the compressor on the mounting bracket.
3. Uncap the discharge and suction ports and the refrigerant lines. Check the refrigerant lines and the discharge and suction ports. They must be clean and free of nicks, gasket residue, and other foreign material.
4. On refrigerant line connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

   On refrigerant line connections that have Mini Stat-O-Seals, replace the seals. **Do not** lubricate the Mini Stat-O-Seals prior to installation. Use only a Mini Stat-O-Seal on a Mini Stat-O-Seal assembly.
5. Connect the refrigerant lines to the compressor.
6. Connect the wiring harness to the compressor.
7. Install the drive belt.
8. If installing a new compressor, or if the system was without any refrigerant pressure before repairs were started, replace the receiver-drier; for instructions, see **Section 83.02, Subject 200**.
9. Evacuate, charge, and leak test the refrigerant system; for instructions, see **Section 83.02, Subject 250**.
10. Return the hood or cab to the operating position. For cab tilt instructions, see **Group 60**.

Oil Check and Adding Oil to the Compressor

WARNING

Before doing any of the work below, read the information under Safety Precautions 100. Failure to read the safety precautions and to be aware of the dangers involved when working with refrigerant, could lead to serious personal injury.

General Information

Compressors are charged with 10 fl oz (296 mL) of refrigerant oil. When the air conditioning system is operating, some refrigerant oil leaves the compressor and is circulated through the system with the refrigerant, but the refrigerant oil cannot leave the system except when there is a leak, when the refrigerant is recovered, or when a system part is replaced.

It is important that the air conditioning system has the correct amount of refrigerant oil for proper operation. Too little oil will result in compressor failure. Too much oil will degrade the performance of the air conditioner and may cause damage to the compressor.

IMPORTANT: Whenever the air conditioning system is discharged or recovered, the recovered oil, from the charging machine, must be measured in order to know how much oil must be returned to the system. When a system component is replaced, a quantity of new oil equal to the recovered oil plus the oil coating the inside of the component must be returned to the system. New oil must be from a container that has not been opened or that has been tightly sealed since its last use.

Order Sanden PAG oil SKI 7803 1997 (type SP–20) for an 8.45-ounce (250-mL) can of refrigerant oil from your local Daimler Trucks North America Parts Distribution Center. Tubing, funnels, or other equipment used to transfer the oil should be very clean and dry.

When handling refrigerant oil:

- Be sure that the oil is free of water, dust, metal powder, and other foreign substances;
- Do not mix the refrigerant oil with other types or viscosities of oil;
- Quickly seal the oil container after use. Refrigerant oil absorbs moisture when exposed to the air for any period of time.

Checking and Adding Refrigerant Oil

WARNING

Do not remove the oil fill plug on the refrigerant compressor without first recovering the system. Failure to recover the system could cause uncontrolled release of high-pressure refrigerant, which can freeze skin and eye tissue causing serious injury or blindness.

1. Before beginning the refrigerant recovery process, make sure that the oil accumulator and oil drain bottle on the recovery/recycle machine are emptied of oil from previous repairs.
2. Recover all of the refrigerant from the system. For instructions, see **Section 83.04, Subject 220**.
3. Drain the recovered oil into the calibrated drain bottle of the recovery/recycle machine. Record the amount of oil recovered.
4. Inspect the refrigerant oil. If the oil has any of the following characteristics, flush and charge the system with 10 fl oz (296 mL) of oil.
   - silver or black oil—indicates metal in the air conditioning system due to compressor wear
   - milky oil—may indicate moisture in the system
   - grit or debris in the oil
5. Properly dispose of the recovered oil.
6. After repairs are finished, refer to **Table 1** and use the following equation to determine the quantity of refrigerant oil that needs to be added to the system.

   [Quantity Recovered] + [Quantity for All Replaced Components] = [Quantity to add to the System]

   Table 1 provides the quantities of oil that need to be added to the system for each component that was replaced. Add the quantities listed in the table for each component that was replaced. Use the sum of the quantities or 6 fl oz (177 mL), whichever is less.

Oil Check and Adding Oil to the Compressor

Refrigerant Oil Quantities for Replaced Components	
Add the quantities listed in this table for each component that was replaced. Use the sum of the quantities or 6 fl oz (177 mL), whichever is less.	
Component	**Quantity: oz (mL)**
High Pressure Line (main A/C)	1 (30)
Low Pressure Line (main A/C)	2 (59)
High Pressure Line (auxiliary A/C)	1 (30)
Low Pressure Line (auxiliary A/C)	3 (89)
Condenser	1 (30)
Evaporator (main A/C)	3 (89)
Evaporator (auxiliary A/C)	2 (59)
Receiver-Drier	3 (89)
Minor Leak at Connector Only	0.5 (15)
Major Leak at Connector Only	2 (59)

Table 1, Refrigerant Oil Quantities for Replaced Components

7. Remove the oil fill plug on the refrigerant compressor and add the refrigerant oil. Never add more than 8 fl oz (237 mL) to the system unless the system has been flushed.
8. Evacuate, charge, and leak test the refrigerant system. See **Section 83.04, Subject 220** for instructions.

Adjusting the Refrigerant Oil Level in a New Compressor

Sanden refrigerant compressors are charged with 10 fl oz (296 mL) of refrigerant oil. If the air conditioning system has been flushed, the compressor will need a 10-ounce charge. If the system has not been flushed, use the following procedure to adjust the oil level in the compressor.

Use the "Worksheet for Adjusting the Refrigerant Oil Level in a New Compressor" shown in **Fig. 1** to adjust the refrigerant oil level in a new compressor.

Worksheet for Adjusting the Refrigerant Oil Level in a New Compressor

1. Drain the oil from the old compressor.
   - 1.1 Remove the oil plug and drain as much oil as possible into a clean, calibrated container.
   - 1.2 If there are caps on the suction and discharge ports, remove them.
   - 1.3 Drain the oil from the suction and discharge ports into the container while turning the shaft clockwise using a socket wrench on the armature retaining nut.
   - 1.4 Enter the amount of oil that was drained from the compressor. 1. ☐
2. See Table 1 of this subject to determine the total amount of refrigerant oil that is needed for each component that was replaced. Enter the amount, up to 6 fl oz (177 mL), here. 2. ☐
3. Add the amounts from steps 1 and 2 and enter the total. 3. ☐
4. Subtract the total in step 3 from 10 and enter that number. For example, if the total in line 3 was six, the calculation would be 10 − 6 = 4. 4. ☐
5. Refer to the table below for the amount of oil that must be drained from the new compressor.

If the number in step 4 is:	Drain this amount from the new compressor:
a negative number(−)	2 fl oz (59 mL)
0	2 fl oz (59 mL)
1	2 fl oz (59 mL)
2	2 fl oz (59 mL)
3	3 fl oz (89 mL)
4	4 fl oz (118 mL)
5	4 fl oz (118 mL)
6	4 fl oz (118 mL)
7	4 fl oz (118 mL)
8	4 fl oz (118 mL)
9	4 fl oz (118 mL)
10	4 fl oz (118 mL)

Fig. 1, Refrigerant Compressor (exploded view)

1. Remove the compressor from the vehicle. For instructions, refer to **Subject 120.**
2. Remove the six bolts that attach the drive plate cover and remove the cover.
3. Insert the pins of the drive plate spanner into the threaded holes of the drive plate. Hold the drive plate securely while removing the retaining nut. **See Fig. 2 .**
4. Using the drive-plate puller, thread the three puller bolts into the drive plate. Turn the center screw clockwise to loosen and remove the drive plate. **See Fig. 3.**
5. Remove the pulley bearing dust cover (if equipped), the shaft key, and the clutch shims. Use a slotted screwdriver and hammer to tap the shaft key loose. **See Fig. 4 .**
6. Using external snap-ring pliers, remove the pulley assembly snap ring.
7. Remove the pulley assembly.
   - 7.1 Insert the lip of the pulley puller jaws into the snap ring groove. **See Fig. 5.**
   - 7.2 Place the puller shaft protector over the exposed shaft.
   - 7.3 Align the thumb screws to the puller jaws. Tighten the screws finger tight.
   - 7.4 Using a socket wrench, turn the puller center bolt clockwise and remove the pulley.
8. Remove the coil assembly.
   - 8.1 Remove the coil's lead wire from the wire holder on the compressor.

Clutch Assembly Removal, Inspection, and Installation

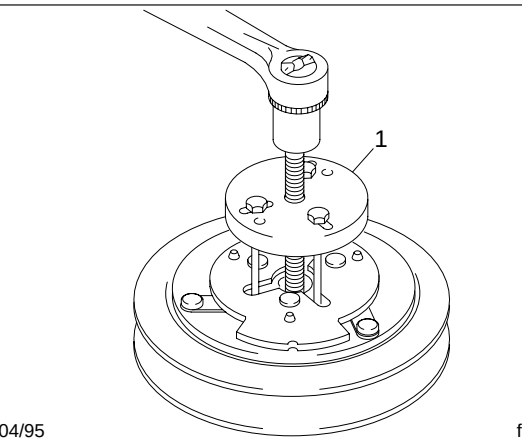
2. Drive Plate Spanner

Fig. 2, Remove the Retaining Nut



1. Puller

Fig. 3, Remove the Drive Plate

8.2 Disconnect the wiring harness.

8.3 Remove the snap ring **Fig. 6**; then, remove the coil assembly.

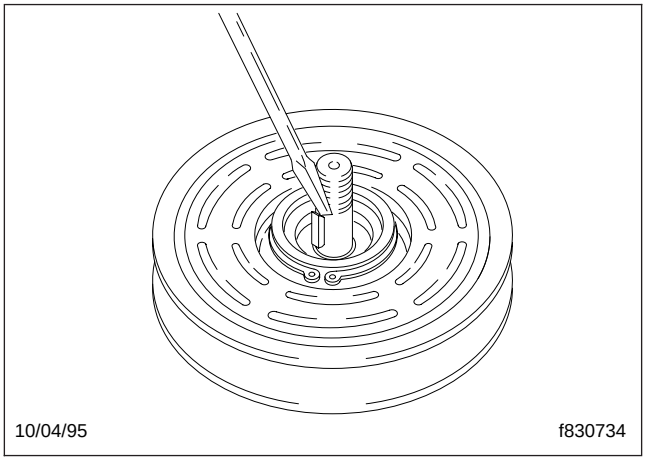


Fig. 4, Remove the Shaft Key

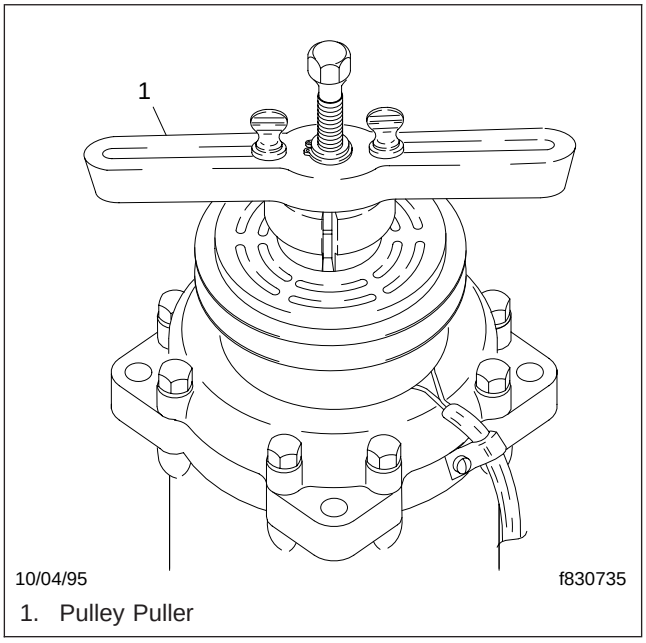

1. Pulley Puller

Fig. 5, Position the Pulley Puller Jaws

Inspection

1. Inspect the drive plate. If the frictional surface shows signs of damage due to too much heat, replace the drive plate and pulley assembly.
2. Check the appearance of the pulley assembly. If the friction surface of the pulley shows signs of too much grooving due to slippage, replace both the pulley and drive plate. Clean the friction surfaces of the pulley assembly before installing it.

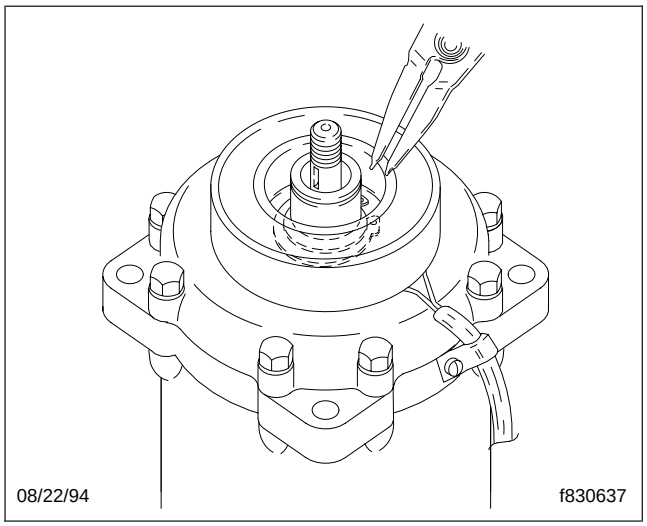

Fig. 6, Remove the Snap Ring

3. Check the coil for a loose connector and for cracked insulation. Replace it if necessary.

Installation

NOTE: When supporting the compressor in a vise, clamp only on the mounting ears, never on the body of the compressor.

1. Install the coil assembly.
   - 1.1 Position the coil assembly on the compressor.
   - 1.2 Install the snap ring.
   - 1.3 Attach the coil's lead wire to the wire holder on the compressor.
   - 1.4 Connect the wiring harness.
2. Install the pulley assembly.
   - 2.1 Position the pulley over the boss of the front housing.
   - 2.2 Place the pulley installer ring into the bearing bore. Make sure that the edge rests only on the inner race of the bearing, not on the seal, pulley, or outer race of the bearing.
   - 2.3 Place the driver into the ring. Using a hammer or arbor press, drive the pulley down against the front housing step. **See Fig. 7.**

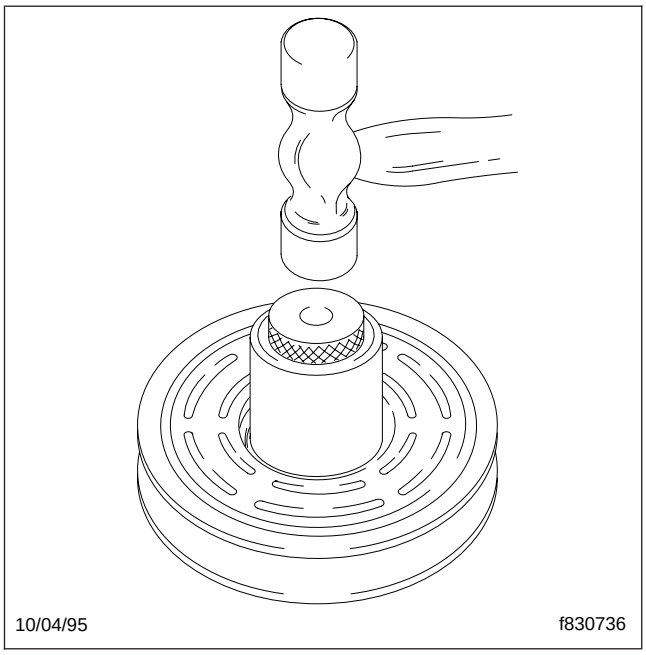

Fig. 7, Drive the Pulley Down Against the Front Housing Step.

   - 2.4 Using internal snap ring pliers, install the pulley bearing snap ring.
   - 2.5 Using external snap ring pliers, install the pulley snap ring. If a bevel is present on the snap ring, make sure that it is facing up (away from the body of the compressor).
   - 2.6 Install the pulley bearing dust cover by gently tapping it into place.
3. Install the drive plate assembly.
   - 3.1 Using pliers, install the shaft key. **See Fig. 8.**
   - 3.2 Install the shims.
   - 3.3 Align the keyway in the drive plate assembly with the shaft key. Using a driver, and a hammer or an arbor press, drive the assembly down over the shaft until it bottoms on the shims. **See Fig. 9.**
   - 3.4 Install the retaining nut. Tighten the nut to the torque in **Specifications, 400.**
4. Using a feeler gauge, check that the clutch clearance is 0.02 to 0.03 inch (0.4 to 0.8 mm). **See Fig. 10**. Adjust the clearance by gently tap-

Clutch Assembly Removal, Inspection, and Installation

ping down on the front plate at the high spots, or gently prying up at the low spots.

5. Install the drive plate dust cover. Tighten the bolts to the torque in **Specifications, 400.**
6. Install the compressor on the vehicle. For instructions, refer to **Subject 120.**

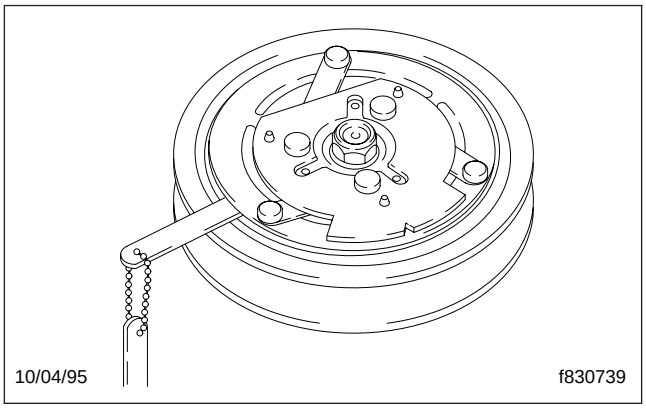

Fig. 10, Check the Clutch Clearance

Replacement

1. Remove the drive plate and pulley assemblies. For instructions, refer to **Subject 140.**
2. Using snap ring pliers, remove the felt ring retainer. **See Fig. 1.** Then remove the felt ring.

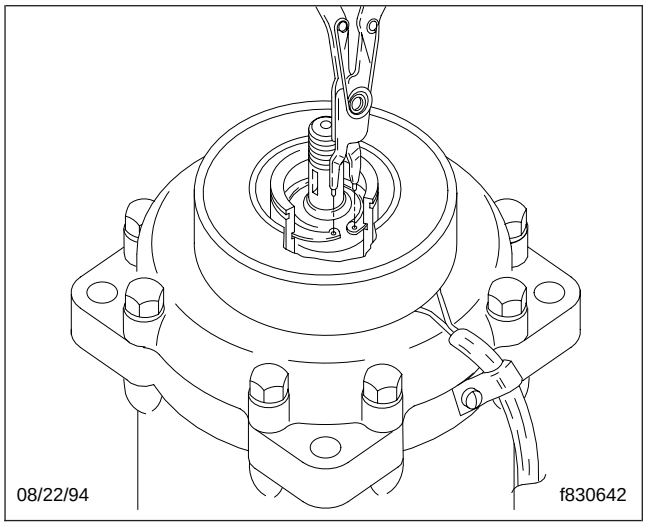

Fig. 1, Remove the Felt Ring Retainer and the Felt Ring

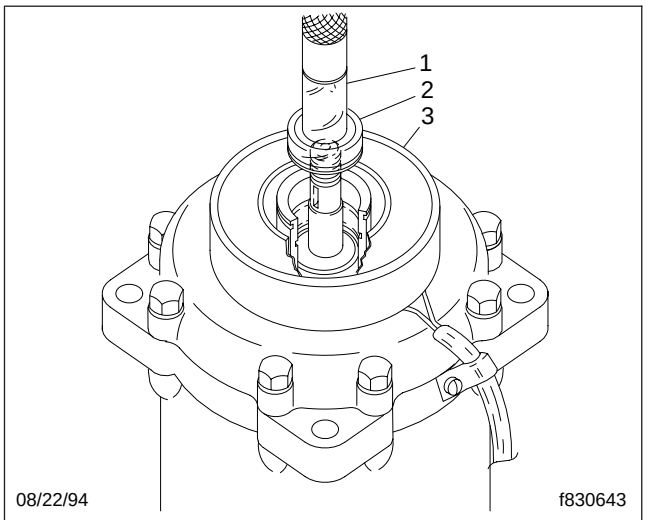
3. Using snap ring pliers, remove the shaft seal snap ring.
4. Position the shaft seal removal and installation tool on the shaft seal. Twist the tool until the hooks on the tool engage the slots in the shaft seal housing, then pull the seal out with a twisting motion. **See Fig. 2.**

NOTE: The shaft seal and felt ring should not be reused. Always use a new seal kit. Be very careful that the lip of the shaft seal to be installed is not scratched or damaged in any way. Make sure the shaft seal is free of lint and dirt, which could damage the shaft seal surface.

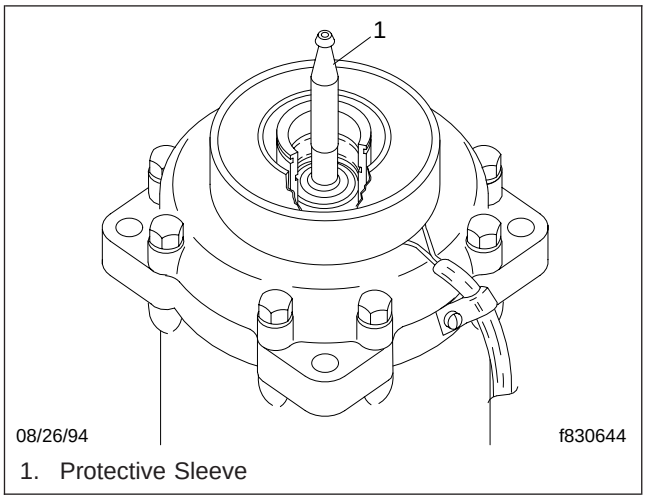
5. Using a non-petroleum based solvent and a lint-free cloth, clean the shaft seal cavity. Then, use dry compressed air to blow out the shaft seal cavity.
6. Position the shaft seal protective sleeve over the compressor shaft. **See Fig. 3** . Make sure that the sleeve has no scratches so that the shaft seal will not be damaged. Also, make sure that



1. Shaft Seal Removal and Installation Tool
2. Shaft Seal
3. Coil Assembly

Fig. 2, Remove the Shaft Seal

there is no gap between the end of the sleeve and the seal surface of the shaft.



1. Protective Sleeve

Fig. 3, Position the Shaft Seal Protective Sleeve

7. Position the shaft seal removal and installation tool until the hooks on the tool engage the slots in the new shaft seal housing.
8. Place the entire assembly into clean 5GS refrigerant oil. **See Fig. 4.**
9. Insert the shaft seal over the protective sleeve, then press it down as far as possible. Twist the

removal and installation tool to remove it from the seal. Remove the tool and the protective sleeve.

10. Using internal snap-ring pliers, install the snap ring. **See Fig. 1.** If needed, gently tap the snap ring to ensure that it is seated in the groove.

NOTE: When installing the snap ring, the beveled end of the snap ring must face away from the compressor body.

11. Gently tap the new felt ring in place. **See Fig. 5.**
12. Install the drive plate and pulley assemblies. For instructions, refer to **Subject 140.**

Removal

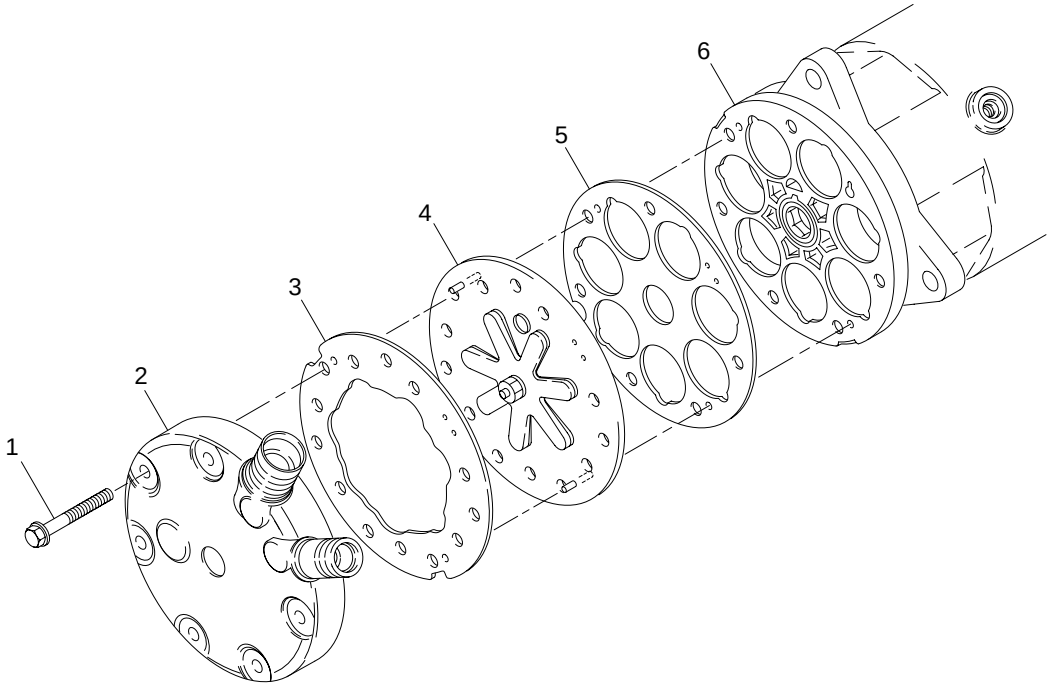
NOTE: Before doing any work on the head and valve plate, open both service valves to release any gas pressure in the compressor.

1. Remove the bolts from the cylinder head. **See Fig. 1.**

⚠ CAUTION

CAUTION: Do not hit or tap the head to separate it from the valve plate. Damage to the head may result.

NOTE: It is recommended that the head gasket (located between the cylinder head and the valve plate) and the block gasket (located between the valve plate and the cylinder block) be replaced any time the cylinder head is removed.



1. Cylinder Head Bolt
2. Cylinder Head
3. Head Gasket
4. Valve Plate Assembly
5. Block Gasket
6. Compressor Body

Fig. 1, Head and Valve Plate Assembly

2. Remove the valve plate assembly and the cylinder head from the compressor. Use a gasket scraper to separate the cylinder head from the valve plate. **See Fig. 2**. Use care not to scratch the gasket surface of the cylinder head.
3. Being careful not to scratch or nick the machined sealing surfaces, remove all gasket material adhering to the head, valve plate, or compressor block.

Head and Valve Plate Removal and Installation

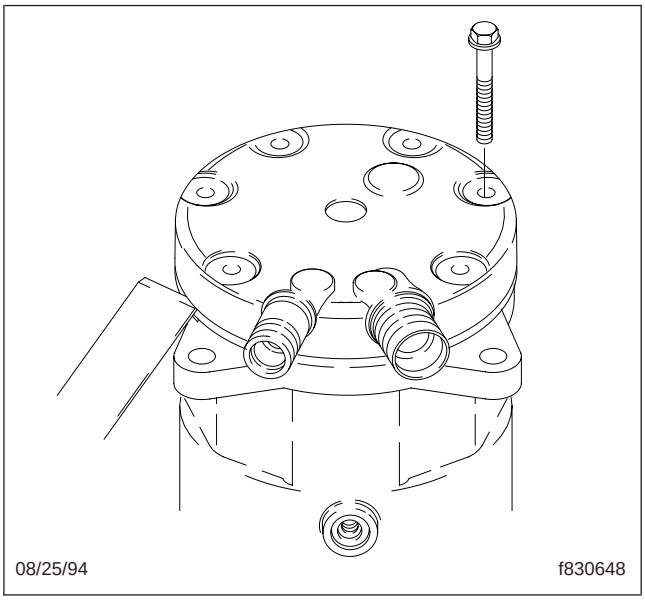


Fig. 2, Separate the Cylinder Head from the Valve Plate

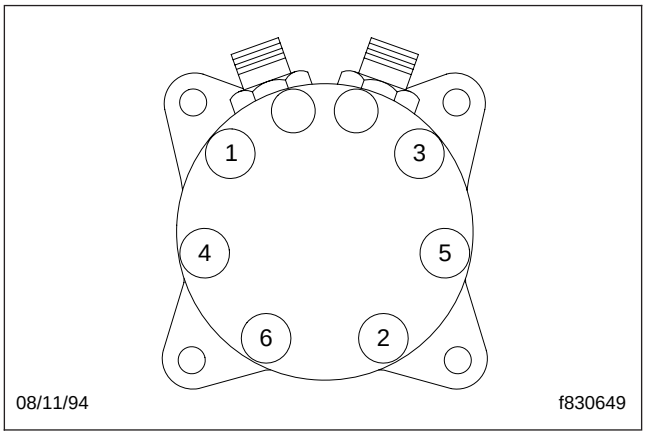

Fig. 3, Tightening Sequence

Installation

1. Apply a thin film of clean 5GS refrigerant oil to the new block gasket. Place the block gasket in position on the compressor so that the pin holes in the compressor block line up with the pin holes in the block gasket.
2. Place the valve plate assembly in position on the block gasket so that the discharge valve, retainer, and the nut are facing up (away from the cylinder block). Make sure that the locating pins on the valve plate go through the pin holes in the gasket.
3. Remove all residual oil from each bolt hole on the cylinder block.
4. Apply a thin film of clean 5GS refrigerant oil to the new head gasket. Place the gasket in position over the valve plate locating pins. Make sure that the locating pins on the valve plate go through the pin holes in the gasket.
5. Place the head on the cylinder head gasket so that the dowel pins go into the dowel pin holes in the head.
6. Install the head bolts. Tighten the bolts in sequence to the values given in **Specifications 400. See Fig. 3** for the tightening sequence.

General Information

The heating and air conditioning unit is mounted behind the dash. It consists of a heater core, evaporator, blower motor, control valves, and air ducts. The system is controlled by a dash-mounted climate control panel. See **Fig. 1**. The panel controls heating, air conditioning, defrosting, and ventilation of the cab. By regulating the following things, an even cab temperature is maintained:

- Fresh air intake.
- Speed of the blower motor.
- Coolant flow through the heater core.
- Refrigerant flow through the evaporator.

See the vehicle driver's manual for heater and air conditioner operating instructions.

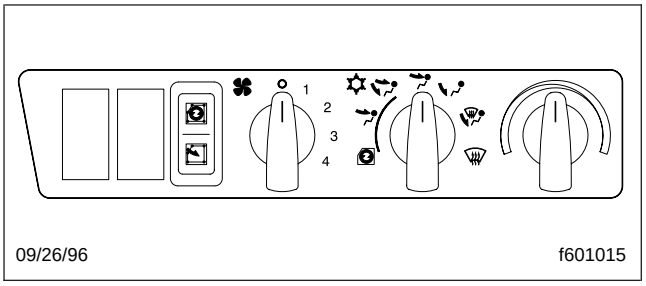

Fig. 1, Climate Control Panel

Thermodynamic Principles

Air conditioning is the cooling (or refrigeration) of the air in the passenger compartment. Refrigeration is accomplished by making practical use of three thermodynamic principles. These principles and their practical application are described below.

Heat Transfer

If two objects of different temperatures are placed near each other, the heat in the warmer object will always travel to the cooler object, until both are of equal temperature.

For example, a block of ice in a refrigerator does not transfer its coldness to a nearby warm container. Instead, the heat in the warm container flows to the ice.

The British Thermal Unit (BTU) is used to determine the amount of heat transferred from one object to another. One BTU is the amount of heat required to raise the temperature of 1 pound (0.45 kg) of water 1°F (0.55°C).

For example, to raise the temperature of 1 pound (0.45 kg) of water from 32°F to 212°F (0°C to 100°C), one BTU of heat must be added for 1°F (0.55°C) rise in temperature, or a total of 180 BTUs of heat. Conversely, in order to lower the temperature of 1 pound (0.45 kg) of water from 212°F to 32°F (100°C to 0°C), 180 BTUs of heat must be removed from the water.

Latent Heat of Vaporization

When a liquid boils, it absorbs heat without raising the temperature of the resulting gas. When the gas condenses (changes back to a liquid), it gives off heat without lowering the temperature of the resulting liquid.

For example, when a container holding 1 pound (0.45 kg) of water at 32°F (0°C) is heated, the temperature of the water rises 1°F (0.55°C) with each BTU of heat energy that the water absorbs. After it absorbs 180 BTUs of heat, raising its temperature 180°F (100°C), the water reaches a temperature of 212°F (100°C). This is the boiling point of water at standard sea level conditions.

Even as more heat is absorbed by the water, the temperature of the water can not go above 212°F (100°C). The water starts to boil, to change from a liquid to a gas. It continues to boil until the water has passed off into the atmosphere as vapor. Under normal conditions the vapor rapidly gives off its heat to the surrounding air, but it rises from the water at a temperature of 212°F (100°C).

In other words, the water and vapor temperatures can rise only 180°F (from 32°F to 212°F [0°C to 100°C]) at sea level pressure, even though many more than 180 BTUs of heat are absorbed. The heat absorbed by the liquid in the process of boiling dissipates from the vapor into the surrounding air, and the vapor condenses back to water.

The transfer of heat as substances change their physical state, such as water boiling to vapor, and vapor condensing back to water, is called the latent (hidden) heat of vaporization.

Water has a latent heat of vaporization of 970 BTUs and a boiling point of 212°F (100°C). This means that 1 pound (0.45 kg) of water at 212°F (100°C), will

General Information

absorb 970 BTUs of heat when changing to vapor at 212°F (100°C). Conversely, the vapor will give off 970 BTUs of heat when condensing back to water at 212°F (100°C).

This heat energy transfer, occurring when a liquid boils or a vapor condenses, forms the basic principle of all conventional refrigerant systems.

For a liquid to be a refrigerant, it must also have a low boiling point. That is, the temperature at which it boils must be lower than the temperature of the substance to be cooled.

R–134a is a non-CFC refrigerant. Its temperature/pressure relationship makes it suitable for mobile air conditioning systems.

Effect of Pressure on Boiling or Condensation

Refrigerant passes through an air conditioning system under high-pressure conditions. It expands to a low-pressure vapor between the evaporator orifice and the refrigerant return port in the refrigerant compressor. As pressures in the closed refrigerant circuit vary, the temperature of the refrigerant also varies. As pressure increases, temperatures increase; as the pressure decreases, temperatures also decrease:

- First, as a high-pressure vapor between the refrigerant compressor and the condenser
- Then, as a high-pressure liquid between the condenser and the evaporator orifice.

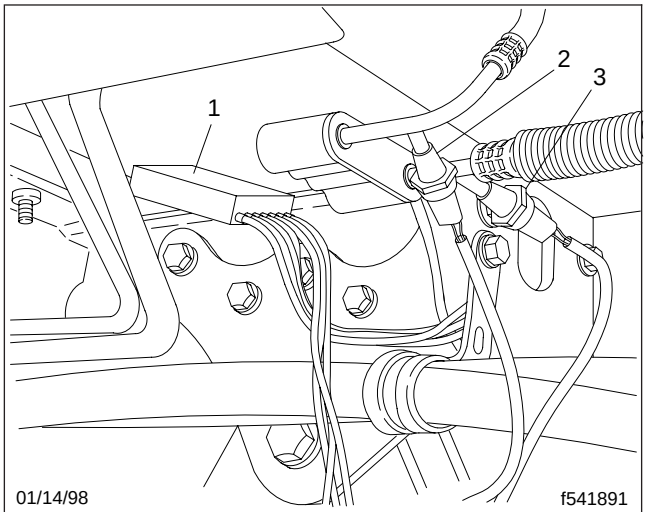
Description of Components

Air Conditioning Protection Unit (ACPU)

The ACPU is installed on vehicles built before April 16, 1999.

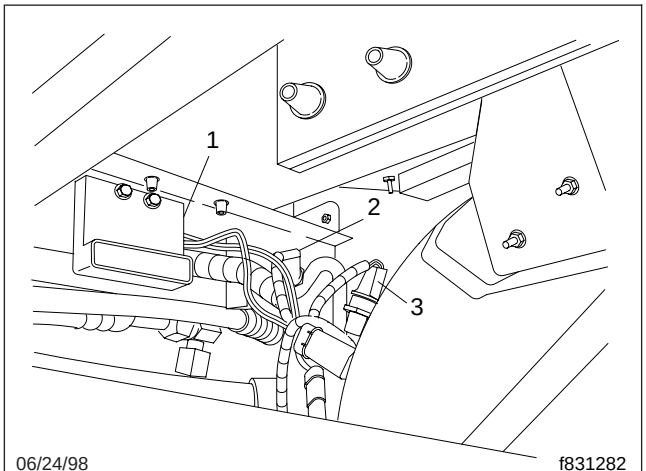
The ACPU system consists of an electronic control module, high and low-pressure switches, and the thermostatic switch. The control module monitors system conditions (low or high refrigerant charge), and controls the operation of the refrigerant compressor and the on-off fan drive. See Principles of Operation for more information on this system.

On a Century Class Conventional, the ACPU control module is located under the hood on the right side of the frontwall. See **Fig. 2**. On an Argosy COE, the ACPU control module is located on the right side of the vehicle behind the bumper. See **Fig. 3**.



1. ACPU Control Module
2. high-pressure Switch
3. low-pressure Switch

Fig. 2, ACPU Mounting, Century Class Conventional



1. ACPU Control Module
2. low-pressure Switch
3. high-pressure Switch

Fig. 3, ACPU Mounting, Argosy COE

The control module registers fault codes that warn of existing or impending problems in the air conditioning system. The control module displays these fault

codes on the Instrumentation Control Unit (ICU) message display screen.

For further information on system fault codes, see **Troubleshooting 300**. Also, if ServicePro is available, a technician diagnostic routine is available covering the ACPU system.

CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power, ground cables, and the ACPU. Electric currents produced during electric welding can damage various electric components on the vehicle.

At the high and low pressure switches at the discharge and suction service ports, disconnect the harness connectors. See Subject 210 in this section for instructions.

The air conditioning protection unit (ACPU) is a micro controller-based device used to control the air conditioning system and help in diagnosing air conditioning system problems. It uses the vehicle's J1587 serial data bus to communicate with other electronic devices on the vehicle, and with off-board diagnostic tools.

ACPU System Components

The system components include the ACPU control module and the pressure switches.

- On a Century Class Conventional, the ACPU control module is located under the hood on the right side of the frontwall. On an Argosy COE, the ACPU control module is located on the right side of the vehicle behind the bumper.
- The pressure switches include one high-side pressure switch and one low-side pressure switch. The pressure switches are located near the ACPU control module on both the Century Class Conventional and Argosy COE models.

ACPU System Inputs

The two system inputs are the thermostat and the pressure switches.

- The HVAC thermostat switch (circuit 97T) is the primary control unit. It is connected in series with the main air conditioning on/off switch and the evaporator thermostat (circuit 97T). The ACPU will cycle the air conditioning compressor on and off in response to the thermostat input, but will not do so more than once every 15 seconds. The thermostat contacts close when the evaporator temperature exceeds 38°F (3°C) on the rise, and open when the temperature decreases below about 32°F (0°C) on the fall. The thermostat turns off the compressor whenever frost begins to form on the evaporator.
- The ACPU high and low-pressure switches monitor air conditioning system pressure. Both switches are closed at low-pressure and opened on increasing pressure. See **Table 1** for opening and closing pressures for the ACPU high and low-pressure switches. Both switches have a 2490 ohm resistor in parallel with the contacts, allowing the ACPU module to detect an open circuit (broken wire) condition.

  The static pressure in a properly charged air conditioning system will cause the low-pressure switch to be normally opened (2490 ohms) and the high-pressure switch to be normally closed.(0 ohms). A closed low-pressure switch is usually indicative of a partial or complete loss of refrigerant. However, at very low ambient temperatures the air conditioning system pressure may drop low enough to close the low-pressure switch, even if the refrigerant charge is adequate. The air conditioning system will not operate if this happens.

ACPU System Outputs

The two ACPU system outputs are the fan request to the engine ECM (circuit 234A) and the refrigerant compressor clutch.

- Although the engine fan is actually controlled by the electronic control module (ECM), the manufacturers provide a fan request input so that other systems, such as air conditioning, may request fan operation. A fan request is sent to the ECM via circuit 234A on pin G of the 8-way ACPU connector. The fan request input is connected to electrical ground to turn the fan off, and is disconnected from ground to request fan operation. The actual fan behavior in a vehicle will depend on the engine installation. The details about fan operation are given later in this subject under the heading "ACPU Control Rules."

General Information

Opening and Closing Pressures for the ACPU Pressure Switches			
ACPU Pressure Switch	**Opens psi (kPa)**	**Closes psi (kPa)**	**Color of Cap**
Low Pressure Switch	34 (234)	10 (69)	—
High Pressure Switch (on vehicles built before December 11, 1998)	290 to 310 (1999 to 2137)	250 to 270 (1724 to 1862)	blue
High Pressure Switch (on vehicles built from December 11, 1998)	340 to 375 (2344 to 2586)		red

Table 1, Opening and Closing Pressures for the ACPU Pressure Switches

- Operation of the refrigerant compressor clutch is directly controlled by the ACPU module via circuit 97C on pin E of the 8-way ACPU connector. It will discontinue operation of the compressor clutch if it detects a short or open circuit condition. The clutch coil has a nominal resistance of 3.5 ohms. The ACPU calculates actual coil resistance from current and voltage measurements. If the calculated resistance is less than about 2 ohms or greater than about 12 ohms, the ACPU will de-energize the clutch coil circuit. It will make another attempt after 15 seconds. Then, if the coil resistance is still out of limits the circuit will be latched off until the next ignition cycle, and a fault message will broadcast on the J1587 databus.

ACPU Data Communications (J1587/J1708 Serial Databus)

The ACPU uses the following data transmitted by other electronic devices to control the air conditioning system. In the event the ACPU becomes disconnected from the databus it will assume default values for these parameters that will allow the air conditioning system to continue operating. The default values are shown in **Table 2**.

Parameter Defaults	
Missing Parameter	**Default Value**
Ambient Air Temperature	48°F (9°C)
Road Speed	32 mph (51 km/h)
Engine Speed	384 rpm
Park Brake Status	Not Set
Air Pressure	Okay

Table 2, Parameter Defaults

These parameters include:

- Ambient Air Temperature: The ACPU uses ambient air temperature data broadcast by the Instrumentation Control Unit (MID 140, PID 171) in determining whether or not to transmit a low-pressure fault message if the low-pressure switch closes. Below a certain preset temperature the low-pressure fault message is suppressed, since the low-pressure may simply be the result of the low ambient temperature. For details, refer to information under the heading "High and low-pressure Switches" in this subject. Note that if this is the case, air conditioning function will still be disabled, but no fault message will be broadcast on the J1587 bus. Pressing the TEMP key on the keypad will display the ambient temperature being broadcast by the ICU.
- Road Speed: The ACPU uses road speed data from the data bus (MID 128, PID 84) to determine how long to keep the fan running in response to a high-pressure condition. The actual length of time the fan operates depends on the engine installation. The details about fan operation are given later in this subject under the heading "ACPU Control Rules."
- Engine Speed: The ACPU reads engine RPM data from the data bus (MID 128, PID 190) and disables air conditioning operation if the engine speed is below 300 rpm. Once the engine speed exceeds 300 rpm, there is a delay of 15 seconds before air conditioning operation is allowed.
- Park Brake Status: Park Brake status is broadcast by the ICU (MID 140, PID 70). The ACPU uses different control rules to govern fan-on time when the truck is parked. The details

about fan operation are given later in this subject under the heading "ACPU Control Rules."

- Low Air Pressure: A low air pressure message is broadcast by the ICU if system air pressure drops below about 60 psi (414 kPa). This is a Freightliner proprietary message broadcast under MID 142, PID 254. When this happens the LOW AIR warning will also be activated on the ICU. To prevent possible damage to the fan clutch, the ACPU will not operate the air conditioning system when the LOW AIR warning is active.
- Transmitted Messages: The ACPU periodically transmits the following information on the data bus for use by other electronic devices on the vehicle.
  - Diagnostic Fault Codes. When the ACPU senses a fault condition, it broadcasts a fault code which will be received and displayed by the ICU. A list of fault messages as they would appear on the message display screen is included later in this subject. The ACPU broadcasts a list of faults once every fifteen seconds. Although some fault messages continue to be broadcast after a fault becomes inactive, only active faults are displayed on the message display screen.
  - Local Battery Voltage. The ACPU broadcasts locally sensed battery voltage once per second (MID 190, PID 168).

ACPU Control Rules

The ACPU uses the following logic rules to control the air conditioning system.

NOTE: After the first two rules have been completed, the ACPU will go into its normal operating mode in which the remaining two rules apply.

1. Air conditioning start delay: The air conditioning compressor is not allowed to run under any circumstances until the engine has been running for at least 15 seconds, and is turning over 300 rpm.
2. After the ignition has been switched on, and the engine has been running over 300 rpm for 15 seconds, the air conditioning compressor engages for 15 seconds, this provides compressor lubrication, provided the following additional conditions are satisfied:
   - The high and low-pressure switches do not indicate out-of-limits or fault conditions.
   - No low air pressure message is being received from the ICU.
   - Battery voltage sensed by the ACPU module is at least 11 volts and less than 16 volts.
   - There are no active fault codes which would disable air conditioning operation. These faults are: low-pressure, Open Clutch Circuit, Shorted Clutch Circuit.
3. For basic fan operation, the ACPU signals the engine ECU when the high-side pressure exceeds 290 to 310 psi (1999 to 2137 kPa) on vehicles built before December 11, 1998, or 340 to 375 psi (2344 to 2586 kPa) on vehicles built from December 11, 1998. The signal opens the high-pressure switch, turning the fan on. After the high-pressure condition no longer exists, the high-pressure switch closes. The ACPU fan request to the ECU remains active for a variable length of time, as described below. The actual length of time the fan runs depends on the engine installation and ECU programming.

   The basic fan operating times are as follows:
   - If the high-pressure switch indicates a high-pressure condition, and if road speed is less than 5 mph (8 km/h), the fan request remains active for three minutes after the high-pressure condition no longer exists.
   - If the high-pressure switch indicates a high-pressure condition and if road speed is 5 mph (8 km/h) or greater, but less than 30 mph (48 km/h), the fan request remains active for one minute and 30 seconds after the high-pressure condition no longer exists.
   - If the high-pressure switch indicates a high-pressure condition and if road speed is 30 mph (48 km/h) or greater, the fan request remains active for 45 seconds after the high-pressure condition no longer exists.
   - If the ACPU fan request has been active for at least 20 seconds and road speed

increases from less than 30 mph (48 km/h) to more than 30 mph (48 km/h), the ACPU turns the fan request off.

- If the high-pressure switch indicates a high-pressure condition and if the parking brake is set, the ACPU fan request remains on indefinitely once it has been activated.

  Please note the following exceptions based on the engine installed in the vehicle:

  For a vehicle equipped a with a Caterpillar engine, the ECU has a minimum programmable fan time of 30 seconds, meaning that it will keep the fan clutch engaged for an additional 30 seconds after the fan request from the ACPU has been discontinued. Therefore, the total length of time that the engine fan runs after the ACPU high-pressure switch closes will be 30 seconds longer than the basic fan operating times listed above.

  For a vehicle equipped with a Cummins engine, the ECU can be programmed for zero fan delay time. Therefore, the time the fan actually runs in response to a fan request input from the ACPU will be equal to the basic fan operating times listed above.

  For a vehicle equipped with a Detroit Diesel DDEC III engine, the ECU fan timing is set to one second, which is the minimum allowable time. This means it will keep the fan clutch engaged for one additional second after the fan request from the ACPU has been discontinued.

4. The ACPU turns the air conditioning clutch on and off in response to the thermostat switch input, subject to the following conditions:
   - The air conditioning clutch will not engage if data received from the databus indicates that engine speed is less than 300 rpm.
   - The air conditioning clutch will not engage more than once every 15 seconds.
   - The air conditioning clutch will turn off if the low-pressure switch closes.
   - If the high-pressure switch opens, the air conditioning clutch will turn off after a length of time equal to the time the clutch was turned on before the high-pressure switch opened, or after 10 seconds, whichever occurs first.
   - The air conditioning clutch will turn off if the locally sensed battery voltage is less than 11.0 volts.
   - The air conditioning clutch will turn off if an overcurrent or undercurrent condition is detected in the clutch coil circuit (low or high coil resistance, respectively). If this happens, the ACPU will wait for 15 seconds, then attempt to energize the clutch coil circuit again. If the overcurrent or undercurrent condition is still present, air conditioning operation will be disabled until the next ignition cycle.

Air Conditioning Protection Unit High-Pressure Switch

This switch is located on the discharge side of the service ports (small refrigerant line). If the pressure becomes too high, it signals the control module to turn on the fan. Too much pressure may be caused by blocked air flow through the condenser, a plugged expansion valve or receiver-drier, or too much refrigerant in the system.

If the compressor cylinder head pressure reaches unsafe levels above 290 to 310 psi (1999 to 2137 kPa) on vehicles built before December 11, 1998 or 340 to 375 psi (2344 to 2586 kPa) on vehicles built from December 11, 1998, the module shuts off the compressor and turns on the fan. When the pressure returns to 250 to 270 psi (1724 to 1862 kPa) the compressor resumes operation, and the control module turns off the fan.

Air Conditioning Protection Unit Low-Pressure Switch

Located on the suction side of the service ports (large refrigerant line), this switch signals the control module to disengage the refrigerant compressor, to protect it from harmful operating conditions.

If refrigerant is lost or the outside temperature is too low, the switch continually signals the module to keep the compressor from operating. The control module disengages the compressor when falling pressure goes below 10 psi (69 kPa); normal com-

pressor operation resumes when rising pressure reaches 34 psi (234 kPa).

Binary Switch

A binary switch disengages the refrigerant compressor clutch to protect the compressor from harmful operating conditions. It performs two functions.

- If the refrigerant system pressure is too low, the binary switch will keep the compressor from operating. The switch disengages the compressor clutch when falling pressure drops below 25.6 to 31.2 psig (177 to 215 kPa). Normal compressor operation resumes when rising pressure reaches 25.7 to 34.3 psig (177 to 236 kPa).
- If the refrigerant system pressure increases above 426.5 to 483.5 psig (2941 to 3334 kPa), the binary switch shuts off the compressor clutch. When system pressure falls back to 313 to 426 psig (2158 to 2937 kPa), the compressor resumes operation.

Blower Motor Resistor Block Assembly

The blower motor draws air over the evaporator, and forces it through the heater core, into the cab. The resistor block assembly controls the speed of the blower motor by reducing the voltage to the motor, and has a thermal cutout which shuts off current to the blower motor, if the circuit overheats.

Condenser

A condenser turns hot refrigerant gas, coming from the compressor, into liquid. Mounted in front of the radiator, it is made up of coiled tubes covered with cooling fins. Because of its location, the condenser transfers heat to air that is drawn in by the engine fan, and to ram air, which is forced into the engine compartment by the vehicle's forward motion.

Evaporator

Because the evaporator holds an area of low-pressure in the system, the boiling point of the refrigerant falls, which causes it to absorb heat from the tubing walls and fins of the coils. As it absorbs heat, liquid refrigerant quickly boils and turns into a gas.

As heat is absorbed through the outside surfaces of the evaporator, air passing over the unit loses its heat to these cooler surfaces. Moisture in the air condenses on the outside of the evaporator and drains off as water, dehumidifying the air in the cab.

Expansion Valve

The expansion valve is a dividing point between the high- and low-pressure parts of the refrigerant system. High-pressure liquid refrigerant from the receiver-drier passes through the expansion valve and moves into the low-pressure area of the evaporator. See **Fig. 4** and **Fig. 5**.

A. From the evaporator
B. To the evaporator
C. To the refrigerant compressor
D. From the receiver-drier

1. Expansion Valve

Fig. 4, Expansion Valve Refrigerant Lines

The expansion valve proportions the flow rate of refrigerant according to the rate of evaporation in the evaporator. If the amount of liquid in the evaporator drops off, the temperature of the gas going to the compressor rises. This causes a sensor tube in the expansion valve to react to the temperature changes, which causes an orifice in the valve to open or close. Through the orifice, liquid refrigerant is metered into the evaporator.

Fig. 5, Expansion Valve

Heater Core

The heater core is a series of tubes covered with fins. When the water valve is open, warm engine coolant flows through the heater core tubes, heating the tubes and fins. The blower motor blows air through the finned tubes and into the cab, to heat the cab.

Receiver-Drier

The receiver-drier is a reservoir and filter for liquid refrigerant. It also removes water and acids from the refrigerant. The water-absorbing material (desiccant) in the unit helps stop blockages caused by moisture forming in the expansion valve and other parts of the system.

Refrigerant

Refrigerant is the chemical substance that is used to absorb heat from the air in the cab and release it to the air outside the cab.

During compressor operation, refrigerant constantly changes from a gas to a liquid, then back to a gas, depending on whether it is absorbing heat (boiling) in the low-pressure evaporator, or releasing absorbed heat in the high-pressure condenser.

Refrigerant Compressor

"Heat" in the low-pressure gas of the evaporator does not feel like heat to the touch, because liquid refrigerant boils at a temperature much lower than the temperature at which water turns to ice. By touch, the "heated" gas in the coils is very cold. As a result, there is the problem of how to remove heat from subfreezing gas using outside air that may be higher than 100°F (38°C).

With a refrigerant compressor, low-pressure gas from the evaporator can be squeezed into a much smaller space. When the gas is compressed, the heat it contains becomes concentrated. In this way, the gas is made hotter than the outside air without adding heat.

If the system pressure rises above 550 ± 50 psi (3792 ± 345 kPa), a pressure relief valve will vent, disengaging the compressor clutch until the pressure drops to 400 psi (2758 kPa).

A second purpose of the compressor is to move refrigerant through the system.

Thermostatic Switch

A thermostatic switch signals the ACPU to engage and disengage the refrigerant compressor. See **Fig. 6**. From the thermostatic switch, a sensing tube extends to the evaporator where it monitors the temperature near the coil tubes. As air passes through the evaporator, water vapor can condense and freeze on the evaporator, blocking airflow. If the coil temperature drops too low, the thermostatic switch disengages the refrigerant compressor clutch until a temperature just above freezing is reached, to prevent the formation of ice.

Water Regulating Valve

The water regulating valve is controlled by the temperature control knob on the dash panel. On vehicles

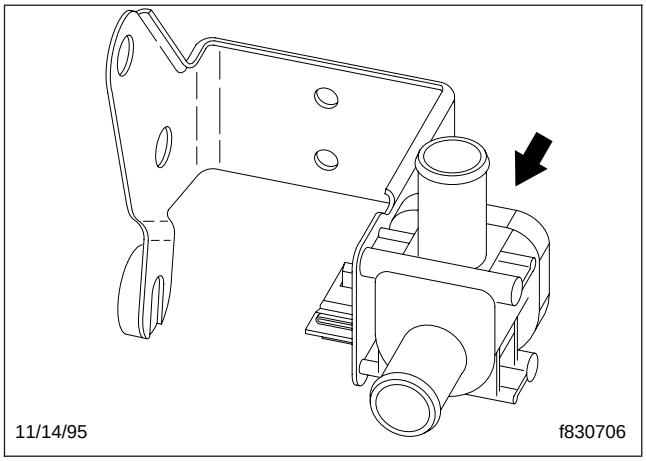
equipped with a mechanically controlled water regulating valve, a cable opens and closes the valve, regulating the amount of coolant flowing through the heater core. See **Fig. 7** and **Fig. 8**. On vehicles equipped with an electronically controlled water regulating valve, the amount of coolant flowing through the heater core is regulated electronically. See **Fig. 9**.

Definition of Terms

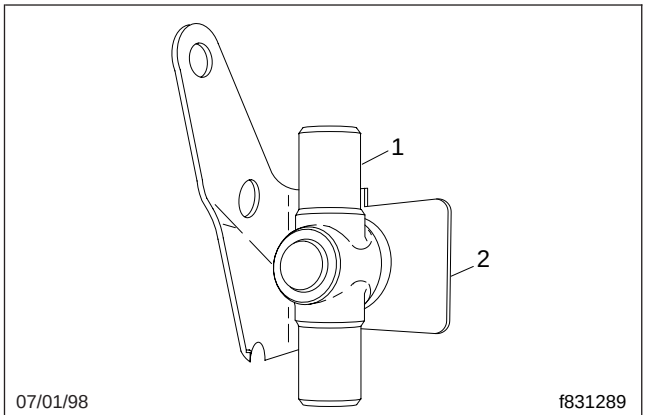
Refer to the following terms for a better understanding of the heater and air conditioning system.

Air Conditioner A system used to control the temperature, humidity, and movement of air in the cab.



11/14/95 f830706

Fig. 7, Mechanically Controlled Water Regulating Valve, Century Class Conventional



07/01/98 f831289

1. Water Regulating Valve
2. Mounting Bracket

Fig. 8, Mechanically Controlled Water Regulating Valve, Argosy COE

Air Cylinder Air-operated device used to open or close vents through which air is pushed into the cab by the blower.

Ambient Air Temperature The temperature of air around an object or the outside temperature.

Air Conditioning Protection Unit (ACPU) A system that monitors heater and air conditioner conditions (low or high refrigerant charge) and controls the refrigerant compressor and the on-off fan drive. Impending or existing problems are registered as fault codes through the Instrumentation Control Unit. The ACPU was installed on vehicles built before April 16, 1999.

General Information

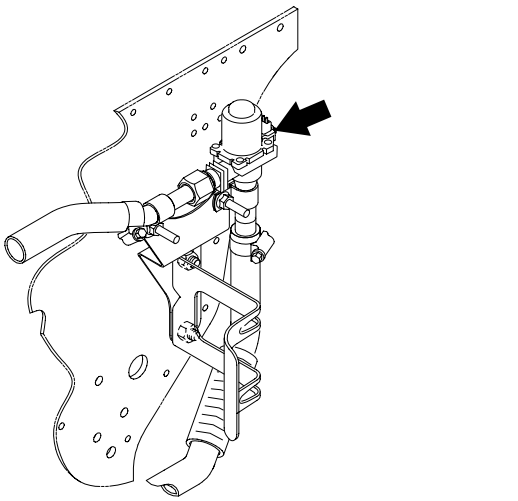


Fig. 9, Electronically-Controlled Water Regulating Valve

Binary Switch This switch disengages the refrigerant compressor clutch to protect the compressor from harmful operating conditions.

Blower Motor A blower motor forces air through the HVAC assembly and through the duct work.

Blower Resistor Block Assembly Inline resistors that control the amount of voltage going to the blower motor. By controlling the voltage, you can control the fan speed.

Boiling Point The temperature at which a liquid changes to a gas. The boiling point varies with pressure.

Bulk Charging Use of large containers of refrigerant for charging a refrigerant system. Normally used for charging empty systems.

Charge A specific amount of refrigerant or oil by volume or weight. Also the act of placing an amount of refrigerant or oil into the air conditioning system.

Clutch Cycling Switch (Thermostatic Switch) Engages or disengages the compressor depending on changes in evaporator temperature.

Condensate Water taken from the air, which forms on the outer surface of the evaporator.

Condenser A heat exchanger that is used to remove heat from refrigerant, changing it from a high-pressure hot gas to a high-pressure warm liquid. Typically the condenser is mounted in front of the radiator.

Contaminants Anything other than refrigerant or refrigerant oil in the system. Usually means water, dirt, or air in the system.

Dehumidify To remove water from the air at the evaporator.

Dehydrate To remove all traces of moisture from the refrigerant system. This process occurs during evacuation.

Desiccant A drying agent used in the receiver-drier to remove moisture and create an extremely dry condition.

Discharge Line Connects the refrigerant compressor outlet to the condenser inlet.

Discharge Pressure High-side pressure or condensing pressure of the refrigerant being discharged from the compressor.

Discharge Service Valve A device that allows high-side pressure to be checked and other service operations to be performed. This valve is located between the receiver-drier and the expansion valve.

Drive Pulley A pulley attached to the front of the engine crankshaft. It drives the compressor clutch pulley with a belt.

Duct A passageway for the transfer of air from one point to another.

Evacuate To place a high vacuum in the refrigeration system to remove air and dehydrate or remove traces of moisture.

Evaporate A change of state from a liquid to a gas.

Evaporator A component in which liquid refrigerant changes to a gas after it absorbs heat from the air. Also removes some moisture from the cab air.

Expansion Valve A device that causes a pressure-drop of the refrigerant and also regulates its flow.

Flooding A condition caused by too much liquid refrigerant going into the evaporator. Usually caused by an expansion valve that is stuck open.

Flushing A process of passing liquid refrigerant through an air conditioner component to remove dirt and water from the part. Liquid refrigerant removes heavy contamination, such as gritty dirt and large dirt buildup.

Freeze-Up Failure of a unit to operate properly because of ice forming at the expansion valve orifice or on the evaporator.

General Information

Heater Core A part of the heating system through which hot engine coolant flows to provide heat to the cab, or to adjust the temperature produced by the air conditioner.

High-Pressure Switch (Air Conditioning Protection Unit) Located on the discharge side of the service ports (small refrigerant line), this switch signals the electronic control module to turn the fan on or off, depending on refrigerant pressure. Additionally, if the high-pressure condition does not return to normal within a programmed period of time, the control module will turn off the compressor.

Humidity The amount of water vapor in the air.

Hydraulic Lock The return of liquid refrigerant to the compressor, which could destroy the unit.

Leak Detector Any device used to detect refrigerant leaks in a refrigerant system.

Liquid Line high-pressure liquid refrigerant is carried back to the evaporator from the condenser by the liquid line to repeat the evaporation/condensation cycle.

Liquid Pressure Pressure of refrigerant in the liquid line from the condenser to the expansion device.

Low Head Pressure High-side pressure that is lower than normal due to a system problem.

Low-Pressure Switch (Air Conditioning Protection Unit) Located on the suction side of the service ports (large refrigerant line), this switch signals the electronic control module to disengage the refrigerant compressor to protect it from harmful operating conditions.

Low Suction Pressure Low-side pressure that is lower than normal due to a system problem.

Magnetic Clutch An electrical coupling device used to engage or disengage the compressor.

Manifold Designed to control refrigerant flow for system test purposes. It is used with manifold gauges.

Manifold Gauge A calibrated instrument used for measuring system pressures.

Manifold Gauge Set A manifold that is complete with gauges and charging hoses and is used to measure or test pressure.

Micron A metric unit of length equal to one-millionth of a meter. This unit of measure is used to measure vacuum drawn from a refrigerant system by a vacuum pump.

Nitrogen A colorless, odorless, dry, inert gas that can be used to remove light contaminants, such as dust, from air conditioner parts.

Opacity A measure of contamination of refrigerant oil in the compressor. Fresh refrigerant oil is clear; when contaminated, it appears cloudy or may have fine particles held in suspension.

Overcharge Too much refrigerant or oil in the system.

Polyalkylene Glycol (PAG) A highly refined synthetic oil used in R–134a air conditioning systems.

Polyol Ester (POE) A highly refined synthetic oil used in R–134a air conditioning systems.

Purge To remove damp air, traces of refrigerant, and loose dirt from a system or part, by flushing with a dry inert gas, such as nitrogen.

PSIA Pounds per square inch, absolute pressure. Pressure exerted by the air at sea level. Atmospheric pressure is usually measured with a mercury barometer.

PSIG Gauge pressure, relative to the local atmosphere. At sea level, 0 PSIG is about 14.7 PSIA, which is standard atmospheric pressure. But in Denver, which is at about 5000 feet altitude, standard atmospheric pressure and PSIG are about 12.5 PSIA. It is possible to have a negative gauge pressure, indicating a vacuum.

Receiver-Drier A combination desiccant, filter, and storage container for liquid refrigerant.

Recovery Removal of the refrigerant from the air conditioning system.

Recycling Removal of contaminants and moisture from R–134a using a recovery and recycling station.

Refrigerant–134a (R–134a) The cooling agent used in automotive air conditioning systems. The chemical name for R–134a is tetrafluoroethane.

Refrigerant Compressor A device used to draw low-pressure refrigerant gas from the evaporator and squeeze it into a high-temperature, high-pressure gas. A second purpose of the compressor is to move refrigerant through the system.

Refrigeration Cycle The complete circulation of refrigerant through an air conditioning system, accompanied by changes in temperature and pressure.

General Information

Relative Humidity The actual water content of the air in relation to the total water the air can hold at a given temperature.

Resistor A voltage-dropping device, usually wire wound, for controlling fan speed.

Sensor A temperature- or pressure-sensing unit that is used to sense air temperatures or pressures, and provide a control voltage for operation of automatic temperature control units.

Suction Line The line connecting the evaporator outlet to the compressor inlet.

Suction Pressure Compressor inlet pressure or the system's low-side pressure.

Suction Service Valve A device that allows low-side pressure to be checked and other service operations to be performed. This valve is located between the evaporator and the compressor.

Suction Side The low-pressure area of the system, extending from the expansion valve to the compressor inlet.

Thermistor A vacuum pressure sensor that is used to measure, in microns of mercury, the internal system vacuum level after evacuation.

Thermostatic Vacuum Gauge A high-vacuum gauge sensitive to pressures ranging from atmospheric pressure to less than 1 micron of mercury, with scales reading from 25,000 microns to 1 micron of mercury.

Thermostatic Switch A temperature-sensitive switch used to control system temperature and prevent evaporator freeze-up. It does this by controlling the compressor's clutch operation.

Undercharge A system low on refrigerant resulting in lack of cooling and possible compressor damage.

Vacuum Refers to pressure that is less than atmospheric pressure.

Vacuum Pump A mechanical device used to evacuate and create a high vacuum in the refrigerant system.

Vacuum Pump Oil Water soluble oil used in some vacuum pumps to absorb moisture from the refrigerant system.

Vapor The gaseous state of a material.

Water Regulating Valve The mechanically or electronically controlled valve, used for controlling the flow of coolant to the heater core.

Principles of Operation

Air Conditioner

The refrigerant compressor crankshaft actuates the pistons and connecting rods, drawing in and compressing the low-pressure refrigerant gas into a high-pressure, high-temperature gas. high-pressure raises the condensation point of refrigerant gas, which allows the condenser to change it to a liquid.

After it is compressed, refrigerant gas moves out of the discharge port of the compressor and on to the condenser. At the condenser, air passing over the fins absorbs heat from the hot refrigerant gas and causes it to change into a liquid. The liquid moves to the receiver-drier, which filters it and removes traces of moisture and acids, then stores the refrigerant until it is needed by the system.

From the receiver-drier, liquid refrigerant moves to the expansion valve, which meters the flow into the evaporator and acts as a boundary between the high- and low-pressure sides of the system. The metered release of the expansion valve greatly drops the liquid's pressure causing it to expand. The pressure drop lowers the boiling point of the refrigerant and causes it to quickly evaporate as it absorbs heat from air passing over the coil. The resulting cool air is forced into the cab by the blower. The heated refrigerant gas is drawn back into the compressor, where the cycle is repeated.

Air Conditioning Protection Unit (ACPU)

The ACPU was installed on vehicles built before April 16, 1999.

After the engine is started, the electronic control module holds off compressor activation for about fifteen seconds. After the fifteen second delay, the compressor comes on for about fifteen seconds. This start-up cycle is accomplished with the control module ignoring all input from the thermostatic switch. The purpose of this activity is to circulate lubricant within the compressor, which is beneficial to the system especially when it is not used frequently.

The ACPU controls the length of time the engine fan remains engaged after a system high-pressure condition returns to normal. The length of time it stays on depends on vehicle speed. Basically, the fan stays on longer if the vehicle is parked or the speed is low. If the parking brake is on and the fan engages (high system pressure is sensed), it is held on until either the air conditioning is turned off for more than about two minutes, the parking brake is released, or the engine is shut down.

Additional air conditioning system controls performed by the ACPU include automatic shutdown of the air conditioning system if pressure drops below 60 psi (414 kPa). If an air conditioning fault occurs that causes the system to turn off the air conditioning, the refrigerant compressor clutch will not operate until the vehicle is shut down, then restarted. All of these controls are designed into the ACPU system to reduce air conditioning maintenance and increase the life of air conditioning components.

Heater

Turning the temperature control knob from COOL to WARM opens the water regulating valve, which allows engine-heated coolant to flow through the heater core. Air heated by the air passing over the heater core fins is forced through ducts and into the cab.

Safety Precautions

Whenever repairs are made to any air conditioner parts that hold R–134a refrigerant, you must recover, purge or flush (if contaminated), evacuate, charge, and leak test the system. In a good system, refrigerant lines are always under pressure and you should disconnect them only after the refrigerant charge has been recovered (discharged) at the service valves.

Refrigerant R–134a is safe when used under the right conditions. Always wear safety goggles and non-leather gloves while recovering, evacuating, charging, and leak testing the system. Do not wear leather gloves; when refrigerant gas or liquid contacts leather, the leather will stick to your skin.

⚠ WARNING

Use care to prevent refrigerant from touching your skin or eyes, because liquid refrigerant, when exposed to the air, quickly evaporates and will freeze skin or eye tissue. Serious injury or blindness could result if you come into contact with liquid refrigerant.

Refrigerant splashed in the eyes should be rinsed with lukewarm water, not hot or cold. Do not rub the eyes. Apply a light bandage and contact a physician right away.

Refrigerant splashed on the skin should be rinsed with lukewarm water, not hot or cold. Do not rub the skin. Apply a light coat of a nonmedicated ointment, such as petroleum jelly. Contact a physician right away.

R–134a refrigerant does not burn at ambient temperatures and atmospheric pressure. However, it can be combustible at pressures as low as 5.5 psig (139 kPa absolute) at 350°F (177°C) when mixed with air concentrations that are greater than 60 percent.

⚠ WARNING

R–134a air conditioning systems should not be pressure tested or leak tested with compressed air. Combustible mixtures of air and R–134a may form, resulting in a fire or explosion, which could cause personal injury or property damage. R–134a may be safely pressured with dry nitrogen.

You must work in an area where there is a constant flow of fresh air when the system is recovered, evacuated, charged, and leak tested. R–134a vapors have a slightly sweet odor that is difficult to detect. Frequent leak checks and air monitoring equipment are recommended to ensure a safe working environment.

IMPORTANT: When servicing an R–134a air conditioning system, use only service equipment certified to meet the requirements of SAE J2210 (R-134a recycling equipment). The equipment should be operated only by qualified personnel who are familiar with the recycling station manufacturer's instructions.

Because of its very low boiling point, refrigerant must be stored under pressure. To prevent the refrigerant containers from exploding, never expose them to temperatures higher than 125°F (52°C).

On R–134a refrigerant systems, polyalkylene glycol (PAG), or polyol ester (POE) oil is used in the compressor. When handling these oils, observe the following:

- keep the oil free of contaminants
- do not expose the a/c system or the oil container to air for long periods of time; PAG and POE oils absorb moisture quickly
- use care when handling: painted surfaces, plastic parts, and other components (drive belts) could be damaged if the oil is spilled on them
- never mix the oils with other types of refrigerant oil

Fan Cycling Switch Replacement

Replacement

1. Turn off the engine, apply the brakes, and chock the tires.
2. Access the receiver-drier. The fan cycling switch is mounted to the port on the receiver-drier. See **Fig. 1**.

   On Century Class vehicles, open the hood. On Argosy COEs, open the access panel on the front of the vehicle.
3. If the wiring harness is secured to the receiver-drier with a tie-strap, remove the tie-strap. Disconnect the wiring harness from the fan cycling switch.
4. Remove the fan cycling switch, and remove and discard the O-ring on the port.

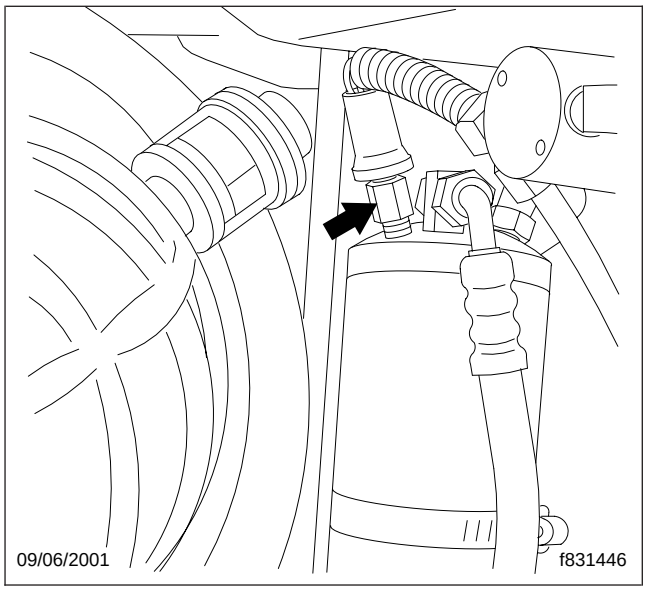

Fig. 1, Fan Cycling Pressure Switch

5. Lubricate a new O-ring with mineral oil and install the O-ring on the port.
6. Install a new fan cycling switch on the receiver-drier port. Torque the switch 60 to 72 lbf·in (678 to 813 N·cm).
7. Connect the wiring harness to the fan cycling switch. Using a tie-strap, make sure the wiring harness is kept away from the rain tray by securing the wiring harness to the receiver-drier on Century Class vehicles.
8. On Century Class vehicles, close the hood. On Argosy COEs, close the access panel on the front of the vehicle.
9. Remove the chocks from the tires.

Heater and Air Conditioner Removal and Installation

Removal

1. Turn off the engine, apply the brakes, and chock the tires.
2. Disconnect the batteries.

NOTE: When the dash is completely assembled, all dash fasteners are hidden from view. See **Fig. 1**, **Fig. 2** and **Fig. 3**.

3. Remove the right-hand dash panels, the left-hand dash panels as needed, and the upper dash panels to access the heater and air conditioner assembly. See **Fig. 4**, **Fig. 5**, **Fig. 6**, **Fig. 7** and **Fig. 8**. For instructions, refer to **Group 60**.

NOTE: On right-hand-drive (RH DR) vehicles, the dash panels are in the reverse position from the left-hand-drive (LH DR) vehicle.

4. At the climate control panel, disconnect the air lines and unplug the electrical connector.
5. Remove the air distribution duct that runs across the top of the power distribution module.
6. Remove the two fasteners holding the vertical air duct that is located along the kick panel. Remove the duct.
7. Remove the power distribution module. See **Fig. 9**. For instructions, refer to **Group 54**.
8. Remove the air distribution duct located on top of the heater and air conditioner assembly.
9. On Century Class Conventionals, remove the rain gutter and the air intake duct in the engine compartment.
10. On Century Class Conventionals, remove the air cleaner. For instructions, refer to **Group 09**.
11. At the frontwall (just above the expansion valve), disconnect the heater core supply and return lines. Clamp off the lines to prevent coolant loss.
12. Remove the mastic insulating tape from around the expansion valve.
13. Remove the refrigerant from the air conditioning system. For instructions, see **Subject 250**.
14. At the expansion valve, disconnect the refrigerant lines that are routed to the junction block (then on to the receiver-drier and the refrigerant compressor). See **Fig. 10**. Quickly cap the expansion valve ports and plug the fittings.

IMPORTANT: Under no circumstances should the expansion valve ports remain uncapped or the fittings remain unplugged for longer than five minutes total. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

15. Remove the drain tubes that pass through the frontwall.
16. Remove the two capscrews and the four nuts that hold the heater and air-conditioner unit in place. Remove the heater and air conditioner.

NOTE: Pull out the lower right-hand side of the heater and air conditioner first.

Installation

1. Align the left side of the heater and air conditioner in the cab. Make sure that the ducts on the left side mate with their respective cavities in the dash structure.
2. Check that the left-hand heat duct slides into position and that all gaskets are flush against the frontwall.
3. Install the capscrews and nuts that secure the heater and air conditioner. Tighten them 16 lbf·ft (22 N·m).
4. Feed the drain tubes through the frontwall.
5. Uncap the expansion valve ports and unplug the fittings. Check the fittings and the ports. They must be clean and free of nicks, gasket residue, and other foreign material.
6. On hose connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

   On hose connections that have a SlimLine seal assembly (**Fig. 11**), replace the seals. **Do not** lubricate SlimLine seals prior to installation. Use **only** a SlimLine seal on a SlimLine seal assembly.
7. Install the refrigerant lines to the expansion valve.

On hose connections that have threaded fittings, torque the large line 35 to 40 lbf·ft (47 to 54 N·m). Torque the small line 20 to 25 lbf·ft (27 to 34 N·m).

On hose connections that have a SlimLine seal assembly, torque the bolt on the SlimLine seal assembly 11 to 15 lbf·ft (15 to 20 N·m).

8. Evacuate and charge the system with refrigerant. Refer to **Subject 250** for instructions. Be sure to add refrigerant oil to the compressor to replace that which is lost when the system is discharged. For instructions, refer to the applicable refrigerant compressor section in this group.
9. Cover the expansion valve with mastic insulating tape.
10. Connect the heater inlet and outlet hoses to the heater core pipe elbows. Tighten the clamps securely.
11. On Century Class Conventionals, install the air intake duct and the rain gutter in the engine compartment. Tighten the fasteners securely.
12. On Century Class Conventionals, install the air cleaner. For instructions, refer to **Group 09**.
13. Install the power distribution module. For instructions, refer to **Group 54**.

9. On Century Class Conventionals, open the hood and remove the air cleaner. For instructions, refer to **Group 09**.
10. At the frontwall (just above the expansion valve), disconnect the heater core supply and return lines. Clamp off the lines to prevent coolant loss.

⚠ WARNING

Failure to wear protective gloves could result in serious skin cuts due to the sharp edges on the heater core fins.

IMPORTANT: A small amount of antifreeze may be present in the heater core. Protect the interior of the vehicle to prevent any damage from antifreeze spillage.

11. Wearing protective gloves, slide the heater core out of the housing. See **Fig. 9**.

Installation

1. Wearing protective gloves, slide the new heater core into the housing. Make sure that the heater core gasket is flush against the frontwall. Con-

10. On Century Class Conventionals, return the hood to the operating position.
11. Remove the chocks from the tires.

Removal

WARNING

Failure to turn off the ignition switch could allow the blower motor to operate during repairs. This could result in personal injury or electrical shock.

1. Turn off the engine, apply the brakes, and chock the tires.

NOTE: When the dash is completely assembled, all dash fasteners are hidden from view. See **Fig. 1**, **Fig. 2**, and **Fig. 3**.

2. Remove the right-hand dash panels as needed to access the blower motor. See **Fig. 4** and **Fig. 5**. For instructions, refer to **Group 60**.

NOTE: On right-hand-drive (RH DR) vehicles, the dash panels are in the reverse position from the left-hand-drive (LH DR) vehicle.

3. Disconnect the blower motor wires. See **Fig. 6**.
4. Remove the three screws from the blower motor bracket, then lift the blower motor out of the housing.

Installation

IMPORTANT: Make sure that the wiring exiting the motor is positioned at 4 o'clock to prevent excess slack in the harness.

1. Position the blower motor on the mounting bracket in the housing. Install the screws and tighten them securely.
2. Connect the blower motor wires.
3. Install the right-hand dash panels. For instructions, refer to **Group 60** of this manual.
4. Turn on the ignition key and test the blower motor.
5. Remove the chocks from the tires.

Replacement

CAUTION

Never try to bypass the fuse in the blower motor resistor block. To do so could cause the blower motor to overheat, resulting in serious damage to the heater and air-conditioning system.

WARNING

Failure to turn off the ignition switch could allow the blower motor to operate during repairs. This could result in personal injury or electrical shock.

1. Turn off the engine, apply the brakes, and chock the tires.

NOTE: When the dash is completely assembled, all dash fasteners are hidden from view. See **Fig. 1**, **Fig. 2**, and **Fig. 3**.

2. Remove the right-hand dash panels as needed to access the resistor block. See **Fig. 4** and **Fig. 5**. For instructions, see **Group 60**.

NOTE: On right-hand-drive (RH DR) vehicles, the dash panels are in the reverse position from the left-hand-drive (LH DR) vehicle.

3. Disconnect the harness from the resistor block. See **Fig. 6**.
4. Remove the two screws and lift out the resistor block.
5. Position the new resistor block and install the mounting screws firmly.
6. Connect the wire harness.
7. Turn on the ignition key and test the blower motor.
8. Install the right-hand dash covers. For instructions, see **Group 60**.
9. Remove the chocks from the tires.

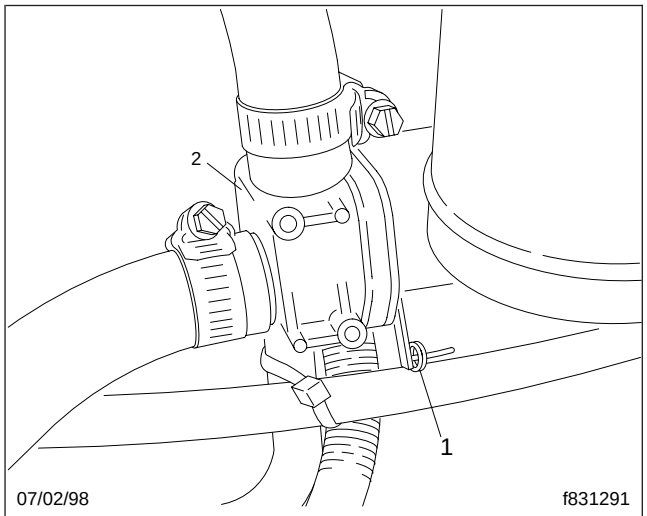
Water Regulating Valve Replacement, Mechanically-Controlled

Replacement

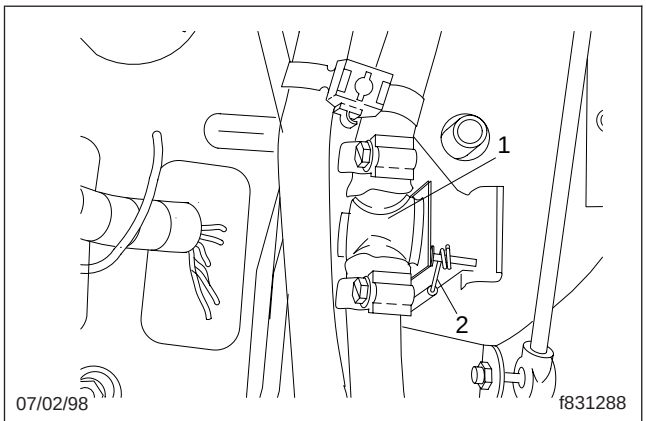
1. Turn off the engine, apply the brakes, and chock the tires.
2. On Century Class Conventionals, open the hood. On Argosy COEs, open the access panel on the front of the vehicle.
3. On Century Class Conventionals, remove the air cleaner. For instructions, refer to **Group 09**.
4. Clamp off the heater hoses to prevent coolant loss.
5. Remove the hoses from the water regulating valve. See **Fig. 1** and **Fig. 2**.



1. Control Cable
2. Water Regulating Valve

Fig. 1, Water Regulating Valve, Century Class Conventional

6. Slip the control cable off the end of the rod. See **Fig. 1** and **Fig. 2**. Remove the control cable from the cable bracket.
7. Remove the nuts and washers that attach the water regulating valve mounting bracket to the frontwall. Remove the valve and mounting bracket.
8. Remove the water regulating valve from the valve mounting bracket. See **Fig. 3** and **Fig. 4**.
9. Place a new water regulating valve on the valve bracket.



1. Water Regulating Valve
2. Control Cable

Fig. 2, Water Regulating Valve, Argosy COE

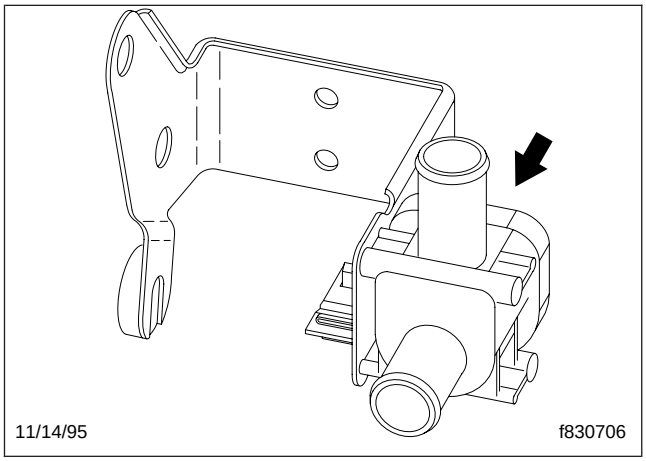


Fig. 3, Water Regulating Valve, Century Class Conventional

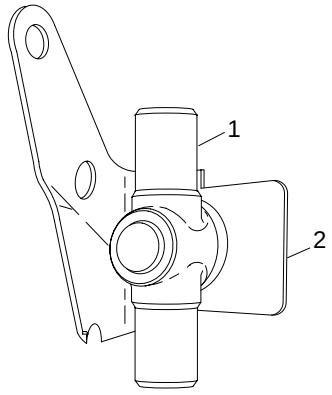
10. Place the water regulating valve and mounting bracket on the frontwall. Install the washers and nuts that attach the valve and mounting bracket to the frontwall. Tighten the nuts securely.
11. Place the control cable through the valve mounting bracket, and slip the end of the control cable over the valve rod.
12. Connect the heater hoses to the water regulating valve. Tighten the hose clamps securely.
13. Move the temperature control knob to COOL. The water regulating valve should close completely. Move the control knob to WARM. The valve should open. The travel of the knob should

Water Regulating Valve Replacement, Mechanically-Controlled



1. Water Regulating Valve
2. Mounting Bracket

Fig. 4, Water Regulating Valve, Argosy COE

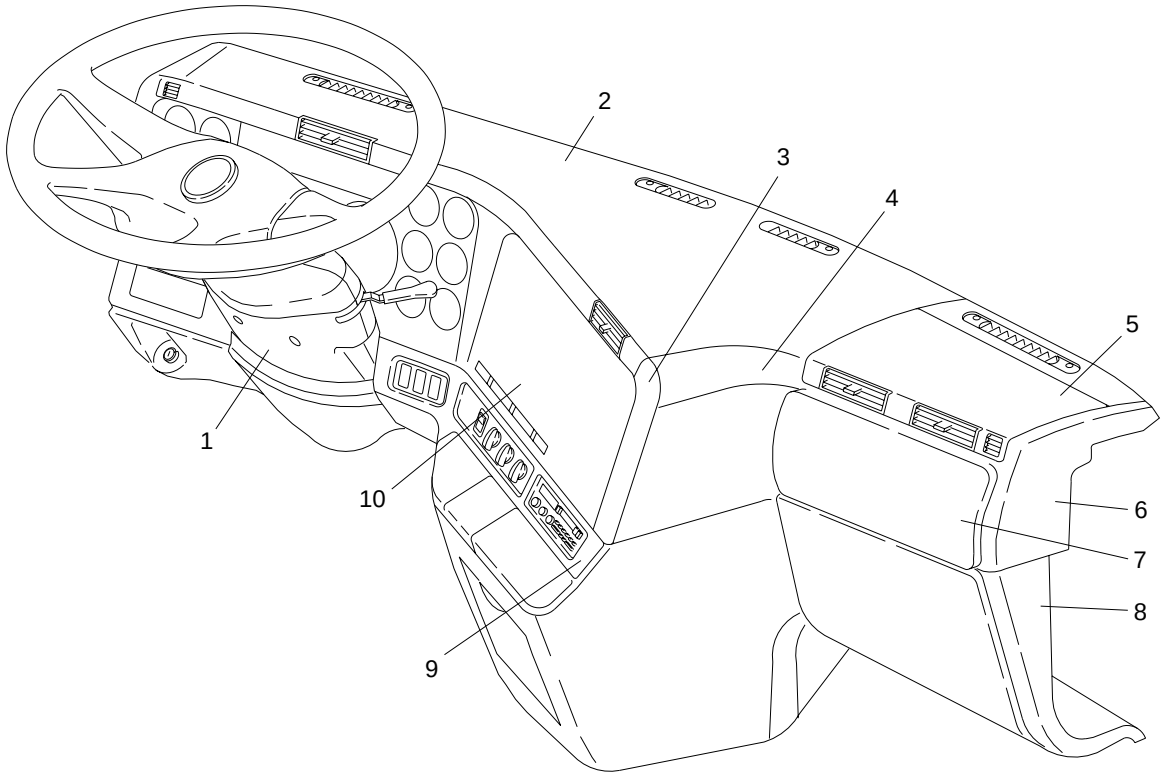
be smooth. If it isn't, adjust the turnbuckle following the instructions in **Subject 170**.

14. Start the engine. Turn the heat control knob to hot (this opens the water valve). When the engine thermostat(s) opens, air will be forced from the heater core as the coolant circulates. Check the coolant level and fill as needed.
15. Check for leaks around the water regulating valve and correct the cause.
16. On Century Class Conventionals, install the air cleaner. For instructions, refer to **Group 09**.
17. On Century Class Conventionals, return the hood to the operating position. On Argosy COEs, close the access panel
18. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the brakes, and chock the tires.

NOTE: On right-hand-drive (RH DR) vehicles, the dash panels are in the reverse position from the left-hand-drive (LH DR) vehicle.



1. Steering Column Cover
2. Upper Dash Assembly (left-hand panel)
3. Dash Trim Cap, Right-Hand

9. Waste Bin Outer Wall
10. Console Cover, Right-Hand
11. HVAC/Radio Trim Plate
12. Auxiliary Gauge Panel

Fig. 1, Dash Panels, Century Class Conventional, LH DR

NOTE: When the dash is completely assembled, all dash fasteners are hidden from view. See **Fig. 1**, **Fig. 2**, and **Fig. 3**.

2. Remove the right-hand dash panels as needed to replace the water regulating valve cable. See **Fig. 4**, **Fig. 5** and **Fig. 6**. For instructions, refer to **Group 60**.
3. Unhook the water regulator valve cable from the temperature control switch assembly.
4. Cut the tie strap that secures the cable to the dash brace.
5. On Century Class Conventionals, open the hood and remove the air cleaner. For instructions, see **Group 09**.
6. Access the water regulating valve.

11. Console Cover, Left-Hand

Fig. 2, Dash Panels, Century Class Conventional, RH DR

On Century Class Conventionals, open the hood.

On Argosy COEs, open the access panel on the front of the vehicle.

7. Slip the control cable off the end of the rod on the water regulating valve. See **Fig. 7** and **Fig. 8**. Remove the cable from the cable bracket.
8. Inside the cab, pull the cable out of the engine compartment.
9. Inside the cab, feed the replacement cable through the frontwall and through the clamp. Slip the end of the cable over the water regulating valve rod. Place the cable in the cable bracket and secure it to the valve mounting bracket.
10. At the other end of the cable, feed the end of the cable through the cable clamp and hook the end on the temperature control switch.
11. Tie strap the cable to the dash brace.
12. On Century Class Conventionals, install the air cleaner. For instructions, see **Group 09**.
13. Position the control panel on the dash.
14. Adjust the cable.

    The temperature control knob should spring back from the full-hot and full-cold positions. The amount of spring back should be equal at each of these positions. If it isn't, turn the adjustment turnbuckle as needed to correct.

Evaporator Coil Removal and Installation

Removal

1. Turn off the engine, apply the brakes, and chock the tires.
2. Disconnect the batteries.

NOTE: When the dash is completely assembled, all dash fasteners are hidden from view. See **Fig. 1**, **Fig. 2**, and **Fig. 3**.

3. Remove the right-hand dash panels as needed to access the evaporator coil. See **Fig. 4**, **Fig. 5** and **Fig. 6**. For instructions, see **Group 60**.

NOTE: On right-hand-drive (RH DR) vehicles, the dash panels are in the reverse position from the left-hand-drive (LH DR) vehicle.

4. Remove the air duct that is located on top of the power distribution module.
5. Disconnect the harness from the thermostatic switch. See **Fig. 7**.
6. Remove the two screws attaching the thermostatic switch to the heater core and evaporator coil cover. Remove the switch and the sensor tube.

8. Steering Column Cover
9. Auxiliary Gauge Panel
10. HVAC/Radio Trim Plate
11. Console Cover, Left-Hand

Fig. 2, Dash Panels, Century Class Conventional, RH DR

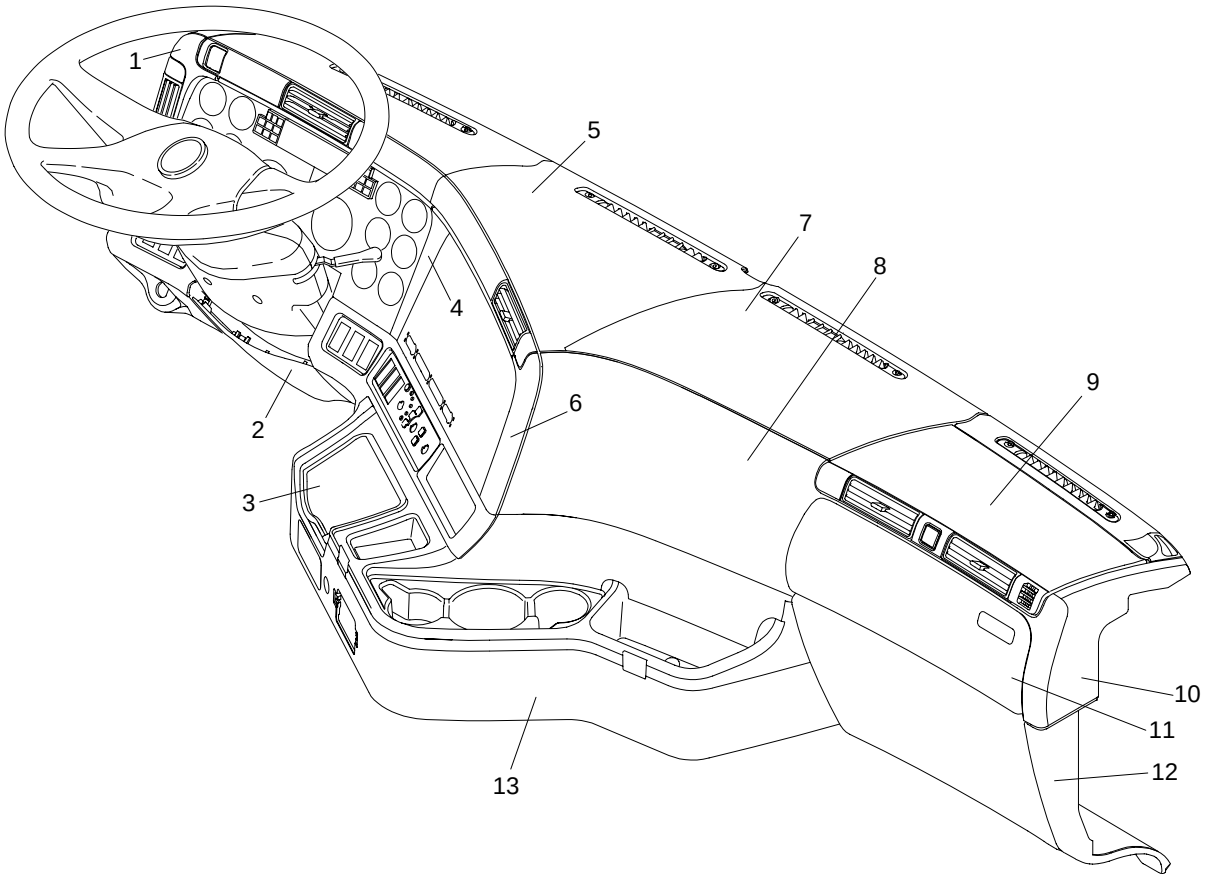
8. On Century Class Conventionals, open the hood and remove the air cleaner. For instructions, see **Group 09**.
9. Remove the mastic insulating tape from around the expansion valve.
10. Remove the refrigerant from the air conditioning system. For instructions, see **Subject 250**.
11. At the expansion valve, disconnect the refrigerant lines that are routed to the junction block (then on to the receiver-drier and the refrigerant compressor). See **Fig. 9**. Quickly cap the expansion valve ports and plug the fittings

IMPORTANT: Under no circumstances should the expansion valve ports remain uncapped or the fittings remain unplugged for longer than five minutes total. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

⚠ WARNING

Failure to wear protective gloves could result in serious skin cuts due to the sharp edges on the evaporator coil fins.

12. Wearing protective gloves, slide the evaporator coil out of the housing. See **Fig. 10**.



06/19/98 f610220

9. Upper Dash Electrical Access Panel
10. Dash Assembly, Right-Hand
11. Dash Cover
12. HVAC Cover
13. Lower Dash Console

Fig. 3, Dash Panels, Argosy COE

Installation

1. Wearing protective gloves, slide the evaporator coil into the housing.
2. Uncap the expansion valve ports and unplug the fittings. Check the fittings and the ports. They must be clean and free of nicks, gasket residue, and other foreign material.
3. On hose connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

   On hose connections that have a SlimLine seal assembly (**Fig. 11**), replace the seals. **Do not** lubricate SlimLine seals prior to installation. Use **only** a SlimLine seal on a SlimLine seal assembly.

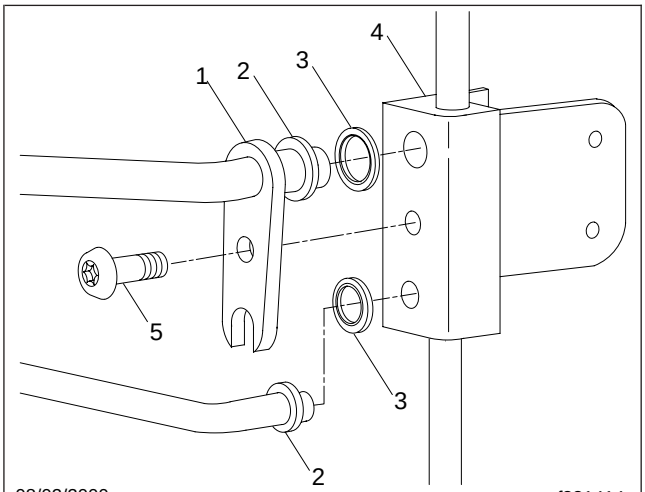
2. Heater Core

Fig. 10, Remove the Evaporator Coil



1. Plate
2. Fitting
3. Seal
4. Block
5. Bolt

Fig. 11, A Typical SlimLine Seal Assembly

⚠ CAUTION

Be careful when installing the thermostat sensor tube. Using too much force will bend the tube, which could damage it.

9. Carefully insert the thermostatic switch sensor tube into the same hole from which it was removed. The tip of the sensor tube must be in direct contact with an evaporator coil fin and be inserted at least 6 inches (15 cm) into the evaporator coil.
10. Using the two screws removed previously, install the thermostatic switch.
11. Connect the wire harness to the thermostatic switch.
12. Install the air duct on top of the power distribution module.
13. Install the right-hand dash panels. For instructions, see **Group 60**.
14. Connect the batteries.
15. On Century Class Conventionals, return the hood to the operating position. On Argosy COEs, close the access panel.
16. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. On Century Class Conventionals, open the hood. On Argosy COEs, open the access panel on the front of the vehicle.
3. Remove the refrigerant from the air conditioning system. For instructions, see **Subject 250**.
4. On Century Class Conventionals, remove the air cleaner. For instructions, refer to **Group 09**.
5. Remove the mastic insulating tape from around the expansion valve.
6. Disconnect the four lines from the expansion valve. See **Fig. 1**. Quickly cap the expansion valve ports, and plug the fittings.

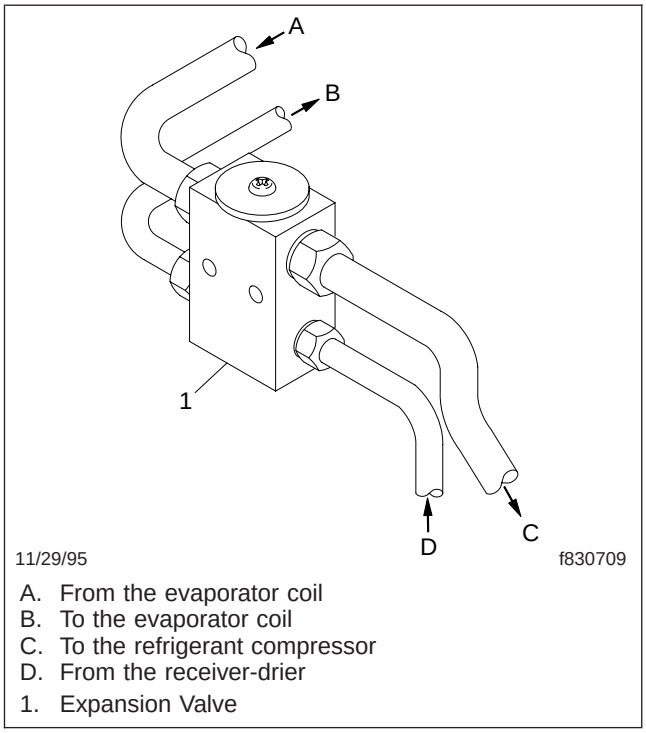
IMPORTANT: Under no circumstances should the expansion valve ports remain uncapped or the fittings remain unplugged for longer than five minutes total. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

7. Remove the expansion valve.
8. Install a new expansion valve.
9. Uncap the inlet and outlet ports on the expansion valve. Unplug the fittings. Check the fittings, and the inlet and outlet ports. They must be clean and free of nicks, gasket residue, and other foreign material.
10. On hose connections that have a SlimLine seal assembly (**Fig. 2**), replace the seals. **Do not** lubricate SlimLine seals prior to installation. Use **only** a SlimLine seal on a SlimLine seal assembly.

    On hose connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.
11. Attach the four lines to the expansion valve.

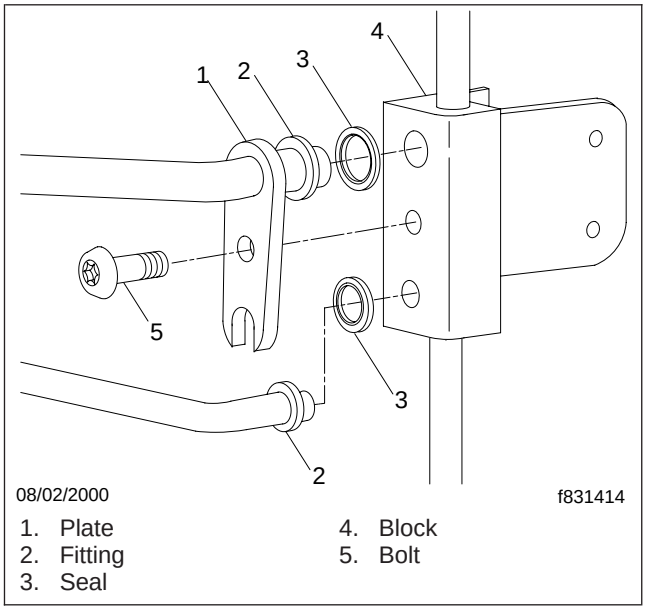
    On hose connections that have a SlimLine seal assembly, torque the bolt on the SlimLine seal assembly 11 to 15 lbf·ft (15 to 20 N·m).

    On hose connections that have threaded fittings, tighten the fittings to the following specs. See **Fig. 1**.



A. From the evaporator coil
B. To the evaporator coil
C. To the refrigerant compressor
D. From the receiver-drier
1. Expansion Valve

Fig. 1, Expansion Valve



1. Plate
2. Fitting
3. Seal
4. Block
5. Bolt

Fig. 2, A Typical SlimLine Seal Assembly

- A. 35 to 40 lbf·ft (47 to 54 N·m)
- B. 30 to 35 lbf·ft (41 to 47 N·m)

Expansion Valve Replacement

- C. 35 to 40 lbf·ft (47 to 54 N·m)
- D. 20 to 25 lbf·ft (27 to 34 N·m)

12. Evacuate and charge the air conditioning system with refrigerant. For instructions, see **Subject 250**.
13. Be sure to add refrigerant oil to the compressor to replace that which is lost when the system is discharged. Refer to the applicable refrigerant compressor section in this group.
14. Wipe the expansion valve and refrigerant line connections clean, and wrap them with mastic insulating tape.
15. On Century Class Conventionals, install the air cleaner. For instructions, refer to **Group 09**.
16. On Century Class Conventionals, return the hood to the operating position. On Argosy COEs, close the access panel.
17. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the brakes, and chock the tires.
2. On Century Class vehicles, open the hood. On Argosy COEs, open the access panel on the front of the vehicle.
3. Remove the refrigerant from the air conditioning system. For instructions, see **Subject 250**.
4. On Argosy COEs, tilt the cab. For cab tilt instructions, see **Group 60**.
5. Disconnect the refrigerant lines from the receiver-drier. See **Fig. 1**. Quickly plug the fittings.

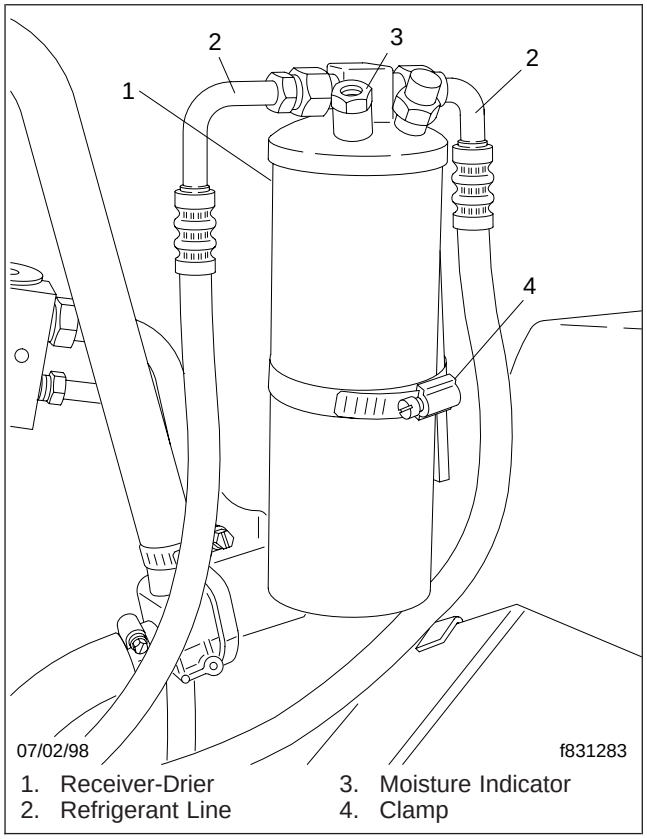


Fig. 1, Receiver-Drier

IMPORTANT: Under no circumstances should the fittings remain unplugged for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

6. Loosen the clamp that attaches the receiver-drier to the mounting bracket. Remove the receiver-drier.

IMPORTANT: If the desiccant cartridge inside the receiver-drier has fallen apart, evacuate the system and replace the expansion valve and the refrigerant compressor (desiccant matter can't be removed from these parts). A cartridge may fall apart from too much moisture in the system, because of poor evacuation of the system, or lack of maintenance.

7. Place a new receiver-drier on the mounting bracket and tighten the clamp securely.
8. Unplug the fittings.
9. On hose connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

   On hose connections that have a SlimLine seal assembly (**Fig. 2**), replace the seals. **Do not** lubricate SlimLine seals prior to installation. Use **only** a SlimLine seal on a SlimLine seal assembly.

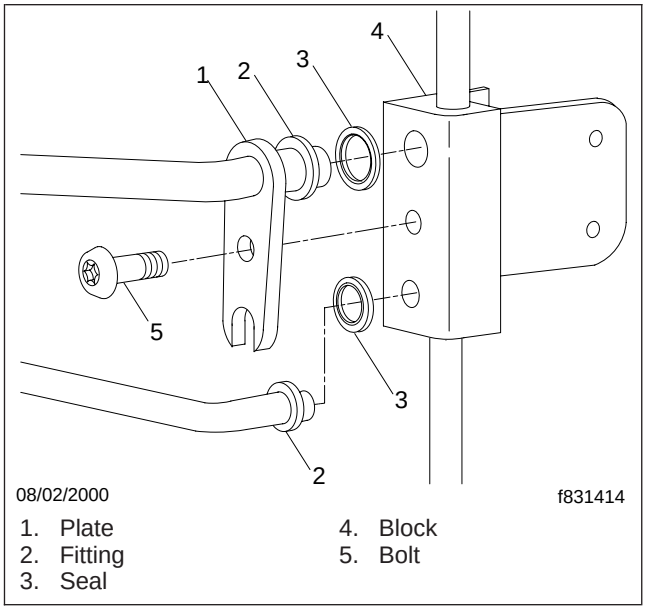

Fig. 2, A Typical SlimLine Seal Assembly

10. Connect the refrigerant lines to the receiver-drier.

Receiver-Drier Replacement

On hose connections that have threaded fittings, tighten the fittings to the torque specifications in **Table 1**.

On hose connections that have a SlimLine seal assembly, torque the bolt on the SlimLine seal block and plate assembly 11 to 15 lbf·ft (15 to 20 N·m).

A/C Threaded Fitting Torque Specifications *	
Hose Size	**Torque lbf·ft (N·m)**
#6	20–25 (27–34)
#8	30–35 (41–47)
#10 and #12	35–40 (47–54)

* One-inch fittings on the A/C compressor need to be torqued 21 to 27 lbf·ft (28 to 37 N·m) regardless of hose size.

Table 1, A/C Threaded Fitting Torque Specifications

11. Charge the system with refrigerant. Refer to **Subject 250** for instructions. Be sure to add refrigerant oil to the compressor to replace that which is lost when the system is recovered. Refer to the applicable refrigerant compressor section.
12. On Century Class Conventionals, return the hood to the operating position. On Argosy COEs, close the access panel and tilt the cab. For cab tilt instructions, see **Group 60**.
13. Remove the chocks from the tires.

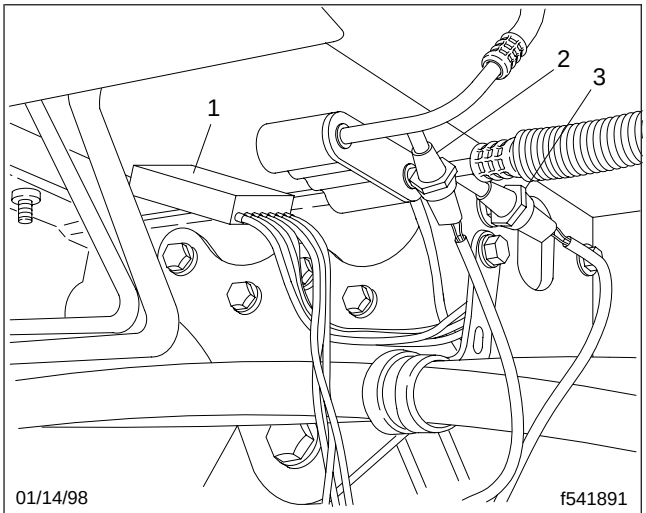
Air Conditioning Protection Unit Pressure Switch Replacement

Replacement

1. Turn off the engine, apply the brakes, and chock the tires.
2. Open the hood or tilt the cab. For cab tilt instructions, see **Group 60**.
3. Access the ACPU pressure switches.

   On Century Class Conventionals, the ACPU pressure switches are located under the hood on the right-hand side of the vehicle near the front-wall. See **Fig. 1**.

   On Argosy COEs, the ACPU pressure switches are located on the right-hand side of the vehicle behind the bumper. See **Fig. 2**.

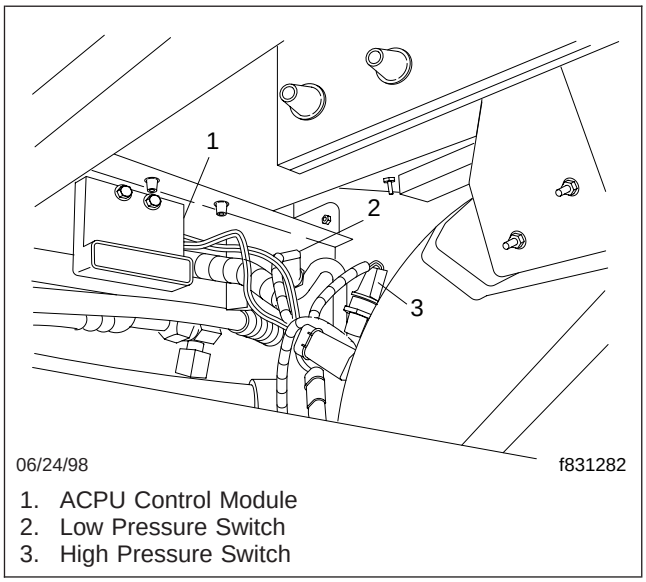


1. ACPU Control Module
2. High Pressure Switch
3. Low Pressure Switch

Fig. 1, ACPU Pressure Switches, Century Class Conventional

4. Disconnect the wiring harness from the pressure switch.
5. Remove the pressure switch.
6. Replace the O-ring on the fitting. Lubricate the O-ring with mineral oil before installing.
7. Install a new pressure switch on the fitting and tighten 20 to 25 lbf·ft (27 to 34 N·m).

IMPORTANT: After replacing the high pressure switch, reset the high pressure cycle to zero.



1. ACPU Control Module
2. Low Pressure Switch
3. High Pressure Switch

Fig. 2, ACPU Pressure Switches, Argosy COE

For more information on setting this parameter, refer to the Freightliner ServiceLink on-line help program.

8. Connect the wiring harness to the pressure switch.
9. Return the hood or cab to the operating position. For cab tilt instructions, see **Group 60**.
10. Remove the chocks from the tires.

Removal

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood or tilt the cab. For cab tilt instructions, refer to **Group 60**.
3. Recover the refrigerant from the A/C system. For instructions, refer to **Subject 250**.
4. Disconnect the refrigerant lines from the condenser. Quickly cap the condenser inlet and outlet ports if the condenser will be reinstalled, and plug the fittings.

IMPORTANT: Under no circumstances should the ports remain uncapped or the fittings remain unplugged for longer than five minutes total. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

5. Remove the fasteners that attach the condenser to the radiator, and remove the condenser.

Installation

1. Place the condenser on the radiator. Install and tighten the fasteners 108 lbf·in (1220 N·cm).
2. Uncap the inlet and outlet ports on the condenser. Unplug the fittings.
3. On hose connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

   On hose connections that have a SlimLine seal assembly (**Fig. 1**), replace the seals. **Do not** lubricate SlimLine seals prior to installation. Use **only** a SlimLine seal on a SlimLine seal assembly.
4. Install the refrigerant lines on the condenser.

   On hose connections that have threaded fittings, tighten the fittings to the torque specifications in **Table 1**.

   On hose connections that have a SlimLine seal assembly, tighten the bolt on the SlimLine seal assembly 11 to 15 lbf·ft (15 to 20 N·m).
5. If needed, add refrigerant oil to the compressor to replace that which is lost in the old condenser.

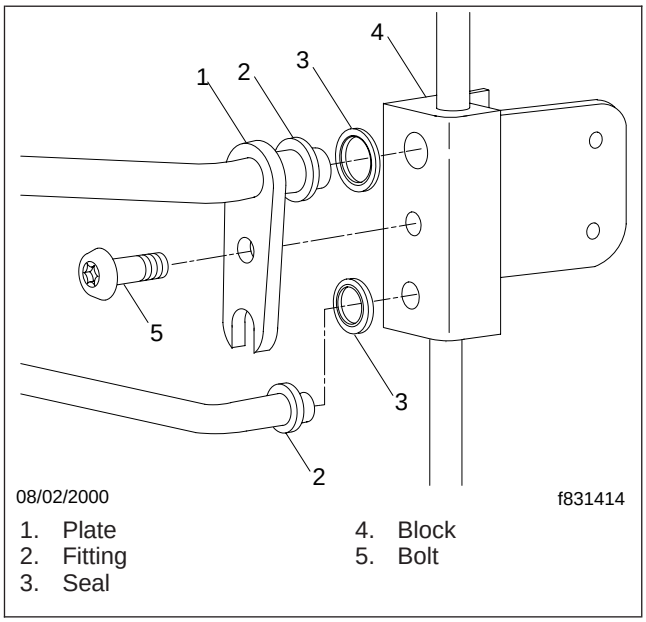


Fig. 1, Typical SlimLine Seal Assembly

   For instructions, refer to the applicable refrigerant compressor section.
6. Evacuate and charge the system with refrigerant. For instructions, refer to **Subject 250**.

A/C Threaded Fitting Torque Specifications*	
Hose Size	**Torque lbf·ft (N·m)**
#6	20–25 (27–34)
#8	30–35 (41–47)
#10 and #12	35v40 (47–54)

* One-inch fittings on the A/C compressor need to be tightened 21 to 27 lbf·ft (28 to 37 N·m) regardless of hose size.

Table 1, A/C Threaded Fitting Torque Specifications

7. Return the hood or cab to the operating position. For cab tilt instructions, see **Group 60**.

Thermostatic Switch Removal and Installation

Removal

1. Turn off the engine, apply the brakes, and chock the tires.

⚠ WARNING

Failure to turn off the ignition switch could result in personal injury or electrical shock.

2. Turn off the ignition switch.

NOTE: When the dash is completely assembled, all dash fasteners are hidden from view. See **Fig. 1**, **Fig. 2**, and **Fig. 3**.

3. Remove the right-hand dash panels as needed to access the thermostatic switch. See **Fig. 4** and **Fig. 5**. For instructions, refer to **Group 60**.

NOTE: On right-hand-drive (RH DR) vehicles, the dash panels are in the reverse position from the left-hand-drive (LH DR) vehicle.

4. Disconnect the harness from the thermostatic switch. See **Fig. 6**.
5. Remove the two screws attaching the thermostatic switch to the heater core and evaporator coil cover. Remove the switch and the sensor tube.

Installation

⚠ CAUTION

Be careful when installing the thermostat sensor tube. Using too much force will bend the tube, which could damage it.

1. Carefully insert the thermostatic switch sensor tube into the same hole from which it was removed. The tip of the sensor tube must be in direct contact with an evaporator coil fin and be inserted at least 6 inches (15 cm) into the evaporator.
2. Using the two screws removed previously, install the new thermostatic switch.
3. Connect the wire harness to the thermostatic switch.
4. Install the right-hand dash covers. For instructions, refer to **Group 60**.
5. Remove the chocks from the tires.

Thermostatic Switch Removal and Installation

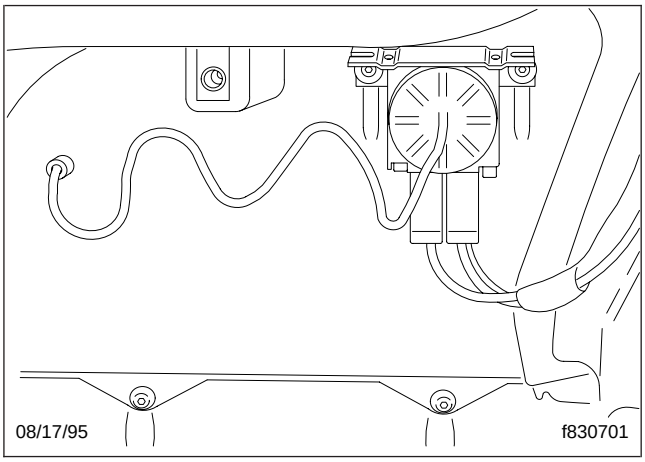

Fig. 6, Thermostatic Switch Mounting

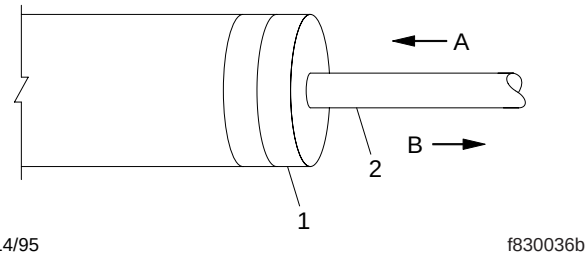
Replacement

1. Turn off the engine, apply the brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the HVAC/radio trimplate from the dash. For instructions, see **Section 60.08**.
4. Remove the fasteners that attach the HVAC control panel to the dash. Move the control panel away from the dash to service it.
5. Disconnect the pigtail connectors from the rear of the control panel. Disconnect the electrical connectors from the control panel harness.
6. If the vehicle is equipped with a mechanically controlled water regulating valve, unhook the water regulator valve cable from the temperature control switch assembly.

   If the vehicle is equipped with an electronically controlled water regulating valve, disconnect the connector from the potentiometer behind the temperature control switch.
7. Disconnect the air lines from the control panel by pushing in the cover ring and pulling out the air line. See **Fig. 1**.



A. push
B. pull
1. Collar
2. Air Line

Fig. 1, Air Line

8. Remove the control panel from the dash.
9. Position the new control panel and connect the air lines by pushing them into the fittings as far as they will go. Then, give the air line a slight tug so the line will lock in to place.

NOTE: The color of the air lines should match the colored collar at the back of the control panel.

10. Insert the control panel and connect pig-tail connectors at the back of the panel.
11. Connect the electrical connectors to the control panel harness.
12. If the vehicle is equipped with a mechanically controlled water regulating valve, hook the end of the water regulating valve control cable onto the temperature control switch assembly.

    If the vehicle is equipped with an electronically controlled water regulating valve, attach the connector to the potentiometer behind the temperature control switch.
13. If the vehicle is equipped with a mechanically-controlled water regulating valve, check the cable adjustment. For instructions, see **Subject 170**.
14. Position the control panel and install the fasteners that attach it to the dash.
15. Connect the batteries.
16. Turn on the ignition switch and test the blower motor.
17. Install the HVAC/radio trimplate. For instructions, see **Section 60.08**.
18. Remove the chocks from the tires.

Required Equipment

You will need a machine, or machines, to identify the refrigerant and to recover, evacuate, flush, and charge the refrigerant system. Ideally, one machine should do all the following functions:

- Identification–The machine must be able to verify the purity of the refrigerant in the refrigerant system, and the presence of hydrocarbon-based refrigerants or other unapproved refrigerants.
- Recovery–The machine must be able to recover the refrigerant fully, from the refrigerant system.
- Evacuation–Ideally, the machine should have a vacuum pump rated at 6 cfm (170 liters per minute) and be maintenance-free. (A machine that requires maintenance is acceptable, as long as it has been properly maintained.)
- Charging–The scale used in charging should be accurate to within ±1 ounce (30 mL).
- Flushing–Adaptors for the compressor(s), expansion device(s), and receiver-drier should be purchased or fabricated, to flush the system with refrigerant.

Refrigerant Identification

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

IMPORTANT: Identify the refrigerant in the refrigerant system if you suspect one of the following conditions:

- Noncondensable gas, such as nitrogen or air, is in the system.
- An unapproved refrigerant is in the system.
- The history of refrigerant system repairs is unknown.

1. Using a high-quality refrigerant identifier and the manufacturer's instructions, attach the identifier to the vehicle and perform the test.
2. If the system passes the test, it is safe to recover the refrigerant.
3. If the vehicle failed the test due to an excessive amount of noncondensable gas, recover the refrigerant system, then purge the recovery tank of the noncondensable gas.
4. If the vehicle failed the test due to the presence of a hydrocarbon-based refrigerant or a refrigerant other than R-134a, **do not recover the refrigerant into the general-use machine.** To recover the refrigerant, put it into a separate container that contains refrigerant for recycling by a qualified recycling center. It is best to refer the customer to the place where the vehicle was last serviced.

Recovery

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

The recovery process removes most of the refrigerant charge in the system.

1. Turn off the engine, apply the parking brakes, chock the tires, and open the hood.
2. Remove the caps from the suction and discharge service valves.
3. If the history of refrigerant system repairs is unknown, or if you suspect that the system is charged with an unapproved refrigerant, identify the refrigerant using the "Refrigerant Identification" procedures.
4. Wearing protective goggles and nonleather gloves, attach the refrigerant recovery and charging machine hoses to the valves.

IMPORTANT: Push down firmly on the hose connectors until they click into engagement. This will ensure that the coupler is locked.

5. Follow the refrigerant recovery and charging machine manufacturer's instructions, and recover all of the refrigerant from the refrigerant system.

IMPORTANT: Always comply with all federal and local regulations regarding refrigerant recovery and disposal. There are substantial penalties for using improper procedures.

6. Measure the oil recovered during the recovery process. The refrigerant system will have to be filled with the same quantity of new refrigerant oil. If the system is contaminated with moisture, all of the compressor oil must be replaced with clean oil. If the system is heavily contaminated with desiccant or grit, replace the compressor, expansion valve, and receiver-drier, and flush the condenser and evaporator(s). After the system is charged, perform a performance check to ensure that the heat exchangers are not plugged.

Evacuating

The main purpose in evacuating the refrigerant system is to remove noncondensable gases (NCG), such as nitrogen and air. The secondary purpose is to boil off free water molecules.

In rare cases, water forms ice crystals at the expansion valve. Ice crystals retard or stop the flow of refrigerant, causing a reduction or complete loss of cooling. As the expansion valve warms due to the lack of refrigerant, the ice melts and passes through the expansion valve. Then refrigerant will flow again until the ice crystals re-form. The result is intermittent cooling.

Refrigerant oil has an extremely high moisture absorption capacity. Typically, the moisture picked up by the oil is passed on to the receiver-drier. If excessive moisture exists in the system, the lubricating ability of the oil is reduced, which could damage the compressor and other components.

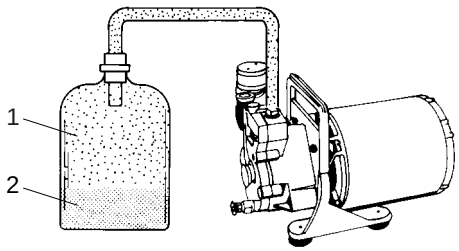
Effects of Pressure on the Boiling Point of Water

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

Water boils at 212°F (100°C) at an atmospheric pressure of 14.7 psi (101 kPa) at sea level. At higher elevations the atmospheric pressure is lower, which allows water to boil at lower temperatures. See **Table 1** for boiling temperatures of water at converted pressures.

Similarly you can boil and remove water from the air conditioning system by lowering the system pressure to a vacuum to cause the moisture to vaporize at normal ambient temperatures. A vacuum pump can reduce the pressure in the system. Since the pressure is lowest at the pump, NCG and water vapor are pulled out of the system. This process is called evacuation or dehydration. See **Fig. 1**.



11/14/95 f830489b

1. Vapor 2. Water

Fig. 1, Water to Vapor

Measuring Vacuum

Vacuum should be measured with an electronic thermistor vacuum gauge, which is designed for use with high vacuum pumps and can accurately read as low as 100 microns. This gauge can have an analog scale or a digital (LED or LCD) display.

The location of the vacuum gauge will affect the reading. The closer to the vacuum source, the lower the reading will be. Follow the manufacturer's instructions for proper use of the vacuum gauge.

If the pressure will not stabilize, it is an indication of a leak. If it does stabilize at a vacuum that is too high, for example 1500 microns Hg, it is an indication of moisture and more evacuation is required.

Boiling Temperatures of Water at Converted Pressures		
Boiling Temperature of Water: °F (°C)	**Absolute Pressure: psi (microns Hg)**	**Vacuum: inHg (mmHg)**
212 (100)	14.696 (759993.4)	0 (0)
205 (96)	12.770 (660400.0)	3.92 (99.6)
194 (90)	10.169 (523881.6)	9.22 (234.2)
176 (80)	6.8699 (355269.8)	15.93 (404.6)
158 (70)	4.5207 (233786.7)	20.72 (526.3)
140 (60)	2.8900 (149580.7)	24.04 (610.6)
122 (50)	1.7987 (92555.1)	26.28 (667.5)
104 (40)	1.0700 (55336.4)	27.74 (704.6)
89 (30)	0.61540 (31826.2)	28.67 (728.2)
86 (27)	0.57010 (26220.4)	28.89 (733.8)
76 (24)	0.44435 (22979.9)	29.02 (737.1)
72 (22)	0.38856 (20094.7)	29.13 (739.9)
69 (21)	0.35084 (18143.7)	29.21 (741.9)
64 (18)	0.29505 (15258.5)	29.32 (744.7)
59 (15)	0.24720 (12783.8)	29.42 (747.3)
53 (12)	0.19888 (10285.0)	29.52 (749.8)
45 (7)	0.14746 (7625.8)	29.62 (752.3)
32 (0)	0.08858 (4579.6)	29.74 (755.4)
21 (–6)	0.05293 (2738.1)	29.81 (757.2)
6 (–14)	0.02521 (1304.0)	29.87 (758.7)
–24 (–31)	0.004905 (253.7)	29.911 (759.74)
–35 (–37)	0.002544 (131.6)	29.915 (759.84)
–60 (–51)	0.0004972 (25.7)	29.9200 (759.968)
–70 (–57)	0.0002443 (12.69)	29.92050 (759.9807)
–90 (–68)	0.0000526 (2.72)	29.92089 (759.9906)

Table 1, Boiling Temperatures of Water at Converted Pressures

Holding a vacuum is only an indication that there are not any leaks that are present under a vacuum. Other leaks may exist when the system is pressurized, so a proper leak test must be performed in conjunction with holding a vacuum.

Maintaining an Oil-Lubricated Vacuum Pump

Maintenance is important for a high-vacuum pump. The oil must be changed at regular intervals to prevent moisture buildup, which will cause decreased pump performance and eventual pump failure.

Pumping down for extremely wet air conditioning systems can completely saturate the pump oil, which will require the replacement of the vacuum pump oil.

⚠ CAUTION

Flush the vacuum pump every fourth time it is used, and before storing for long periods of time.

Acid will form and corrode the pump, if water-laden oil remains in the pump for an extended period.

Vacuum pump oil is water soluble. This aids the pump in reaching a high vacuum by absorbing water and sealing the pump.

Use only vacuum pump oil as a lubricant. Do not use any solvent or any other oil. Clean oil should be run through the pump until it runs out clear. Oil should be added to the fill level indicated on the pump. Check the oil level before each use.

Evacuation Procedure

1. The system must have been recovered and the refrigerant compressor filled with the correct amount of refrigerant oil. Replace the receiver-drier if the system conditions require it.
2. Make sure the vacuum pump has been properly maintained.
3. Wearing protective goggles and nonleather gloves, attach the refrigerant recovery and charging machine hoses, or a vacuum pump, to the valves.

IMPORTANT: Push down firmly on the hose connectors until a clicking sound is heard. This will ensure that the coupler is locked.

4. Follow the refrigerant recovery and charging machine manufacturer's instructions and evacuate the refrigerant system.
5. The system should be evacuated a minimum of 10 minutes with a 6-cfm (170 liter per minute) pump. Evacuate the system for a longer time, if using a smaller pump. Make sure that the vacuum level reaches the point where water would boil, and does not go back toward zero, then proceed with charging and leak testing the system.

Flushing

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

Flushing removes moisture-laden oil and some types of contamination, such as dirty oil and some particles. When a part is flushed, liquid refrigerant is forced through it. The liquid picks up the contaminants, and flushes them out.

Whether to flush or replace a part depends on how much contamination there is, as previously described.

Normally, the system always has pressure in it. Some loss of refrigerant from one season to the next is normal, and does not mean that the system is dirty. If refrigerant parts show signs of internal corrosion and grit, the system is contaminated.

If the system is contaminated with moisture, flush all sections of the system. Then change the oil in the compressor and replace the receiver-drier, prior to evacuating and charging the system.

If the system is heavily contaminated or if desiccant has circulated through the system, replace the receiver-drier and expansion valve(s), and inspect the compressor.

Flush the system in segments, to lessen the chance of blowing deposits against a port.

Flush the system in the opposite direction of refrigerant flow. In other words, backflush the sections.

Flushing parts with refrigerant requires a refrigerant recovery and charging machine.

Flushing Procedure

Method 1

NOTE: Use this method when the recovery and charging machine is equipped with a flush cycle.

1. Recover the refrigerant from the air conditioning system.
2. Disconnect both ends of the line or part(s) being flushed. Tightly cap the lines to the rest of the system.

NOTE: You must remove the expansion device(s), receiver-drier, and compressor(s) when flushing. These components must be removed and bypassed when performing a system flush.

3. Install the flushing adaptors and an inline filter, and follow the instructions from the manufacturer

of the recovery and charging machine to perform the flush. When flushing the entire system, use an adaptor that fits where the compressor was located, and backflush.

4. Remove the adaptors and bypass devices and install the expansion device(s), the compressor, and a new receiver-drier.
5. If installing the existing compressor, remove the oil in it, and replace the oil with new oil. New compressors may or may not have a full charge of oil.
6. Charge the system with refrigerant and check the system performance.

Method 2

NOTE: Use this method when two recovery and charging machines are available.

1. Recover the refrigerant from the air conditioning system.
2. Disconnect both ends of the line or part(s) being flushed. Tightly cap the lines to the rest of the system.

NOTE: You must remove the expansion device(s), receiver-drier, and compressor(s) when flushing. These components must be removed and bypassed when performing a system flush.

3. Install the flushing adaptors and an inline filter. When flushing the entire system, use an adaptor that fits where the compressor was located and backflush.
4. Charge the part with 2 pounds (0.9 kg) of refrigerant or the system with 5 pounds (2.3 kg) of refrigerant, then recover the refrigerant with a second machine. It is desirable to start the recovery slightly before the charge cycle is done since this helps to pull fluid through the system. Repeat the process several times, until you think that all the oil has been removed.
5. Remove the adaptors and bypass devices. Install the expansion device(s), the compressor(s), and a new receiver-drier.
6. If installing the existing compressor, remove the oil in it and replace the oil with new oil. New compressors may or may not have a full charge of oil.
7. Charge the system with refrigerant and check the system performance.

Oil Balancing

General Information

Compressors require refrigerant oil to function. When the air conditioning system is operating, some of the oil leaves the compressor and is circulated through the system with the refrigerant. The refrigerant oil cannot leave the system except when there is a leak, the refrigerant is recovered, or when a system part is replaced. It is important that the air conditioning system has the correct amount of refrigerant oil for proper operation. Too little oil will result in compressor failure. Too much oil will degrade the performance of the air conditioner, and cause damage to the compressor.

IMPORTANT: Whenever the air conditioning system is discharged or recovered, the recovered oil, from the charging machine, must be measured in order to know how much oil must be returned to the system. When a system component is replaced, a quantity of new oil equal to the recovered oil plus the oil coating the inside of the component must be returned to the system.

IMPORTANT: Refrigerant oil is hygroscopic (attracts moisture from its surroundings), and must not be exposed to the moisture that is present in the air. New oil must be from a container that has not been opened or that has been tightly sealed since its last use.

Tubing, funnels, or other equipment used to transfer the oil must be very clean and dry. When handling refrigerant oil:

- Be sure that the oil is free of water, dust, metal powder, and other foreign substances;
- Do not mix the refrigerant oil with other types or viscosities of oil;
- Quickly seal the oil container after use. Refrigerant oil absorbs moisture when exposed to the air for any period of time.

Referigerant Service Operations

Compressor Oil Balancing

Replacement refrigerant compressors are supplied with some refrigerant oil. If the air conditioning system has been flushed, the system will need a complete new charge of oil. If the system has not been flushed, use the following procedures to adjust the oil level, when a new compressor or other system component has been installed. The type of oil required depends on the brand of compressor used on the system. See the refrigerant compressor section for details about how the total system volume is determined for the compressor being serviced. See PartsPro MOD 700 to determine the oil type and vehicle specific oil quantities.

1. Drain the remaining oil from the compressor into a clean graduated container, and note the amount. See **Fig. 2**.

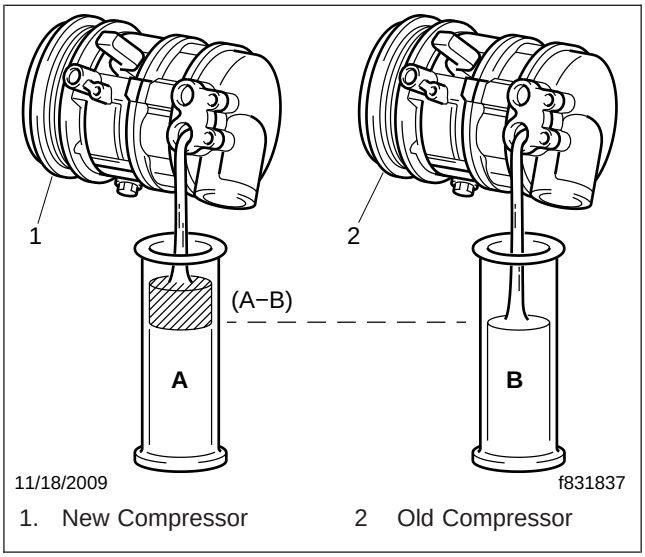


Fig. 2, Oil Balancing

2. Make note of the total volume of oil recovered.
3. Drain the oil from new compressor into a clean calibrated container, and compare the two quantities of oil.
4. Add only the amount of oil removed during recovery and from the old compressor to the system.
5. Add the new compressor oil as described in the supplier specific compressor service section of the workshop manual.

System Oil Balancing

After repairs are finished, refer to **Table 2** and use the following equation to determine the quantity of refrigerant oil that needs to be added to the system.

[Quantity Recovered] + [Quantity for All Replaced Components] = [Quantity Added to the System]

Table 2 provides the quantities of oil that need to be added to the system for each component that was replaced. Add the quantities listed in the table for each component that was replaced. Use the sum of the quantities or 6 fl oz (177 mL), whichever is less. Inject the calculated oil volume at the high-side pressure port during the refrigerant charging process.

Refrigerant Oil Quantities for Replaced Components	
Add the quantities listed in this table for each component that was replaced. Use the sum of the quantities or 6 fl oz (177 mL), whichever is less.	
Component	**Quantity oz (mL)**
High Pressure Line (main A/C)	1 (30)
Low Pressure Line (main A/C)	2 (59)
High Pressure Line (auxiliary A/C)	1 (30)
Low Pressure Line (auxiliary A/C)	3 (89)
Condenser	1 (30)
Evaporator (main A/C)	3 (89)
Evaporator (auxiliary A/C)	2 (59)
Receiver-Drier	3 (89)
Minor Leak at Connector Only	0.5 (15)
Major Leak at Connector Only	2 (59)

Table 2, Refrigerant Oil Quantities for Replaced Components

Charging

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

NOTE: Before charging, the system must be recovered and evacuated with the recovery and charging machine connected to the service and discharge port connections.

1. Obtain enough refrigerant to fully charge the system. To determine the amount of refrigerant needed to fully charge the system, read the Air Conditioner label on the vehicle or see **Specifications 400**.
2. Charge the system on the high side following the refrigerant recovery and charging machine manufacturer's instructions.
3. While the compressor is engaged, check the duct temperature and operating pressures at the suction and discharge ports. Compare the temperature and pressures to those in **Specifications 400**. If the operating pressures are not acceptable, see **Subject 300** for troubleshooting procedures.
4. Disconnect the hoses.
5. Shut down the engine.
6. Recover the refrigerant that is in the hoses.

Leak Testing Methods

General Information

⚠ WARNING

Before doing any of the work below, read the information under Safety Precautions 100. Failure to read the safety precautions, and to take precautions against the dangers involved when working with refrigerant, could lead to serious personal injury.

Refrigerant is nearly odorless. As a result, it may leak away and not be noticed, until the system stops cooling. All vehicle refrigerant systems lose some refrigerant. Higher loss rates signal a need to locate and repair the leaks.

Leaks are most often found at the compressor hose connections and at the various fittings and joints in the system. If unapproved replacement hoses are installed, refrigerant can be lost through hose permeation.

There are two leak testing methods that can be used to detect leaks in the refrigerant system: UV (ultraviolet) dye leak detection and electronic leak detection. Daimler Trucks North America LLC recommends using the UV dye leak detection method whenever possible, even though there are some limitations to using this method. A leak on the front seal of the compressor **must** be verified using a heated diode leak detector and the instructions under "Electronic Leak Detection" in this subject. Visible dye on the front of the compressor clutch **does not** verify that there is a repairable leak at the front seal. Evaporator leaks may not show up with dye, and must be checked using a heated diode leak detector if dye is not present at the condensate drain.

UV Dye Leak Detection

IMPORTANT: When using the UV dye leak detection method, always wear protective eyewear that blocks UV rays and enhances the appearance of the dye. Always wear nonleather gloves and protective eyewear, when servicing the air conditioning system.

1. Inspect the refrigerant system for leaks using a UV lamp.
   - 1.1 Inspect the entire refrigerant system under low lighting using a UV lamp. Low lighting will increase the apparent brightness of the UV dye at leak sites.
   - 1.2 Move the UV lamp along the entire refrigerant system, looking for signs of damage or corrosion on the fittings, hose-to-line crimps, switch ports, service ports with caps installed (dye inside the port is not an indication of a leak), brazed or welded areas, and around all connections. Check for evaporator leaks by illuminating the condensate drain tube or hole using the UV lamp.
   - 1.3 Move the UV lamp along the refrigerant system following a continuous path, so that no potential leak sites are missed. If a leak is found, continue to check the remainder of the system since other leaks may be present.
2. After repairing a leak, remove all UV dye residue remaining on the outside of the refrigerant system using the cleaner provided by the dye manufacturer, or a comparable cleaner. Use a spray

bottle of cleaner, a toothbrush, and a spray bottle of clean water for hard-to-reach areas.

NOTE: Minor UV dye residue, or residue that is impossible to reach, will lose its fluorescence over time.

3. See **Table 3** for a list of products that have been tested and approved for use by Freightliner dealers.

Electronic Leak Detection

NOTE: Do not try to use a leak tester immediately after connecting or disconnecting service hoses. Traces of refrigerant at the fittings can falsely indicate a leak. Always verify a leak by blowing shop air into the area of the suspected leak, and checking the area again.

When checking for leaks, move the probe all the way around the fitting or suspected leak.

Daimler Trucks North America LLC recommends using only certain makes of the heated diode and infrared (IR) types of electronic leak detectors.

Recommended electronic heated diode type leak detectors are available from their manufacturers. See **Table 4**.

Another type of detector, the corona discharge type, is specifically **not recommended**.

Use the following procedures to locate refrigerant system refrigerant gas leaks using an electronic leak detector.

Approved Products for UV Dye Leak Detection

Table 3, Approved Products for UV Dye Leak Detection

1. Operate the electronic leak detector in accordance with the manufacturer's instructions. Occasionally use a leak reference bottle of R-134a to ensure that the detector is working properly.
2. Leak test with the engine turned off.
3. Charge the air conditioning system with sufficient refrigerant to indicate a gauge pressure of at least 50 psi (345 kPa) with the system not operating. Typically, one-half pound (0.22 kg) of refrigerant is sufficient to create 50 psi (345 kPa) of pressure. It may not be possible to produce this amount of pressure and measure leakage if the ambient temperature is less than 59°F (15°C).
4. Be careful not to contaminate the detector probe tip if the part being tested is not clean. Wipe the part off with a dry shop towel or blow it off with shop air. Do not use cleaners or solvents as many detectors are sensitive to their chemical ingredients.
5. Visually inspect the entire refrigerant system. Look for air conditioning lubricant leakage and corrosion or damage to lines, hoses, and all other components. Inspect each questionable location carefully with the detector probe.

   Areas to inspect include:

   - All fittings.
   - Couplings.
   - Refrigerant controls.
   - Service ports (with caps installed).
   - Brazed or welded areas.
   - Areas around attachment points and hold-downs.
   - Any other areas of stress or sharp bends.

Electronic Leak Detectors		
Designation	**Manufacturer**	**Comments**
D-TEK, D-Tek Select, and TekMate	Leybold Inficon 2 Technology Place East Syracuse NY 13057 (315) 434–1144	• Rechargeable battery • Hand-held design • Simple to operate
H–10 Professional	Bacharach Inc. c/o Yokogawa Corp. of America 2 Dart Road Newnan GA 30265 (800) 850–0044	• Rechargeable battery • Carrying case with strap • Calibration leak bottle • Manual sensitivity control • Most sensitive available

Table 4, Electronic Leak Detectors

6. Follow the path of the refrigerant system methodically, so that no leaks are missed. If a leak is found, continue to test the rest of the system.
7. Inspect an area of possible leakage slowly and close to the part, moving completely around the part. Move the probe no faster than one to two inches (25 to 50 mm) per second and no farther away than 1/4 inch (6.4 mm) from the part.
8. If there is a large leak of refrigerant in either the system being serviced or the service equipment,

Referigerant Service Operations

the surrounding air will be saturated with refrigerant gas. Refrigerant in the surrounding air makes the leak detector operate erratically, and will give false indications of leaks. To reduce this possibility, place a large fan so that a light breeze blows through the work area. Verify a leak by blowing shop air into the suspected leak site and repeating the inspection. Blow out the area often, to pinpoint a large leak.

9. You can test the evaporator core without removing it from its housing. Turn on the blower motor for a minimum of 15 seconds. Shut off the blower and wait for refrigerant gas to accumulate in the housing. Follow the detector instructions for the specific length of time to wait for the gas to accumulate. Insert the detector probe into the blower resistor block, or condensate drain tube if no water is present. If this is not possible, insert the probe into the closest opening to the evaporator, such as a heater or vent duct.

NOTE: The end opening of the condensate drain tube should be free of water, when the probe tip is inserted into it. To determine whether there is water in the condensate drain tube, insert the eraser end of a pencil in the drain tube. Inserting the pencil will break the surface tension of any water near the opening of the drain tube, and allow the water to drain out before inserting the probe tip. It is only necessary to break the plane of the drain tube with the probe tip. It does not need to be inserted far into the tube.

10. Leak test the front seal area of the compressor. Blow shop air into the cavities in and around the clutch for at least 15 seconds, to clear out any residual gas. Let the compressor stand for one minute, then test for leakage. Inspect axial-type compressors (Sanden or Sel-Tec) by placing the probe near the holes at the front of the clutch. See **Fig. 3**. Inspect two-cylinder reciprocating type compressors (Climate Control) by placing the probe between the clutch coil and the compressor. See **Fig. 4**.

IMPORTANT: Be careful not to damage the clutch bearing seal with high pressure shop air.

11. Leak test the repaired areas of the system, after any repairs have been performed. Leak test the service ports (with caps installed) after any service which disturbs the refrigerant system.

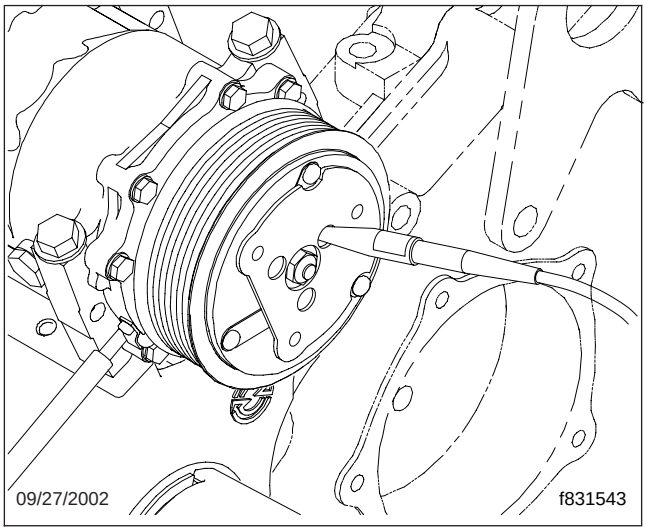

Fig. 3, Axial Type Compressor

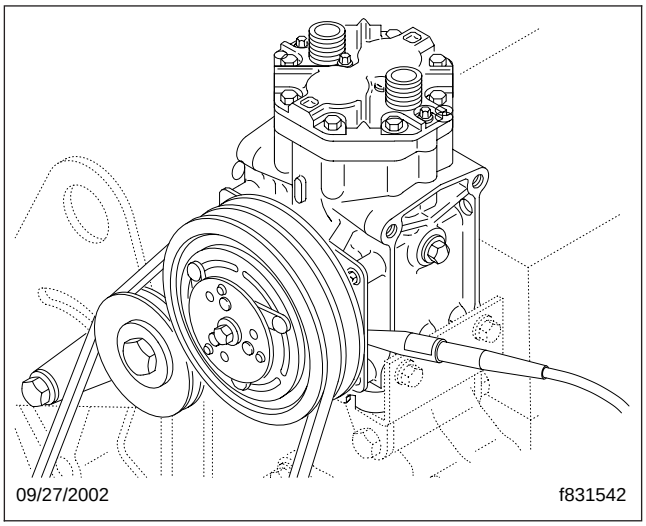

Fig. 4, Two-Cylinder Reciprocating Compressor

Replacement

1. Turn off the engine, apply the brakes, and chock the tires.
2. Open the hood or tilt the cab. For cab tilt instructions, see **Group 60**.
3. Access the binary switch.

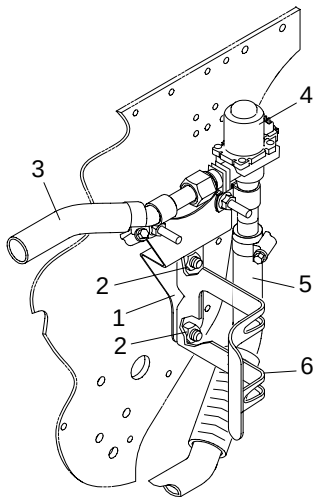
   On Century Class Conventionals, the binary switch is located under the hood on the right-hand side of the frontwall.

   On Argosy COEs, the binary switch is located on the right-hand side of the vehicle behind the bumper.
4. Disconnect the wiring harness from the binary switch.
5. Remove the binary switch.
6. Install a new binary switch and tighten 20 to 25 lbf·ft (27 to 34 N·m).
7. Connect the wiring harness to the binary switch.
8. Return the hood or cab to the operating position. For cab tilt instructions, see **Group 60**.
9. Remove the chocks from the tires.

Water Regulating Valve Replacement, Electronically-Controlled

Replacement

1. Turn off the engine, apply the brakes, and chock the tires.
2. Disconnect the batteries.
3. Open the hood to access the water regulating valve.
4. Remove the air cleaner. For instructions, refer to **Group 09**.
5. Clamp off the heater hoses to prevent coolant loss.
6. Remove the hoses from the water regulating valve. See **Fig. 1**.



05/03/2000 f430155

1. Water Regulating Valve Mounting Bracket
2. Nut
3. Outlet Hose
4. Water Regulating Valve
5. Inlet Hose
6. Receiver-Drier Mounting Bracket

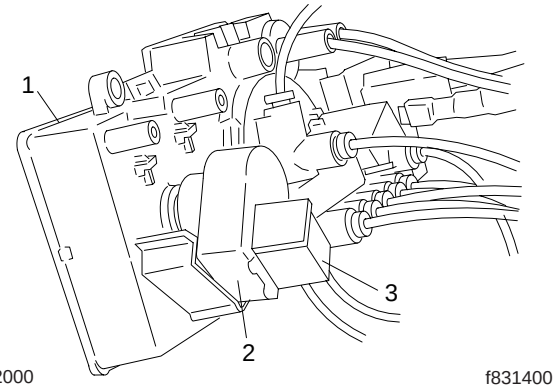
Fig. 1, Water Regulating Valve

7. Disconnect the connector on the water regulating valve.
8. Remove the nuts that attach the water regulating valve and mounting bracket and the receiver-drier mounting bracket to the frontwall. Remove the valve and mounting bracket.
9. Position a new water regulating valve and mounting bracket on the frontwall. Attach the receiver-drier mounting bracket to the front wall and install the nuts and tighten them securely.
10. Attach the connector on the water regulating valve to the mating connector.
11. Connect the heater hoses to the water regulating valve. Tighten the hose clamps 40 lbf·in (452 N·cm).
12. Remove the clamps from the heater hoses.
13. Install the air cleaner. For instructions, refer to **Group 09**.
14. Return the hood to the operating position.
15. Connect the batteries.
16. Remove the chocks from the tires.

Constant Discharge Temperature Control Potentiometer Replacement

Replacement

1. Turn off the engine, apply the brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the HVAC/radio trimplate from the dash. For instructions, see **Section 60.08**.
4. Remove the four screws that attach the HVAC control panel to the dash.
5. Disconnect the connector on the potentiometer behind the temperature control switch. See **Fig. 1**.



1. Control Panel
2. Potentiometer
3. Connector

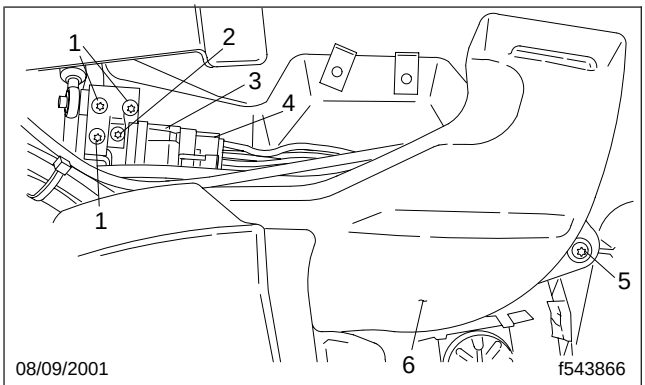
Fig. 1, HVAC Control Panel

6. Remove the temperature control knob from the control panel.
7. Remove the nut that attaches the potentiometer to the control panel and remove the potentiometer.
8. Install a new potentiometer and secure it to the control panel using a nut.
9. Attach the connector to the potentiometer.
10. Using four screws, attach the control panel to the dash.
11. Attach the temperature control knob to the control panel.
12. Attach the HVAC/radio trimplate to the dash. For instructions, see **Section 60.08**.
13. Connect the batteries.
14. Remove the chocks from the tires.

CDTC Controller With Sensor Replacement

Replacement

1. Turn off the engine, apply the brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the following dash panels. For instructions, see **Section 60.08**, Subject 100.
    - electrical cover
    - right-hand upper dash cover
    - HVAC cover
    - HVAC/radio trimplate
    - right-hand dash trimcap
4. Remove the HVAC duct that is above the power distribution module.
5. Remove the screws that secure the upper dash assembly. Lift the upper dash assembly to access the CDTC controller. See **Fig. 1**.



1. Air Cylinder Mounting Bracket Capscrew
2. CDTC Controller Capscrew
3. CDTC Controller
4. Connector
5. HVAC Duct Capscrew
6. HVAC Duct

Fig. 1, CDTC Controller With Sensor

6. Remove the capscrew that attaches the HVAC duct to the HVAC unit. See **Fig. 1**.
7. Remove the 7-pin connector from the CDTC controller.
8. Remove the capscrew that attaches the CDTC controller to the mounting bracket.
9. Loosen the three capscrews that attach the air cylinder mounting bracket to the HVAC unit.
10. Remove the CDTC controller.
11. Using a capscrew, attach a new CDTC controller to the mounting bracket.
12. Tighten the three air cylinder mounting bracket capscrews.
13. Attach the 7-pin connector to the CDTC controller.
14. Using a capscrew, attach the HVAC duct to the HVAC unit.
15. Lower the upper dash assembly back in place and secure it using screws.
16. Install the HVAC duct above the power distribution module.
17. Install the following dash panels. For instructions, see **Section 60.08**, Subject 100.
    - right-hand dash trimcap
    - HVAC/radio trimplate
    - HVAC cover
    - right-hand upper dash cover
    - electrical cover
18. Connect the batteries.
19. Remove the chocks from the tires.

Preliminary Checks

Before testing the operation of the air conditioning system, make the following checks:

1. Make sure the drive belt on the refrigerant compressor is not damaged and is correctly tensioned. Also check the compressor mountings for tightness. For instructions and other information, refer to the applicable refrigerant compressor section in this group.
2. Using a feeler gauge, check for correct refrigerant compressor clutch clearance. For instructions, refer to the applicable refrigerant compressor section in this group.
3. Check for broken, burst, or cut hoses. Also check for loose fittings on all parts.
4. Check for road debris buildup on the condenser coil fins. Using air pressure and a whiskbroom or a soapy spray of water, carefully clean off the condenser. Be careful not to bend the fins.
5. Check the color of the moisture indicator sight glass. If the color is blue, the refrigerant charge is dry. If the indicator is not blue, the system is contaminated with moisture. Recover the refrigerant, evacuate the system, replace the receiver-drier, and add a full refrigerant charge.
6. If there is not enough airflow, make sure that leaves or other debris have not entered the fresh air ports under the windshield. If debris have entered, it could clog the fins of the evaporator core and block airflow.

   Also be sure that all ducts are connected to the dash louvers and that the air-control flaps in the heater housing are moving properly.

Performance Tests

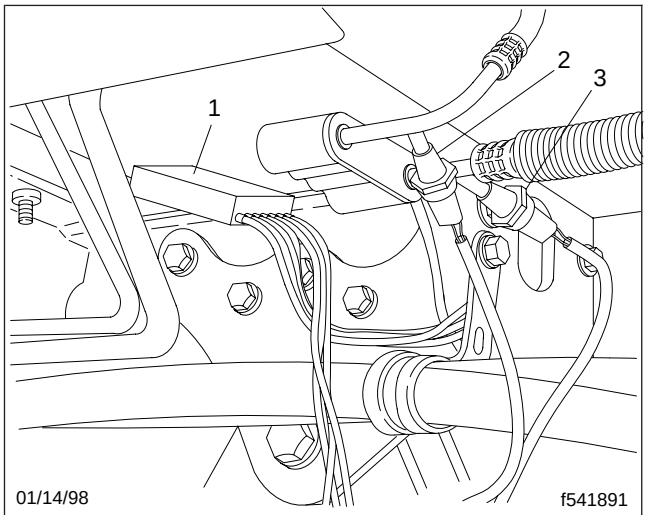
Following is a brief description of symptoms or conditions that could exist if something goes wrong with a refrigerant part.

Air Conditioning Protection Unit (ACPU)

NOTE: For more information about the ACPU, see **Subject 050**. The ACPU was installed on vehicles built before April 16, 1999.

IMPORTANT: The ACPU control system consists of an electronic control module, high and low pressure switches, and the thermostatic switch. The control module monitors system conditions (low or high refrigerant charge) and controls the operation of the refrigerant compressor and the on-off fan drive.

On Century Class Conventionals, the ACPU is located under the hood on the right side of the front-wall. On Argosy COEs, the ACPU is located on the right side of the vehicle behind the bumper. See **Fig. 1** and **Fig. 2**.



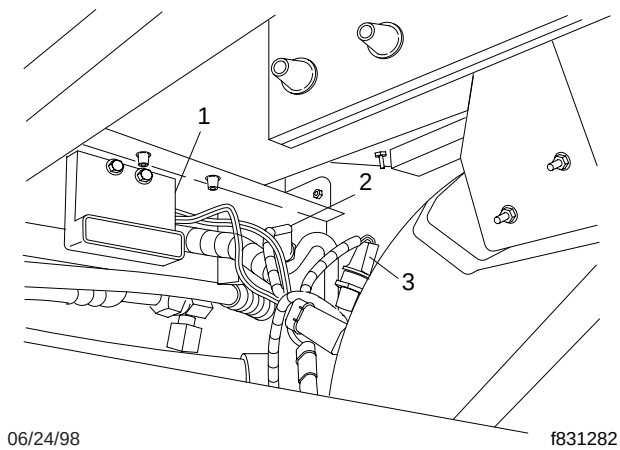
1. ACPU Control Module
2. High Pressure Switch
3. Low Pressure Switch

Fig. 1, ACPU Mounting, Century Class Conventional

The control module registers fault codes that warn of existing or impending problems in the air conditioning system. **Table 1** provides a list of ACPU messages broadcast to the Instrumentation Control Unit (ICU) message display screen. Additionally, corresponding fault codes are provided. Use **Table 1** to assist in troubleshooting the ACPU control system.

For further information on system fault codes, see the section in **Group 54** that discusses the Instrumentation Control Unit. Additionally, if ServicePro is available, a technician diagnostic routine is available covering the ACPU system.

Troubleshooting



1. ACPU Control Module
2. Low Pressure Switch
3. High Pressure Switch

Fig. 2, ACPU Mounting, Argosy COE

Cooling Check

When outside temperature and humidity are high, it will take longer to cool the cab, especially if the fresh air vents are left open.

To determine if the air conditioner is cooling enough:

1. Set the engine speed at 1500 rpm. The engine fan should be on.
2. On Century Class Conventionals, open the hood. On Century Class Conventionals and Argosy COEs, open the cab doors.
3. Turn on the cab air conditioner. Set the controls at air conditioning (not max AC), fresh air (not recirculated air), and maximum blower speed. The compressor must be engaged during this test.
4. In the sleeper (if equipped), turn the temperature control knob all the way counterclockwise to COOL. Turn the fan control knob to position 3 (high).
5. Allow the system to run for at least 10 minutes (longer on hot and humid days).
6. In the cab, place a thermometer inside the center dash outlet. In the sleeper, place a thermometer inside the lower outlet. Make sure the controls are set so that air flows out of the duct being tested.
7. Record the temperatures and take pressure readings at the service valves. Record the readings again after three minutes. If the temperature readings have not stabilized, run the system for an additional three minutes and record the readings again.
8. Compare the measured temperature readings to the readings in the temperature/pressure tables in **Specifications 400**. If the duct's air temperature is higher than normal readings, the system isn't cooling enough. For possible causes, see the troubleshooting chart.

Receiver-Drier

The receiver-drier is normally at outside temperature. To the touch, the entire length of the unit should be the same temperature. If noticeable cool spots exist, replace the receiver-drier.

A blockage at the inlet of the unit will cause high head pressures. Outlet blockages will cause low head pressures and little or no cooling.

If the moisture indicator is pink or white (showing that the system is wet), the receiver-drier is saturated with moisture and must be replaced.

Cooling System

Although they are not physically connected, there is a close tie between a vehicle's air conditioner and its cooling system. Poor air conditioner cooling can be the result of a problem in the cooling system.

If the cooling system does not work correctly, the heat of the engine will rise to abnormal levels. The added heat will transfer to the air conditioner, other underhood parts, and maybe make its way into the cab. The added heat makes it necessary for the air conditioner to work harder and, at the same time, it reduces the air conditioner's ability to cool down the air in the cab. Also, if the water regulating valve isn't closing all the way, heat will enter the cab, giving the impression that the air conditioning system is not working.

Refer to **Group 20** for cooling system troubleshooting and to the engine manufacturer's service manual for other details about cooling system problems.

ACPU Fault Codes and Tests					
ICU Text Message	**Problem**	**MID**	**SID**	**FMI**	**Remedy**
REFRIG PRES HIGH	Refrigerant charge above normal, high pressure	190	1	00	Condenser is clogged, or the system is overcharged. Clean the condenser, then check system pressure. If okay, start the engine. After system pressure reaches 290 to 310 psi (1999 to 2137 kPa) on vehicles built before December 11, 1998 or 340 to 375 psi (2344 to 2586 kPa) on vehicles built from December 11, 1998 the fan should come on. If it doesn't, the fan hub could be damaged.
REFRIG PRES LOW	Refrigerant charge is below normal, low pressure	190	1	01	Check system pressure. If the low-side pressure is below 35 psi (241 kPa) there is a loss of refrigerant charge. Perform a leak test. Repair any leaks, evacuate the system, replace the receiver-drier, and add a full charge of refrigerant. If the pressure is okay, use an ohmmeter to measure the resistance between the low pressure switch wires. Replace the switch if resistance is not 2.25–2.75 kilo ohms.
CLUTCH CIR OPEN	Open circuit	190	6	05	Check the wiring to the compressor clutch. Repair or replace as needed.
CLUTCH CIR SHORT	Short circuit	190	6	06	Check the wiring to the compressor clutch. Repair or replace as needed.
BAT VOLTAGE LOW	Low battery voltage	190	168	04	Check for excessive electrical loads, a damaged alternator, or a discharged battery. Repair or replace as needed.
LO PRES SW OPEN	Low pressure switch, open circuit	190	5	05	Check that the correct switches are installed. Check the switch wiring. Repair or replace as needed. Use an ohmmeter to measure the resistance between the low pressure switch wires. Replace the switch if resistance is not 2.25–2.75 kilo ohms when the switch is open.
HI PRES SW OPEN	High pressure switch, open circuit	190	228	05	Check that the correct switches are installed. Check the switch wiring. Repair or replace as needed. Use an ohmmeter to measure the resistance between the high pressure switch wires. Replace the switch if resistance is not 2.25–2.75 kilo ohms when the switch is open.
HI PRES SW CALIBRT	High pressure switch, life cycle exceeded	190	228	13	Replace the high pressure switch. After replacing the high pressure switch, reset the high pressure cycle to zero. For more information on resetting this parameter, see the Freightliner ServiceLink on-line help program.

Table 1, ACPU Fault Codes and Tests

Expansion Valve

Problems that start in the expansion valve show up as follows: when stuck closed, the evaporator coil and the expansion valve will be at outside temperature; when stuck open, both the coil and the valve will be extremely cold with frost or ice buildup.

Because the expansion valve channels are very small, blockages in the system tend to be found here (the valve is very sensitive to contamination). Usually, the contaminant is water; less than a drop of water is all it takes to make the valve inoperative. When water reaches the valve, the extreme cold that results from the pressure drop freezes the water, forming a block of ice in the valve. After the system shuts down and the valve warms up, the ice melts, and the valve operates again, only to freeze-up when the moisture returns.

On-and-off operation of the expansion valve means that the receiver-drier is not removing moisture from the system. These contaminants should cause the moisture indicator to turn white and then pink.

Refrigerant Compressor

Compressor problems usually show in one of four ways: abnormal noise, seizure, leakage, or low suction and discharge pressures.

Resonant compressor noises are not causes for alarm. Irregular noise or rattles are likely to be caused by broken parts. To check for seizure, de-energize the magnetic clutch and see if the drive plate can be turned. If it won't turn, the compressor has seized.

Low discharge pressure may be caused by not enough refrigerant, not enough belt tension, or a blockage somewhere in the system. These things should be checked before servicing the compressor.

Evaporator

The evaporator coils are basically trouble-free when airflow over the fins is not blocked. External or, less often, internal blockages will cause low suction pressure as well as little or no cooling.

If a leak exists in the system, and it cannot be traced to other parts or fittings, suspect damage to one of the evaporator coils.

Condenser

The condenser is usually trouble-free. Normally, the temperature of the condenser outlet line is noticeably cooler than the inlet line. However, when road debris, such as leaves or dirt, build up, airflow over the condenser fins is blocked. Air is not able to absorb enough heat to turn the hot refrigerant gas into a liquid. High head pressures will result. In these cases, carefully clean off the outer surfaces of the condenser with compressed air or a soap and water solution. Be careful not to bend the fins.

High head pressures will also occur if the condenser's tubing is abnormally bent, blocking the flow of refrigerant. Frost will appear at the point where the flow is restricted.

Less common internal blockages (bits of foreign material or metallic grit buildup) will stop the flow of refrigerant.

A quick test to check that poor system performance is caused by the condenser is to direct a spray of water onto the condenser while the system is running. If the air conditioner cools better because of the assist provided by the water, it is a sign that the condenser is not working.

When troubleshooting a suspected condenser problem, remember that the problem may be caused by the radiator transferring high levels of heat to the condenser. Refer to **Group 20** of this manual for cooling system troubleshooting and to the engine

manufacturer's service manual for other details about cooling system problems.

Thermostatic Switch

IMPORTANT: Before troubleshooting the thermostatic switch, be sure there is a full charge of refrigerant in the system. The compressor will not operate or will cycle too often if there is not enough refrigerant in the system.

Quick or delayed cycling of the compressor may be caused by a thermostatic switch that is working, but is out of adjustment. If, after doing the tests below, the switch seems to be out of adjustment, replace it (the thermostatic switch cannot be recalibrated).

1. Be sure the compressor clutch is operating correctly. See the applicable refrigerant compressor section in this group.
2. Expose the evaporator coil. See **Subject 180** for instructions.
3. Start the engine. Place the air conditioner control at its coldest setting. Turn on the air conditioner and the fan.
4. Place an accurate thermometer in contact with a tube on the evaporator coil. Be sure the thermometer is in good contact with the tube or you will get a wrong reading.

   When the temperature drops below 31 to 36°F (–1 to 2°C), the compressor clutch should disengage and remain this way until the temperature rises to 39 to 44°F (4 to 7°C).
5. If the compressor did not engage when the temperature was above the accepted high range, do the following test:

   5.1 Connect a voltmeter or a test light from one of the terminals on the thermostatic switch to ground. Repeat this test with the other terminal on the switch.

   5.2 With the engine running and the air conditioner and blower on, both terminals will show voltage when the compressor should be engaged. One terminal will show voltage when the compressor should be disengaged.

   If there is no voltage, there is a problem in the electrical system from the batteries to the thermostatic switch. Check all circuits for the cause, and repair or replace the wiring or parts.

   In all other cases where the compressor is not engaging and disengaging properly, the thermostatic switch is the cause. Replace it with a new switch.
6. Shut down the engine and, to prevent accidental electric shock or shorting during dash assembling, disconnect the batteries.
7. Assemble the dash. See **Subject 180** for instructions.

Discharge Temperature Control (DTC) System Troubleshooting

The water regulating valve clicks when it opens and closes. The clicks can be used to confirm operation of the water valve. The valve is normally open (NO). When the potentiometer is turned to full cold and the cab is warm, the controller should send electricity to the solenoid that closes the water valve and stops coolant flow through the heater core. By listening for the sound of the valve opening and closing, the technician can determine if the water valve is operating.

See **Fig. 3** for the wiring schematic for the cab Discharge Temperture Control (DTC) module.

See **Table 2** for the electrical pinout descriptions of the DTC module.

DTC Module Pinout	
Pin	**Electrical Function**
A	Ground
B	Potentiometer Input (–) Cold
C	Potentiometer Input (wiper)
D	Potentiometer Input (+) Hot
E	Solenoid Valve Output (–)
F	Solenoid Valve Output (+)
G	Ignition +12V

Table 2, DTC Module Pinout

Use the troubleshooting procedures in **Table 3** first.

Use the troubleshooting procedures in **Table 3** before using the procedures in **Table 4**.

Use the troubleshooting procedures in **Table 3** and **Table 4** before using the procedures in **Table 5**.

Troubleshooting

Use the troubleshooting procedures in **Table 3** before using the procedures in **Table 6**.

Use the troubleshooting procedures in **Table 3** before using the procedures in **Table 7**.

See **Table 8** for the electrical pinout descriptions of the DTC module.

Line Restrictions

A restricted suction line causes low suction pressure at the compressor and little or no cooling. A restriction in a line between the compressor and the expansion valve can cause high discharge and low suction pressure, and insufficient cooling.

Usually, areas of ice or frost buildup mean a blockage. Parts that often freeze-up are probably corroded or inoperative and should be replaced. Parts (such as the expansion valve) that freeze-up once in a while may do so because of moisture in the system, which will cause the moisture indicator to turn white or pink. If this happens, recover the refrigerant charge, evacuate/recycle the system refrigerant, replace the receiver-drier, and install a new charge.

CDTC System Initial Electrical Diagnosis				
Test No.	**Test Procedure**	**Test Criteria**	**Test Result**	**Action**
1	Measure voltage at the water valve by backprobing the connector. Voltage should be approximately 12V.	• Engine running • Engine at normal operating temperature • Temperature setting at **full cold**	OK	**Go to test no. 2.**
			Not OK	**Go to test no. 3.**

CDTC System Initial Electrical Diagnosis				
Test No.	**Test Procedure**	**Test Criteria**	**Test Result**	**Action**
2	Measure voltage at the water valve by backprobing the connector. Voltage should be approximately 0V.	• Engine running • Engine at normal operating temperature • Temperature setting at **full hot**	OK	There are no apparent electrical problems with the system. With the engine at normal operating temperature, hot air should come from the vents when the temperature setting is **full hot**. When switched to **full cold**, cooler air should come from the vents within approximately 10 minutes. If the system does not operate as stated above, refer to one of the following: • For little or no heat symptom, see **Table 6**. • For blowing warm/hot air symptom, see **Table 7**.
			Not OK	Perform tests in **Table 4**, CDTC System Temperature Potentiometer Test.
3	Repeat test no. 1 using a known good ground instead of water valve ground wire. Voltage should be approximately 12V.	• Engine running • Engine at normal operating temperature • Temperature setting at **full cold**	OK	**Go to test no. 4.**
			Not OK	Perform tests in **Table 4**, CDTC System Temperature Potentiometer Test.
4	Check the ground wire to the controller (terminal A).	—	OK	Perform tests in **Table 4**, CDTC System Temperature Potentiometer Test.
			Not OK	Repair controller ground circuit.

Table 3, CDTC System Initial Electrical Diagnosis

CDTC System Temperature Potentiometer Test			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Disconnect the temperature potentiometer from the harness. Using an ohmmeter, measure the potentiometer resistance as follows: • A to B (knob full CCW) 8000 to 12,000 ohms • A to B (knob full CW) 40 to 60 ohms • B to C (knob full CCW) 40 to 60 ohms • B to C (knob full CW) 8000 to 12,000 ohms NOTE: Resistance ranges are approximate.	OK	**Go to test no. 2.**
		Not OK	Replace temperature potentiometer.

Troubleshooting

CDTC System Temperature Potentiometer Test			
Test No.	**Test Procedure**	**Test Result**	**Action**
2	Connect the potentiometer. Disconnect the harness from the controller. Using an ohmmeter, measure the potentiometer resistance through the harness pins at the controller as follows: • C to D (knob full CCW) 8000 to 12,000 ohms • C to D (knob full CW) 40 to 60 ohms • B to C (knob full CCW) 40 to 60 ohms • B to C (knob full CW) 8000 to 12,000 ohms NOTE: Resistance ranges are approximate.	OK	Temperature potentiometer and wires are okay. Perform tests in the table titled CDTC System Controller Test.
		Not OK	Repair wiring between temperature potentiometer and CDTC controller.

Table 4, CDTC System Temperature Potentiometer Test

CDTC System Controller Test				
Test No.	**Test Procedure**	**Test Criteria**	**Test Result**	**Action**
1	Disconnect the harness from the CDTC controller. Measure voltage across pins A and G. Voltage should be approximately 12V.	• Ignition on • CDTC controller disconnected	OK	**Go to test no. 2.**
			Not OK	Check power supply wire and fuse to CDTC controller. Check CDTC controller ground circuit. Repair as necessary.
2	Connect the harness to the CDTC controller. Measure voltage by backprobing one meter lead to pin F and placing the other lead to a known good ground. Voltage should be approximately 12V.	• Ignition on • CDTC controller connected	OK	**Go to test no. 3.**
			Not OK	Replace the CDTC controller.
3	Measure voltage by backprobing pins F and E of the CDTC controller connector. Voltage readings should be: • Slightly less than 12V when the control knob is **full cold** (CCW) • 0V when the control knob is **full hot** (CW).	• Ignition on • CDTC controller connected	OK	No problem found. Repeat tests **Table 3**.
			Not OK	Replace the CDTC controller.

Table 5, CDTC System Controller Test

CDTC System Special Test-Symptom: Little or No Heat and Passes All Electrical Tests			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Check to make sure that the coolant source from the engine is connected to the inlet pipe on the water valve.	OK	**Go to test no. 2.**
		Not OK	Route hose to correct connections.
2	Check to make sure that the water inlet hose at the water valve is hot.	OK	Check for blocked heater core and repair as necessary.
		Not OK	Check for closed heater hose shutoff valve. If okay or not present, repair engine cooling system as necessary.

Table 6, CDTC System Special Test-Symptom: Little or No Heat and Passes All Electrical Tests

CDTC System Special Test-Symptom: Blows Warm/Hot Air and Passes All Electrical Tests			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Remove the water valve and visually inspect the inside of the outlet tube to see if the plunger is broken or if debris is preventing the plunger from seating properly.	OK	If the vehicle: • Has a 2002 or newer Detroit Diesel engine, **or** • Has an MBE engine, **or** • If water pump pressure or flow is higher than a standard truck, **then** Install a water flow restrictor, part number RCV H43 1000 000 (available in the PDCs). Install the flow restrictor in the heater hose between the engine and the inlet side of the water valve. IMPORTANT: Make sure the flow restrictor is installed so that the flow direction arrow is toward the water valve, which is the direction of coolant flow.
		Not OK	If plunger is broken, replace the water valve. If debris is present, clean the cooling system.

Table 7, CDTC System Special Test-Symptom: Blows Warm/Hot Air and Passes All Electrical Tests

DTC Module Pinout	
Pin	**Electrical Function**
A	Ground 2
B	Potentiometer (CCW–cold) 98U
C	Potentiometer (center tap) 98T
D	Potentiometer (CW–hot) 98J
E	Water Valve (–) 98X
F	Water Valve (+) 98W

DTC Module Pinout

Fault Analysis Flow Chart

See **Fig. 4** for the fault analysis flow chart.

Troubleshooting

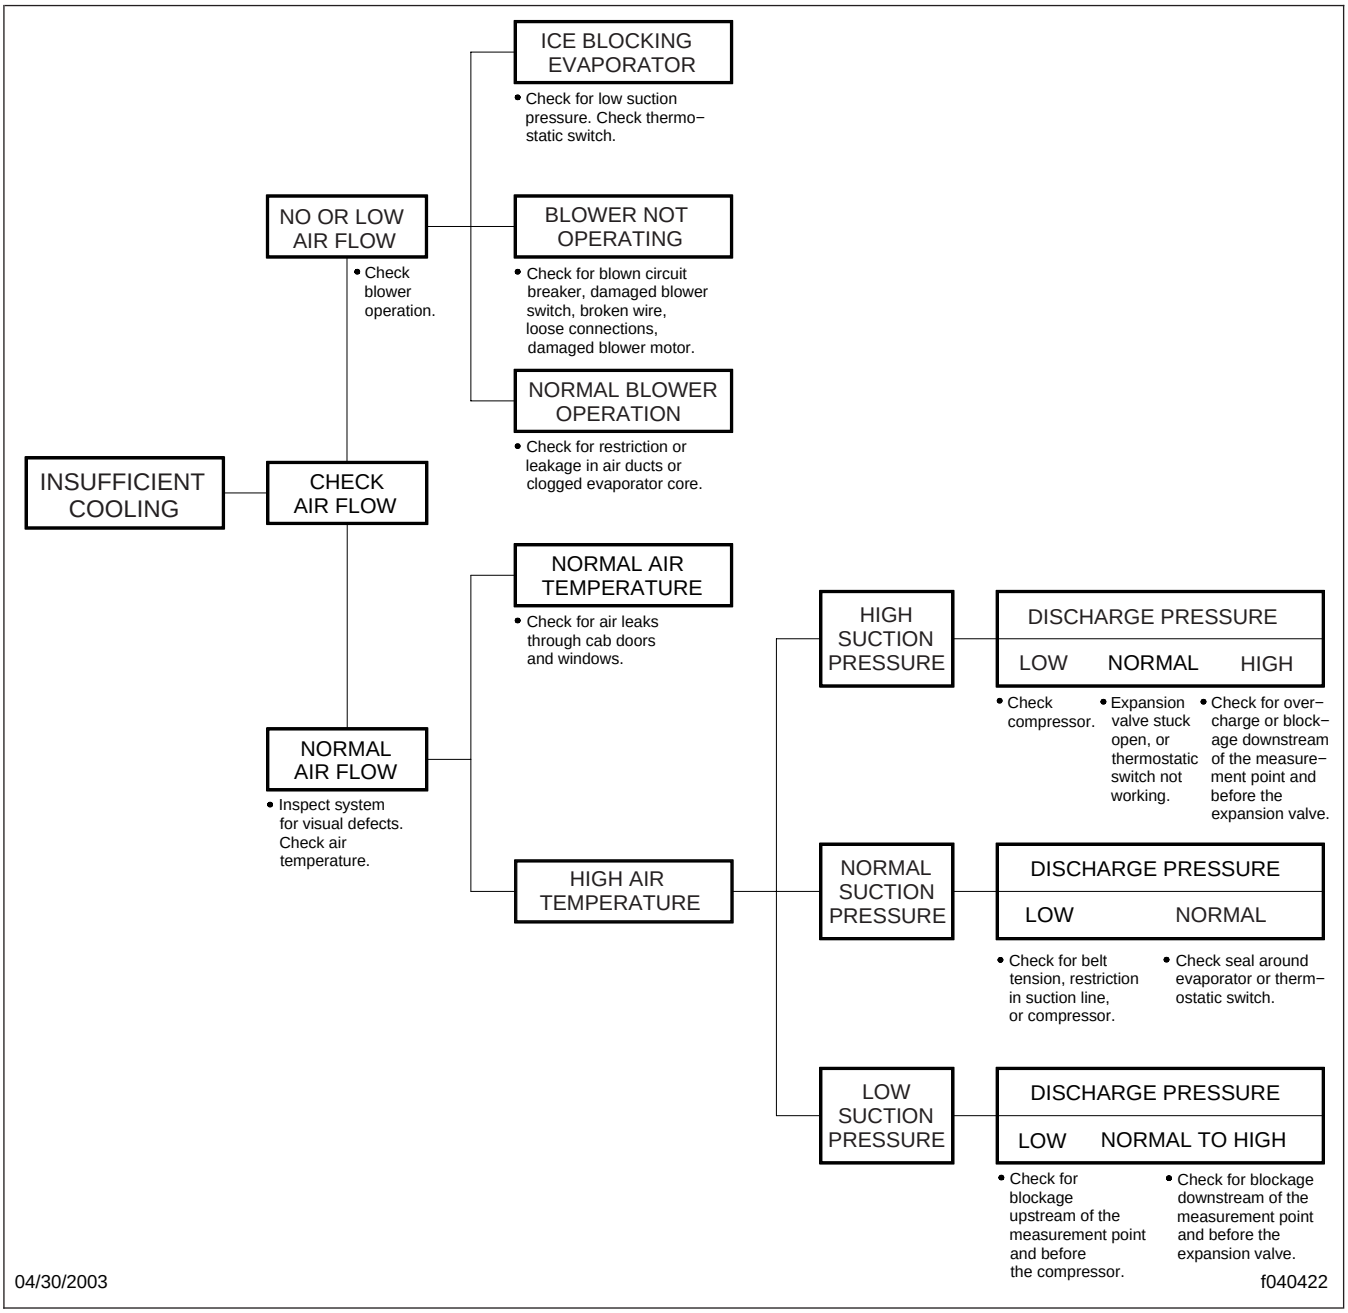

Fig. 4, Fault Analysis Flow Chart

System Troubleshooting Tables

Problem—Little or No Airflow

Problem—Little or No Airflow	
Possible Cause	**Remedy**
The blower is not operating.	Check for an open circuit breaker. An open circuit indicates a short in the electrical system, which must be located and repaired.
	Check the air conditioner relays for operation. Replace, as necessary.
	Make sure the blower motor switch is working. Replace, if necessary.
	Check the wiring to the blower motor. If any connections are loose, securely tighten them. Make sure the wiring conforms to the applicable diagram under **Specifications 400**.
	Check the blower motor for operation. Replace if sticking or otherwise inoperative.
	Check the resistor block. Replace, if necessary. **CAUTION** **Never try to bypass the fuse in the resistor block. To do so could cause the blower motor to overheat, resulting in serious damage to the heater/ air-conditioning system.**
There are restrictions or leaks in the air ducts.	Examine all air ducts and remove any blockages. Stop any leaks or replace any portion where the leaks cannot be stopped.
Ice has formed on the evaporator coil.	Defrost the evaporator coil before resuming operation of the air conditioner. Review "Performance Tests" in this subject for possible causes and corrective action.

Problem—Warm Airflow When the Air Conditioner Is On

Problem—Warm Airflow When the Air Conditioner Is On	
Possible Cause	**Remedy**
There is no refrigerant charge in the system.	Perform a leak test. Repair any leaks, evacuate the system, replace the receiver-drier, and add a full charge of refrigerant.
Moisture in the system.	If moisture is in the system, ice crystals may form at the expansion valve, blocking the flow of refrigerant (off and on). Recover the refrigerant charge, replace the receiver-drier, evacuate the system, and add a full charge of refrigerant.
The refrigerant compressor is not operating.	If the refrigerant charge is low, charge and leak test the system. Repair any leaks.
	The refrigerant compressor clutch or drive belt needs repair or replacement. For instructions, see the applicable refrigerant compressor section elsewhere in this group.
Ice has formed on the evaporator coil.	Defrost the evaporator coil before resuming operation of the air conditioner. Review "Performance Tests" in this subject for possible causes and corrective action.

Troubleshooting

Problem—Low Evaporator Coil Outlet Pressure (Low Compressor Suction Pressure)

Problem—Low Evaporator Coil Outlet Pressure (Low Compressor Suction Pressure)	
Possible Cause	**Remedy**
The expansion valve is not working.	Replace the expansion valve.
There are restrictions in the line to the expansion valve.	Remove the line restrictions.
There is an insufficient refrigerant charge in the system.	Locate the leak. Recover the charge, replace the receiver-drier, and add a full refrigerant charge.

Problem—High Compressor Discharge Pressure

Problem—High Compressor Discharge Pressure	
Possible Cause	**Remedy**
The shutters are not opening.	Replace the shutter solenoid valve, Air Conditioning Protection Unit high pressure switch, or both.
Airflow through the condenser is restricted.	Remove the debris from the condenser.
There is an internal restriction in the condenser. Ice buildup on the condenser or a cool spot on the line from the condenser to the receiver-drier.	Replace the condenser.
Air is present in the system.	Perform a leak test. Repair any leaks, evacuate the system, and add a full charge of refrigerant.
Heavy frosting on the suction line suggests that the evaporator coil is flooded.	Defrost the evaporator coil before resuming operation of the air conditioner.
The engine is overheated.	See the engine manufacturer's operations manual for corrective measures.
Restriction in the compressor discharge line.	Repair or replace the line.

Problem—Evaporator Outlet Air Temperature Increases as the Compressor Discharge Pressure Drops

Problem—Evaporator Outlet Air Temperature Increases as the Compressor Discharge Pressure Drops	
Possible Cause	**Remedy**
There are leaks in the system.	Leak test the system.
The expansion valve setting is too low.	Replace the expansion valve. Add a full charge of refrigerant.
Too much oil is in the system. An indication of this is clutch or belt slippage at governed engine speed.	Check and remove excess refrigerant oil. For instructions, see the applicable refrigerant compressor section elsewhere in this group.

Problem—Compressor Operates Too Often or Continuously

Problem—Compressor Operates Too Often or Continuously	
Possible Cause	**Remedy**
There is too little refrigerant in the system.	Perform a leak test. Repair any leaks, and add a full charge of refrigerant.

Problem—Compressor Operates Too Often or Continuously	
Possible Cause	**Remedy**
Ice has formed on the evaporator coil.	Defrost the evaporator coil before resuming operation of the air conditioner. Check the operation of the thermostatic switch, and replace as necessary.
There is a restriction in the refrigerant system.	Remove the restriction from the line.
Dirt and debris are clogging the condenser fins.	Remove all dirt and debris from the condenser fins.
The thermostatic switch isn't working.	Replace the thermostatic switch.

Problem—Quick or Delayed Cycling of the Compressor

Problem—Quick or Delayed Cycling of the Compressor	
Possible Cause	**Remedy**
The thermostatic switch operates, but is out of adjustment.	Replace the thermostatic switch. Do not attempt to adjust it.
Loss of refrigerant is causing a delayed cycling of the compressor.	Leak test and add a full charge of refrigerant.

Problem—Temperature in the Cab Too Low or No Heat

Problem—Temperature in the Cab Too Low or No Heat	
Possible Cause	**Remedy**
The water regulating valve is not opened.	Move the temperature control knob toward warm.
The water regulating valve is not opening all the way.	Adjust the water regulating valve cable.
The water regulating valve is not working.	Replace the water regulating valve.
A heater hose is pinched or twisted.	Repair or replace the heater hose.
Coolant is leaking from the system.	Check for leakage at the heater core, and at all hose connections from the heater core to the engine. Check the radiator coolant level, as instructed in the vehicle driver's manual, and add coolant, if necessary. Check and repair any leaks at the radiator.
Dust or dirt is clogging the heater core fins.	Remove and clean the heater core.

Problem—Condensed Water Is Leaking from the Air Conditioner

Problem—Condensed Water Is Leaking from the Air Conditioner	
Possible Cause	**Remedy**
The drain tubes are plugged.	Clean the drain holes and drain tubes.

Troubleshooting the Refrigerant System Using ACPU Fault Codes

For ACPU faults accompanied by fault messages, **Fig. 5** and **Table 9** list faults that the ACPU is capable of detecting. The wording of the fault message display may vary depending on the level of software installed in the instrument cluster. Use ServicePro to clear fault codes.

See **Fig. 6** for the ACPU system schematic.

Troubleshooting Fault Code Definitions

High Pressure: The high pressure condition is detected by monitoring high pressure switch activity after the fan has been engaged. This fault can be caused by fan drive failure, condenser airflow blockage, or refrigerant overcharging.

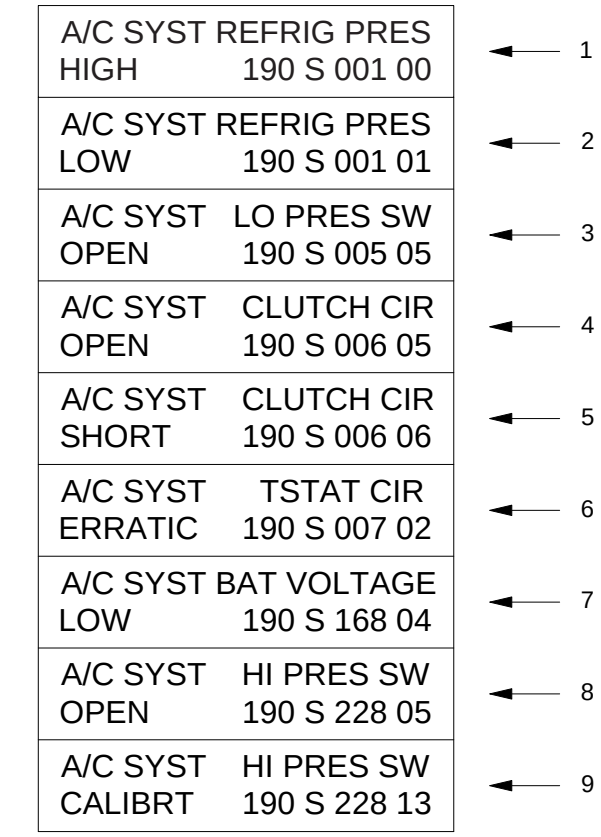
High Pressure Switch Open: Indicates that the wiring to the high pressure switch is an open circuit. This can be caused by an unseated connector, a break in the wiring harness, or moisture intrusion into the connectors or switch. When continuity to the switch resumes, this fault becomes inactive.

High Voltage: Indicates a high supply voltage condition (greater than 16 volts). This can be caused by a defective alternator, voltage regulator or surges on the supply line. The high voltage warning goes away when the supply voltage returns to normal (below 16 volts).

Low Pressure: This is detected by monitoring the ambient temperature and activity of the low pressure switch. It indicates a loss of refrigerant.

Low Pressure Switch Open: Indicates that the wiring to the low pressure switch is an open circuit. This can be caused by an unseated connector, break in the wiring harness, or moisture intrusion into the connectors or switch. When continuity to the switch resumes, this fault code becomes inactive.

Low Voltage: Indicates a low supply voltage condition. This can be caused by a defective alternator, discharged batteries or excessive loads. The low voltage warning goes away when the supply voltage returns to normal (above 11 volts).



1. High Pressure Fault
2. Low Pressure Fault
3. Low Pressure Switch Open
4. Open Wire to Clutch
5. Shorted Clutch
6. Erratic Thermostatic Switch
7. Low Battery Voltage
8. High Pressure Switch Open
9. High Pressure Switch Life has Exceeded 260,000 Cycles

Fig. 5, ACPU Fault Messages

Open Clutch: If no current is sensed when the AC clutch is engaged, an open connection to the clutch coil is inferred. When continuity to the clutch resumes, this fault becomes inactive. If this fault is detected, the AC is held off for the remainder of the ignition cycle.

Shorted Clutch: This is detected by excessive current flowing to the compressor clutch. This indicates

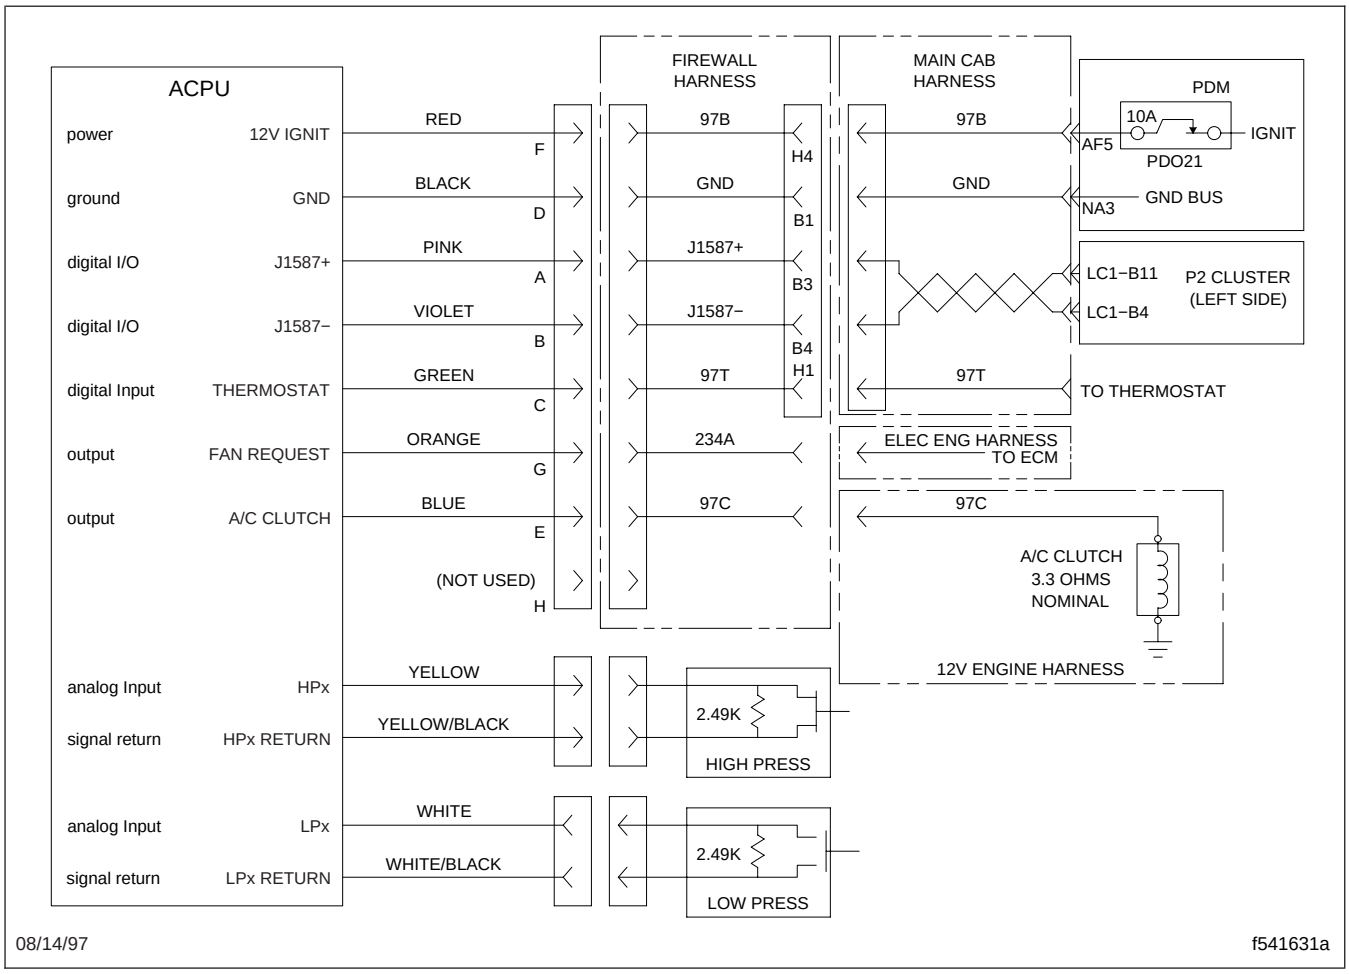


Fig. 6, ACPU System Schematic

either a shorted clutch coil or shorted wiring to the clutch. If this fault is detected, the AC is held off for the remainder of the ignition cycle.

Erratic Thermostatic Switch: The thermostatic switch input has been detected to be switching on and off at a rapid rate. This indicates a bad AC selector, fan switch, thermostatic switch, or intermittent connections in the wiring or connectors.

High Pressure Switch Calibration: Cycle life of the high pressure switch has been exceeded (260,000 cycles). Replace the switch and reset the ACPU by pressing the HPX button in ServiceLink.

NOTE: Use ServiceLink to clear fault codes.

ACPU Troubleshooting Table

Troubleshooting

ACPU Troubleshooting Table			
Dash Message	**Definition**	**Possible Cause**	**Action**
See **Fig. 7**.	High pressure fault. The system is exhibiting abnormal high pressure activity.	Fan drive failure	Inspect for proper operation of the solenoid valve/relay and/or related components.
		Blocked air flow	Remove the restriction from the condenser.
		Refrigerant overcharge	Recover refrigerant and charge to the manufacturer recommended specification.
		High pressure switch out of tolerance	Perform steps 3.1 through 3.7 in the following section to test fan and compressor operation and replace the high pressure switch if necessary.
		Fan circuit has not been turned on in the Engine Control Module	Disconnect the main harness to the ACPU module. If the engine fan engages, replace the ACPU module. If the engine fan doesn't engage, check the fan circuit in the ECM, and have the ECM programmed to accept ACPU input.
See **Fig. 8**.	Low pressure fault. This is detected by monitoring the ambient temperature and the switching activity of the low pressure switch.	Partial or total loss of refrigerant	Check the system for leaks.
		A damaged low pressure switch	Disconnect the low side pressure switch connector and measure the resistance value of the switch. If the resistance shows 2490 ohms, the switch is operating properly, if resistance shows less than 5 ohms, replace the switch. NOTE: This check must be done with the switch installed, the ignition in the off position, and the system properly charged.
See **Fig. 9**.	Open in wiring to the low pressure switch. Indicates that the wiring to the low pressure switch is damaged.	Unseated connector	Check the connectors at the module and the pressure switch for loose pins.
		Break between wiring harness and pressure switch	Using an ohmmeter, probe the white and white/black pins of the module harness. Resistance should read 2490 ohms with the switch installed and proper charge.
		Moisture intrusion into the connectors or switch	Check seals and inspect wires for hole punctures.
		Incorrect pressure switch installed	Install the correct pressure switch.

ACPU Troubleshooting Table			
Dash Message	**Definition**	**Possible Cause**	**Action**
See **Fig. 10**.	Open wire to the A/C clutch. Detected by inadequate current through the compressor clutch. If no current is sensed when the A/C drive is turned on, an open connection to the clutch coil is indicated.	A break in the wiring between the ACPU module and the A/C compressor clutch	Use an ohmmeter to check the wiring for continuity.
		Poor electrical contact between the compressor and the vehicle ground	Using an ohmmeter, test the resistance between the clutch and the compressor, and between the compressor and the engine block. If necessary, loosen the mounting on the compressor and retighten it to repair the contacts.
		No clutch output from the ACPU	Replace the ACPU with a binary switch. For instructions, see Service Bulletin 83-71.
See **Fig. 11**.	Shorted wire or A/C clutch. Detected by excessive current through the compressor clutch.	This means either a shorted clutch coil or shorted wiring to the clutch	With the use of an ohmmeter, check the resistance of the clutch coil. If the reading is less than 2.8 ohms, replace the clutch.
		No clutch output from the ACPU	Replace the ACPU with a binary switch. For instructions, see Service Bulletin 83-71.
See **Fig. 12**.	Erratic evaporator thermostatic switch. The thermostat input has been detected to be switching on and off at a rapid rate.	An erratic power signal between the A/C cab controls and the ACPU module	Check for a bad A/C-On switch, thermostat, or an intermittent connection in the wiring or connection between the cab controls and the ACPU module (pin c).
See **Fig. 13**.	Low system voltage. Indicates voltage has dropped below 11.0 volts.	Possibly caused by a defective alternator, discharged batteries or excessive electrical loads	Check voltage at the control module harness by probing pins D (ground) and F (power). If voltage is less than 11.0 volts, start checking for voltage drops.
See **Fig. 14**.	Open in wiring to the high pressure switch. Indicates that the wiring to the high pressure switch is damaged.	Unseated connector	Check connectors at the module and the pressure switch for loose pins.
		Break between wiring harness and pressure switch	With the use of an ohmmeter, probe the yellow and yellow/black pins of the switch harness. Replace the switch if resistance is greater than 5 ohms.
		Moisture intrusion into the connectors or the switch	Check seals and inspect wires for continuity.
		Incorrect pressure switch installed	Install the correct pressure switch.
See **Fig. 15**.	Cycle life of the high pressure switch has been exceeded.	High pressure switch has exceeded more than 260,000 cycles	Replace the pressure switch with F/L part number 8040151. Using ServiceLink, reset the high pressure cycle counter to zero.

Troubleshooting

ACPU Troubleshooting Table			
Dash Message	**Definition**	**Possible Cause**	**Action**
No Dash Message.	Clutch is engaged, A/C is not cooling.	Inoperative blower motor, or loose or broken compressor belts	Check for proper operation of the blower motors. Tighten or replace the compressor belts.
No Dash Message.	A/C compressor is not engaging.	System air pressure is less than 60 psi (414 kPa)	Check for low air pressure.
No Dash Message.	A/C system is not cooling properly.	Cable to the heater control valve is disconnected or the valve is not completely closing	Check the cable at the heater control valve and behind the dash. Be sure the valve opens and closes completely.
No Dash Message.	A/C compressor is not engaging.	Engine rpm is less than 300	Check the cause of the low rpm.

Table 9, ACPU Troubleshooting Table

NOTE: Use ServiceLink to clear fault codes.

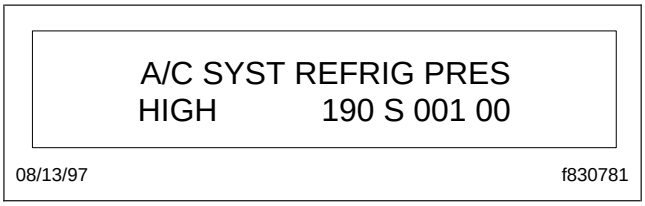

Fig. 7, High Pressure Fault Code

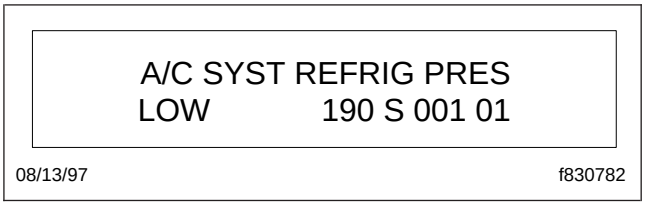

Fig. 8, Low Pressure Fault Code

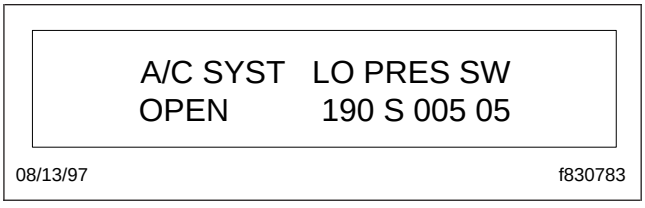

Fig. 9, Low Pressure Switch Open Fault Code

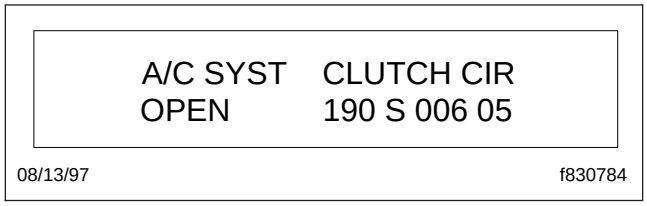

Fig. 10, Open Wire to Clutch Fault Code

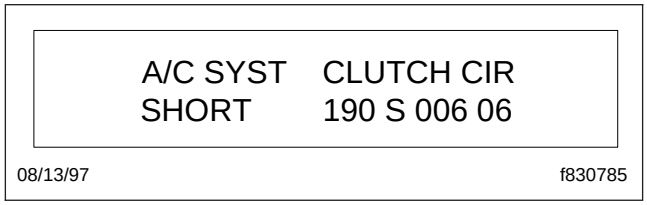

Fig. 11, Shorted Clutch Fault Code

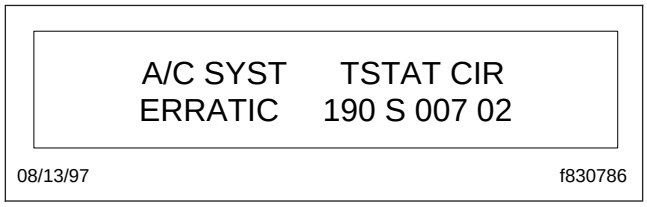

Fig. 12, Erratic Thermostatic Switch Fault Code

Troubleshooting the ACPU

Use the following procedure for troubleshooting ACPU faults not accompanied by fault codes.

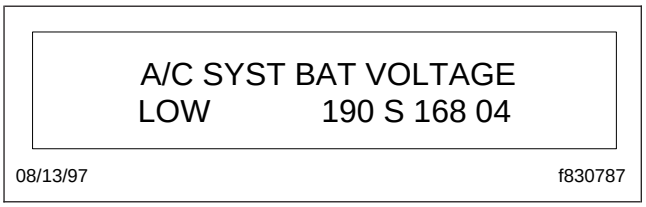

Fig. 13, Low Battery Voltage Fault Code

Fig. 14, High Pressure Switch Open Fault Code

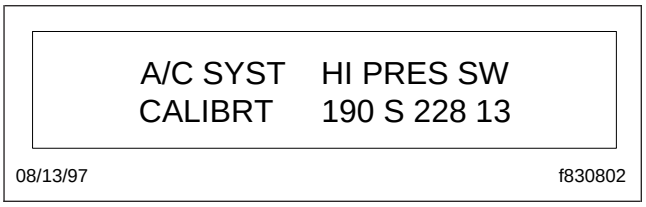

Fig. 15, High Pressure Switch Life Has Exceeded 260,000 Cycles Fault Code

1. Connect ServiceLink to the truck and download the fault codes.
   - 1.1 Make repairs to correct existing fault codes.
   - 1.2 Clear the fault codes using ServiceLink.
   - 1.3 If the ACPU does not report on ServiceLink, see **Table 10**.
2. Check for initial (lube) cycle.
   - 2.1 With the main AC selector in the AC **off** position, start the truck. The compressor clutch should remain disengaged for about 15 seconds after starting the truck, then the compressor should engage for 15 seconds and shut off. This is the initial (lube) cycle.
   - 2.2 If the compressor does not complete the initial (lube) cycle, see **Table 11**.
3. Test fan and compressor operation.
   - 3.1 Apply the parking brakes and chock the tires.
   - 3.2 Connect a refrigerant service cart to the truck air conditioning system.
   - 3.3 Place cardboard in front of the air conditioning condenser so that it blocks all air from being drawn into the condenser.
   - 3.4 Start the truck with the transmission in neutral, the main cab air conditioning selector switch in the **on** position, and the fan switch on high (position 4).
   - 3.5 Check that the air conditioning compressor engages after about 15 seconds.
   - 3.6 Check the reading of the high pressure gauge on the service cart when the fan comes on the first time. The fan should come on between 290 and 310 psi (1999 and 2137 kPa) on vehicles built before December 11, 1998 or between 340 and 375 psi (2344 and 2586 kPa) on vehicles built from December 11, 1998. This is the high pressure switch **set** point. The pressure may not reach the set point of the high pressure switch if the ambient air temperature is below 60°F (16°C).
   - 3.7 If the compressor disengages after 15 seconds, see **Table 12**.
   - 3.8 If the fan does not come on between 290 and 310 psi (1999 and 2137 kPa) on vehicles built before December 11, 1998 or between 340 and 375 psi (2344 and 2586 kPa) on vehicles built from December 11, 1998, see **Table 13** and refer to step 3 in the ACPU Control Rules section of Service Bulletin 83-58.
   - 3.9 Continue to observe the reading of the high pressure gauge on the service cart as the pressure falls. The compressor should re-engage at between 250 and 270 psi (1724 and 1862 kPa). This is the high pressure switch **reset** point. If the compressor does not re-engage at between 250 and 270 psi (1724 and 1862 kPa), see **Table 14**.

Troubleshooting

Problem—ACPU Not Reported on ServiceLink	
Possible Cause	**Remedy**
No power supply to the ACPU.	Check the voltage between pins D (ground) and F (power) at the frontwall harness connector to the ACPU. If the voltage is less than 11.0 volts, start checking for voltage drops.
Open J1587 circuit.	Check for voltage between pins A (J1587+) and B (1587-) at the frontwall harness connector to the ACPU using a voltmeter in AC mode. The reading on the J1587 bus should be a constantly varying voltage between 0.5 and 5 volts. If there is no voltage signal on the J1587 bus with the ignition on, check for an open circuit in the J1587 bus.
ACPU not responding.	Replace the ACPU with a binary switch. For instructions, see Service Bulletin 83-71.

Table 10, Problem-ACPU Not Reported on ServiceLink

Problem—Compressor Doesn't Engage for Initial (Lube) Cycle	
Possible Cause	**Remedy**
Normal operation	If the AC is on, the compressor will operate longer than 15 seconds after the initial engagement.
Active fault codes.	Use ServiceLink to download fault codes and perform necessary repairs.
Low air pressure.	Check the air pressure. It must be above 60 psi (414 kPa) for the compressor to engage.
The high pressure switch is reporting a high pressure situation to the ACPU	Check the resistance between the leads to the high pressure switch. If it is greater than one ohm, check the air conditioning system pressures. If the high side pressure is below 250 to 270 psi (1724 to 1862 kPa), replace the high pressure switch and use ServiceLink to reset the HPX switch counter.
The low pressure switch is reporting a low pressure situation to the ACPU.	Check the resistance between the leads to the low pressure switch. If it shows less than one ohm, check the air conditioning system pressures. If the low side pressure is above 34 psi (234 kPa), replace the low pressure switch.
Low or no battery power to the ACPU.	Check the voltage between pins D (ground) and F (power) at the frontwall harness connector to the ACPU. If the voltage is less than 11.0 volts, start checking for voltage drops.
ACPU is not operating correctly.	Replace the ACPU with a binary switch. For instructions, see Service Bulletin 83-71.

Table 11, Problem-Compressor Doesn't Engage for Initial (Lube) Cycle

Problem—The Compressor Doesn't Engage or Stays Engaged After the Initial (Lube) Cycle	
Possible Cause	**Remedy**
Active fault codes.	Use ServiceLink to download fault codes and perform necessary repairs.
High pressure switch reporting a high pressure situation to the ACPU.	Check resistance between the leads to the high pressure switch after the initial (lube) cycle. If the resistance is greater than one ohm and the pressure on the high side of the system is less than 250 to 270 psi (1724 to 1862 kPa), replace the high pressure switch and use ServiceLink to reset the high pressure switch counter.
No power from the thermostat to the ACPU.	With the AC on, check for voltage between pins D (ground) and C (thermostat) at the frontwall harness connector to the ACPU. If the voltage is less than 11.0 volts check the circuit from the main cab HVAC selector switch, through the thermostatic switch, to the ACPU.

Problem—The Compressor Doesn't Engage or Stays Engaged After the Initial (Lube) Cycle	
Possible Cause	**Remedy**
The thermostatic sensor detects an evaporator freeze condition.	Determine if the freeze condition should exist. Refer to the steps for the thermostatic switch in this subject.
The ACPU is not operating correctly.	Replace the ACPU with a binary switch. For instructions, see Service Bulletin 83-71.

Table 12, Problem-The Compressor Doesn't Engage or Stays Engaged After the Initial (Lube) Cycle

Problem—The Fan Doesn't Engage at the Set Point	
Possible Cause	**Remedy**
Fault code.	Check ServiceLink for fault codes, make necessary repairs, and clear fault codes with ServiceLink.
Temperature too cold.	If the ambient temperature is too cold (60°F [16°C] or below) the high side pressure may not reach the high pressure set point.
Low refrigerant charge.	If the system does not reach the high pressure set point, there may not be a proper charge in the air conditioning system.
Fan does not engage. Fan request lead is grounded.	Disconnect the main connector to the ACPU and start the engine. If the fan does not come on immediately check to see if the fan request lead from the ACPU to the engine control module is grounded.
The set point of the high pressure switch is incorrect.	Replace the high pressure switch and use ServiceLink to reset the HPX switch counter.
The ACPU is not operating correctly.	On increasing pressure, if the fan does not come on before the compressor shuts off, the ACPU is not operating correctly. Replace the ACPU with a binary switch. For instructions, see Service Bulletin 83-71.

Table 13, Problem-The Fan Doesn't Engage at the Set Point

Problem—The Compressor Doesn't Re-Engage at the Reset Point	
Possible Cause	**Remedy**
Fault code.	Check ServiceLink for fault codes, make necessary repairs, and clear fault codes with ServiceLink.
The reset point of the high pressure switch is incorrect.	Replace the high pressure switch and use ServiceLink to reset the high pressure switch counter in the ACPU.
The thermostatic sensor detects an evaporator freeze condition.	Determine if a freeze condition should exist. Refer to the information on the thermostatic switch in this subject.
The ACPU is not operating correctly.	Replace the ACPU with a binary switch. For instructions, see Service Bulletin 83-71.

* The thermostatic switch may cause the compressor to cycle. In these situations, the high-side pressure will vary when the reading is taken and the dash outlet temperature will be higher than normal. If this occurs, use the lowest high-side pressure readings (after the compressor has been running for a time).

Fig. 4, Heater and Air Conditioning With CDTC Wiring Schematic

General Description and Principles of Operation

The sleeper heater and air conditioner housings are self-contained, and include the heater core/evaporator coil, blower motor, and control valves. See **Fig. 1** and **Fig. 2**. They are mounted either in the baggage compartment or under the lower bunk, depending on the cab model.

The sleeper heater is plumbed directly to the engine, independent of the cab heater. The sleeper air conditioner is dependent on the cab's air conditioning system, sharing the same refrigerant and compressor.

The Automatic Temperature Control (A.T.C.) system automatically maintains the selected outlet temperature. For general information and principles of operation on the air conditioner, see Section 83.02, **Subject 050**.

The climate control panel for the sleeper heater and air conditioner is installed in various locations in the sleeper, depending on the sleeper size. See **Fig. 3**. Refer to the vehicle driver's manual for operating instructions.

Opening of the A.T.C. water supply solenoid valve allows engine-heated coolant to flow through the heater core. Heat is absorbed by air passing over the heater core fins.

The blower forces the heated air through the ducts and into the sleeper.

The water supply solenoid valve opens when the rotary temperature control knob is turned clockwise to HEAT.

The A.T.C. system has three major components:

- A.T.C Module

  —Supplies power to the water supply solenoid.

  —Monitors air output temperature.

  —Used with the temperature control knob to select the desired air output temperature.

- Water Supply Solenoid Valve

  —Receives power from the A.T.C. module.

  —Controls the supply of water to the heater core.

- Air Temperature Sensor

  —Monitors air output temperature.

With an A.T.C. system, a preselected temperature is maintained by directing the flow of hot water through the heater core.

Once the operator adjusts the temperature control knob, the air output temperature is monitored by an air temperature sensor at the sleeper heater and air conditioner unit. Any change in output temperature activates the A.T.C. module, energizing or de-energizing the water supply solenoid valve.

If the air is colder than the selected temperature, hot water is allowed to flow into the heater core. As the output temperature reaches the desired setting, the water supply solenoid valve closes, preventing hot water from entering the heater core, until air output temperature becomes too cool again. Then the process starts over.

A fan control knob controls a three-speed blower motor and allows the operator to choose the amount of air flow in the sleeper.

Safety Precautions

Whenever repairs are made to any air conditioner parts that hold R–134a refrigerant, you must recover, purge or flush (if contaminated), evacuate, charge, and leak test the system. In a good system, refrigerant lines are always under pressure and you should disconnect them only after the refrigerant charge has been recovered (discharged) at the service valves.

Refrigerant R–134a is safe when used under the right conditions. Always wear safety goggles and non-leather gloves while recovering, evacuating, charging, and leak testing the system. Do not wear leather gloves; when refrigerant gas or liquid contacts leather, the leather will stick to your skin.

⚠ WARNING

Use care to prevent refrigerant from touching your skin or eyes, because liquid refrigerant, when exposed to the air, quickly evaporates and will freeze skin or eye tissue. Serious injury or blindness could result if you come into contact with liquid refrigerant.

Refrigerant splashed in the eyes should be rinsed with lukewarm water, not hot or cold. Do not rub the eyes. Apply a light bandage and contact a physician right away.

Refrigerant splashed on the skin should be rinsed with lukewarm water, not hot or cold. Do not rub the skin. Apply a light coat of a nonmedicated ointment, such as petroleum jelly. Contact a physician right away.

R–134a refrigerant does not burn at ambient temperatures and atmospheric pressure. However, it can be combustible at pressures as low as 5.5 psig (139 kPa absolute) at 350°F (177°C) when mixed with air concentrations that are greater than 60 percent.

⚠ WARNING

R–134a air conditioning systems should not be pressure tested or leak tested with compressed air. Combustible mixtures of air and R–134a may form, resulting in a fire or explosion that could cause personal injury or property damage.

You must work in an area where there is a constant flow of fresh air when the system is recovered, evacuated, charged, and leak tested. R–134a vapors have a slightly sweet odor that is difficult to detect. Frequent leak checks and air monitoring equipment are recommended to ensure a safe working environment.

IMPORTANT: When servicing an R–134a air conditioning system, use only service equipment certified to meet the requirements of SAE J2210 (R–134a recycling equipment). The equipment should be operated only by qualified personnel who are familiar with the recycling station manufacturer's instructions.

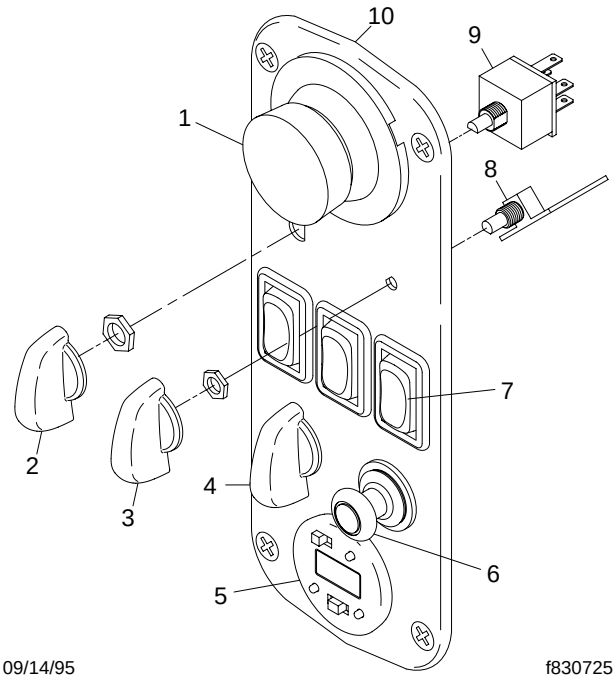
Because of its very low boiling point, refrigerant must be stored under pressure. To prevent the refrigerant containers from exploding, never expose them to temperatures higher than 125°F (52°C).

On R–134a refrigerant systems, polyalkylene glycol (PAG), or polyol ester (POE) oil is used in the compressor. When handling these oils, observe the following:

- Keep the oil free of contaminants;
- Do not expose the a/c system or the oil container to air for long periods of time; PAG and POE oils have a high moisture absorption capacity;
- Use care when handling: painted surfaces, plastic parts, and other components (drive belts) could be damaged if the oil is spilled on them;
- Never mix the oils with other types of refrigerant oil.

Automatic Temperature Control (A.T.C.) Module Replacement

1. Turn off the engine, apply the brakes, and chock the tires.
2. Remove the four screws that attach the control panel to the sleeper compartment wall, and pull the panel away from the wall. See **Fig. 1**.



1. Reading Lamp
2. Fan Control Knob
3. A.T.C. Control Knob
4. Volume Control Knob
5. Clock
6. Cigarette Lighter
7. Dome and Reading Light Switches
8. A.T.C. Control Module
9. Fan Control Switch
10. Control Panel

Fig. 1, Control Panel for A.T.C. System

3. Unplug the wiring connector at the A.T.C. control module.
4. Pull the temperature control knob off of the control switch stem. Remove the nut, and pull the module out of the back of the panel.
5. Install the new module and replace the nut. Replace the temperature control knob.
6. Connect the wiring connector at the A.T.C. module.
7. Install the control panel on the wall. Tighten the four screws firmly.
8. Remove the chocks from the tires.

Fan Control Switch Replacement

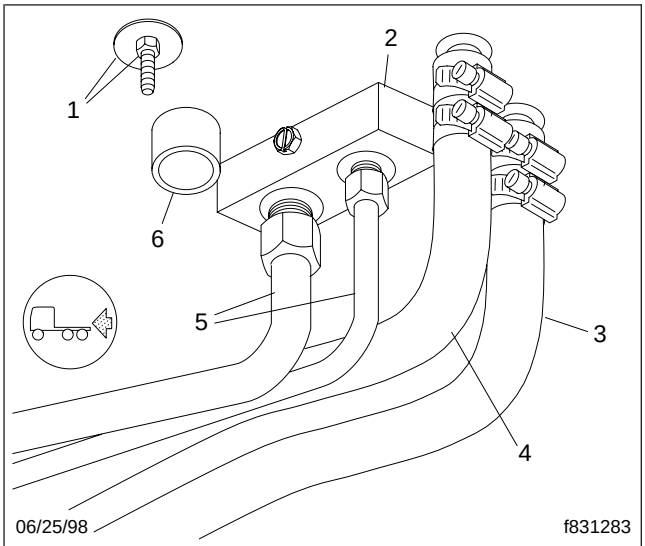
1. Turn off the engine, apply the brakes, and chock the tires.
2. Remove the four screws attaching the control panel to the sleeper compartment wall, and pull the panel away from the wall. See **Fig. 1**.
3. On fan control switches that have four wires, mark the four wires before unplugging them from the connectors. On all other fan control switches, unplug the connector from the switch.
4. Pull the fan control knob off of the control switch stem. Remove the nut, and pull the switch out of the back of the panel.
5. Install the new fan control switch and replace the nut. Position the knob so that the indicating dot aligns with OFF.

IMPORTANT: The tab on the positioning washer between the control panel and the switch should be in the upright position, and as level as possible in order to obtain the full range of the fan control knob.

6. Connect the wires to the switch, making sure the wires are connected to the correct tabs, or plug the connector to the switch.
7. Install the control panel on the wall. Tighten the four screws firmly.
8. Remove the chocks from the tires.

Removal

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Remove the refrigerant from the air conditioning system. For instructions, see **Section 83.02**, Subject 250.
3. Remove enough coolant from the radiator so that the level of coolant is below the inlet and outlet lines at the expansion valve, or clamp off the radiator hoses to prevent coolant loss.
4. From under the sleeper on the right-hand side of the vehicle, remove the standoff bracket (if equipped) that separates the water supply inlet and outlet lines. See **Fig. 1**. Mark the inlet and outlet lines for later reference and drain the heater core by disconnecting the inlet and outlet lines.
5. From under the sleeper, disconnect the refrigerant lines from the expansion valve. Quickly cap the expansion valve inlet and outlet ports and plug the fittings.



1. Mounting Fasteners
2. Expansion Valve
3. Inlet Line
4. Outlet Line
5. Refrigerant Lines
6. Drain Tube

Fig. 1, Expansion Valve

IMPORTANT: Under no circumstances should the expansion valve ports remain uncapped or the fittings remain unplugged for longer than five minutes total. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

6. From under the sleeper, remove the nuts and washers that attach the heater and air conditioner housing to the cab floor.
7. Access the sleeper heater and air conditioner housing.

   On vehicles with a baggage compartment on the right-hand side of the cab, open the door to the baggage compartment.

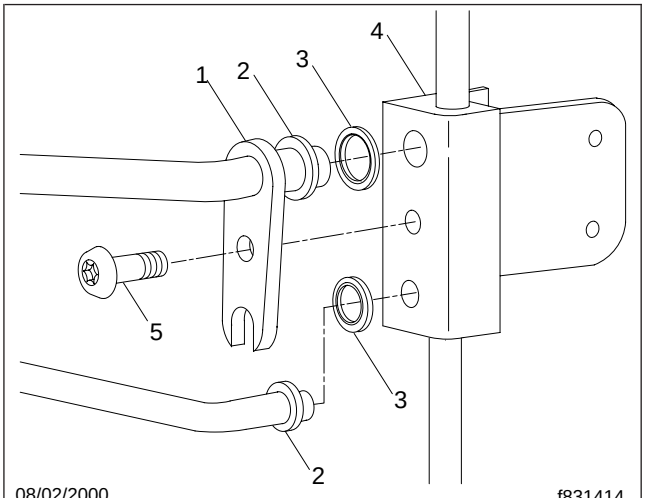
   On vehicles without a baggage compartment on the right-hand side of the cab, raise the mattress and bunk panel to the locked position.
8. Disconnect the wiring harnesses from the sleeper heater and air conditioner housing.
9. Remove the sleeper heater and air conditioner housing from the cab. Be sure not to damage the water drain tube or heater core/evaporator coil while removing the housing.

Installation

1. Place the sleeper heater and air conditioner housing on the cab floor. Make sure the heater core elbows, expansion valve, water drain tube, and mounting studs protrude through the floor.
2. From under the cab, install the washers and nuts on the mounting studs. Tighten the nuts 13 lbf·ft (18 N·m).
3. Connect the wiring harnesses to the sleeper heater and air conditioner housing.
4. Uncap the inlet and outlet ports on the expansion valve. Unplug the fittings. Check the fittings and the inlet and outlet ports. They must be clean and free of nicks, gasket residue, and other foreign material.
5. On hose connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

   On hose connections that have a SlimLine seal assembly (**Fig. 2**), replace the seals. **Do not** lubricate SlimLine seals prior to installation. Use **only** a SlimLine seal on a SlimLine seal assembly.

Heater and Air Conditioner Removal and Installation



1. Plate
2. Fitting
3. Seal
4. Block
5. Bolt

Fig. 2, A Typical SlimLine Seal Assembly

6. Attach the refrigerant lines to the expansion valve.

   On hose connections that have threaded fittings, tighten the #6 fitting 20 to 25 lbf·ft (27 to 34 N·m). Tighten the #10 and #12 fittings 35 to 40 lbf·ft (47 to 54 N·m).

   On hose connections that have a SlimLine seal assembly, torque the bolt on the SlimLine seal assembly 11 to 15 lbf·ft (15 to 20 N·m).

7. Install the standoff bracket (if equipped) that separates the water supply inlet and outlet lines. Attach the inlet and outlet lines to the heater core elbows as marked. Tighten the clamps 40 lbf·in (452 N·cm).

8. Evacuate and charge the air conditioning system. For instructions, see **Section 83.02**, Subject 250.

9. Fill the cooling system with coolant. For coolant specifications, see Group 20 of the *Century Class Trucks Maintenance Manual*.

⚠ CAUTION

Coolant must be filled to the proper level in the surge tank. Low coolant could cause engine overheating, which could damage the engine.

10. Start the engine, let it run for 20 to 30 seconds, and then shut it off. Install a pressure tester, test the cooling system at 10 psi (69 kPa), and then inspect for leaks. If leaks are found, tighten the hose clamps 40 lbf·in (452 N·cm) or replace the hoses as needed. Check the coolant level, and add coolant if needed.

11. Turn the temperature control knob clockwise for warm air.

12. Start the engine. When the radiator thermostat opens, air will be forced from the heater core as the coolant circulates. Check the coolant level again and add coolant if needed.

13. Lower the sleeper mattress and bunk panel or close the baggage compartment door.

14. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the brakes, and chock the tires.
2. Access the sleeper heater and air conditioner housing.

   On vehicles with a baggage compartment on the right-hand side of the cab, open the door to the baggage compartment.

   On vehicles without a baggage compartment on the right-hand side of the cab, raise the mattress and bunk panel to their locked position.
3. Remove the blower motor.

   3.1 Disconnect the blower motor cable assembly.

   3.2 On sleeper heater and air conditioner housings that have a one-piece front cover, remove the fasteners that attach the front cover to the housing. Remove the cover.

   On sleeper heater and air conditioner housings that have a recirculation filter, remove the filter screen and filter from the housing. See **Fig. 1**.

   3.3 Remove the mounting fasteners that attach the motor to the housing. See **Fig. 2**. Remove the blower motor from the housing.
4. Install a new blower motor.

   4.1 Install the fasteners that attach the blower motor to the housing. Tighten the fasteners firmly.

   4.2 Connect the blower motor cable assembly.

   4.3 On sleeper heater and air conditioner housings that have a one-piece front cover, use the fasteners to attach the front cover to the housing.

   On sleeper heater and air conditioner housings that have a recirculation filter, install the filter and filter screen on the housing.
5. Lower the mattress and bunk panel, or close the baggage compartment door.
6. Remove the chocks from the tires.

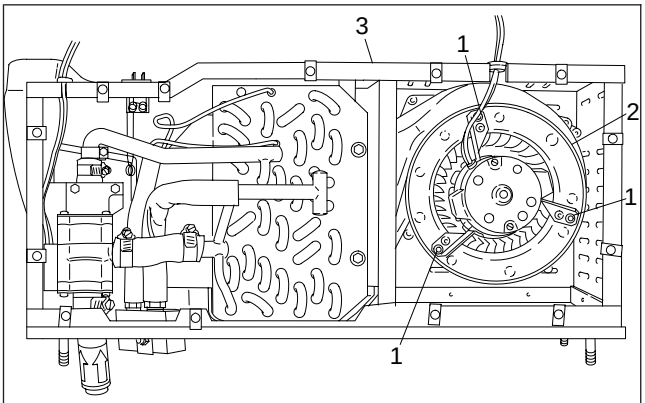
2. Filter Screen
3. Filter

Fig. 1, Sleeper Heater and Air Conditioner Housing With Recirculation Filter



1. Mounting Fastener
2. Blower Motor
3. Sleeper Heater and Air Conditioner Housing

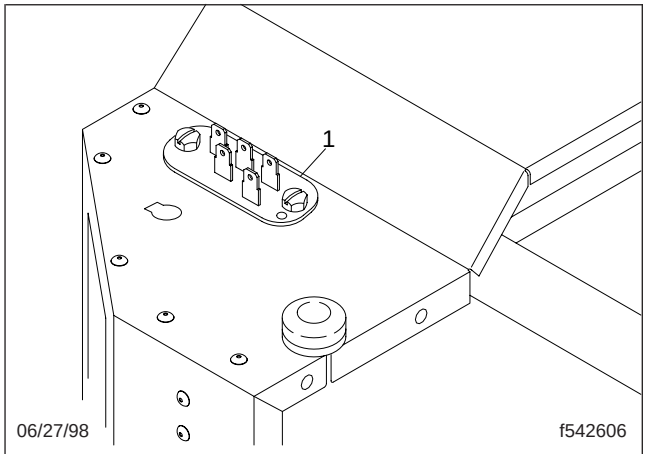
Fig. 2, Blower Motor

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Access the sleeper heater and air conditioner housing.

   On vehicles with a baggage compartment on the right-hand side of the cab, open the door to the baggage compartment.

   On vehicles without a baggage compartment on the right-hand side of the cab, raise the mattress and bunk panel to their locked position.
3. Disconnect the harness from the resistor block assembly. See **Fig. 1** and **Fig. 2**.



1. Resistor Block Assembly

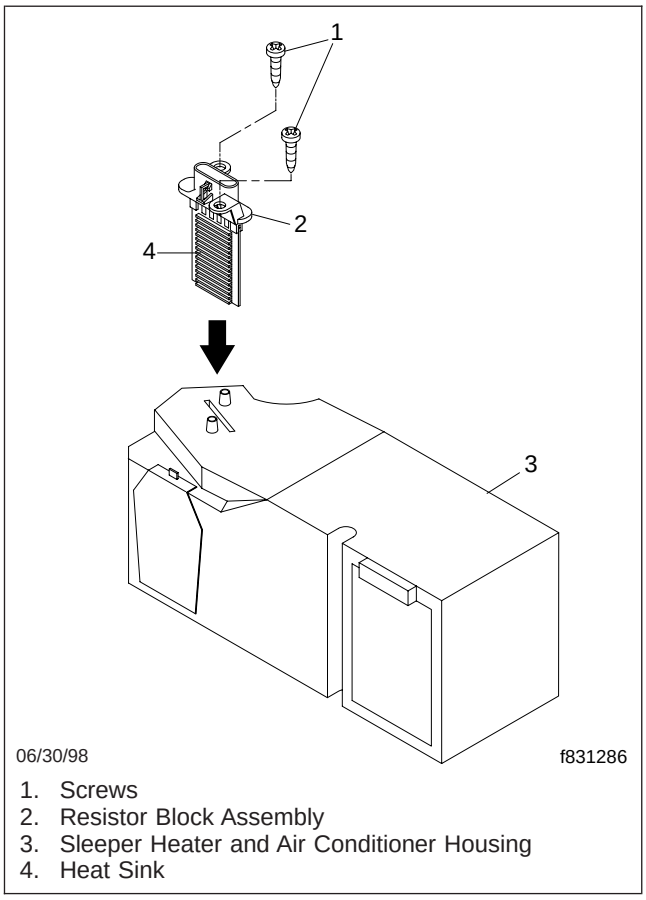
Fig. 1, HVAC Resistor Block, Older Style

4. Remove the screws that attach the resistor block assembly to the sleeper HVAC housing.
5. Remove the resistor block assembly.

CAUTION

Handle the resistor block assembly carefully. If the resistor block assembly is not handled carefully, the heat sink may be damaged or break off the board.

6. Install a new resistor block assembly.
7. Install the screws that fasten the resistor block assembly to the sleeper heater and air conditioner housing.



1. Screws
2. Resistor Block Assembly
3. Sleeper Heater and Air Conditioner Housing
4. Heat Sink

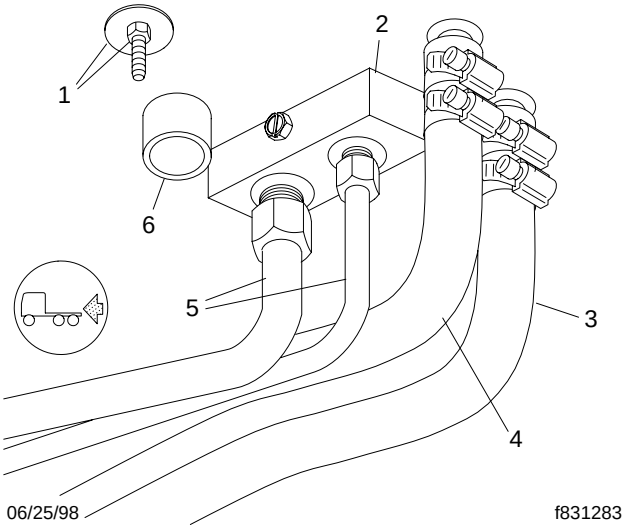
Fig. 2, HVAC Resistor Block, Newer Style

8. Connect the harness to the resistor block assembly.
9. Lower the mattress and bunk panel, or close the baggage compartment door.
10. Remove the chocks from the tires.

A.T.C. Water Supply Solenoid Valve Replacement

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Remove enough coolant from the radiator so that the level of coolant is below the inlet and outlet lines at the expansion valve, or clamp off the radiator hoses to prevent coolant loss.
3. From under the sleeper on the right-hand side of the vehicle, remove the standoff bracket (if equipped) that separates the water supply inlet and outlet lines. Drain the heater core by disconnecting the inlet line. See **Fig. 1**.



1. Mounting Fasteners
2. Expansion Valve
3. Inlet Line
4. Outlet Line
5. Refrigerant Lines
6. Drain Tube

Fig. 1, Expansion Valve

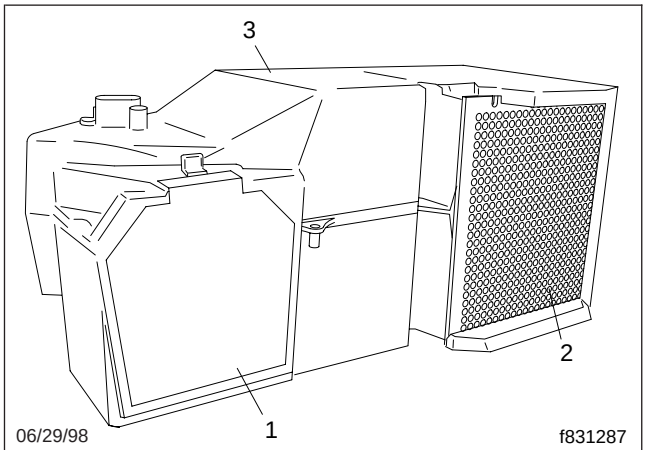
4. Access the sleeper heater and air conditioner housing.

   On vehicles with a baggage compartment on the right-hand side of the cab, open the door to the baggage compartment.

   On vehicles without a baggage compartment on the right-hand side of the cab, raise the mattress and bunk panel to their locked position.
5. Access the water supply solenoid valve.

   On sleeper heater and air conditioner housings that have a one-piece front cover, remove the fasteners that attach the front cover to the housing. Remove the cover.

   On sleeper heater and air conditioner housings that have a recirculation filter, remove the access panel on the front of the housing. See **Fig. 2**.

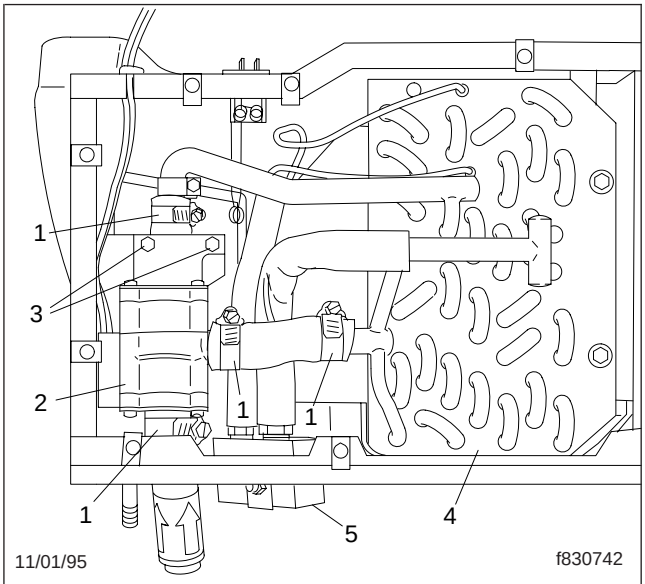


1. Access Panel
2. Filter Screen
3. Sleeper Heater and Air Conditioner Housing

Fig. 2, Sleeper Heater and Air Conditioner Housing With Recirculation Filter

6. Disconnect the water supply solenoid valve wiring harness.
7. Loosen the hose clamps on the hoses that are attached to the water supply solenoid valve, and remove the hoses. See **Fig. 3**.
8. Remove the fasteners that attach the water supply solenoid valve to the housing, and remove the valve.
9. Install a new water supply solenoid valve, and install the fasteners that attach the valve to the housing.
10. Connect the hoses to the water supply solenoid valve, and tighten the hose clamps.
11. Connect the wiring harness to the water supply solenoid valve.
12. Install the standoff bracket (if equipped) that separates the two heater hoses. Reconnect the inlet line under the sleeper. Tighten the clamps 40 lbf·in (452 N·cm).

A.T.C. Water Supply Solenoid Valve Replacement



1. Hose Clamp
2. Water Supply Solenoid Valve
3. Mounting Fasteners
4. Heater Core and Evaporator Coil Assembly
5. Expansion Valve

Fig. 3, A.T.C. Water Supply Solenoid Valve

13. Attach the front cover to the sleeper heater and air conditioner housing, or install the access panel on the housing.
14. Lower the bunk panel and the sleeper mattress, or close the baggage compartment door.
15. Fill the cooling system with coolant. For coolant specifications, see Group 20 of the *Century Class Trucks Maintenance Manual*.

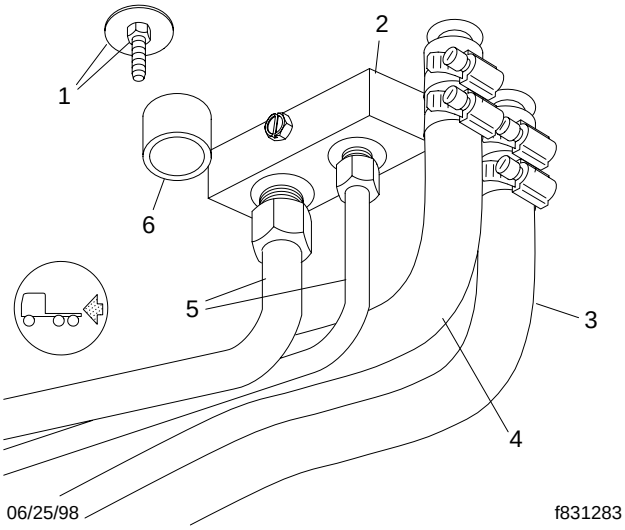
⚠ CAUTION

Coolant must be filled to the proper level in the surge tank. Low coolant could cause engine overheating, which could damage the engine.

16. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Remove the refrigerant from the air conditioning system. For instructions, see **Section 83.02**, Subject 250.
3. From under the sleeper on the right-hand side of the vehicle, disconnect the refrigerant lines from the expansion valve. See **Fig. 1**. Quickly cap the inlet and outlet ports, and plug the fittings.



1. Mounting Fasteners
2. Expansion Valve
3. Inlet Line
4. Outlet Line
5. Refrigerant Lines
6. Drain Tube

Fig. 1, Expansion Valve

IMPORTANT: Under no circumstances should the ports on the expansion valve remain uncapped or the fittings remain unplugged for longer than five minutes total. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

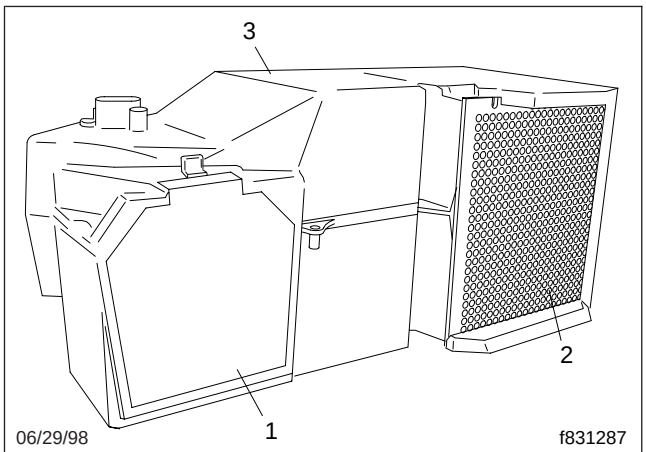
4. Remove enough coolant from the radiator so that the level of coolant is below the inlet and outlet lines at the expansion valve, or clamp off the radiator hoses to prevent coolant loss.
5. Access the sleeper heater and air conditioner housing.

   On vehicles with a baggage compartment on the right-hand side of the cab, open the door to the baggage compartment.

   On vehicles without a baggage compartment on the right-hand side of the cab, raise the mattress and bunk panel to their locked position.
6. Access the expansion valve.

   On sleeper heater and air conditioner housings that have a one-piece front cover, remove the fasteners that attach the front cover to the housing. Remove the cover.

   On sleeper heater and air conditioner housings that have a recirculation filter, remove the access panel on the front of the housing. See **Fig. 2**.



1. Access Panel
2. Filter Screen
3. Sleeper Heater and Air Conditioner Housing

Fig. 2, Sleeper Heater and Air Conditioner Housing With Recirculation Filter

7. Remove the A.T.C. water supply solenoid valve. For instructions, see **Subject 150**.
8. From inside the sleeper heater and air conditioner housing, disconnect the refrigerant lines from the expansion valve. Quickly cap the inlet and outlet ports and plug the fittings.
9. Remove the bolt and nut that attach the expansion valve to the mounting bracket, and remove the expansion valve.
10. Install a new expansion valve. Attach the expansion valve to the mounting bracket with the bolt and nut and tighten 96 lbf·in (1085 N·cm).

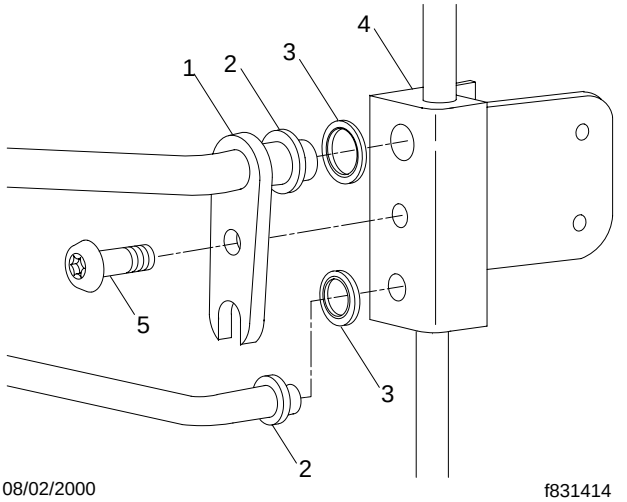
Expansion Valve Replacement

11. Uncap the inlet and outlet ports on the expansion valve. Unplug the fittings. Check the fittings, and the inlet and outlet ports. They must be clean and free of nicks, gasket residue, and other foreign material.
12. On hose connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

    On hose connections that have a SlimLine seal assembly (**Fig. 3**), replace the seals. **Do not** lubricate SlimLine seals prior to installation. Use **only** a SlimLine seal on a SlimLine seal assembly.
13. Install the refrigerant lines on the expansion valve.

    On hose connections that have threaded fittings, torque the #6 fitting 20 to 25 lbf·ft (27 to 34 N·m), and the #10/12 fittings 35 to 40 lbf·ft (47 to 54 N·m).

    On hose connections that have a SlimLine seal assembly, torque the bolt on the SlimLine seal block and plate assembly 11 to 15 lbf·ft (15 to 20 N·m).



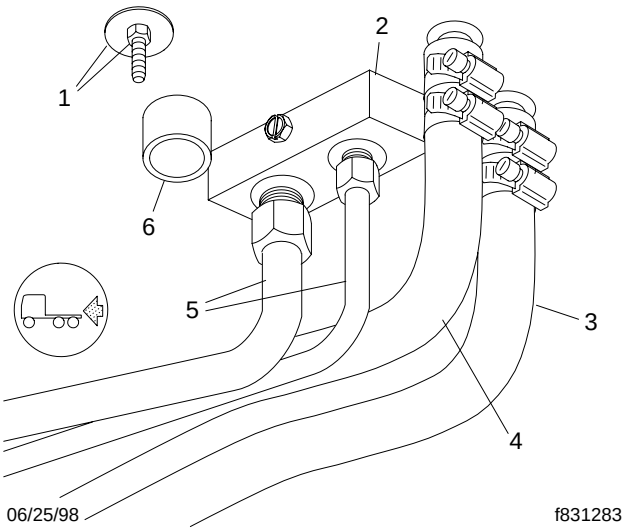
1. Plate
2. Fitting
3. Seal
4. Block
5. Bolt

Fig. 3, A Typical SlimLine Seal Assembly

14. Install the A.T.C. water supply solenoid valve. For instructions, see **Subject 150**.
15. Attach the front cover to the sleeper heater and air conditioner housing, or install the access panel on the housing.
16. Lower the bunk panel and the sleeper mattress, or close the baggage compartment door.
17. Evacuate and charge the air conditioning system. For instructions, see **Section 83.02**, Subject 250.
18. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Remove the refrigerant from the air conditioning system. For instructions, see **Section 83.02**, Subject 250.
3. Remove enough coolant from the radiator so that the level of coolant is below the inlet and outlet lines at the expansion valve, or clamp off the radiator hoses to prevent coolant loss.
4. From under the sleeper, remove the standoff bracket (if equipped) that separates the water supply inlet and outlet lines. Mark the water supply inlet and outlet lines for later reference and drain the heater core by disconnecting the inlet and outlet lines. See **Fig. 1**.



1. Mounting Fasteners
2. Expansion Valve
3. Inlet Line
4. Outlet Line
5. Refrigerant Lines
6. Drain Tube

Fig. 1, Expansion Valve

5. Access the sleeper heater and air conditioner housing.

   On vehicles with a baggage compartment on the right-hand side of the cab, open the door to the baggage compartment.

   On vehicles without a baggage compartment on the right-hand side of the cab, raise the mattress and bunk panel to the locked position.
6. Access the heater core and evaporator coil.

   On sleeper heater and air conditioner housings that have a one-piece front cover, remove the fasteners that attach the front cover to the housing. Remove the front cover.

   On sleeper heater and air conditioner housings that have a recirculation filter, remove the fasteners that attach the top cover to the housing. Remove the top cover.
7. Disconnect the wiring harnesses from the blower motor, the thermistor, the resistor block assembly, and the A.T.C. water supply solenoid valve.
8. Remove the A.T.C. water supply solenoid valve. For instructions, see **Subject 150**.
9. Disconnect the two refrigerant lines from the top of the expansion valve. Quickly cap the expansion valve inlet and outlet ports and plug the fittings.

IMPORTANT: Under no circumstances should the expansion valve ports remain uncapped or the fittings remain unplugged for longer than five minutes total. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

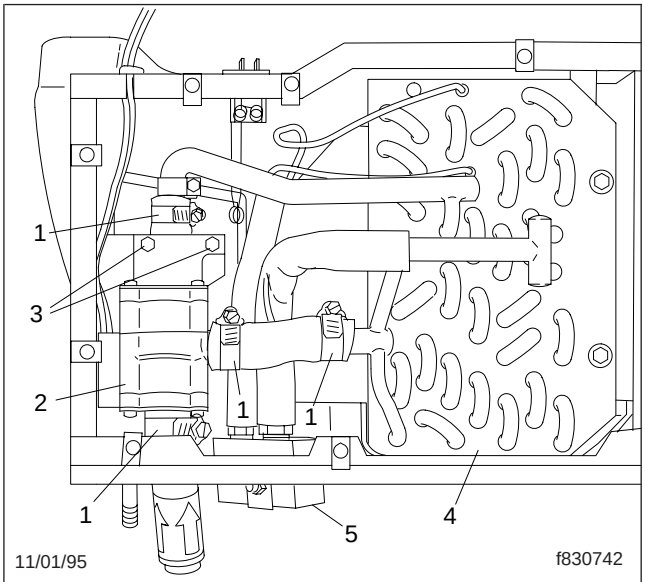
10. Remove the heater core and evaporator coil. See **Fig. 2**.

    10.1 On sleeper heater and air conditioner housings that have a one-piece front cover, remove the four fasteners that attach the heater core and evaporator coil to the housing, and lift the heater core and evaporator coil out of the housing.

    10.2 On sleeper heater and air conditioner housings that have a recirculation filter, lift the heater core and evaporator coil out of the housing.
11. Install a new heater core and evaporator coil.

    11.1 On sleeper heater and air conditioner housings that have a one-piece front cover, install a new heater core and evaporator coil and attach the assembly to the housing using four fasteners. Tighten the fasteners firmly.

Heater Core and Evaporator Coil Replacement



1. Hose Clamp
2. Water Supply Solenoid Valve
3. Mounting Fasteners
4. Heater Core and Evaporator Coil Assembly
5. Expansion Valve

Fig. 2, Heater Core and Evaporator Coil Assembly

11.2 On sleeper heater and air conditioner housings that have a recirculation filter, install a new heater core and evaporator coil.

12. Attach the water outlet line to the heater core.

13. On hose connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

    On hose connections that have a SlimLine seal assembly (**Fig. 3**), replace the seals. **Do not** lubricate SlimLine seals prior to installation. Use **only** a SlimLine seal on a SlimLine seal assembly.

14. Install the refrigerant lines on the expansion valve.

    On hose connections that have threaded fittings, torque the #8 fitting 30 to 35 lbf·ft (41 to 47 N·m), and the #10/12 fittings 35 to 40 lbf·ft (47 to 54 N·m).

    On hose connections that have a SlimLine seal assembly, torque the bolt on the SlimLine seal block and plate assembly 11 to 15 lbf·ft (15 to 20 N·m).

15. Install the A.T.C. water supply solenoid valve. For instructions, see **Subject 150**.

16. On sleeper heater and air conditioner housings that have a one-piece front cover, install the front cover on the housing and attach the fasteners to the cover.

17. On sleeper heater and air conditioner housings that have a recirculation filter, install the top cover on the housing and attach the fasteners to the cover.

18. Evacuate and charge the air conditioning system. For instructions, see **Section 83.02**, Subject 250 in this group.

19. Fill the cooling system with coolant. For coolant specifications, see Group 20 of the *Century Class Trucks Maintenance Manual*.

⚠ CAUTION

Coolant must be filled to the proper level in the surge tank. Low coolant could cause engine overheating, which could damage the engine.

20. Remove the chocks from the tires.

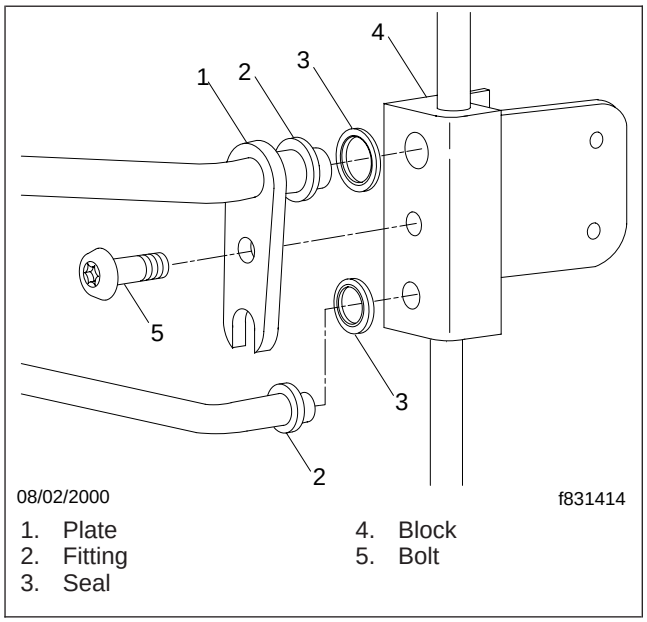


Fig. 3, A Typical SlimLine Seal Assembly

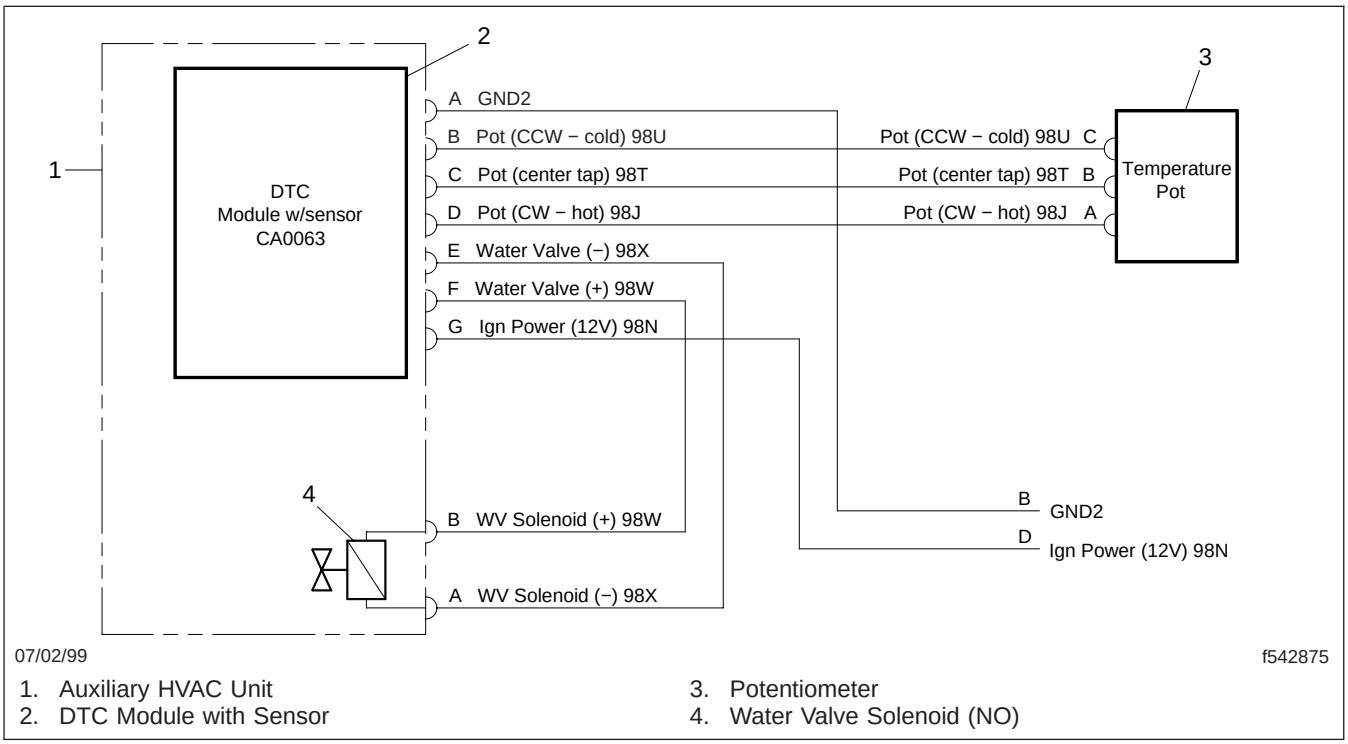
Troubleshooting

Auxiliary HVAC With Constant Discharge Temperature Control

The Constant Discharge Temperature Control (CDTC) module with sensor is mounted on the auxiliary HVAC unit under the bunk. The Discharge Temperature Control (DTC) module with sensor is shown in the diagram in **Fig. 1**. The DTC module receives input from the temperature control pot (potentiometer), which is mounted in the sleeper control panel.

Troubleshooting the CDTC System

Use the troubleshooting procedures in **Table 1** first.



1. Auxiliary HVAC Unit
2. DTC Module with Sensor
3. Potentiometer
4. Water Valve Solenoid (NO)

Fig. 1, Constant Discharge Temperature Control Diagram

CDTC System Initial Electrical Diagnosis				
Test No.	**Test Procedure**	**Test Criteria**	**Test Result**	**Action**
1	Measure voltage at the water valve by backprobing the connector. Voltage should be approximately 12V.	• Engine running • Engine at normal operating temperature • Temperature setting at **full cold**	OK	**Go to test no. 2.**
			Not OK	**Go to test no. 3.**

Troubleshooting

CDTC System Initial Electrical Diagnosis				
Test No.	**Test Procedure**	**Test Criteria**	**Test Result**	**Action**
2	Measure voltage at the water valve by backprobing the connector. Voltage should be approximately 0V.	• Engine running • Engine at normal operating temperature • Temperature setting at **full hot**	OK	There are no apparent electrical problems with the system. With the engine at normal operating temperature, hot air should come from the vents when the temperature setting is **full hot**. When switched to **full cold**, cooler air should come from the vents within approximately 10 minutes. If the system does not operate as stated above, refer to one of the following: • For little or no heat symptom, see **Table 4**. • For blowing warm/hot air symptom, see **Table 5**.
			Not OK	Perform tests in **Table 2**, CDTC System Temperature Potentiometer Test.
3	Repeat test no. 1 using a known good ground instead of water valve ground wire. Voltage should be approximately 12V.	• Engine running • Engine at normal operating temperature • Temperature setting at **full cold**	OK	**Go to test no. 4.**
			Not OK	Perform tests in **Table 2**, CDTC System Temperature Potentiometer Test.
4	Check the ground wire to the controller (terminal A).	—	OK	Perform tests in **Table 2**, CDTC System Temperature Potentiometer Test.
			Not OK	Repair controller ground circuit.

Table 1, CDTC System Initial Electrical Diagnosis

Use the troubleshooting procedures in **Table 1** before using the procedures in **Table 2**.

CDTC System Temperature Potentiometer Test			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Disconnect the temperature potentiometer from the harness. Using an ohmmeter, measure the potentiometer resistance as follows: • A to B (knob full CCW) 8000 to 12,000 ohms • A to B (knob full CW) 40 to 60 ohms • B to C (knob full CCW) 40 to 60 ohms • B to C (knob full CW) 8000 to 12,000 ohms NOTE: Resistance ranges are approximate.	OK	**Go to test no. 2.**
		Not OK	Replace temperature potentiometer.
2	Connect the potentiometer. Disconnect the harness from the controller. Using an ohmmeter, measure the potentiometer resistance through the harness pins at the controller as follows: • C to D (knob full CCW) 8000 to 12,000 ohms • C to D (knob full CW) 40 to 60 ohms • B to C (knob full CCW) 40 to 60 ohms • B to C (knob full CW) 8000 to 12,000 ohms NOTE: Resistance ranges are approximate.	OK	Temperature potentiometer and wires are okay. Perform tests in the table titled CDTC System Controller Test.
		Not OK	Repair wiring between temperature potentiometer and CDTC controller.

Table 2, CDTC System Temperature Potentiometer Test

Use the troubleshooting procedures in **Table 1** and **Table 2** before using the procedures in **Table 3**.

CDTC System Controller Test				
Test No.	**Test Procedure**	**Test Criteria**	**Test Result**	**Action**
1	Disconnect the harness from the CDTC controller. Measure voltage across pins A and G. Voltage should be approximately 12V.	• Ignition on • CDTC controller disconnected	OK	**Go to test no. 2.**
			Not OK	Check power supply wire and fuse to CDTC controller. Check CDTC controller ground circuit. Repair as necessary.

Troubleshooting

CDTC System Controller Test				
Test No.	**Test Procedure**	**Test Criteria**	**Test Result**	**Action**
2	Connect the harness to the CDTC controller. Measure voltage by backprobing one meter lead to pin F and placing the other lead to a known good ground. Voltage should be approximately 12V.	• Ignition on • CDTC controller connected	OK	**Go to test no. 3.**
			Not OK	Replace the CDTC controller.
3	Measure voltage by backprobing pins F and E of the CDTC controller connector. Voltage readings should be: • Slightly less than 12V when the control knob is **full cold** (CCW) • 0V when the control knob is **full hot** (CW).	• Ignition on • CDTC controller connected	OK	No problem found. Repeat tests **Table 1**.
			Not OK	Replace the CDTC controller.

Table 3, CDTC System Controller Test

Use the troubleshooting procedures in **Table 1** before using the procedures in **Table 4**.

CDTC System Special Test-Symptom: Little or No Heat and Passes All Electrical Tests			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Check to make sure that the coolant source from the engine is connected to the inlet pipe on the water valve.	OK	**Go to test no. 2.**
		Not OK	Route hose to correct connections.
2	Check to make sure that the water inlet hose at the water valve is hot.	OK	Check for blocked heater core and repair as necessary.
		Not OK	Check for closed heater hose shutoff valve. If okay or not present, repair engine cooling system as necessary.

Table 4, CDTC System Special Test-Symptom: Little or No Heat and Passes All Electrical Tests

Use the troubleshooting procedures in **Table 1** before using the procedures in **Table 5**.

CDTC System Special Test-Symptom: Blows Warm/Hot Air and Passes All Electrical Tests			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Remove the water valve and visually inspect the inside of the outlet tube to see if the plunger is broken or if debris is preventing the plunger from seating properly.	OK	Problem not found.
		Not OK	If plunger is broken, replace the water valve. If debris is present, clean the cooling system.

Table 5, CDTC System Special Test-Symptom: Blows Warm/Hot Air and Passes All Electrical Tests

See **Table 6** for the electrical pinout descriptions of the DTC module.

DTC Module Pinout	
Pin	**Electrical Function**
A	Ground 2
B	Potentiometer (CCW–cold) 98U
C	Potentiometer (center tap) 98T
D	Potentiometer (CW–hot) 98J
E	Water Valve (–) 98X
F	Water Valve (+) 98W
G	Ignition Power (12V) 98N

Table 6, DTC Module Pinout

Specifications

See **Fig. 1** for the sleeper heater and air conditioner wiring diagram.

Torque Specifications		
Description	**Torque**	
	lbf·in (N·cm)	**lbf·ft (N·m)**
Heater and Air Conditioner Mounting Locknuts	—	13 (18)
Heater Hose Clamps	40 (452)	—
Refrigerant Line (Inlet Side) #6 O-Ring Fitting *	—	20–25 (27– 34)
Refrigerant Line (Outlet Side) #10 O-Ring Fitting *	—	35–40 (47–54)
Blower Motor Mounting Capscrews	28–32 (320–360)	—
Expansion Valve Mounting Bolt	96 (1085)	—

* Replace the O-ring and lubricate it with mineral oil. Apply mineral oil to the male portion of the fitting threads. If equipped with aluminum fittings, apply Molykote M Gear Guard to the male portion of the fitting threads.

Table 1, Torque Specifications

SlimLine Seal Assembly Bolt Torques	
HVAC Component	**Torque**
A/C Compressor	11 to 15 lbf·ft (15 to 20 N·m)
Condenser	11 to 15 lbf·ft (15 to 20 N·m)

5. Water Supply Solenoid Valve
6. Temperature Sensor
7. Automatic Temperature Control Module

Fig. 1, Sleeper Heater and Air Conditioner Wiring Diagram

General Information

The heater and air conditioner assembly is mounted behind the passenger dash panels and contains the following major components:

- brushless blower motor
- evaporator core
- heater core
- a recirculation filter
- an optional outside air filter
- three electric actuators
- temperature control, air selection mode, and recirculation doors
- expansion valve
- evaporator temperature sensor

The heating, air conditioning, and ventilating functions of the cab heater and air conditioner system are controlled by the cab climate control panel mounted on the dashboard. Refer to the *Century Class S/T and Coronado Driver's Manual* for operating instructions.

Thermodynamic Principles

Air conditioning is the cooling or refrigeration of the air in the passenger compartment. Refrigeration is accomplished by making practical use of three thermodynamic principles. These principles and their practical application are described below.

Heat Transfer

If two objects of different temperatures are placed near each other, the heat in the warmer object will always travel to the cooler object until both are of equal temperature.

For example, a block of ice in a refrigerator does not transfer its coldness to a nearby carton of milk. Rather, the heat in the warm milk automatically flows to the ice.

The British Thermal Unit (BTU) is used to determine the amount of heat transferred from one object to another. One BTU is the amount of heat required to raise the temperature of 1 pound (0.45 kg) of water 1°F (0.55°C).

For example, to raise the temperature of 1 pound (0.45 kg) of water from 32°F to 212°F (0°C to 100°C), one BTU of heat must be added for 1°F (0.55°C) rise in temperature or a total of 180 BTUs of heat. Conversely, in order to lower the temperature of 1 pound (0.45 kg) of water from 212°F to 32°F (100°C to 0°C), 180 BTUs of heat must be removed from the water.

Latent Heat of Vaporization

When a liquid boils, it absorbs heat without raising the temperature of the resulting gas. When the gas condenses (changes back to a liquid), it gives off heat without lowering the temperature of the resulting liquid.

For example, when 1 pound (0.45 kg) of water at 32°F (0°C) is placed in a container over a flame, the temperature of the water rises 1°F (0.55°C) with each BTU of heat that the water absorbs from the flame. Thus, after it has absorbed 180 BTUs of heat, the water reaches a temperature of 212°F (100°C).

Even though the flame continues to give its heat to the water, the temperature of the water remains at 212°F (100°C). The water however starts to boil or change from a liquid to a gaseous state. It continues to boil until the water has passed off into the atmosphere as vapor. If this vapor were checked with a thermometer, it also would show a temperature of 212°F (100°C).

In other words, there was a rise of only 180°F (from 32°F to 212°F or 0°C to 100°C) in the water and vapor temperature even though the flame applied many more than 180 BTUs of heat. In this case, the heat is absorbed by the liquid in the process of boiling and disappears in the vapor. If the vapor were brought in contact with cool air, the hidden heat would flow into the cooler air and the vapor would condense back to water. Scientists refer to this principle as the latent (hidden) heat of vaporization.

Water has a latent heat of vaporization of 970 BTUs and a boiling point of 212°F (100°C). This means that 1 pound (0.45 kg) of water at 212°F (100°C) will absorb 970 BTUs of heat when changing to vapor at 212°F (100°C). Conversely, the vapor will give off 970 BTUs of heat when condensing back to water at 212°F (100°C).

This heat transfer, occurring when a liquid boils or a vapor condenses, forms the basic principle of all conventional refrigerant systems.

General Information

For a liquid to be a refrigerant, it must also have a low boiling point. That is, the temperature at which it boils must be lower than the substance to be cooled.

R–134a is a non-CFC refrigerant. Its temperature/pressure relationship makes it suitable for mobile air conditioning systems.

Effect of Pressure on Boiling or Condensation

As refrigerant passes through an air conditioning system, it flows under high-pressure conditions, first as a high-pressure vapor between the refrigerant compressor and the condenser, then as a high-pressure liquid between the condenser and the evaporator orifice. It expands to a low-pressure vapor between the evaporator orifice and the refrigerant return port in the refrigerant compressor. As pressures in the closed refrigerant circuit vary, temperatures will also vary. As pressure increases, temperatures also increase; as the pressure decreases, temperatures also decrease. See **Fig. 1** for a diagram of the refrigerant flow.

Description of Components

Binary Switch

Located on the liquid line from the receiver-drier, the binary switch disengages the refrigerant compressor to protect it from harmful operating conditions. It performs two functions:

- If the refrigerant system pressure is too low, the binary switch will keep the compressor from operating. The switch disengages the compressor when the pressure on the high pressure side of the system falls between 27 and 35 psig (186 and 241 kPa). Normal compressor operation resumes when the rising pressure reaches 28 to 36 psig (193 to 248 kPa) above the shutoff pressure. This occurs when the ambient temperature falls to around 31 to 40°F (–0.56 to 4°C) or when refrigerant has leaked out of the system.
- If the refrigerant system pressure on the high pressure side increases to between 427 and 484 psig (2944 and 3337 kPa), the binary switch shuts off the compressor clutch. Too much pressure may be caused by excess refrigerant in the system or anything that causes poor condenser performance such as poor air flow through the condenser. When the system pressure has decreased to 313 to 426 psig (2158 to 2937 kPa), the compressor resumes operation.

NOTE: Since the binary switch is on the high pressure side, the compressor may continue to operate (trying to cool the cab) if most, but not all, of the refrigerant leaks out of the system until the air conditioner is turned off or the vehicle is shut down for a short time. Continuing to run the compressor with a low charge can lead to a lack of lubrication and high temperatures in the compressor.

Blower Motor

The brushless blower motor forces air through the HVAC assembly and through the duct work.

Condenser

A condenser turns hot refrigerant gas coming from the compressor into liquid. The condenser is mounted either in front of or below the radiator. Because of its location, the condenser transfers heat to air that is drawn in by the engine fan and by air that is forced into the engine compartment as the vehicle moves forward.

Electric Actuator

The electric actuator is a combined motor and gearbox and is used to drive the levers and doors within the HVAC assembly. Movement of the levers and doors is controlled by the settings on the climate control panel. There are three actuators on the HVAC assembly: a temperature actuator, a recirculation actuator, and a mode actuator.

Evaporator

Because the evaporator is an area of low pressure in the system, the boiling point of refrigerant lowers, which causes it to absorb heat from the tubing walls and fins. As it absorbs heat, liquid refrigerant quickly boils and turns into a gas.

As heat is absorbed from the outside surfaces of the evaporator, air passing over the unit loses its heat to these cooler surfaces. Moisture in the air condenses

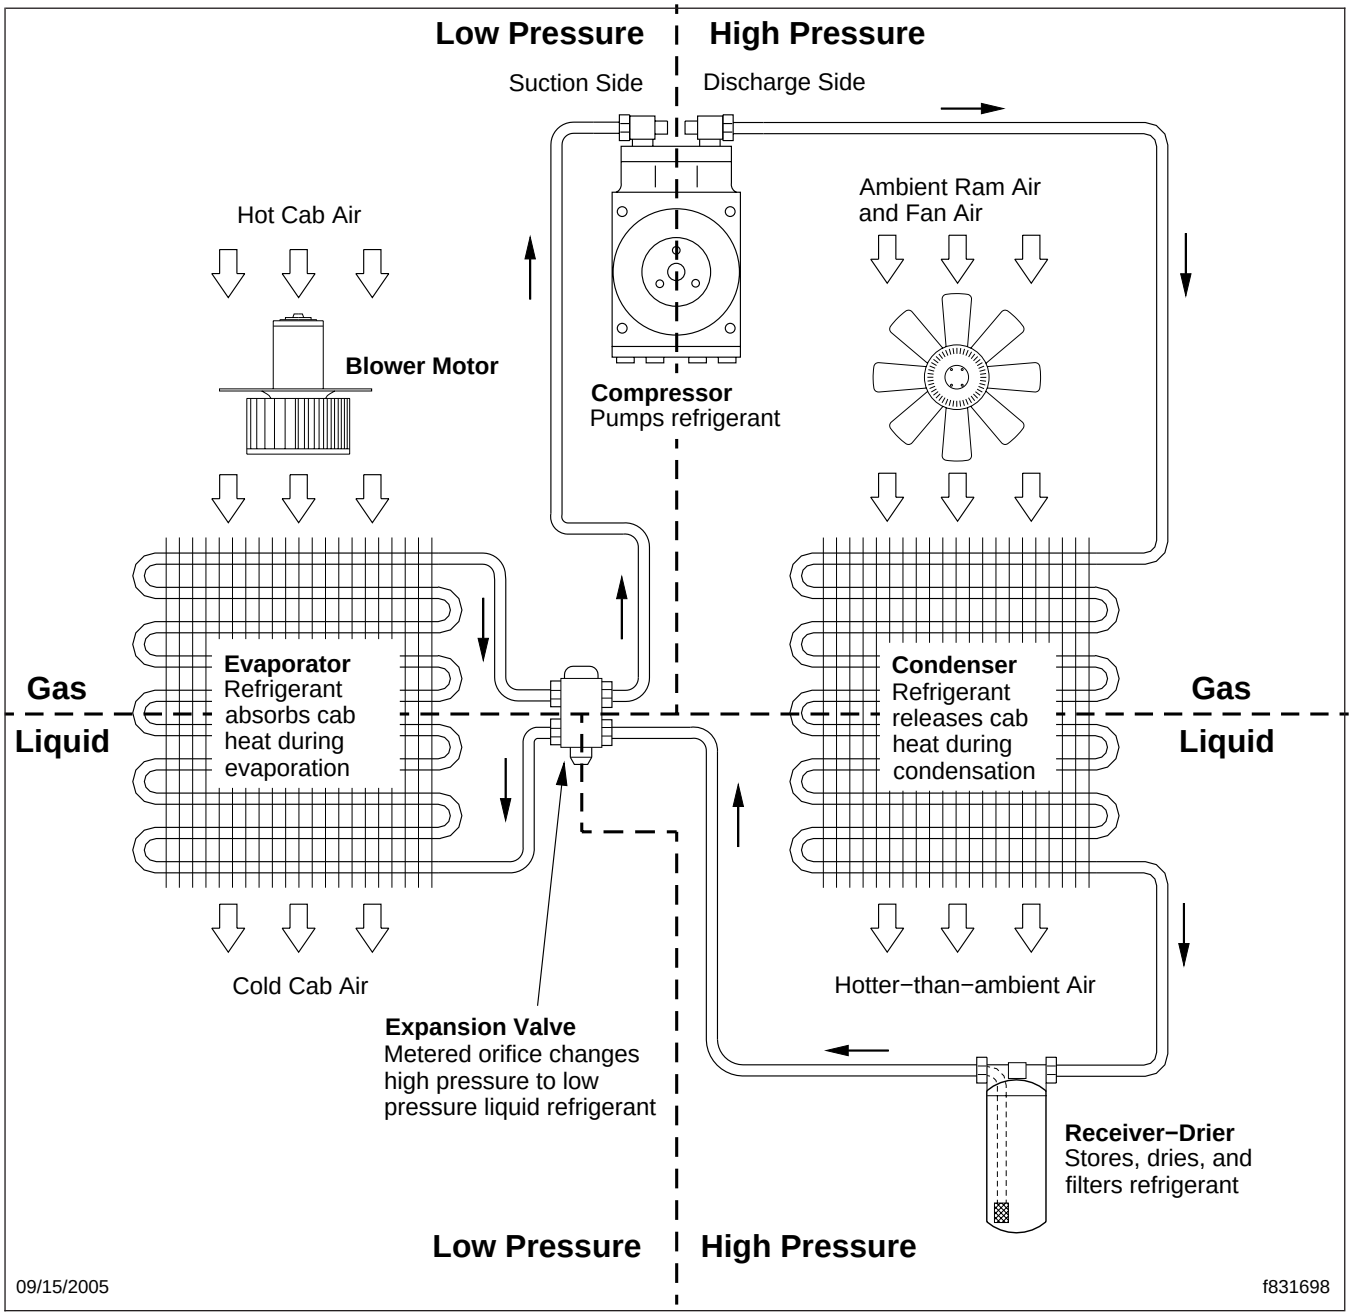

Fig. 1, Refrigerant Flow Diagram

on the outside of the evaporator and drains off as water; the air becomes dehumidified.

Evaporator Temperature Sensor

The temperature of the evaporator is monitored by the evaporator temperature sensor.

The evaporator temperature sensor is in front of the evaporator. The temperature sensor disengages the compressor to prevent the evaporator from freezing up due to, for example, an expansion valve that is stuck open.

Expansion Valve

The expansion valve is a dividing point between the high- and low-pressure parts of the refrigerant system. High-pressure liquid refrigerant from the condenser passes through the expansion valve and moves into the low-pressure area of the evaporator.

An expansion valve controls the flow rate of refrigerant in proportion to the rate of evaporation in the evaporator. If the amount of liquid in the evaporator drops off, the temperature of the gas going to the compressor rises. This causes a diaphragm in the expansion valve to react, which causes an orifice in the valve to open or close. Through the orifice, liquid refrigerant is metered into the evaporator as needed.

Fan Cycling Switch

Located on the junction block liquid line, the fan cycling switch sends a ground signal to the ECM (engine control module) to keep the fan off and take away the ground to engage the fan. The fan will come on if refrigerant pressure is greater than 300 ± 10 psi (2070 ± 69 kPa). The fan turns off when pressure drops below 250 ± 10 psi (1725 ± 69 kPa) and the engine ECU timer (0 to 180 seconds) has expired.

Heater Core

When the engine is on, coolant flows through the heater core tubes heating the tubes and fins. The heat is absorbed by air that is forced through the heater core by the blower motor.

Receiver-Drier

Used as a reservoir and filter for liquid refrigerant from the condenser, a receiver-drier also removes water and acids from the refrigerant. The water-absorbing material, or desiccant, in the unit helps stop blockages from forming in the expansion valve and in other parts of the system.

Refrigerant

Refrigerant absorbs heat from the air in the cab and releases it to the air outside the cab.

In an open container, refrigerants boil at temperatures below the freezing point of water. Sealing and pressurizing refrigerant in the air conditioning system raises its boiling-point temperature.

During refrigerant compressor operation, refrigerant constantly changes from a liquid to a gas. It absorbs heat (boiling) in the low-pressure evaporator and it changes from a gas to a liquid as it releases absorbed heat in the high-pressure condenser.

Refrigerant Compressor

Heat in the low-pressure gas of the evaporator is not heat that can be noticed by touch because liquid refrigerant boils at a temperature much lower than the temperature at which water turns to ice. By touch, the heated gas in the evaporator is very cold. As a result, there is the problem of how to remove heat from cool gas using outside air that may be higher than 100°F (38°C).

With a refrigerant compressor, low-pressure gas from the evaporator can be squeezed into a much smaller space. When the gas is compressed, the heat it contains becomes concentrated. In this way, the gas is made hotter than the outside air without adding heat.

Another function of the compressor is to move refrigerant through the system.

Definition of Terms

Refer to the following terms for a better understanding of the heater and air-conditioning system.

Air Conditioner A system used to control the temperature, humidity, and movement of air in the cab.

Ambient Air Temperature The temperature of air around an object or the outside temperature.

Binary Switch Disengages the refrigerant compressor to protect it from harmful operating conditions.

Blower Motor A brushless blower motor forces air through the HVAC assembly and through the duct work.

Boiling Point The temperature at which a liquid changes to a gas. The boiling point varies with pressure.

Bulk Charging Use of large containers of refrigerant for charging a refrigerant system. Normally used for charging empty systems.

Charge A specific amount of refrigerant or oil by volume or weight. Also, the act of placing an amount of refrigerant or oil in the air conditioning system.

Condensate Water taken from the air, which forms on the outer surface of the evaporator.

Condenser A heat exchanger that is used to remove heat from the refrigerant, changing it from a high-pressure hot gas to a high-pressure warm liquid. Typically the condenser is mounted in front of the radiator.

Condensing Pressure Pressure as read from the gauge at the discharge service valve. Pressure from the discharge side of the compressor into the condenser.

Contaminants Anything other than refrigerant or refrigerant oil in the system. Usually means water, dirt, or air in the system.

Cycling Clutch System A system which controls compressor clutch operation in order to raise or lower the temperature in the cab.

Dehumidify To remove water from the air at the evaporator.

Dehydrate To remove all traces of moisture from the refrigerant system. This process occurs during evacuation.

Desiccant A drying agent used in the receiver-drier to remove water and create an extremely dry condition.

Discharge Line Connects the refrigerant compressor outlet to the condenser inlet.

Discharge Pressure High-side pressure or condensing pressure being discharged from the compressor.

Drive Pulley A pulley attached to the front of the engine crankshaft. It drives the compressor clutch pulley with a belt.

Duct A passageway for the transfer of air from one area to another.

Electric Actuator The actuator is a combined motor and gearbox used to drive the temperature control doors and the air selection mode door within the HVAC assembly.

Evacuate To place a high vacuum in the refrigerant system and dehydrate or remove all traces of moisture.

Evaporate To change state from a liquid to a gas.

Evaporator A component in which liquid refrigerant changes to a gas after it absorbs heat from the air. It also removes some moisture from the air.

Expansion Valve A device that causes a pressure-drop of the refrigerant and also regulates its flow.

Flooding A condition caused by too much liquid refrigerant going into the evaporator, usually caused by an expansion valve that is stuck open.

Flushing A process of passing liquid refrigerant through an air-conditioner component to remove dirt and water from the part. Liquid refrigerant removes heavy contamination, such as gritty dirt and large dirt buildup.

Freeze-Up Failure of a unit to operate properly because of ice forming at the expansion valve orifice or on the evaporator.

Heater Core A part of the heating system in which hot engine coolant flows to provide heat to the cab or to adjust the temperature produced by the air conditioner.

High-Pressure Switch Located on the discharge side of the refrigerant compressor, the high-pressure switch signals the fan on and the refrigerant compressor off in the event of a high pressure condition.

High-Side Service Valve A device located on the liquid line. It allows high-side pressure to be checked and other service operations to be performed.

Humidity The amount of water vapor in the air.

Hydraulic Lock The return of liquid refrigerant to the compressor, which could destroy the unit.

Leak Detector Any device used to detect refrigerant leaks in a refrigerant system.

Liquid Pressure Pressure of refrigerant in the liquid line from the receiver-drier to the thermostatic expansion valve.

Low Head Pressure High-side pressure that is lower than normal due to a system problem.

Low-Pressure Switch Located on the suction side of the refrigerant compressor, the low pressure switch signals the clutch to cycle or shut down in extremely cold temperatures, or if there is a loss of charge.

General Information

Low Suction Pressure Low-side pressure that is lower than normal due to a system problem.

Magnetic Clutch An electrical coupling device used to engage or disengage the compressor.

Manifold A device to control refrigerant flow for system test purposes. It is used with manifold gauges.

Manifold Gauge A calibrated instrument used for measuring system pressures.

Manifold Gauge Set A manifold that is complete with gauges and charging hoses and is used to measure or test pressure.

Micron A metric unit of length equal to one-millionth of a meter. The unit of measure used to measure vacuum drawn from a refrigerant system by a vacuum pump.

Nitrogen A colorless, odorless, dry, inert gas.

Opacity A condition that is used to describe contamination of refrigerant oil in the compressor. Fresh refrigerant oil is clear; when contaminated, it appears cloudy or may have fine particles held in suspension.

Overcharge Too much refrigerant or oil in the system.

Polyalkylene Glycol (PAG) A highly refined, synthetic oil that is used in R–134a air conditioning systems.

Polyol Ester (POE) A highly refined, synthetic oil that is used in R–134a air conditioning systems.

psia Pounds per square inch, absolute pressure. Pressure exerted by the air at sea level. Atmospheric pressure is usually measured with a mercury barometer.

psig Pounds per square inch, gauge pressure. Any pressure above normal atmospheric pressure (14.7 psi) is referred to as gauge pressure.

Receiver-Drier A combination desiccant, filter, and storage container for liquid refrigerant.

Recovery Removal of the refrigerant from air conditioning systems.

Recycling Removal of contaminants and moisture from R–134a using a recovery and recycling station.

Refrigerant–134a (R–134a) The cooling agent used in automotive air conditioning systems. The chemical name for R–134a is tetrafluoroethane.

Refrigerant Compressor A device used to draw low-pressure refrigerant gas from the evaporator and squeeze it into a high-temperature, high-pressure gas. A second purpose of the compressor is to move refrigerant through the system.

Refrigeration Cycle The complete circulation of refrigerant through an air conditioning system accompanied by changes in temperature and pressure.

Relative Humidity The actual water content of the air in relation to the total water vapor the air can hold at a given temperature.

Suction Line The line connecting the evaporator outlet to the compressor inlet.

Suction Pressure Compressor inlet pressure or the system's low-side pressure.

Suction Service Valve A device that allows low-side pressure to be checked and other service operations to be performed.

Suction Side The low-pressure area of the system extending from the expansion valve to the compressor inlet.

Thermistor A vacuum pressure sensor that is used to measure, in microns of mercury, internal system vacuum levels after evacuation.

Thermostatic Vacuum Gauge A high-vacuum gauge sensitive to pressures ranging from atmospheric pressure to less than 1 micron of mercury with scales reading from 25,000 microns to 1 micron of mercury.

Undercharge A system low on refrigerant resulting in lack of cooling and possible compressor damage.

Vacuum Refers to pressure that is less than atmospheric pressure.

Vacuum Pump A mechanical device used to evacuate and place a high vacuum in the refrigerant system.

Vacuum Pump Oil Water soluble oil used in some vacuum pumps to absorb moisture from the refrigerant system.

Vapor The gaseous state of a material.

Principles of Operation

In a blend air HVAC system, the heater core is always filled with warm or hot coolant. Air enters the HVAC assembly through the blower and is always directed through the evaporator. If the refrigerant compressor is engaged, the air is cooled. The tem-

perature control doors then direct the air through or around the heater core depending on the climate control settings. The temperature control doors are used to blend the correct amount of cold and hot air to achieve the selected temperature. The temperature control door, the air selection mode door, and the recirculation door are controlled by electric actuators. See **Fig. 2**.

The brushless blower motor does not have a resistor. Its speed is controlled by a built-in power module.

Safety Precautions

Whenever repairs are made to any air conditioner parts that hold R–134a refrigerant, you must recover, flush (if contaminated), evacuate, charge, and leak test the system. In a good system, refrigerant lines are always under pressure and you should disconnect them only after the refrigerant charge has been recovered (discharged) at the service valves.

Refrigerant R–134a is safe when used under the right conditions. Always wear safety goggles and non-leather gloves while recovering, evacuating, charging, and leak testing the system. Do not wear leather gloves. When refrigerant gas or liquid contacts leather, the leather will stick to your skin.

⚠ WARNING

Use care to prevent refrigerant from touching your skin or eyes because liquid refrigerant, when exposed to the air, quickly evaporates and will freeze skin or eye tissue. Serious injury or blindness could result if you come in contact with liquid refrigerant.

Refrigerant splashed in the eyes should be rinsed with lukewarm water, not hot or cold. Do not rub the eyes. Apply a light bandage and contact a physician right away.

Refrigerant splashed on the skin should be rinsed with lukewarm water, not hot or cold. Do not rub the skin. Apply a light coat of a nonmedicated ointment, such as petroleum jelly. Contact a physician right away.

R–134a refrigerant does not burn at ambient temperatures and atmospheric pressure. However, it can be combustible at pressures as low as 5.5 psig (139 kPa absolute) at 350°F (177°C) when mixed with air concentrations that are greater than 60 percent.

⚠ WARNING

R–134a air conditioning systems should not be pressure tested or leak tested with compressed air. Combustible mixtures of air and R–134a may form, resulting in a fire or explosion that could cause personal injury or property damage.

Always work in an area where there is a constant flow of fresh air when the system is recovered, evacuated, charged, and leak tested. R–134a vapors have a slightly sweet odor that is difficult to detect. Frequent leak checks and air monitoring equipment are recommended to ensure a safe working environment.

IMPORTANT: When servicing an R–134a air conditioning system, use only service equipment certified to meet the requirements of SAE J2210 (R–134a recycling equipment). The equipment should be operated only by qualified personnel who are familiar with the recycling station manufacturer's instructions.

Because of its very low boiling point, refrigerant must be stored under pressure. To prevent the refrigerant containers from exploding, never expose them to temperatures higher than 125°F (52°C).

On R–134a refrigerant systems, polyalkylene glycol (PAG) oil is used in the compressor. When handling PAG oil, observe the following guidelines:

- Keep the oil free of contaminants.
- Do not expose the air conditioning system or the PAG oil container to air for more than five minutes. PAG oil has a high moisture absorption capacity and the oil container should be immediately sealed after each use.
- Use care when handling. Spilled oil could damage painted surfaces, plastic parts, and other components such as drive belts.
- Never mix PAG oil with other types of refrigerant oil.

Heater Core Replacement

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Drain the coolant from the cooling system. For instructions, see **Section 20.01**, Subject 100.
4. Remove the dash panels listed below. See **Fig. 1**. For instructions, see **Section 60.08**.
    - electrical cover
    - upper dash cover
    - heater and air conditioner cover
    - waste bin
    - console cover
    - dash trim cap
    - upper dash assembly, center panel
5. Remove the tie straps on the wiring harness as needed to access the heater core.
6. Remove the capscrew that attaches the right side of the shield to the HVAC assembly. Move the shield to access the heater core. See **Fig. 2**.
7. Remove the capscrews that attach the lower duct to the HVAC assembly and remove the lower duct.
8. Remove the capscrews that attach the heater core service cover to the HVAC assembly and remove the service cover. See **Fig. 3**.
9. Remove the air cleaner. For instructions, see **Section 09.01**.
10. Remove the hose clamps that attach the heater hoses to the heater core tubes. Remove the heater hoses.
11. Remove the heater core retaining plate. See **Fig. 4**.
    - 11.1 Remove the capscrew that attaches the heater core retaining plate to the frontwall.
    - 11.2 Remove and set aside the no-drip tape from around the heater core tubes.
    - 11.3 Pull on the tab to remove the retaining plate.
12. From inside the cab, remove the heater core.
13. Install a new heater core in the HVAC assembly. Push the heater core into the HVAC assembly until the heater core makes contact with the far side of the HVAC assembly.
14. Using a capscrew, attach the heater core retaining plate to the frontwall.
15. Install the no-drip tape around the heater core tubes at the retaining plate.
16. Using hose clamps, attach the heater hoses to the heater core tubes.

NOTE: Make sure that the string seal is in the groove on the lower portion of the heater core service cover before installing the service cover.

17. Using capscrews, install the heater core service cover on the HVAC assembly.
18. Using capscrews, attach the lower duct to the HVAC assembly.
19. Using a capscrew, attach the shield to the HVAC assembly.
20. If needed, use tie straps to bundle the wiring harnesses.
21. Install the dash panels listed below. For instructions, see **Section 60.08**.
    - upper dash assembly, center panel
    - dash trim cap
    - console cover
    - waste bin
    - heater and air conditioner cover
    - upper dash cover
    - electrical cover
22. Install the air cleaner. For instructions, see **Section 09.01**.
23. Fill the cooling system with coolant. For instructions, see **Section 20.01**, Subject 100.
24. Connect the batteries.
25. Remove the chocks from the tires.

Fig. 4, Heater Core Retaining Plate

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Recover the refrigerant from the air conditioning system. For instructions, see **Subject 220**.
4. Remove the dash panels listed below. See **Fig. 1**. For instructions, see **Section 60.08**.
   - electrical cover
   - upper dash cover
   - heater and air conditioner cover
   - waste bin
   - console cover
   - dash trim cap
   - upper dash assembly, center panel
5. Remove the tie straps on the wiring harness as needed to access the evaporator.
6. Disconnect the electrical connector from the evaporator temperature sensor. See **Fig. 2**.
7. Remove the capscrews that attach the evaporator service cover to the HVAC assembly.
8. Remove the air cleaner. For instructions, see **Section 09.01**.
9. Remove the expansion valve and refrigerant lines. See **Fig. 3**.

   9.1 Remove the capscrew that attaches the lower retaining plate and the refrigerant lines to the expansion valve. Remove the refrigerant lines and the retaining plate. Remove and discard the Mini Stat-O-Seals and quickly cap the lines.

   IMPORTANT: Under no circumstances should the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

   9.2 Remove the capscrews that attach the upper retaining plate and the expansion valve to the evaporator refrigerant lines. Remove the retaining plate and the expansion valve. Remove and discard the Mini Stat-O-Seals.
10. Remove and set aside the no-drip tape from around the evaporator refrigerant lines at the plate. See **Fig. 4**.
11. Remove the capscrews that attach the plate that fits around the evaporator refrigerant lines to the frontwall. Remove the plate.
12. From inside the cab, remove the evaporator.
13. Install a new evaporator in the HVAC assembly. Press firmly on the evaporator until it makes contact with the far wall of the HVAC assembly.

NOTE: Make sure that the string seal is in the groove on the lower portion of the evaporator service cover before installing the service cover.

14. Using capscrews, install the evaporator service cover on the HVAC assembly. Make sure that the evaporator service cover is correctly seated to the HVAC assembly.
15. Connect the electrical connector to the evaporator temperature sensor.
16. If needed, use tie straps to bundle the wiring harnesses.
17. Install the dash panels listed below. For instructions, see **Section 60.08**.
    - upper dash assembly, center panel
    - dash trim cap
    - console cover
    - waste bin
    - heater and air conditioner cover
    - upper dash cover
    - electrical cover
18. Using capscrews, attach the plate that fits around the evaporator refrigerant lines to the frontwall.
19. Install the no-drip tape around the evaporator refrigerant lines at the plate.
20. Install the expansion valve and refrigerant lines.

    IMPORTANT: Do not lubricate the Mini Stat-O-Seals prior to installation.

Evaporator Replacement

10. Console Cover
11. HVAC/Radio Trim Plate
12. Auxiliary Gauge Panel

Fig. 1, Century Class Conventional Dash Panels

20.1 Install new Mini Stat-O-Seals on the evaporator refrigerant lines.

20.2 Using capscrews and the upper retaining plate, attach the expansion valve to the evaporator refrigerant lines. Torque the capscrews 35 lbf·in (395 N·cm).

20.3 Install new Mini Stat-O-Seals on the lower refrigerant lines.

20.4 Using a capscrew and the lower retaining plate, attach the refrigerant lines to the expansion valve. Torque the capscrew 11 to 15 lbf·ft (15 to 20 N·m).

21. Install the air cleaner. For instructions, see **Section 09.01**.

22. Be sure to add refrigerant oil to the compressor to replace that which is lost when the system is recovered. For instructions, see the applicable refrigerant compressor section in **Group 83**.

23. Evacuate and charge the air conditioning system with refrigerant. For instructions, see **Subject 220**.

24. Connect the batteries.

25. Remove the chocks from the tires.

Evaporator Temperature Sensor Replacement

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Remove the upper dash cover and the heater and air conditioner cover. See **Fig. 1**. For instructions, see **Section 60.08**.
3. Pull the evaporator temperature sensor out of the evaporator. See **Fig. 2**.
4. Disconnect the electrical connector from the temperature sensor.
5. Connect the electrical connector to the new temperature sensor.
6. Install the evaporator temperature sensor in the evaporator.
7. Install the upper dash cover and the heater and air conditioner cover. For instructions, see **Section 60.08**.
8. Remove the chocks from the tires.

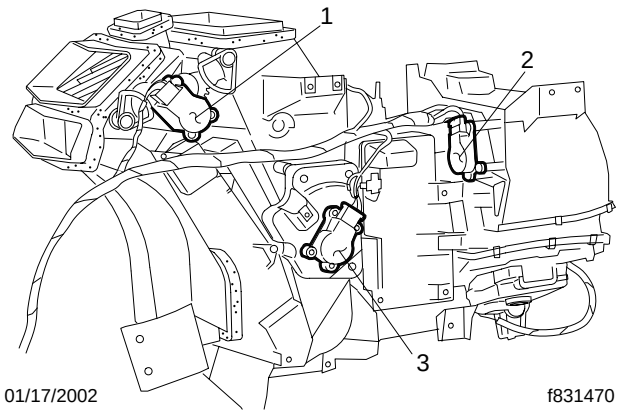
Actuator Replacement



1. Mode Actuator
2. Recirculation Actuator
3. Temperature Actuator

Fig. 2, Actuators

9.1 Turn the ignition key to the on position, but keep the engine off.

9.2 Turn the fan switch to the off position.

9.3 Turn the air selection switch to the full defrost mode.

9.4 Turn the temperature control switch to the full hot position.

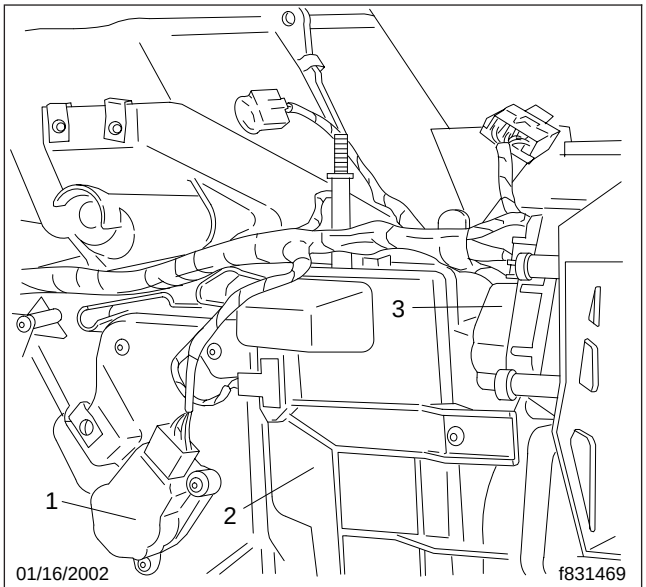
9.5 Press and hold the recirculation and air conditioning buttons for five seconds.

9.6 The recirculation and air conditioning indicators will blink, the fan will turn on the highest fan speed, the air selection switch will cycle through the modes, and the recirculation door will open and close. The entire cycle takes about 20 to 30 seconds.

10. Remove the chocks from the tires.

Recirculation Actuator Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Remove the dash panels listed below. See **Fig. 1**. For instructions, see **Section 60.08**.
   - electrical cover
   - upper dash cover
   - heater and air conditioner cover
   - waste bin
   - console cover
   - dash trim cap
   - upper dash assembly, center panel
3. Remove the tie straps on the wiring harnesses as needed to access the capscrews on the recirculation actuator. It may also be necessary to remove the evaporator service cover to access the actuator mounting hardware. See **Fig. 3**.



1. Temperature Actuator
2. Evaporator Service Cover
3. Recirculation Actuator

Fig. 3, Recirculation Actuator

NOTE: If the evaporator service cover is removed, make sure that the string seal is in the groove on the lower portion of the evaporator service cover before installing the service cover.

4. Remove the capscrews that attach the recirculation actuator to the HVAC assembly.
5. Remove the arm from the back of the actuator. Disconnect the electrical connector from the actuator and remove the actuator.
6. Connect the electrical connector to the new actuator.

7. Attach the arm to the back of the actuator and align the actuator to the keyed shaft on the door.
8. Using capscrews, attach the actuator to the HVAC assembly.
9. If needed, use tie straps to bundle the wiring harnesses.
10. Install the dash panels listed below. For instructions, see **Section 60.08**.
    - upper dash assembly, center panel
    - dash trim cap
    - console cover
    - waste bin
    - heater and air conditioner cover
    - upper dash cover
    - electrical cover
11. Manually calibrate the HVAC system after the actuator has been replaced.
    - 11.1 Turn the ignition key to the on position, but keep the engine off.
    - 11.2 Turn the fan switch to the off position.
    - 11.3 Turn the air selection switch to the full defrost mode.
    - 11.4 Turn the temperature control switch to the full hot position.
    - 11.5 Press and hold the recirculation and air conditioning buttons for five seconds.
    - 11.6 The recirculation and air conditioning indicators will blink, the fan will turn on the highest fan speed, the air selection switch will cycle through the modes, and the recirculation door will open and close. The entire cycle takes about 20 to 30 seconds.
12. Remove the chocks from the tires.

Mode Actuator Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Remove the dash panels listed below. See **Fig. 1**. For instructions, see **Section 60.08**.
    - electrical cover
    - upper dash cover
    - heater and air conditioner cover
    - waste bin
    - console cover
    - dash trim cap
    - upper dash assembly, center panel
3. If needed, remove the capscrew that attaches the shield to the HVAC assembly and move the shield to access the mode actuator. See **Fig. 4**.

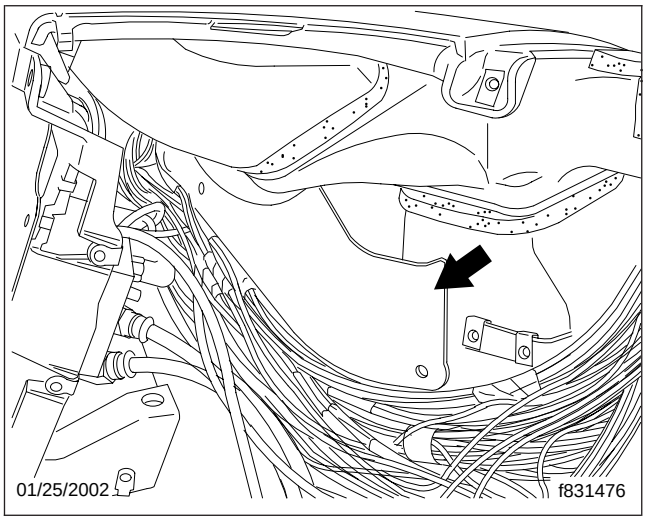


Fig. 4, Shield

4. Remove the capscrews that attach the mode actuator to the HVAC assembly. See **Fig. 2**.
5. Disconnect the electrical connector from the actuator and remove the actuator.
6. Connect the electrical connector to the new mode actuator.
7. Align the actuator to the keyed shaft on the door.
8. Using capscrews, attach the mode actuator to the HVAC assembly.
9. If the shield was moved, move the shield back in place and use a capscrew to attach the shield to the HVAC assembly.
10. Install the dash panels listed below. For instructions, see **Section 60.08**.
    - upper dash assembly, center panel
    - dash trim cap

Actuator Replacement

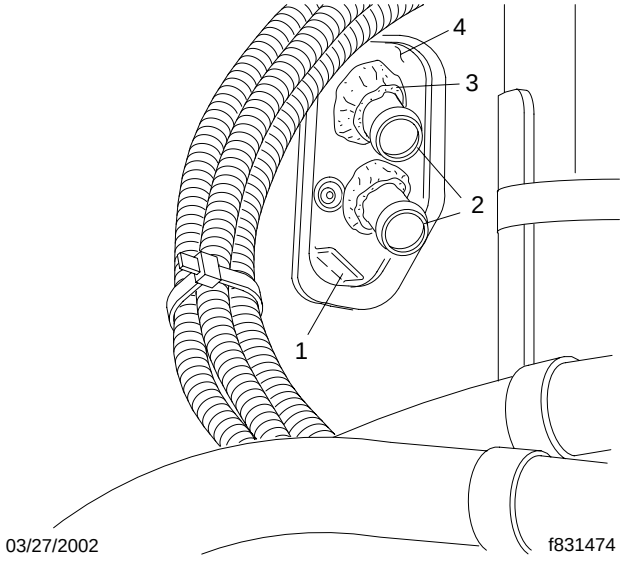
- console cover
- waste bin
- heater and air conditioner cover
- upper dash cover
- electrical cover

11. Manually calibrate the HVAC system after the actuator has been replaced.
    - 11.1 Turn the ignition key to the on position, but keep the engine off.
    - 11.2 Turn the fan switch to the off position.
    - 11.3 Turn the air selection switch to the full defrost mode.
    - 11.4 Turn the temperature control switch to the full hot position.
    - 11.5 Press and hold the recirculation and air conditioning buttons for five seconds.
    - 11.6 The recirculation and air conditioning indicators will blink, the fan will turn on the highest fan speed, the air selection switch will cycle through the modes, and the recirculation door will open and close. The entire cycle takes about 20 to 30 seconds.
12. Remove the chocks from the tires.

Heater and Air Conditioner Assembly Replacement

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the air cleaner. For instructions, see **Section 09.01**.
4. Drain the coolant from the cooling system. For instructions, see **Section 20.01**, Subject 100.
5. Recover the refrigerant from the air conditioning system. For instructions, see **Subject 220**.
6. Remove the hose clamps that attach the heater hoses to the heater core tubes. Disconnect the heater hoses. See **Fig. 1**.
7. Remove the capscrew that attaches the heater core retaining plate to the frontwall. Pull on the tab to remove the retaining plate. See **Fig. 1**.



1. Tab
2. Heater Core Tubes
3. No-Drip Tape
4. Heater Core Retaining Plate

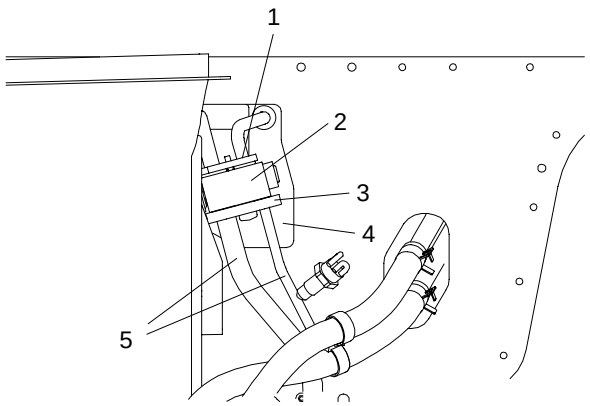
Fig. 1, Heater Core Tubes

8. Remove the expansion valve and refrigerant lines.

   8.1 Remove the capscrew that attaches the lower retaining plate and the refrigerant lines to the expansion valve. Remove the refrigerant lines and retaining plate. Remove and discard the Mini Stat-O-Seals and quickly cap the lines. See **Fig. 2**.

   IMPORTANT: Under no circumstances should the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

   8.2 Remove the capscrews that attach the upper retaining plate and the expansion valve to the evaporator refrigerant lines. Remove the retaining plate and the expansion valve. Remove and discard the Mini Stat-O-Seals.



1. Upper Retaining Plate
2. Expansion Valve
3. Lower Retaining Plate
4. Plate
5. Refrigerant Line

Fig. 2, Expansion Valve

9. Remove the capscrews that attach the plate that fits around the evaporator refrigerant lines to the frontwall. Remove the plate. See **Fig. 3**.
10. Remove the dash panels listed below. See **Fig. 4**. For instructions, see **Section 60.08**.
    - electrical cover
    - upper dash cover
    - heater and air conditioner cover
    - waste bin

Heater and Air Conditioner Assembly Replacement

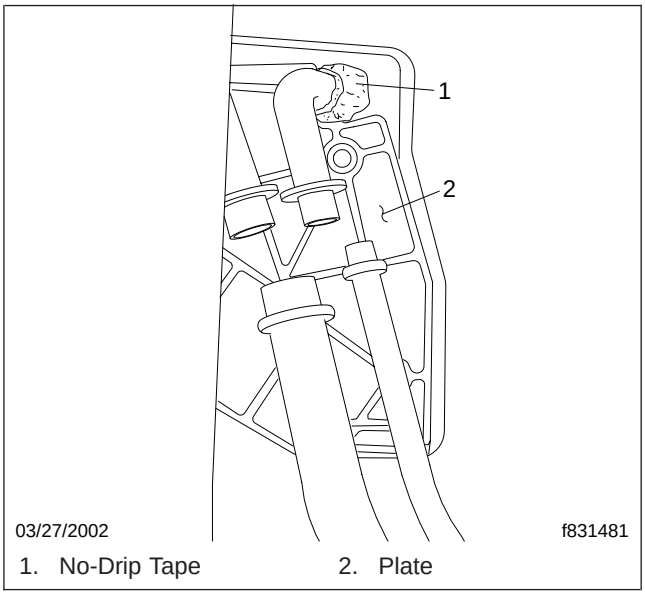


Fig. 3, Plate

- console cover
- dash trim cap
- upper dash assembly, center panel
- left-side upper dash assembly

11. Remove the capscrew on the wiring harness channel that attaches the channel to the temperature control cover. Remove the plastic fastener that attaches the channel to the HVAC assembly.
12. Remove the capscrews that attach the ducts to the HVAC assembly and remove the ducts.
13. Remove the nuts that attach the power distribution module (PDM) to the HVAC assembly.
14. Disconnect the wiring harnesses from the PDM as necessary.
15. Disconnect the power and communication wiring harnesses from the HVAC wiring harness.
16. From the engine side of the frontwall, remove the nut that attaches the HVAC assembly to the frontwall.
17. Remove the hose clamp that attaches the drain hose to the drain tube and remove the drain hose.
18. From inside the cab, remove the capscrews, nuts, and washers that attach the HVAC assembly to the frontwall and remove the assembly.
19. Using a nut, attach a new HVAC assembly to the engine side of the frontwall. Torque the nut 9 to 11 lbf·ft (12 to 15 N·m).
20. From inside the cab, use capscrews, nuts, and washers to attach the HVAC assembly to the frontwall. Torque the nuts and capscrews 9 to 11 lbf·ft (12 to 15 N·m).
21. Using capscrews, attach the plate that fits around the evaporator refrigerant lines to the frontwall.
22. Install the expansion valve and the refrigerant lines.

    IMPORTANT: Do not lubricate the Mini Stat-O-Seals prior to installation.

    22.1 Install new Mini Stat-O-Seals on the evaporator refrigerant lines.

    22.2 Using capscrews and the upper retaining plate, attach the expansion valve to the evaporator refrigerant lines. Torque the capscrews 35 lbf·in (395 N·cm).

    22.3 Install new Mini Stat-O-Seals on the lower refrigerant lines.

    22.4 Using a capscrew and the lower retaining plate, attach the refrigerant lines to the expansion valve. Torque the capscrew 11 to 15 lbf·ft (15 to 20 N·m).
23. Using a capscrew, attach the heater core retaining plate to the frontwall.
24. Using hose clamps, attach the heater hoses to the heater core tubes.
25. Using a hose clamp, attach the drain hose to the drain tube.
26. Install the air cleaner. For instructions, see **Section 09.01**, Subject 110.
27. Connect the wiring harnesses to the PDM as necessary.
28. Using nuts, attach the PDM to the HVAC assembly.
29. Using capscrews, attach the ducts to the HVAC assembly.

Heater and Air Conditioner Assembly Replacement

Fig. 4, Century Class Conventional Dash Panels

30. Move the wiring harness channel back in place, and use a capscrew to attach the channel to the temperature control cover. Using a plastic fastener, attach the channel to the HVAC assembly.
31. Connect the HVAC wiring harness to the power and communication wiring harnesses. If needed, use tie straps to bundle the wiring harnesses.
32. Install the dash panels listed below. For instructions, see **Section 60.08**.
    - left-side upper dash assembly
    - upper dash assembly, center panel
    - dash trim cap
    - console cover
    - waste bin
    - heater and air conditioner cover
    - upper dash cover
    - electrical cover
33. Fill the cooling system with coolant. For instructions, see **Section 20.01**, Subject 100.
34. Be sure to add refrigerant oil to the compressor to replace the oil that is lost when the system is recovered. For instructions, see the applicable refrigerant compressor section in **Group 83**.
35. Evacuate and charge the air conditioning system with refrigerant. For instructions, see **Subject 220**.

Heater and Air Conditioner Assembly Replacement

36. Connect the batteries.
37. Calibrate the HVAC system after the HVAC assembly has been removed or replaced.
    - 37.1 Turn the ignition key to the on position, but keep the engine off.
    - 37.2 Turn the fan switch to the off position.
    - 37.3 Turn the air selection switch to the face mode.
    - 37.4 Turn the temperature control switch to the full hot position.
    - 37.5 Press and hold the recirculation button and the air conditioning button for five seconds.
    - 37.6 The recirculation and air conditioning indicators will blink, the fan will turn on the highest fan speed, the air selection switch will cycle through the modes, and the recirculation door will open and close. The entire cycle takes about 20 to 30 seconds.
38. Remove the chocks from the tires.

Expansion Valve Replacement

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Recover the refrigerant from the air conditioning system. For instructions, see **Subject 220**.
4. Remove the air cleaner. For instructions, see **Section 09.01**.
5. Remove the expansion valve and refrigerant lines.

   5.1 Remove the capscrew that attaches the lower retaining plate and the refrigerant lines to the expansion valve. Remove the refrigerant lines and the retaining plate. Remove and discard the Mini Stat-O-Seals and quickly cap the lines. See **Fig. 1**.

   IMPORTANT: Under no circumstances should the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

   5.2 Remove the capscrews that attach the upper retaining plate and the expansion valve to the evaporator refrigerant lines. Remove the retaining plate and the expansion valve. Remove and discard the Mini Stat-O-Seals.

6. Install the expansion valve and refrigerant lines.

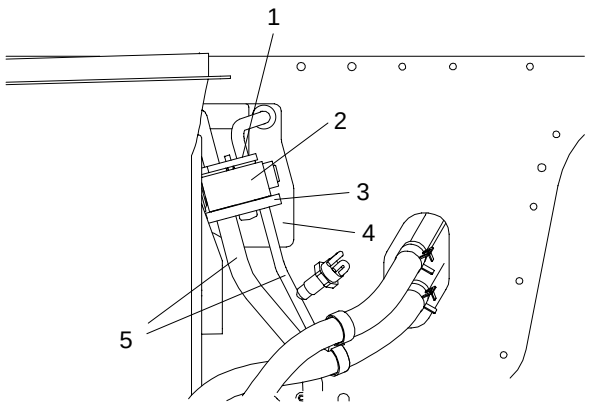
   IMPORTANT: Do not lubricate the Mini Stat-O-Seals prior to installation.

   6.1 Install new Mini Stat-O-Seals on the evaporator refrigerant lines.

   6.2 Using capscrews and the upper retaining plate, attach the new expansion valve to the evaporator refrigerant lines. Torque the capscrews 35 lbf·in (395 N·cm).

   6.3 Install new Mini Stat-O-Seals on the lower refrigerant lines.

   6.4 Using a capscrew and the lower retaining plate, attach the refrigerant lines to the expansion valve. Torque the capscrew 11 to 15 lbf·ft (15 to 20 N·m).



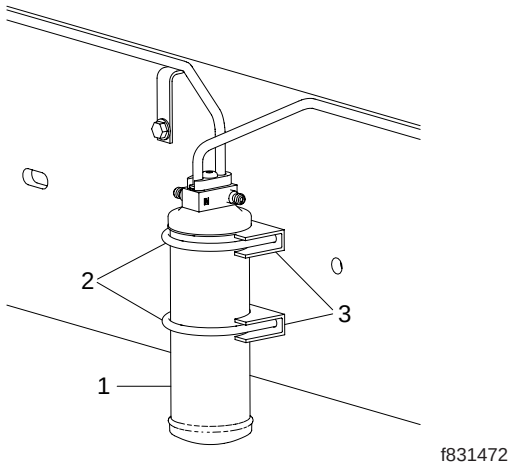
1. Upper Retaining Plate
2. Expansion Valve
3. Lower Retaining Plate
4. Plate
5. Refrigerant Line

Fig. 1, Expansion Valve

7. Install the air cleaner. For instructions, see **Section 09.01**.
8. Be sure to add refrigerant oil to the compressor to replace that which is lost when the system is recovered. For instructions, see the applicable refrigerant compressor section in **Group 83**.
9. Evacuate and charge the air conditioning system with refrigerant. For instructions, see **Subject 220**.
10. Connect the batteries.
11. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Recover the refrigerant from the air conditioning system. For instructions, see **Subject 220**.
4. Remove the capscrew that attaches the retaining plate and refrigerant lines to the receiver-drier. Disconnect the refrigerant lines from the receiver-drier and remove and discard the Mini Stat-O-Seals. Quickly cap the refrigerant lines. See **Fig. 1**.



1. Receiver-Drier
2. U-Bolt
3. Mounting Bracket

Fig. 1, Receiver-Drier

IMPORTANT: Under no circumstances should the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

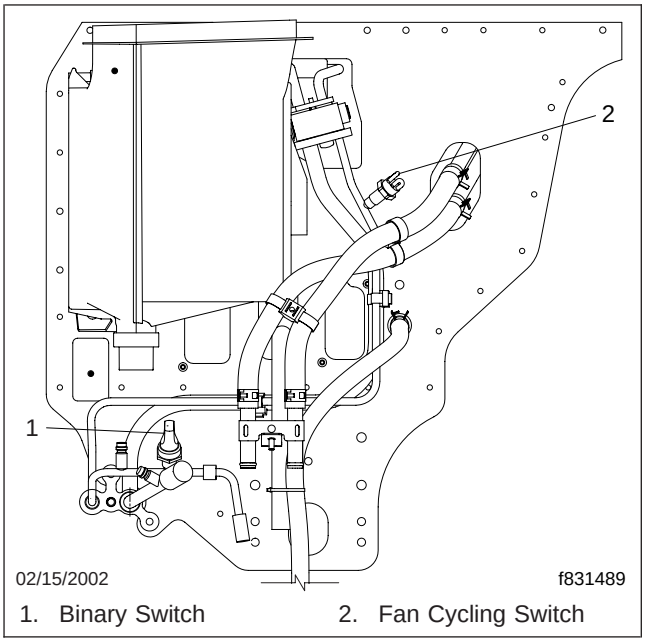
5. Remove the nuts and washers that attach the U-bolts and mounting brackets to the frame rail. Remove the receiver-drier. See **Fig. 1**.

IMPORTANT: If the desiccant cartridge inside the receiver-drier has fallen apart, flush the system and replace the expansion valve and the refrigerant compressor (desiccant matter can't be removed from these parts). A cartridge may fall apart from too much moisture in the system, because of poor evacuation of the system, or lack of maintenance.

6. Using U-bolts, mounting brackets, nuts, and washers, install a new receiver-drier on the frame rail.
7. Uncap the refrigerant lines.
8. Install new Mini Stat-O-Seals on the refrigerant lines. Do not lubricate Mini Stat-O-Seals prior to installation.
9. Using a capscrew, attach the refrigerant lines and retaining plate to the receiver-drier. Torque the capscrew 11 to 15 lbf·ft (15 to 20 N·m).
10. Be sure to add refrigerant oil to the compressor to replace that which is lost when the system is recovered. For instructions, see the applicable refrigerant compressor section in **Group 83**.
11. Evacuate and charge the air conditioning system with refrigerant. For instructions, see **Subject 220**.
12. Return the hood to the operating position.
13. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Disconnect the electrical connector from the binary switch near the junction block. See **Fig. 1**.



1. Binary Switch 2. Fan Cycling Switch

Fig. 1, Engine Side of Frontwall

4. Remove the binary switch and the O-ring.
5. Lubricate a new O-ring with mineral oil before installing it on the new binary switch.
6. Install the binary switch and tighten 60 to 72 lbf·in (678 to 813 N·cm).
7. Connect the electrical connector to the binary switch.
8. Return the hood to the operating position.
9. Remove the chocks from the tires.

Condenser Removal and Installation

Removal

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Recover the refrigerant from the air conditioning system. For instructions, see **Subject 220**.
4. Disconnect the refrigerant lines from the condenser and remove and discard the Mini Stat-O-Seals. Quickly cap the condenser inlet and outlet ports if the condenser will be reinstalled and plug the fittings.

IMPORTANT: Under no circumstances should the ports remain uncapped or the fittings remain unplugged for longer than five minutes total. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

5. Remove the fasteners that attach the condenser to the radiator and remove the condenser.

Installation

1. Place the condenser on the radiator. Install and tighten the fasteners 108 lbf·in (1220 N·cm).
2. Uncap the inlet and outlet ports on the condenser. Unplug the fittings
3. Using only Mini Stat-O-Seals, replace the Mini Stat-O-Seals on the refrigerant lines. Do not lubricate Mini Stat-O-Seals prior to installation.
4. Connect the refrigerant lines to the condenser. Torque the capscrew on the retaining plate 11 to 15 lbf·ft (15 to 20 N·m).
5. Add refrigerant oil to the compressor to replace that which is lost in the old condenser. For instructions, see the applicable refrigerant compressor section in **Group 83**.
6. Evacuate and charge the air conditioning system with refrigerant. For instructions, refer to **Subject 220**.
7. Return the hood to the operating position.
8. Remove the chocks from the tires.

Climate Control Panel (Front Control Unit) Replacement

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Remove the dash trim cap and the HVAC/radio trim plate. See **Fig. 1**. For instructions, see **Section 60.08**.
3. Remove the trailer air supply and the parking brake knobs from the auxiliary gauge panel. See **Fig. 1**.
4. Remove the capscrews that attach the auxiliary gauge panel to the console and move the gauge panel to access the capscrews that attach the climate control panel to the console. See **Fig. 1**.

NOTE: The climate control panel is also referred to as the front control unit (FCU).

5. Remove the capscrews that attach the control panel to the console.
6. Disconnect the electrical connectors from the control panel and remove the control panel.
7. Connect the electrical connectors to the new control panel.

Climate Control Panel (Front Control Unit) Replacement

8. Using capscrews, attach the control panel to the console.
9. Using capscrews, attach the auxiliary gauge panel to the console.
10. Install the trailer air supply and parking brake knobs to the auxiliary gauge panel.
11. Install the HVAC/radio trim plate and the dash trim cap. For instructions, see **Section 60.08**.
12. Manually calibrate the HVAC system after the climate control panel has been removed or replaced.
    - 12.1 Turn the ignition key to the on position, but keep the engine off.
    - 12.2 Turn the fan switch to the off position.
    - 12.3 Turn the air selection switch to the full defrost mode.
    - 12.4 Turn the temperature control switch to the full hot position.
    - 12.5 Press and hold the recirculation and air conditioning buttons for five seconds.
    - 12.6 The recirculation and air conditioning indicators will blink, the fan will turn on the highest fan speed, the air selection switch will cycle through the modes, and the recirculation door will open and close. The entire cycle takes about 20 to 30 seconds.
13. Remove the chocks from the tires.

Required Equipment

You will need a machine, or machines, to identify the refrigerant and to recover, evacuate, flush, and charge the refrigerant system. Ideally, one machine can perform all the following functions:

- Identification–The machine must be able to verify the purity of the refrigerant in the refrigerant system and the presence of hydrocarbon-based refrigerants or other unapproved refrigerants.
- Recovery–The machine must be able to fully recover the refrigerant from the refrigerant system.
- Evacuation–Ideally, the machine should have a vacuum pump rated at 6 cfm and be maintenance free. A machine that requires maintenance is acceptable as long as it is properly maintained.
- Charging–The scale used in charging should be accurate to within ±1 ounce (30 mL).
- Flushing–Adaptors for the compressor(s), expansion device(s), and receiver-drier should be purchased or fabricated to flush the system with refrigerant.

Refrigerant Identification

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

IMPORTANT: Identify the refrigerant in the refrigerant system if you suspect one of the following conditions:

- an excess noncondensable gas, such as nitrogen or air, is in the system
- an unapproved refrigerant is in the system
- the history of refrigerant system repairs is unknown

1. Using a high-quality refrigerant identifier and the manufacturer's instructions, attach the identifier to the vehicle and perform the test.
2. If the vehicle passed the test, it is safe to recover the refrigerant.
3. If the vehicle failed the test due to an excessive amount of noncondensable gas, recover the refrigerant system, then purge the recovery tank of the noncondensable gas.
4. If the vehicle failed the test due to the presence of a hydrocarbon-based refrigerant or a refrigerant other than R-134a, **do not recover the refrigerant into the general-use machine.** To recover the refrigerant system, recover the refrigerant into a separate container that contains refrigerant that must be recycled by a qualified recycling center. It is best to refer the customer to the place where the vehicle was last serviced.

Recovery

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

The recovery process removes most of the refrigerant charge in the system.

1. Turn off the engine, apply the parking brakes, chock the tires, and open the hood.
2. Remove the caps from the suction and discharge service valves.
3. If the history of refrigerant system repairs is unknown, or if you suspect that the system is charged with an unapproved refrigerant, identify the refrigerant using the "Refrigerant Identification" procedures.
4. Wearing protective goggles and nonleather gloves, attach the refrigerant recovery and charging machine hoses to the valves.

IMPORTANT: Push down firmly on the hose connectors until a clicking sound is heard. This will ensure that the coupler is locked.

5. Follow the refrigerant recovery and charging machine manufacturer's instructions and recover all of the refrigerant from the refrigerant system.

IMPORTANT: Always comply with all federal and local regulations regarding refrigerant recovery and disposal. You may be subject to substantial penalties for improper procedures.

6. Measure the oil recovered during the recovery process. The refrigerant system will have to be filled with the same quantity of new refrigerant oil. If the system is contaminated with moisture, all of the compressor oil must be replaced with clean oil. If the system is heavily contaminated with desiccant or grit, replace the compressor, expansion valve, and receiver-drier, and flush the condenser and evaporator(s). After the system is charged, perform a performance check to ensure that the heat exchangers are not plugged.

Evacuating

The main purpose in evacuating the refrigerant system is to remove noncondensable gases (NCG), such as nitrogen and air. The secondary purpose is to boil off free water molecules.

In rare cases, water forms ice crystals at the expansion valve. Ice crystals retard or stop the flow of refrigerant, causing a reduction or complete loss of cooling. As the expansion valve warms due to the lack of refrigerant, the ice melts and passes through the expansion valve. Then refrigerant will flow again until the ice crystals re-form. The result is intermittent cooling.

Refrigerant oil has an extremely high moisture absorption capacity. Typically, the moisture picked up by the oil is passed on to the receiver-drier. If excessive moisture exists in the system, the lubricating ability of the oil is reduced, which could damage the compressor and other components.

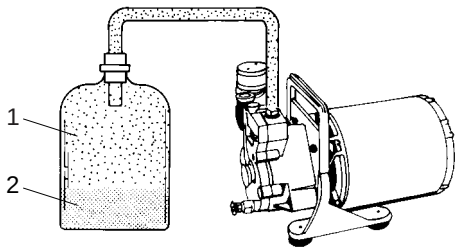
Effects of Pressure on the Boiling Point of Water

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

Water boils at 212°F (100°C) at an atmospheric pressure of 14.7 psi (101 kPa) at sea level. At higher elevations the atmospheric pressure is lower, which allows water to boil at lower temperatures. See **Table 1** for boiling temperatures of water at converted pressures.

Similarly you can boil and remove water from the air conditioning system by lowering the system pressure to a vacuum to cause the moisture to vaporize at normal ambient temperatures. A vacuum pump can reduce the pressure in the system. Since the pressure is lowest at the pump, NCG and water vapor are pulled out of the system. This process is called evacuation or dehydration. See **Fig. 1**.



11/14/95 f830489b

1. Vapor 2. Water

Fig. 1, Water to Vapor

Measuring Vacuum

Vacuum should be measured with an electronic thermistor vacuum gauge, which is designed for use with high vacuum pumps and can accurately read as low as 100 microns. This gauge can have an analog scale or a digital (LED or LCD) display.

The location of the vacuum gauge will affect the reading. The closer to the vacuum source, the lower the reading will be. Follow the manufacturer's instructions for proper use of the vacuum gauge.

If the pressure will not stabilize, it is an indication of a leak. If it does stabilize at a vacuum that is too high, for example 1500 microns Hg, it is an indication of moisture and more evacuation is required.

Boiling Temperatures of Water at Converted Pressures		
Boiling Temperature of Water: °F (°C)	**Absolute Pressure: psi (microns Hg)**	**Vacuum: inHg (mmHg)**
212 (100)	14.696 (759993.4)	0 (0)
205 (96)	12.770 (660400.0)	3.92 (99.6)
194 (90)	10.169 (523881.6)	9.22 (234.2)
176 (80)	6.8699 (355269.8)	15.93 (404.6)
158 (70)	4.5207 (233786.7)	20.72 (526.3)

–70 (–57)	0.0002443 (12.69)	29.92050 (759.9807)
–90 (–68)	0.0000526 (2.72)	29.92089 (759.9906)

Table 1, Boiling Temperatures of Water at Converted Pressures

Holding a vacuum is only an indication that there are not any leaks that are present under a vacuum. Other leaks may exist when the system is pressurized, so a proper leak test must be performed in conjunction with holding a vacuum.

Maintaining an Oil-Lubricated Vacuum Pump

Maintenance is important for a high-vacuum pump. The oil must be changed at regular intervals to prevent moisture buildup, which will cause decreased pump performance and eventual pump failure.

Pumping down for extremely wet air conditioning systems can completely saturate the pump oil, which will require the replacement of the vacuum pump oil.

⚠ CAUTION

Flush the vacuum pump every fourth time it is used, and before storing for long periods of time.

Acid will form and corrode the pump, if water-laden oil remains in the pump for an extended period.

Vacuum pump oil is water soluble. This aids the pump in reaching a high vacuum by absorbing water and sealing the pump.

Use only vacuum pump oil as a lubricant. Do not use any solvent or any other oil. Clean oil should be run through the pump until it runs out clear. Oil should be added to the fill level indicated on the pump. Check the oil level before each use.

Evacuation Procedure

1. The system must have been recovered and the refrigerant compressor filled with the correct amount of refrigerant oil. Replace the receiver-drier if the system conditions require it.
2. Make sure the vacuum pump has been properly maintained.
3. Wearing protective goggles and nonleather gloves, attach the refrigerant recovery and charging machine hoses, or a vacuum pump, to the valves.

IMPORTANT: Push down firmly on the hose connectors until a clicking sound is heard. This will ensure that the coupler is locked.

4. Follow the refrigerant recovery and charging machine manufacturer's instructions and evacuate the refrigerant system.
5. A minimum of 10 minutes with a 6-cfm pump should be used to evacuate the system. Evacuate the system for a longer period of time if using a smaller pump. Make sure that the vacuum level reaches a point where water would boil and does not go back to zero, then proceed with charging and leak testing the system.

Flushing

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

Flushing removes moisture-laden oil and some contamination, such as dirty oil and some particles, that can not be removed by purging with gas. When a part is flushed, liquid refrigerant is forced through it. The liquid picks up the contaminants and flushes them out.

Whether to flush, or replace a part depends on how much contamination there is as previously described.

Normally the system always has pressure in it. Some loss of refrigerant from one season to the next is normal and does not mean that the system is dirty. If refrigerant has leaked until the system is nearly empty and/or refrigerant parts show signs of internal corrosion and grit, the system is contaminated.

If the system is contaminated with moisture, flush all sections of the system. Then change the oil in the compressor and replace the receiver-drier prior to evacuating and charging the system.

If the system is heavily contaminated or if desiccant has circulated through the system, replace the receiver-drier, expansion valve(s), and inspect the compressor.

Do not flush the receiver-drier or the compressor.

Flush the system in segments to lessen the chance of blowing deposits against a port.

Flush the system in the opposite direction of refrigerant flow. In other words, backflush the sections.

Flushing parts with refrigerant requires a refrigerant recovery and charging machine.

Flushing Procedure

Method 1

NOTE: Use this method when the recovery and charging machine is equipped with a flush cycle.

1. Recover the refrigerant from the air conditioning system.
2. Disconnect both ends of the line or part(s) being flushed. Tightly cap the lines to the rest of the system.

NOTE: You must remove the expansion device(s), receiver-drier, and compressor(s) when flushing. These components must be removed and bypassed when performing a system flush.

3. Install the flushing adaptors and an inline filter and follow the instructions from the manufacturer

of the recovery and charging machine to perform the flush. When flushing the entire system, use an adaptor that fits where the compressor was located and backflush.

4. Remove the adaptors and bypass devices and install the expansion device(s), the compressor, and a new receiver-drier.
5. If installing the existing compressor, remove the oil in it and replace the oil with new oil. New compressors may or may not have a full charge of oil.
6. Charge the system with refrigerant and check the system performance.

Method 2

NOTE: Use this method when two recovery and charging machines are available.

1. Recover the refrigerant from the air conditioning system.
2. Disconnect both ends of the line or part(s) being flushed. Tightly cap the lines to the rest of the system.

NOTE: You must remove the expansion device(s), receiver-drier, and compressor(s) when flushing. These components must be removed and bypassed when performing a system flush.

3. Install the flushing adaptors and an inline filter. When flushing the entire system, use an adaptor that fits where the compressor was located and backflush.
4. Charge the part with 2 pounds (0.9 kg) of refrigerant or the system with 5 pounds (2.3 kg) of refrigerant, then recover the refrigerant with a second machine. It is desirable to start the recovery slightly before the charge cycle is done since this helps to push fluid through the system. Repeat the process several times until you think that all the oil has been removed.
5. Remove the adaptors and bypass devices and install the expansion device(s), the compressor(s), and a new receiver-drier.
6. If installing the existing compressor, remove the oil in it and replace the oil with new oil. New compressors may or may not have a full charge of oil.
7. Charge the system with refrigerant and check the system performance.

Oil Balancing

General Information

Compressors require refrigerant oil to function. When the air conditioning system is operating, some of the oil leaves the compressor and is circulated through the system with the refrigerant. The refrigerant oil cannot leave the system except when there is a leak, the refrigerant is recovered, or when a system part is replaced. It is important that the air conditioning system has the correct amount of refrigerant oil for proper operation. Too little oil will result in compressor failure. Too much oil will degrade the performance of the air conditioner, and cause damage to the compressor.

IMPORTANT: Whenever the air conditioning system is discharged or recovered, the recovered oil, from the charging machine, must be measured in order to know how much oil must be returned to the system. When a system component is replaced, a quantity of new oil equal to the recovered oil plus the oil coating the inside of the component must be returned to the system.

IMPORTANT: Refrigerant oil is hygroscopic (attracts moisture from its surroundings), and must not be exposed to the moisture that is present in the air. New oil must be from a container that has not been opened or that has been tightly sealed since its last use.

Tubing, funnels, or other equipment used to transfer the oil must be very clean and dry. When handling refrigerant oil:

- Be sure that the oil is free of water, dust, metal powder, and other foreign substances;
- Do not mix the refrigerant oil with other types or viscosities of oil;
- Quickly seal the oil container after use. Refrigerant oil absorbs moisture when exposed to the air for any period of time.

Compressor Oil Balancing

Replacement refrigerant compressors are supplied with some refrigerant oil. If the air conditioning system has been flushed, the system will need a complete new charge of oil. If the system has not been flushed, use the following procedures to adjust the oil level, when a new compressor or other system component has been installed. The type of oil required depends on the brand of compressor used on the system. See the refrigerant compressor section for details about how the total system volume is determined for the compressor being serviced. See PartsPro MOD 700 to determine the oil type and vehicle specific oil quantities.

1. Drain the remaining oil from the compressor into a clean graduated container, and note the amount. See **Fig. 2**.

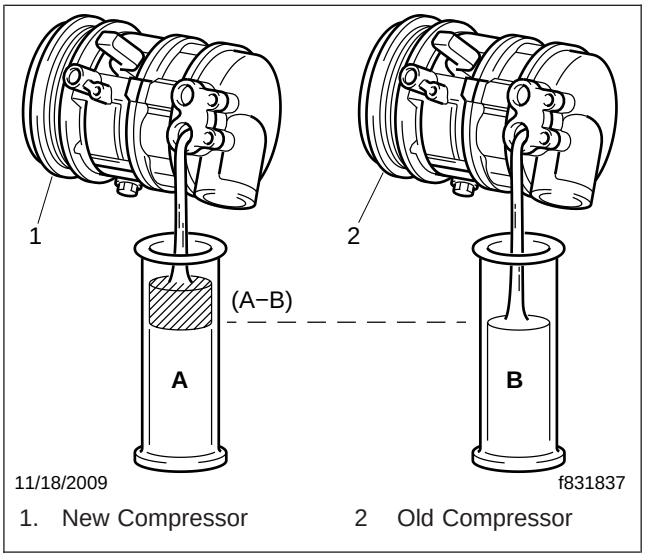

Fig. 2, Oil Balancing

2. Make note of the total volume of oil recovered.
3. Drain the oil from new compressor into a clean calibrated container, and compare the two quantities of oil.
4. Add only the amount of oil removed during recovery and from the old compressor to the system.
5. Add the new compressor oil as described in the supplier specific compressor service section of the workshop manual.

System Oil Balancing

After repairs are finished, refer to **Table 2** and use the following equation to determine the quantity of refrigerant oil that needs to be added to the system.

[Quantity Recovered] + [Quantity for All Replaced Components] = [Quantity Added to the System]

Table 2 provides the quantities of oil that need to be added to the system for each component that was replaced. Add the quantities listed in the table for each component that was replaced. Use the sum of the quantities or 6 fl oz (177 mL), whichever is less. Inject the calculated oil volume at the high-side pressure port during the refrigerant charging process.

Refrigerant Oil Quantities for Replaced Components	
Add the quantities listed in this table for each component that was replaced. Use the sum of the quantities or 6 fl oz (177 mL), whichever is less.	
Component	**Quantity oz (mL)**
High Pressure Line (main A/C)	1 (30)
Low Pressure Line (main A/C)	2 (59)
High Pressure Line (auxiliary A/C)	1 (30)
Low Pressure Line (auxiliary A/C)	3 (89)
Condenser	1 (30)
Evaporator (main A/C)	3 (89)
Evaporator (auxiliary A/C)	2 (59)
Receiver-Drier	3 (89)
Minor Leak at Connector Only	0.5 (15)
Major Leak at Connector Only	2 (59)

Table 2, Refrigerant Oil Quantities for Replaced Components

Charging

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

NOTE: Before charging, the system must be recovered and evacuated with the recovery and charging machine connected to the service and discharge port connections.

1. Obtain enough refrigerant to fully charge the system. To determine the amount of refrigerant needed to fully charge the system, read the Air Conditioner label on the vehicle or see **Subject 400**.
2. Charge the system on the high side following the refrigerant recovery and charging machine manufacturer's instructions.
3. While the compressor is engaged, check the duct temperature and operating pressures at the suction and discharge ports. Compare the temperature and pressures to those in **Section 83.06, Subject 300**. If the operating pressures are not acceptable, see **Section 83.06, Subject 300** for troubleshooting procedures.
4. Disconnect the hoses.
5. Shut down the engine.
6. Recover the refrigerant that is in the hoses.

Leak Testing Methods

General Information

⚠ WARNING

Before doing any of the work below, read the information under Safety Precautions 100. Failure to read the safety precautions, and to take precautions against the dangers involved when working with refrigerant, could lead to serious personal injury.

Refrigerant is nearly odorless. As a result, all of it may leak away and not be noticed until the system stops cooling. All vehicle refrigerant systems lose some refrigerant. Higher loss rates signal a need to locate and repair the leaks.

Leaks are most often found at the compressor hose connections and at the various fittings and joints in the system. If unapproved replacement hoses are installed, refrigerant can be lost through hose permeation.

There are two leak testing methods that can be used to detect leaks in the refrigerant system: UV (ultraviolet) dye leak detection and electronic leak detection. Freightliner recommends using the UV dye leak detection method whenever possible, even though there are some limitations to using this method. A leak on the front seal of the compressor **must** be verified using a heated diode leak detector and the instructions elsewhere in this subject. Visible dye on the front of the compressor clutch **does not** verify that there is a repairable leak at the front seal. Evaporator leaks may not show up with dye, and must be checked using a heated diode leak detector if dye is not present at the condensate drain.

UV Dye Leak Detection

IMPORTANT: When using the UV dye leak detection method, always wear protective eyewear that blocks UV rays and enhances the appearance of the dye. Always wear nonleather gloves and protective eyewear when servicing the air conditioning system.

1. Inspect the refrigerant system for leaks using a UV lamp.
   - 1.1 Inspect the entire refrigerant system under low lighting using a UV lamp. Low lighting will increase the apparent brightness of the UV dye at leak sights.
   - 1.2 Move the UV lamp along the entire refrigerant system, looking for signs of damage or corrosion on the fittings, hose-to-line crimps, switch ports, service ports with caps installed (dye inside the port is not an indication of a leak), brazed or welded areas, and around all connections. Check for evaporator leaks by illuminating the condensate drain tube or hole using the UV lamp.
   - 1.3 Move the UV lamp along the refrigerant system following a continuous path so that no potential leak sites are missed. If a leak is found, continue to check the remainder of the system since other leaks may be present.
2. After repairing a leak, remove all UV dye residue remaining on the outside of the refrigerant system using the cleaner provided by the dye manufacturer, or a comparable cleaner. Use a spray

bottle of cleaner, a toothbrush, and a spray bottle of clean water for hard-to-reach areas.

NOTE: Minor UV dye residue, or residue that is impossible to reach, will lose its fluorescence over time.

3. See **Table 3** for a list of products that have been tested and approved for use by Freightliner dealers.

Electronic Leak Detection

NOTE: Do not try to use a leak tester right after connecting or disconnecting service hoses.

Traces of refrigerant at the fittings can falsely signal a leak. Always verify a leak by blowing shop air in to the area of the suspected leak and checking the area again.

When checking for leaks, move the probe all the way around the fitting or suspected leak.

Freightliner recommends using only certain makes of the heated diode and infrared (IR) types of electronic leak detectors.

Recommended electronic heated diode type leak detectors are available from their manufacturers. See **Table 4**.

Approved Products for UV Dye Leak Detection				
Type of Refrigerant Oil	**Product Description**	**Vendor Part Number**	**Freightliner Part Number**	**Website Address**
PAG	Tracerline BigEZ Kit—Can be injected without discharging the system. • Each kit includes one 4-oz (118-mL) cartridge and an injection tool.	TP-9741CS	ABP N83 327911	**www.tracerline.com**
	• A 4-oz (118-mL) replacement cartridge services 16 vehicles.	TP-9760-0004CS	ABP N83 327961	
	• An 8-oz (237-mL) replacement cartridge services 32 vehicles.	TP-9760-0108	ABP N83 327951

Table 3, Approved Products for UV Dye Leak Detection

Another type of detector, the corona discharge type, is specifically **not recommended**.

Use the following procedures to locate refrigerant system refrigerant gas leaks using an electronic leak detector.

1. Operate the electronic leak detector in accordance with the manufacturer's instructions.
2. Leak test with the engine turned off.
3. Charge the air conditioning system with sufficient refrigerant to indicate a gauge pressure of at least 50 psi (345 kPa) with the system not operating. Typically, one-half pound (0.22 kg) of refrigerant is sufficient to create 50 psi (345 kPa) of pressure. It may not be possible to produce this amount of pressure and measure leakage if the ambient temperature is less than 59°F (15°C).
4. Be careful not to contaminate the detector probe tip if the part being tested is not clean. Wipe the part off with a dry shop towel or blow it off with shop air. Do not use cleaners or solvents as many detectors are sensitive to their chemical ingredients.
5. Visually inspect the entire refrigerant system. Look for air conditioning lubricant leakage and corrosion or damage to lines, hoses, and all other components. Inspect each questionable location carefully with the detector probe. Check all fittings, couplings, refrigerant controls, service ports (with caps installed), brazed or welded areas, and areas around attachment points and hold-downs.

Electronic Leak Detectors		
Designation	**Manufacturer**	**Comments**
D-TEK, D-Tek Select, and TekMate	Leybold Inficon 2 Technology Place East Syracuse NY 13057 (315) 434–1144	• Rechargeable battery • Hand-held design • Simple to operate
H–10 Professional	Bacharach Inc. c/o Yokogawa Corp. of America 2 Dart Road Newnan GA 30265 (800) 850–0044	• Rechargeable battery • Carrying case with strap • Calibration leak bottle • Manual sensitivity control • Most sensitive available
J 39400	SPX Kent-Moore 28635 Mound Road Warren MI 48092–3499 (800) 328–6657	• 12V DC or 120V AC • Carrying case with strap • Calibration leak bottle • Manual sensitivity control • Manual balance control

Table 4, Electronic Leak Detectors

6. Follow the path of the refrigerant system methodically so that no leaks are missed. If a leak is found, continue to test the rest of the system.
7. Inspect an area of possible leakage slowly and close to the part, moving completely around the part. Move the probe no faster than one to two inches (25 to 50 mm) per second and no farther away than 1/4 inch (6.4 mm) from the part.
8. If a large leak is present in either the system being serviced or the service equipment, the surrounding air will be saturated with refrigerant gas. In this situation the leak detector operates erratically and will indicate leakage without being near a possible leak source. Place a large fan so that a light breeze blows through the work area. Verify a leak by blowing shop air into the area and repeating the inspection. Pinpoint a large leak by blowing out the area often.
9. You may test the evaporator core while it is in its housing. Turn on the blower motor for a minimum of 15 seconds. Shut off the blower and wait for refrigerant gas to accumulate in the housing.

Refrigerant Service Operations

Follow the detector instructions for the specific length of time to wait for the gas to accumulate. Insert the detector probe into the blower resistor block, or condensate drain tube if no water is present. If this is not possible insert the probe into the closest opening to the evaporator, such as a heater or vent duct.

NOTE: The presence of water in the condensate drain tube can be determined by inserting the eraser end of a pencil in the drain tube. Inserting the pencil will break the surface tension of any water near the opening of the drain tube and allow the water to drain out before inserting the probe tip. It is only necessary to break the plane of the drain tube with the probe tip. It does not need to be inserted far into the tube.

10. Leak test the front seal area of the compressor. Blow shop air into the cavities in and around the clutch for at least 15 seconds. Let the compressor stand for one minute and then test for leakage. Inspect axial-type compressors (Sanden or Sel-Tec) by placing the probe near the holes at the front of the clutch. See **Fig. 3**. Inspect two-cylinder reciprocating type compressors (Climate Control) by placing the probe between the clutch coil and the compressor. See **Fig. 4**.

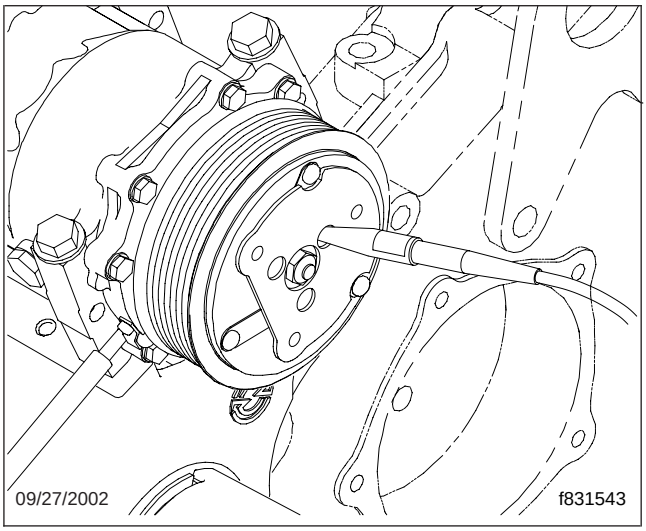

Fig. 3, Axial Type Compressor

IMPORTANT: Be careful not to damage the clutch bearing seal with high pressure shop air.

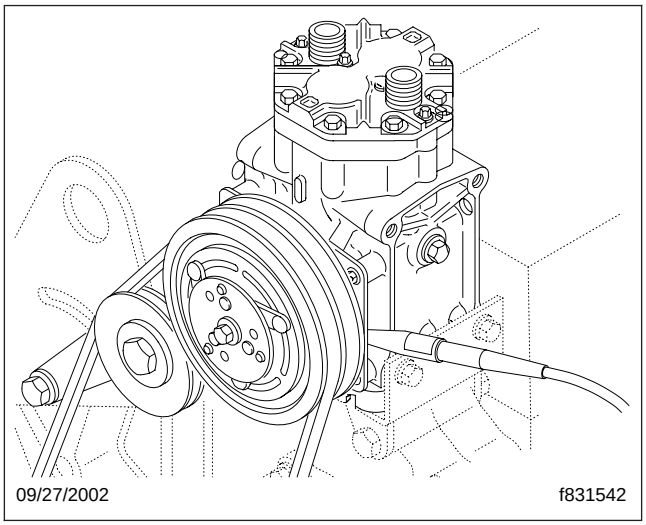

Fig. 4, Two-Cylinder Reciprocating Compressor

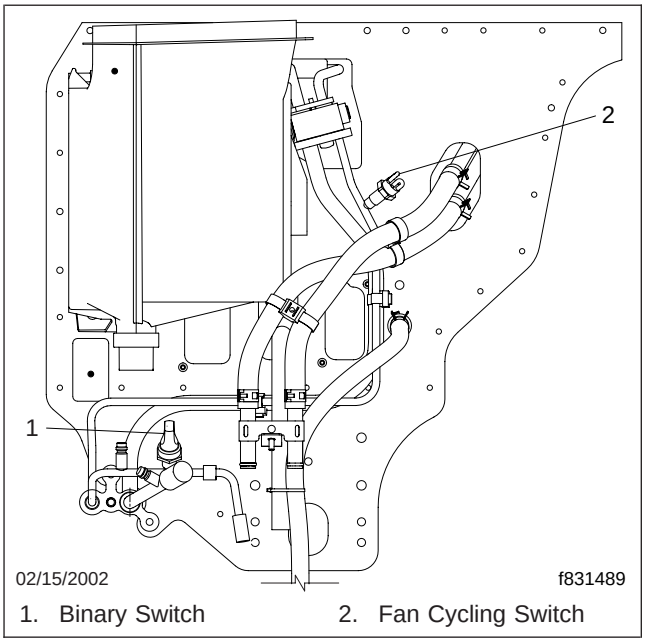
11. Leak test repaired areas of the system after repairs have been performed. Leak test the service ports (with caps installed) after any service which disturbs the refrigerant system.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Disconnect the electrical connector from the fan cycling switch near the expansion valve. See **Fig. 1**.



1. Binary Switch 2. Fan Cycling Switch

Fig. 1, Engine Side of Frontwall

4. Remove the fan cycling switch and the O-ring.
5. Lubricate a new O-ring with mineral oil before installing it on the new fan cycling switch.
6. Install the fan cycling switch on the receiver-drier and tighten 60 to 72 lbf·in (678 to 813 N·cm).
7. Connect the electrical connector to the fan cycling switch.
8. Return the hood to the operating position.
9. Remove the chocks from the tires.

CDTC Sensor Replacement

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Remove the dash panels listed below. See **Fig. 1**. For instructions, see **Section 60.08**.
    - electrical cover
    - upper dash cover
    - heater and air conditioner cover
    - waste bin
    - console cover
    - dash trim cap
    - upper dash assembly, center panel
3. Remove the tie straps on the wiring harness as needed to access the CDTC sensor. See **Fig. 2**.
4. Remove the capscrew that attaches the right side of the shield to the HVAC assembly. Move the shield to access the CDTC sensor. See **Fig. 3**.
5. Disconnect the electrical connector from the CDTC sensor.
6. Turn the CDTC sensor one-quarter turn and remove the CDTC sensor.
7. Install a new CDTC sensor in the HVAC assembly and turn the sensor one-quarter turn.
8. Connect the electrical connector to the CDTC sensor.
9. Using a capscrew, attach the shield to the HVAC assembly.
10. If needed, use tie straps to bundle the wiring harnesses.
11. Install the dash panels listed below. For instructions, see **Section 60.08**.
    - upper dash assembly, center panel
    - dash trim cap
    - console cover
    - waste bin
    - heater and air conditioner cover
    - upper dash cover
    - electrical cover
12. Remove the chocks from the tires.

CDTC Sensor Replacement

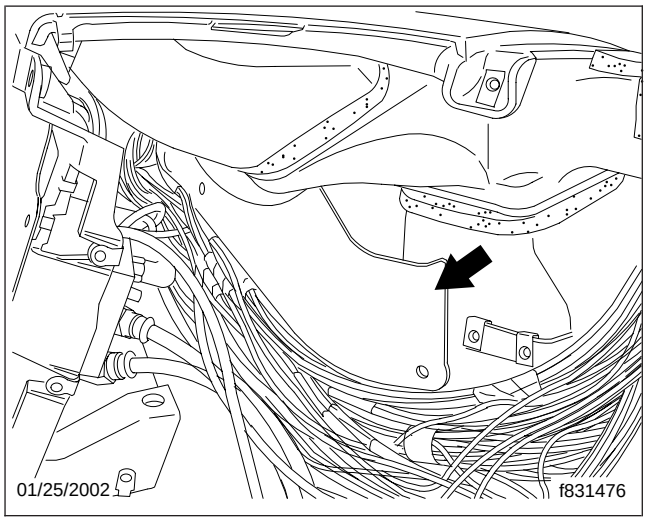

Fig. 3, Shield

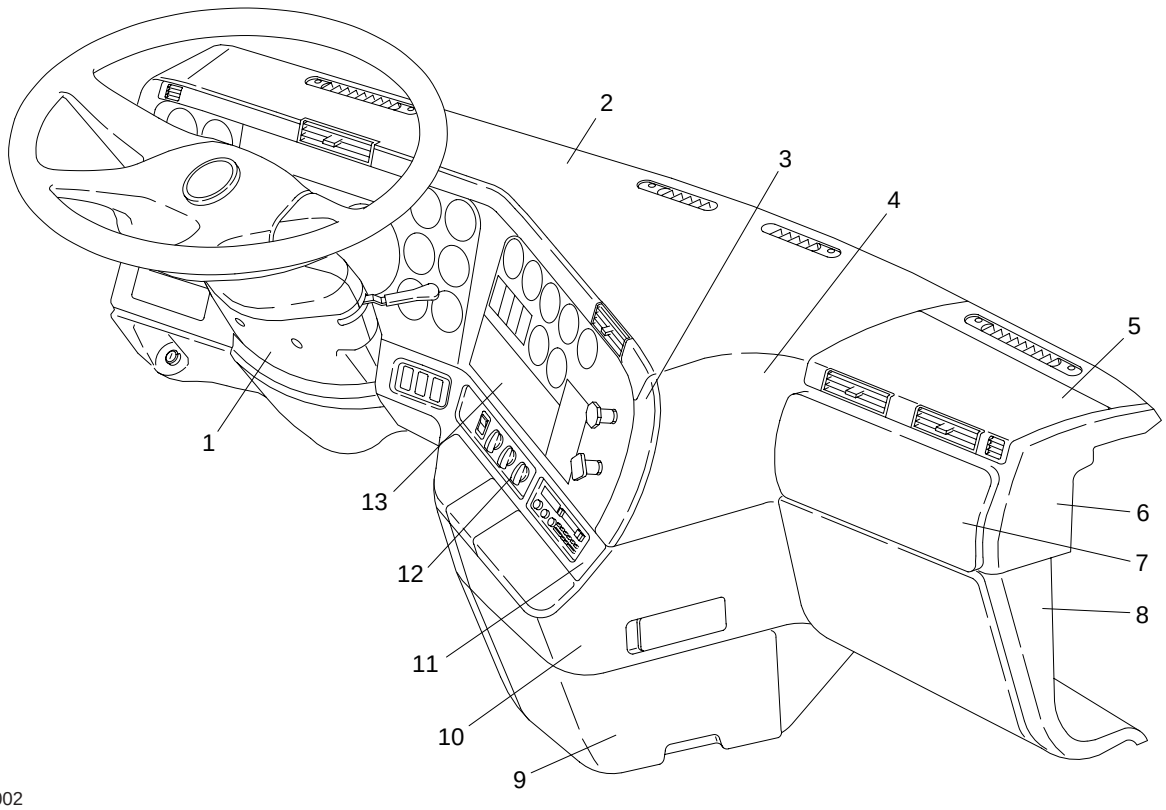
Mode Control Kinematics Replacement

Replacement

1. Turn off the engine, apply the parking brakes, and chock the rear tires.
2. Remove the dash panels listed below. See **Fig. 1**. For instructions, see **Section 60.08**.
   - electrical cover
   - upper dash cover
   - heater and air conditioner cover
   - waste bin
   - console cover
   - dash trim cap
   - upper dash assembly, center panel
3. Remove the tie straps on the wiring harnesses as needed to access the wiring harness channel on the HVAC assembly.
4. Pull the plastic fastener that attaches the wiring harness channel to the HVAC assembly out of the HVAC assembly, and move the wiring harness channel to access the mode actuator.
5. Remove the mode actuator from the HVAC assembly. See **Fig. 2**.



08/19/2002 f600939b

1. Steering Column Cover
2. Left-Side Upper Dash Assembly
3. Dash Trim Cap
4. Upper Dash Assembly, Center Panel
5. Electrical Cover

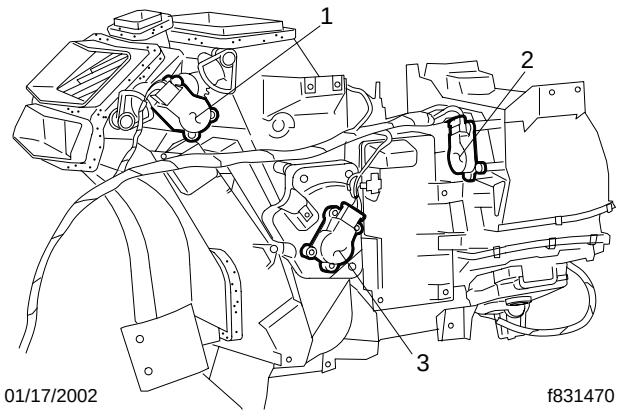
Mode Control Kinematics Replacement



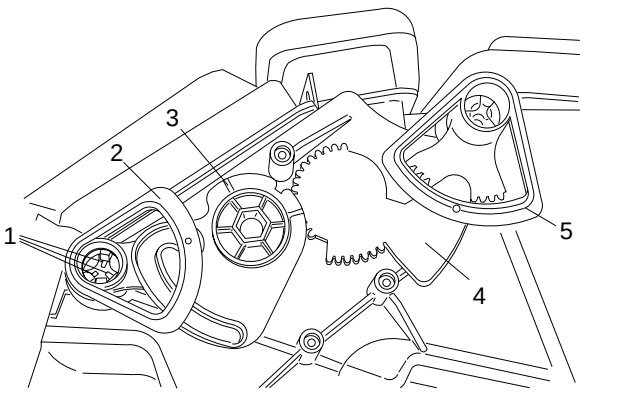
1. Mode Actuator
2. Recirculation Actuator
3. Temperature Actuator

Fig. 2, Actuators

5.1 Remove the capscrews that attach the mode actuator to the HVAC assembly.

5.2 Disconnect the electrical connector from the actuator, and remove the actuator.

6. Remove the defrost door lever, drive gear, face door lever, and idler. See **Fig. 3**.



1. Wing Clips
2. Defrost Door Lever
3. Drive Gear
4. Idler
5. Face Door Lever

Fig. 3, Defrost Door Lever

6.1 Pull the defrost door lever over the wing clips.

6.2 Pull the drive gear and defrost door lever off the pivot and door shaft.

6.3 Pull the face door lever over the wing clips.

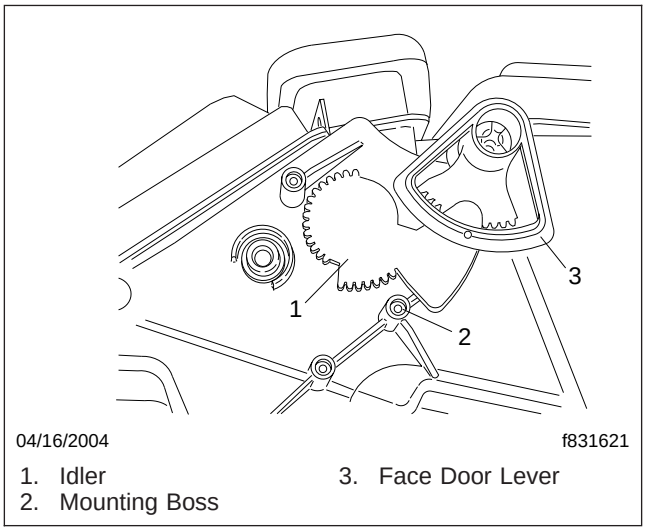
6.4 Pull the idler off the pivot.

6.5 Make sure the wing clips are in good condition. If any of the wings are broken or missing, remove all of the clips.

7. Install a new idler and face door lever.

7.1 Move the face door shaft counterclockwise as far as it will move.

7.2 Install the idler so that it is against the actuator mounting boss. See **Fig. 4**.



1. Idler
2. Mounting Boss
3. Face Door Lever

Fig. 4, Idler and Face Door Lever

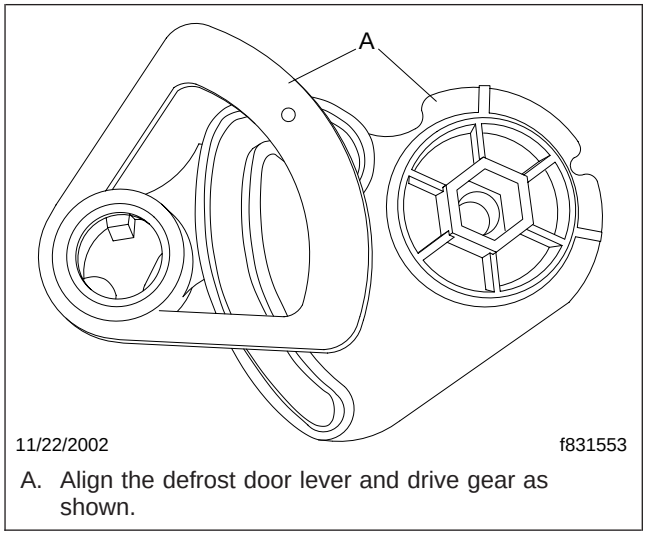
7.3 Press the face door lever on the door shaft until the door lever is secured by the three wing clips. If necessary, use a screwdriver to spread the wing clips for engagement.

7.4 If the wing clips were removed, use a screw similar in size to the actuator mounting screw to install the face door lever on the shaft.

8. Install a new defrost door lever.

8.1 Move the defrost door shaft counterclockwise as far as it will move.

8.2 Align the defrost door lever with the drive gear as shown in **Fig. 5** before installing the parts on the HVAC assembly.



A. Align the defrost door lever and drive gear as shown.

Fig. 5, Defrost Door Lever and Drive Gear

IMPORTANT: Make sure the teeth on the defrost door lever align with the wide tooth on the mating gear. See **Fig. 6**.

8.3 Install the defrost door lever and drive gear as a unit on the HVAC assembly. Make sure the wing clips are visible.

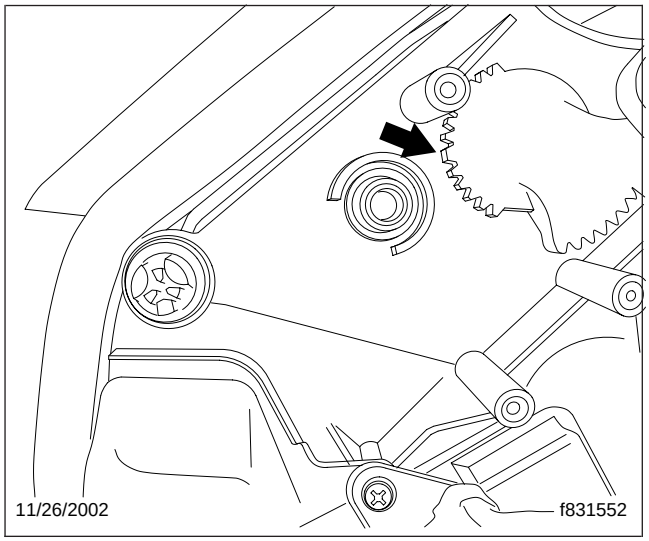


Fig. 6, Wide Tooth on Mating Gear

8.4 Press the defrost door lever on the door shaft until the door lever is secured by the three wing clips. If necessary, use a screwdriver to spread the wing clips for engagement.

8.5 If the wing clips were removed, use a screw similar in size to the actuator mounting screw to install the defrost door lever on the shaft.

9. Install the mode actuator.

   9.1 Connect the electrical connector to the mode actuator.

   9.2 Align the actuator to the keyed shaft on the door.

   9.3 Using capscrews, attach the mode actuator to the HVAC assembly.

10. Move the wiring harness channel back in place and use the plastic fastener to attach the wiring harness channel to the HVAC assembly.

11. If needed, use tie straps to bundle the wiring harnesses.

12. Install the dash panels listed below. For instructions, see **Section 60.08**.

    - upper dash assembly, center panel
    - dash trim cap
    - console cover
    - waste bin
    - heater and air conditioner cover
    - upper dash cover
    - electrical cover

13. Calibrate the HVAC system after the actuator has been replaced.

    13.1 Turn the ignition key to the on position, but keep the engine off.

    13.2 Turn the fan switch to the off position.

    13.3 Turn the air selection switch to the full defrost mode.

    13.4 Turn the temperature control switch to the full hot position.

Mode Control Kinematics Replacement

13.5 Press and hold the recirculation and air conditioning buttons until they begin to blink.

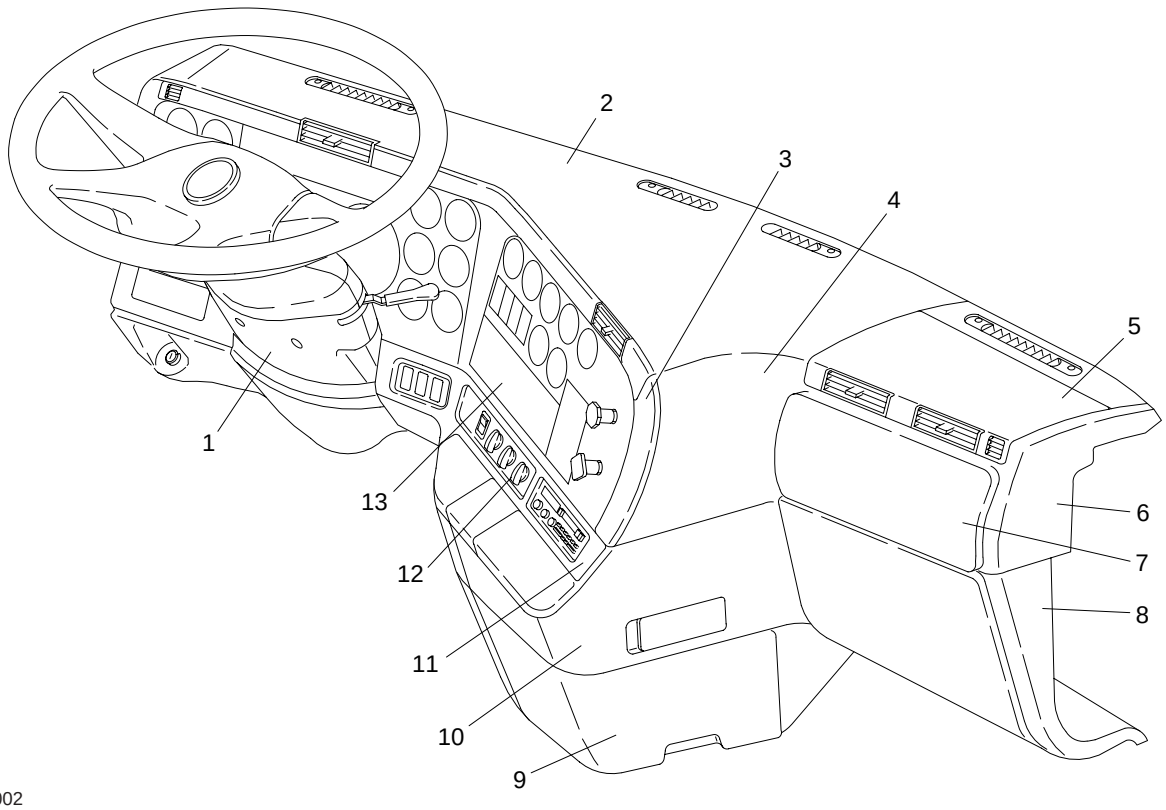
13.6 The recirculation and air conditioning indicators will blink, the fan will turn on the highest fan speed, the air selection switch will cycle through the modes, and the recirculation door will open and close. The entire cycle takes about 20 to 30 seconds.

14. Remove the chocks from the tires.

Temperature Control Kinematics Replacement

Replacement

1. Turn off the engine, apply the parking brakes, and chock the rear tires.
2. Remove the dash panels listed below. See **Fig. 1**. For instructions, see **Section 60.08**.
   - electrical cover
   - upper dash cover
   - heater and air conditioner cover
   - console cover
   - dash trim cap
   - upper dash assembly, center panel
3. Remove the capscrew on the wiring harness channel that attaches the channel to the temperature control cover.
4. Remove the temperature actuator from the temperature control cover. See **Fig. 2**.
   - 4.1 Remove the capscrews that attach the temperature actuator to the temperature control cover.
   - 4.2 Disconnect the electrical connector from the actuator, and remove the actuator.



08/19/2002 f600939b

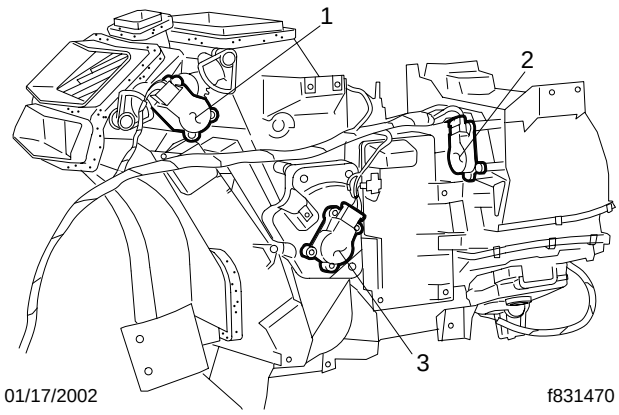
12. Front Control Unit
13. Auxiliary Gauge Panel

Fig. 1, Dash Panels

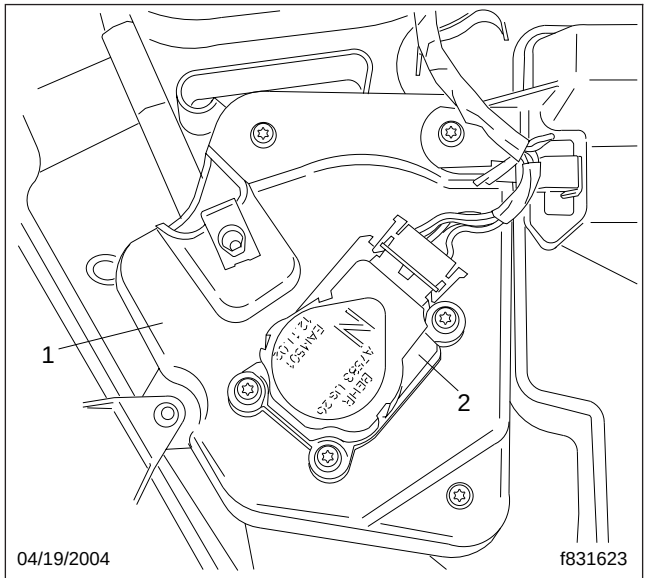
Temperature Control Kinematics Replacement



1. Mode Actuator
2. Recirculation Actuator
3. Temperature Actuator

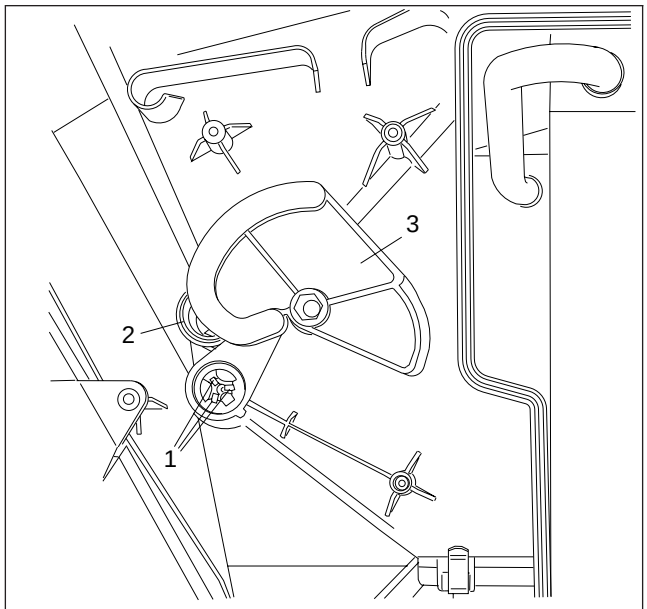
Fig. 2, Actuators

5. Remove the evaporator temperature sensor by turning the sensor counterclockwise one-quarter turn.
6. Remove the capscrews that attach the evaporator service cover to the HVAC assembly. Remove the service cover.
7. Remove the screws that attach the temperature control cover to the HVAC assembly. Remove the cover. See **Fig. 3**.
8. Pull the temperature control cam off the pivot. See **Fig. 4**.
9. Pull the temperature control levers off the wing clips. Make sure the wing clips are in good condition. See **Fig. 4**.
10. Install new temperature control levers.
    - 10.1 If the wing clips are broken, use a screw similar in size to the actuator mounting screw, and a washer to attach the levers to the shafts.
    - 10.2 Install the levers on the shafts. Move the lower lever counterclockwise and the top lever clockwise, then install the cam on the levers. The levers and cam should be in the positions shown in **Fig. 4**.
11. Using capscrews, attach the temperature control cover to the HVAC assembly.
12. Install the temperature actuator.



1. Temperature Control Cover
2. Temperature Actuator

Fig. 3, Temperature Actuator



1. Wing Clips
2. Temperature Control Lever
3. Temperature Control Cam

Fig. 4, Temperature Control Kinematics

12.1 Connect the electrical connector to the temperature actuator.

12.2 Align the actuator to the keyed shaft on the door.

12.3 Using capscrews, attach the temperature actuator to the temperature control cover.

13. Move the wiring harness channel back in place and use a capscrew to attach the channel to the temperature control cover.

14. Install the dash panels listed below. For instructions, see **Section 60.08**.
    - upper dash assembly, center panel
    - dash trim cap
    - console cover
    - heater and air conditioner cover
    - upper dash cover
    - electrical cover

15. Calibrate the HVAC system after the actuator has been installed.

    15.1 Turn the ignition key to the on position, but keep the engine off.

    15.2 Turn the fan switch to the off position.

    15.3 Turn the air selection switch to the full defrost mode.

    15.4 Turn the temperature control switch to the full hot position.

    15.5 Press and hold the recirculation and air conditioning buttons until they begin to blink.

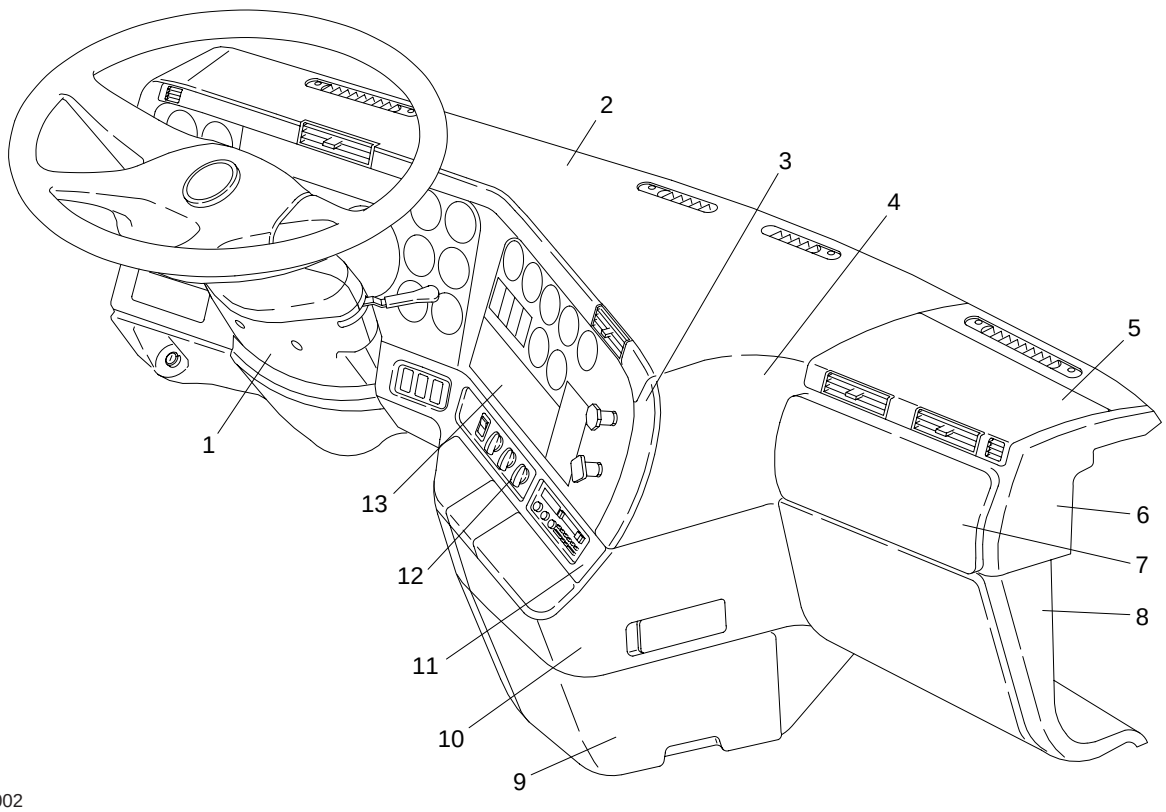
    15.6 The recirculation and air conditioning indicators will blink, the fan will turn on at the highest fan speed, the air selection switch will cycle through the modes, and the recirculation door will open and close. The entire cycle takes about 20 to 30 seconds.

16. Remove the chocks from the tires.

Recirculation and Fresh Air Kinematics Replacement

Replacement

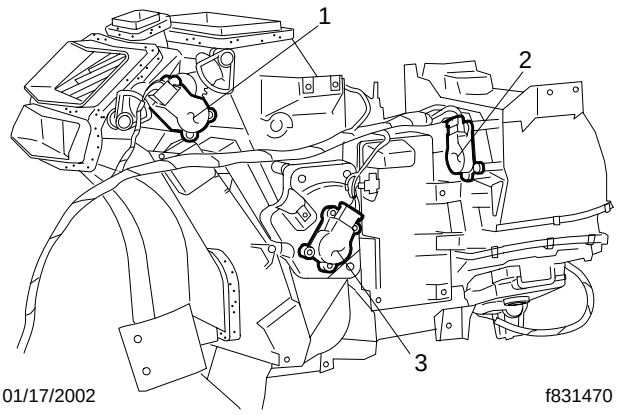
1. Turn off the engine, apply the parking brakes, and chock the rear tires.
2. Remove the dash panels listed below. See **Fig. 1**. For instructions, see **Section 60.08**.
   - electrical cover
   - right-side upper dash assembly
   - upper dash cover
   - heater and air conditioner cover
   - console cover
   - dash trim cap
   - upper dash assembly, center panel
3. Remove the evaporator temperature sensor by turning the sensor counterclockwise one-quarter turn.
4. Remove the capscrews that attach the evaporator service cover to the HVAC assembly. Remove the service cover.
5. Remove the recirculation actuator. See **Fig. 2**.



1. Steering Column Cover
2. Left-Side Upper Dash Assembly
3. Dash Trim Cap
4. Upper Dash Assembly, Center Panel
5. Electrical Cover
6. Right-Side Upper Dash Assembly
7. Upper Dash Cover
8. Heater and Air Conditioner Cover
9. Waste Bin Outer Wall
10. Console Cover
11. HVAC/Radio Trim Plate
12. Front Control Unit
13. Auxiliary Gauge Panel

Fig. 1, Dash Panels

Recirculation and Fresh Air Kinematics Replacement



1. Mode Actuator
2. Recirculation Actuator
3. Temperature Actuator

Fig. 2, Actuators

5.1 Remove the capscrews that attach the recirculation actuator to the HVAC assembly.

5.2 Remove the linkage from the back of the actuator. Disconnect the electrical connector from the actuator, and remove the actuator.

6. Remove the nuts that attach the power distribution module (PDM) to the HVAC assembly. Lift the PDM to access the linkage or arm.
7. Remove the linkage from the lever.
8. Install a new linkage on the lever.
9. Lower the PDM. Using nuts, attach the PDM to the HVAC assembly.
10. Install the recirculation actuator.

    10.1 Connect the electrical connector to the actuator.

    10.2 Attach the linkage to the back of the actuator and align the actuator to the keyed shaft on the door.

    10.3 Using capscrews, attach the actuator to the HVAC assembly.

11. Using capscrews, install the evaporator service cover on the HVAC assembly. Make sure that the evaporator service cover is correctly seated to the HVAC assembly.
12. Install the temperature sensor in the evaporator and turn the sensor clockwise one-quarter turn.
13. Install the dash panels listed below. For instructions, see **Section 60.08**.
    - upper dash assembly, center panel
    - dash trim cap
    - console cover
    - heater and air conditioner cover
    - upper dash cover
    - right-side upper dash assembly
    - electrical cover
14. Calibrate the HVAC system after the actuator has been installed.

    14.1 Turn the ignition key to the on position, but keep the engine off.

    14.2 Turn the fan switch to the off position.

    14.3 Turn the air selection switch to the full defrost mode.

    14.4 Turn the temperature control switch to the full hot position.

    14.5 Press and hold the recirculation and air conditioning buttons until they begin to blink.

    14.6 The recirculation and air conditioning indicators will blink, the fan will turn on at the highest fan speed, the air selection switch will cycle through the modes, and the recirculation door will open and close. The entire cycle takes about 20 to 30 seconds.

15. Remove the chocks from the tires.

Specifications

WARNING

R–134a is the only refrigerant that is approved for use on Freightliner vehicles. Several companies offer less expensive, hydrocarbon-based refrigerant, such as propane and methane. Use of these refrigerants will void the warranty on the air conditioning system, cause damage to the air conditioning system, and possibly result in personal injury or property damage. Leaking air conditioning systems charged with hydrocarbon-based refrigerants pose a serious risk of fire or explosion under the hood, or inside the passenger compartment. No vehicle built by Freightliner Trucks can be safely charged with hydrocarbon-based refrigerants, regardless of what the refrigerant supplier states.

When servicing an air conditioning system, be sure to use a refrigerant identifier to ensure that the system has not been charged with something other than R–134a. This should be standard practice since there is no way to tell what services have been previously performed. Identification by service technicians will help to avoid the risk of explosion and guard against contamination of equipment when refrigerant is recovered and recycled.

See **Fig. 1** for an illustration that shows the difference between the Behr and Modine condensers.

Temperature/pressure specifications and wiring diagrams for the blend air HVAC system can be found in **Section 83.06**, Subject 300.

Refrigerant Oil Specifications		
Refrigerant Compressor Make	**Oil Type**	**Refrigerant Oil Capacity**
Sanden	PAG	10.1 oz (286 grams)
Climate Control	PAG	14 oz (397 grams)

Table 1, Refrigerant Oil Specifications

Refrigerant Charge Specifications		
Condenser Make	**Type of Cab**	**Refrigerant Amount**
Behr	Day Cab	2.875 lb or 2 lb 14 oz (1.30 kg)
	SleeperCab	3.438 lb or 3 lb 7 oz (1.56 kg)
Modine	Day Cab	3.25 lb or 3 lb 4 oz (1.47 kg)
	SleeperCab	3.75 lb or 3 lb 12 oz (1.70 kg)

Table 2, Refrigerant Charge Specifications

General Description

The sleeper heater and air conditioner assembly is mounted in either the baggage compartment or under the lower bunk, depending on the cab model, and contains the following major components. See **Fig. 1**.

- brushless blower motor
- evaporator
- heater core
- air filter
- actuator
- temperature control doors
- expansion valve
- CDTC temperature sensor

The heating and air conditioning functions of the sleeper heater and air conditioner system are controlled by the sleeper climate control panel. See **Fig. 2**.

The cab climate control panel may have a bunk override (BUNK OVRD) switch that allows the driver to remotely control the fan speed and temperature settings in the sleeper. The bunk override mode can be canceled by adjusting the fan speed or temperature setting on the sleeper climate control panel when the bunk override mode is on. Refer to the *Century Class S/T and Coronado Driver's Manual* for operating instructions.

Principles of Operation

The sleeper heater and air conditioner system is a constant discharge temperature control (CDTC) system. The CDTC maintains a constant temperature of airflow in the sleeper regardless of outside air temperature, selected fan speed, or engine coolant temperature. Once the temperature control switch is turned to the desired temperature, no other adjustments are necessary.

The sleeper heater is plumbed directly to the engine, independent of the cab heater. The sleeper air conditioner is dependent on the cab air conditioning system, sharing the refrigerant and compressor.

When the air conditioner is operating, the amber indicator on the air conditioning button will be on whether the request for air conditioning comes from the cab climate control panel or the sleeper climate control panel. When the instrument panel lights are on, the blue snowflake indicator on the air conditioning button will be on.

Safety Precautions

Whenever repairs are made to any air conditioner parts that hold R–134a refrigerant, you must recover, flush (if contaminated), evacuate, charge, and leak test the system. In a good system, refrigerant lines are always under pressure and you should disconnect them only after the refrigerant charge has been recovered (discharged) at the service valves.

Refrigerant R–134a is safe when used under the right conditions. Always wear safety goggles and non-leather gloves while recovering, evacuating, charging, and leak testing the system. Do not wear leather gloves. When refrigerant gas or liquid contacts leather, the leather will stick to your skin.

⚠ WARNING

Use care to prevent refrigerant from touching your skin or eyes because liquid refrigerant, when exposed to the air, quickly evaporates and will freeze skin or eye tissue. Serious injury or blindness could result if you come in contact with liquid refrigerant.

Refrigerant splashed in the eyes should be rinsed with lukewarm water, not hot or cold. Do not rub the eyes. Apply a light bandage and contact a physician right away.

Refrigerant splashed on the skin should be rinsed with lukewarm water, not hot or cold. Do not rub the skin. Apply a light coat of a nonmedicated ointment, such as petroleum jelly. Contact a physician right away.

R–134a refrigerant does not burn at ambient temperatures and atmospheric pressure. However, it can be combustible at pressures as low as 5.5 psig (139 kPa absolute) at 350°F (177°C) when mixed with air concentrations that are greater than 60 percent.

⚠ WARNING

R–134a air conditioning systems should not be pressure tested or leak tested with compressed air. Combustible mixtures of air and R–134a may form, resulting in a fire or explosion that could cause personal injury or property damage.

Always work in an area where there is a constant flow of fresh air when the system is recovered, evacuated, charged, and leak tested. R–134a vapors have a slightly sweet odor that is difficult to detect. Frequent leak checks and air monitoring equipment are recommended to ensure a safe working environment.

IMPORTANT: When servicing an R–134a air conditioning system, use only service equipment certified to meet the requirements of SAE J2210 (R–134a recycling equipment). The equipment should be operated only by qualified personnel who are familiar with the recycling station manufacturer's instructions.

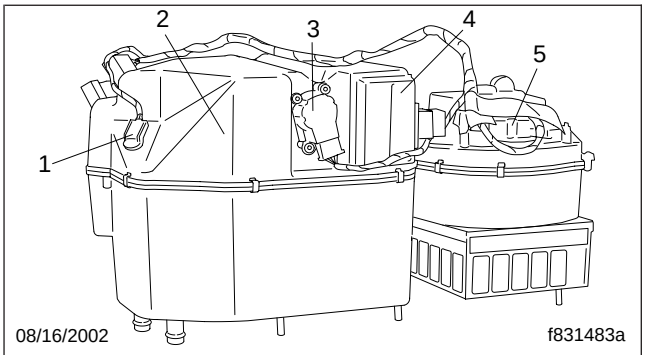
Because of its very low boiling point, refrigerant must be stored under pressure. To prevent the refrigerant containers from exploding, never expose them to temperatures higher than 125°F (52°C).

On R–134a refrigerant systems, polyalkylene glycol (PAG) oil is used in the compressor. When handling PAG oil, observe the following guidelines:

- Keep the oil free of contaminants.
- Do not expose the air conditioning system or the PAG oil container to air for more than five minutes. PAG oil has a high moisture absorption capacity and the oil container should be immediately sealed after each use.
- Use care when handling. Spilled oil could damage painted surfaces, plastic parts, and other components such as drive belts.
- Never mix PAG oil with other types of refrigerant oil.

Replacement

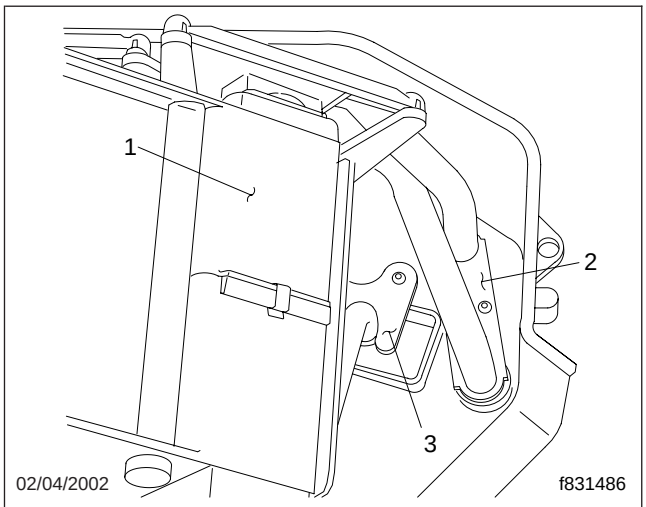
1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.04**, Subject 220.
4. Drain the coolant from the cooling system. For instructions, see **Section 20.01**, Subject 100.
5. Remove the sleeper heater and air conditioner (HVAC) assembly from the vehicle. For instructions, see **Subject 150**.
6. Remove the capscrews that attach the temperature actuator to the HVAC assembly and remove the actuator. See **Fig. 1**.



1. CDTC Sensor
2. Sleeper HVAC Assembly
3. Temperature Actuator
4. Auxiliary Control Unit (ACU)
5. Blower Motor

Fig. 1, Sleeper HVAC Assembly

7. Remove the clips that attach the upper housing of the HVAC assembly to the lower housing. Remove the upper housing.
8. Remove the heater core subassembly from the HVAC assembly.
   - 8.1 Remove the capscrew that attaches the heater tube retention bracket to the lower housing and remove the bracket. See **Fig. 2**.
   - 8.2 Remove the heater core subassembly from the lower housing.

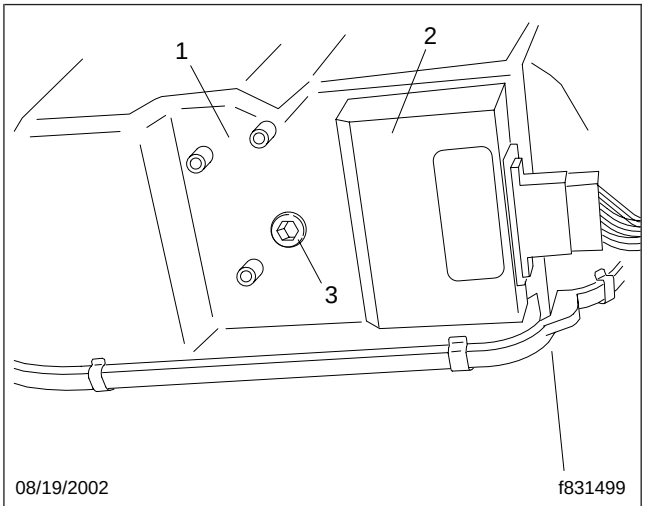


1. Heater Core Subassembly
2. Heater Tube Retention Bracket
3. Evaporator Tube Retaining Bracket

Fig. 2, Heater Core Subassembly

9. Spread the tabs to remove the heater core from the heater core housing. Remove the heater core.
10. Remove the heater core tubes from the heater core.
11. Attach the heater core tubes to the new heater core. Position the heater core tubes as shown in **Fig. 2**.
12. Install the heater core in the heater core housing. Press firmly on the heater core until the tabs are in the locked position.
13. Install the heater core subassembly in the lower housing. Make sure the heater core tubes protrude through the bottom of the housing.
14. Using a capscrew, attach the heater core tubes and the heater tube retention bracket to the lower housing.
15. Install the upper housing on the lower housing. Make sure the entire seam between the two housings is flush.
16. Check that the kinematic drive socket is aligned with the hole in the upper housing. See **Fig. 3**.
17. Using clips, secure the upper housing to the lower housing.

Heater Core Replacement



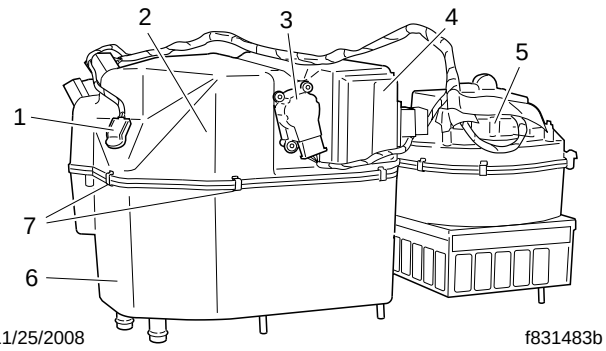
1. Upper Housing
2. Auxiliary Control Unit
3. Kinematic Drive Socket

Fig. 3, Upper Housing

18. Check that the temperature kinematic is working. Turn the kinematic drive lever and verify the temperature mix doors move when the drive lever is turned.
19. Install the temperature actuator.
    - 19.1 Align the actuator to the keyed shaft on the door.
    - 19.2 Using capscrews, attach the actuator to the HVAC assembly.
20. Install the HVAC assembly in the vehicle. For instructions, see **Subject 150**.
21. Fill the cooling system with coolant. For instructions, see **Section 20.01**, Subject 100.
22. Evacuate and charge the air conditioning system. For instructions, see **Section 83.04**, Subject 220.
23. Connect the batteries.
24. Remove the chocks from the tires.

Replacement

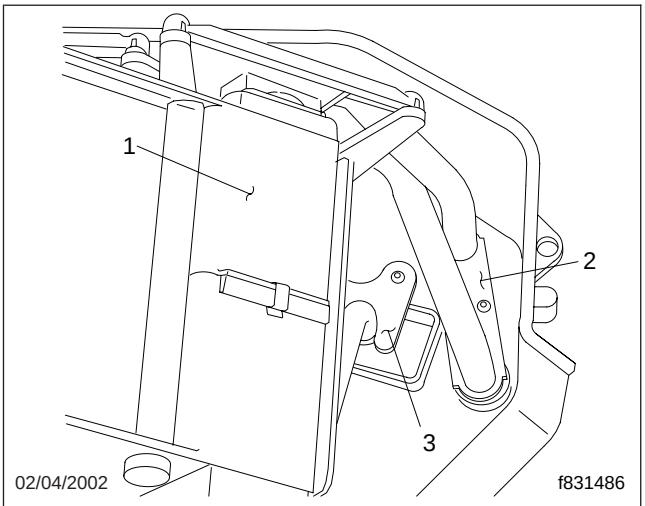
1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Recover the refrigerant from the air conditioning system. See **Section 83.04, Subject 220** for instructions.
4. Drain the coolant from the cooling system. See **Section 20.01, Subject 100** for instructions.
5. Remove the sleeper heater and air conditioner (HVAC) assembly from the vehicle. See **Subject 150** for instructions.
6. Remove the capscrews that attach the blend door actuator to the HVAC assembly, and remove the actuator. See **Fig. 1**.



1. CDTC Sensor
2. Upper Housing
3. Blend Door Actuator
4. Auxiliary Control Unit (ACU)
5. Blower Motor
6. Lower Housing
7. Clips

Fig. 1, Sleeper HVAC Assembly

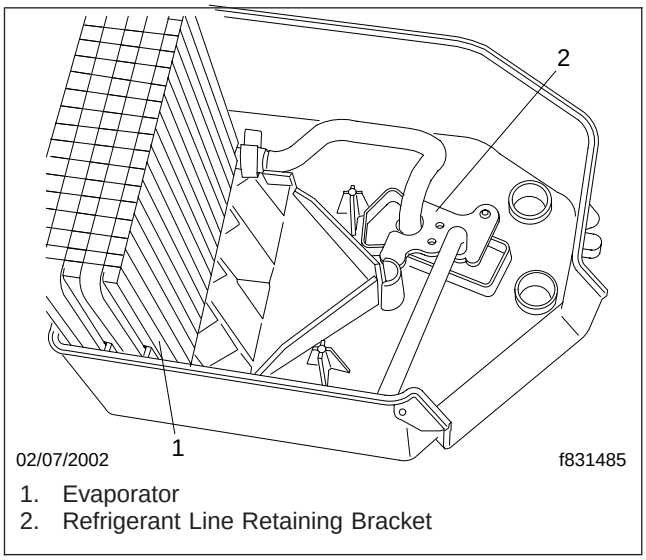
7. Remove the clips that attach the upper housing of the HVAC assembly to the lower housing. Remove the upper housing.
8. Remove the capscrew that attaches the heater tube retention bracket to the lower housing. See **Fig. 2**.
9. Remove the heater core subassembly from the lower housing.



1. Heater Core Subassembly
2. Heater Tube Retention Bracket
3. Refrigerant Line Retaining Bracket

Fig. 2, Heater Core Subassembly

10. Remove the capscrews that attach the refrigerant line retaining bracket to the lower housing. See **Fig. 3**.



1. Evaporator
2. Refrigerant Line Retaining Bracket

Fig. 3, Evaporator

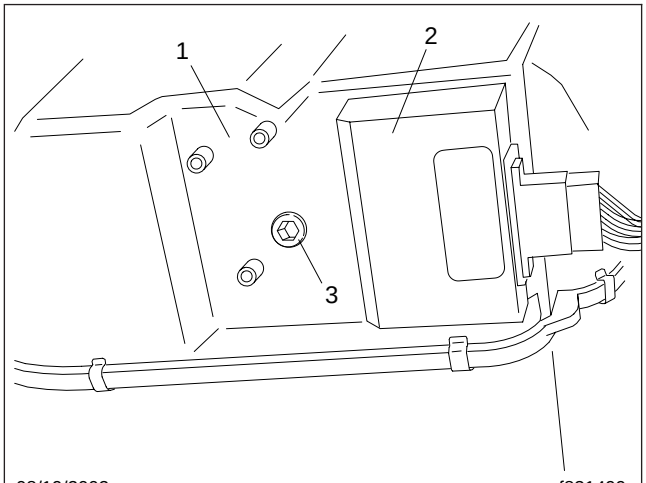
11. Remove the evaporator.
12. Remove the capscrews that attach the upper retaining plate and the expansion valve to the refrigerant lines. Remove the expansion valve.

Evaporator Replacement

13. Remove and discard the Mini Stat-O-Seals from the evaporator refrigerant lines.

IMPORTANT: Do not lubricate the Mini Stat-O-Seals prior to installation.

14. Install new Mini Stat-O-Seals on the evaporator refrigerant lines.
15. Using capscrews, attach the expansion valve and the upper retaining plate to the evaporator refrigerant lines. Tighten the capscrews 35 lbf·in (400 N·cm).
16. Install the evaporator in the lower housing, as follows.
    - 16.1 The base of the evaporator should rest on the condensate channels and the expansion valve should protrude through the bottom of the lower housing.
    - 16.2 Attach the refrigerant line retaining bracket to the housing. See **Fig. 3**.
17. Install the heater core subassembly in the lower housing. Make sure the heater core tubes protrude through the bottom of the housing.
18. Using a capscrew, attach the heater tube retention bracket to the lower housing. See **Fig. 2**.
19. Install the upper housing on the lower housing. Make sure the entire seam between the two housings is flush, and that the kinematic drive socket is aligned with the hole in the upper housing. See **Fig. 4**.
20. Using clips, secure the upper housing to the lower housing.
21. Check that the blend door kinematic is working. Turn the kinematic drive socket and verify the blend doors function correctly.
22. Align the blend door actuator to the drive socket. Then, using capscrews, attach the actuator to the HVAC assembly.
23. Install the HVAC assembly in the vehicle. For instructions, see **Subject 150**.
24. Fill the cooling system with coolant. For instructions, see **Section 20.01, Subject 100**.
25. Connect the batteries.
26. Evacuate and charge the air conditioning system. For instructions, see **Section 83.04, Subject 220**.



1. Upper Housing
2. Auxiliary Control Unit
3. Kinematic Drive Socket

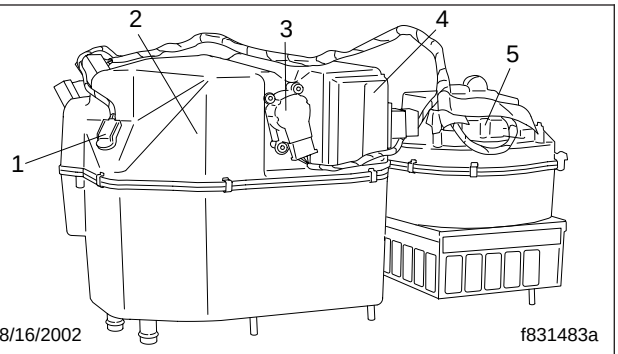
Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Access the sleeper heater and air conditioner (HVAC) assembly.

   On vehicles with a baggage compartment on the right side of the cab, open the door to the baggage compartment.

   On vehicles without a baggage compartment on the right side of the cab, raise the mattress and bunk panel to the locked position.
4. Disconnect the electrical connector from the blower motor. See **Fig. 1**.



1. CDTC Sensor
2. Sleeper HVAC Assembly
3. Temperature Actuator
4. Auxiliary Control Unit (ACU)
5. Blower Motor

Fig. 1, Sleeper HVAC Assembly

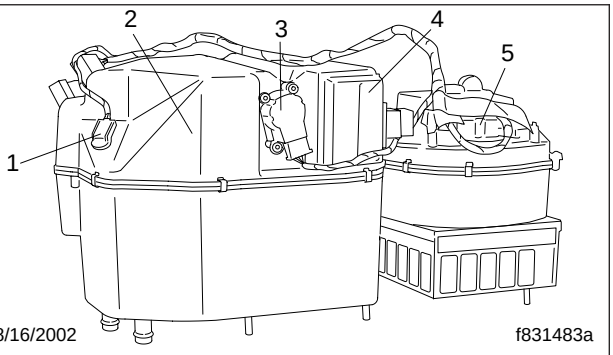
5. Remove the capscrews that attach the blower motor to the HVAC assembly and remove the blower motor.
6. Using capscrews, install a new blower motor on the HVAC assembly.
7. Connect the electrical connector to the blower motor.
8. Lower the sleeper mattress and bunk panel or close the baggage compartment door.
9. Connect the batteries.
10. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Access the sleeper heater and air conditioner (HVAC) assembly.

   On vehicles with a baggage compartment on the right side of the cab, open the door to the baggage compartment.

   On vehicles without a baggage compartment on the right side of the cab, raise the mattress and bunk panel to the locked position.
3. Remove the capscrews that attach the temperature actuator to the HVAC assembly. See **Fig. 1**.



1. CDTC Sensor
2. Sleeper HVAC Assembly
3. Temperature Actuator
4. Auxiliary Control Unit (ACU)
5. Blower Motor

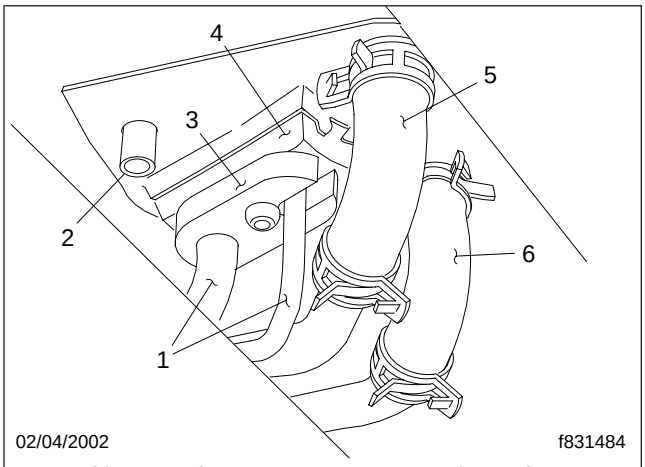
Fig. 1, Sleeper HVAC Assembly

4. Disconnect the electrical connector from the actuator and discard the actuator.
5. Connect the electrical connector to the new actuator.
6. Align the actuator to the keyed shaft on the door.
7. Using capscrews, attach the actuator to the HVAC assembly.
8. Lower the sleeper mattress and bunk panel or close the baggage compartment door.
9. Remove the chocks from the tires.

Heater and Air Conditioner Assembly Removal and Installation

Removal

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.04**, Subject 220.
3. Drain the coolant from the cooling system. For instructions, see **Section 20.01**, Subject 100.
4. Place a drain pan under the sleeper on the right side of the vehicle to catch any coolant that may spill from the coolant lines. Remove the clamps that attach the coolant hoses to the coolant lines and remove the coolant hoses. See **Fig. 1**.



1. Refrigerant Line
2. Drain Tube
3. Retaining Plate
4. Expansion Valve
5. Coolant Return Line
6. Coolant Supply Line

Fig. 1, Expansion Valve

IMPORTANT: Under no circumstances should the expansion valve ports remain uncapped or the fittings remain unplugged for longer than five minutes total. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

5. From under the sleeper on the right side of the vehicle, remove the capscrew that attaches the lower retaining plate and refrigerant lines to the expansion valve. Remove and discard the Mini Stat-O-Seals. Quickly cap the refrigerant lines. See **Fig. 1**.
6. From under the sleeper, remove the nuts and washers that attach the sleeper heater and air conditioner (HVAC) assembly to the floor of the sleeper.
7. Access the HVAC assembly.

   On vehicles with a baggage compartment on the right side of the cab, open the door to the baggage compartment.

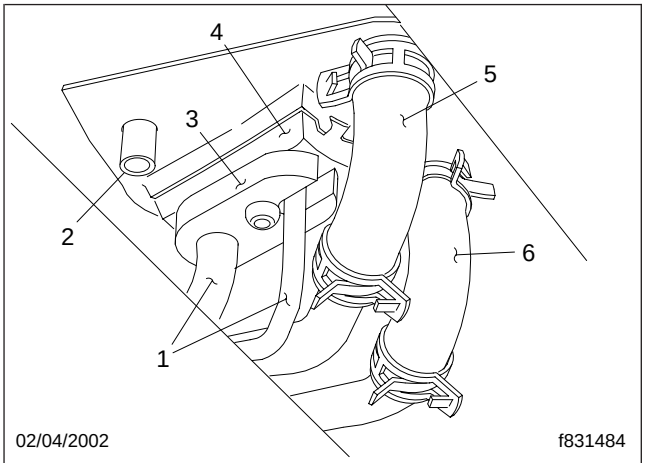
   On vehicles without a baggage compartment on the right side of the cab, raise the mattress and bunk panel to the locked position.
8. From inside the sleeper, disconnect the wiring harnesses from the HVAC assembly.
9. Remove the HVAC assembly from the vehicle.

Installation

1. Place the HVAC assembly on the floor of the sleeper. Make sure the heater core tubes, water drain tube, and mounting studs protrude through the floor.
2. Connect the wiring harnesses to the HVAC assembly.
3. From under the sleeper, install the washers and nuts on the mounting studs. Tighten the nuts 48 lbf·in (542 N·cm) maximum.
4. Uncap the refrigerant lines and install new Mini Stat-O-Seals on the refrigerant lines.
5. Using a capscrew, attach the lower retaining plate and the refrigerant lines to the expansion valve. Torque the capscrew 11 to 15 lbf·ft (15 to 20 N·m).
6. Fill the cooling system with coolant. For instructions, see **Section 20.01**, Subject 100.
7. Evacuate and charge the air conditioning system. For instructions, see **Section 83.04**, Subject 220.
8. Lower the mattress and the bunk panel or close the baggage compartment door.
9. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.04**, Subject 220.
3. From under the sleeper on the right side of the vehicle, remove the capscrew that attaches the lower retaining plate and refrigerant lines to the expansion valve. Remove and discard the Mini Stat-O-Seals. Quickly cap the refrigerant lines. See **Fig. 1**.



1. Refrigerant Lines
2. Drain Tube
3. Retaining Plate
4. Expansion Valve
5. Coolant Return Line
6. Coolant Supply Line

Fig. 1, Expansion Valve

IMPORTANT: Under no circumstances should the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

4. Remove the capscrews that attach the expansion valve to the upper retaining plate and remove the expansion valve.
5. Remove and discard the Mini Stat-O-Seals from the refrigerant lines.

IMPORTANT: Do not lubricate the Mini Stat-O-Seals prior to installation.

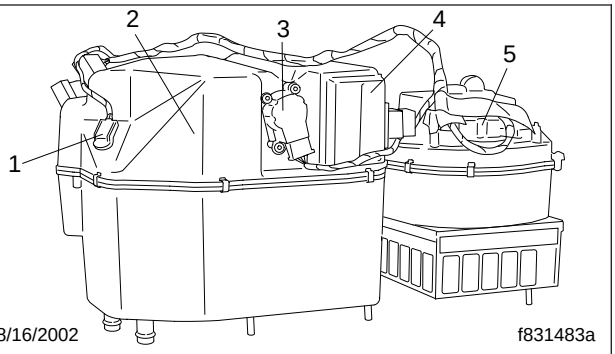
6. Install new Mini Stat-O-Seals on the evaporator refrigerant lines.
7. Using capscrews, attach the new expansion valve to the upper retaining plate. Using a torque wrench set to inch-pounds, tighten the capscrews 35 lbf·in (395 N·cm).
8. Uncap the lower refrigerant lines and install new Mini Stat-O-Seals on the refrigerant lines.
9. Using a capscrew, attach the lower retaining plate and the refrigerant lines to the expansion valve. Torque the capscrew 11 to 15 lbf·ft (15 to 20 N·m).
10. Evacuate and charge the air conditioning system. For instructions, see **Section 83.04**, Subject 220.
11. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Access the sleeper heater and air conditioner (HVAC) assembly.

   On vehicles with a baggage compartment on the right side of the cab, open the door to the baggage compartment.

   On vehicles without a baggage compartment on the right side of the cab, raise the mattress and bunk panel to the locked position.
4. Disconnect the electrical connector from the auxiliary control unit (ACU). See **Fig. 1**.



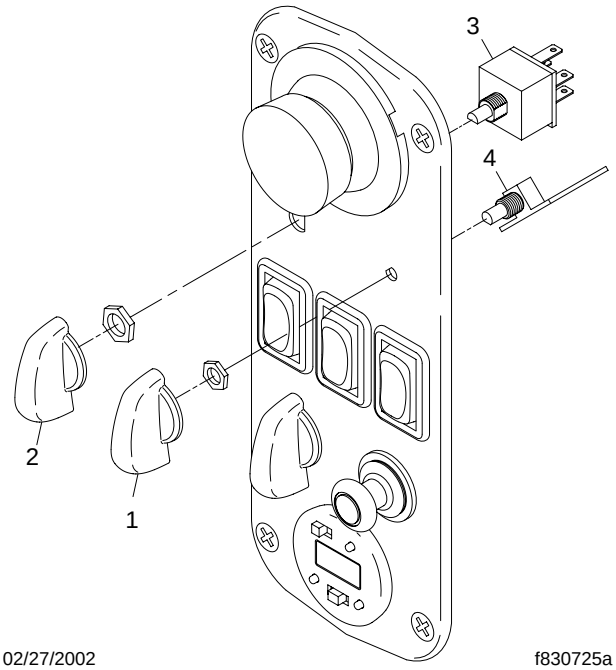
1. CDTC Sensor
2. Sleeper HVAC Assembly
3. Temperature Actuator
4. Auxiliary Control Unit
5. Blower Motor

Fig. 1, Sleeper HVAC Assembly

5. Release the clips at the bottom of the auxiliary control unit to remove the ACU from the HVAC assembly.
6. Connect the electrical connector to the new auxiliary control unit.
7. Install the new auxiliary control unit on the HVAC assembly.
8. Lower the sleeper mattress and bunk panel or close the baggage compartment door.
9. Connect the batteries.
10. Remove the chocks from the tires.

Fan Switch Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the Torx® fasteners that attach the climate control panel to the cab wall and pull the panel away from the wall. See **Fig. 1**.



1. Temperature Control Switch Knob
2. Fan Switch Knob
3. Fan Switch
4. Temperature Control Switch

Fig. 1, Climate Control Panel

4. Pull the fan switch knob off the fan switch.
5. Disconnect the electrical connector from the fan switch.
6. Remove the nut and pull the fan switch out of the control panel.
7. Using a new nut, install a new fan switch on the climate control panel.
8. Attach the fan switch knob to the fan switch.
9. Connect the electrical connector to the fan switch.
10. Using Torx fasteners, attach the climate control panel to the cab wall.
11. Connect the batteries.
12. Remove the chocks from the tires.

Temperature Control Switch Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the Torx fasteners that attach the climate control panel to the cab wall and pull the panel away from the wall. See **Fig. 1**.
4. Pull the temperature control switch knob off the temperature control switch.
5. Disconnect the electrical connector from the temperature control switch.
6. Remove the nut and pull the temperature control switch out of the control panel.
7. Using a new nut, install a new temperature control switch on the climate control panel.
8. Attach the temperature control switch knob to the temperature control switch.
9. Connect the electrical connector to the temperature control switch.
10. Using Torx fasteners, attach the climate control panel to the cab wall.
11. Connect the batteries.
12. Remove the chocks from the tires.

Specifications

WARNING

R–134a is the only refrigerant that is approved for use on Freightliner vehicles. Several companies offer less expensive, hydrocarbon-based refrigerant, such as propane and methane. Use of these refrigerants will void the warranty on the air conditioning system, cause damage to the air conditioning system, and possibly result in personal injury or property damage. Leaking air conditioning systems charged with hydrocarbon-based refrigerants pose a serious risk of fire or explosion under the hood, or inside the passenger compartment. No vehicle built by Freightliner Trucks can be safely charged with hydrocarbon-based refrigerants, regardless of what the refrigerant supplier states.

When servicing an air conditioning system, be sure to use a refrigerant identifier to ensure that the system has not been charged with something other than R–134a. This should be standard practice since there is no way to tell what services have been previously performed. Identification by service technicians will help to avoid the risk of explosion and guard against contamination of equipment when refrigerant is recovered and recycled.

Temperature/pressure specifications and wiring diagrams for the blend air HVAC system can be found in **Section 83.06**, Subject 300.

Refrigerant Oil Specifications		
Refrigerant Compressor Make	**Oil Type**	**Refrigerant Oil Capacity**
Sanden	PAG	10.1 oz (286 grams)
Climate Control	PAG	14 oz (397 grams)

Table 1, Refrigerant Oil Specifications

Refrigerant Charge Specifications		
Condenser Make	**Type of Cab**	**Refrigerant Amount**
Behr	Day Cab	2.875 lb or 2 lb 14 oz (1.30 kg)
	SleeperCab	3.438 lb or 3 lb 7 oz (1.56 kg)

	SleeperCab	3.75 lb or 3 lb 12 oz (1.70 kg)

Table 2, Refrigerant Charge Specifications

Diagnostic Overview

A/C cooling problems fit into two basic failure categories, refrigerant or electrical. The goal of this troubleshooting guide is to provide the information necessary to determine what part is causing the problem. We expect the tech to use approved tools and shop practices, symptom driven diagnostics, and warranty component evaluation guides to properly asses component failures. Refer to www.accessfreightliner.com for available tool information, service training, and warranty documentation.

For system performance testing, ambient temperature must be above 70°F (21°C) to produce reliable results. In order to quickly determine if your symptoms are refrigerant or electrical, two main tools should be utilized by the technician; ServiceLink and a refrigerant gauge set.

General Diagnostic Procedure

1. Perform the preliminary checks.
2. Perform an initial system inspection.
3. Make a determination about which system is suspected (refrigerant or electrical), and follow the symptoms through to a suspected part.
4. Repair the problem.
5. Verify that all of the refrigerant connections removed during the service are properly sealed using an approved refrigerant leak detector.
6. Verify that the problem has been resolved.

System Overview

The blend air system uses Constant Discharge Temperature Control (CDTC) to regulate the temperature in the vehicle. The CDTC is a closed-loop system that uses the climate control panel settings, the temperature sensors, and various J1587 databus inputs to control and maintain the outlet temperature of the system. The blend air system has an electronically controlled, brushless, direct current (BLDC) blower motor that does not require a resistor block to control the blower speed.

In the blend air system, all air is directed through the evaporator. The amount of air needing to be reheated is controlled by the temperature control door, which directs that amount of air through the heater core.

The cab HVAC assembly consists of a blower motor, evaporator, heater core, CDTC sensor, evaporator temperature sensor, and three electric actuators that drive the air direction control doors. The doors perform the following functions:

- temperature control door—controls how much air is directed through or around the heater core
- air selection mode door—directs airflow to the face, floor, or defrost outlets
- recirculation door—controls the amount of outside air that enters the HVAC unit

The cab climate control panel (front control unit) contains the microprocessor that controls the system.

The sleeper or auxiliary HVAC assembly consists of a brushless blower motor, evaporator, heater core, auxiliary control unit, air filter, CDTC temperature sensor, and an electric actuator that drives the temperature control door.

The refrigerant system consists of a compressor, condenser, receiver-drier, thermal expansion valve(s), and pressure sensors.

Preliminary Checks

NOTE: Pay attention to the refrigerant system components for evidence of oil seepage and other potential leaks that will be checked during subsequent diagnostic steps.

Before testing the operation of the air conditioning system, check the following items:

1. Inspect the drive belt and mounting fasteners for signs of wear or looseness.
2. Visually inspect the clutch for signs of over heating, damage, or wear. If necessary, check the clutch gap. For instructions, see **Section 83.01**, Subject 140.
3. Check for road debris buildup on the condenser coil fins. Using air pressure and a whisk broom or a soapy spray of water, carefully clean off the condenser. Be careful not to bend the fins.
4. Inspect the fresh and recirculation air filter elements, and inspect the intake-air ducting for debris.
5. With the engine off, and Optimized Idle (if applicable) disabled, turn the compressor drive plate by hand to feel for grinding or harshness inside the compressor.

Initial Inspection

1. Connect refrigerant pressure gauges and ServiceLink to the vehicle.
2. Start the vehicle and select A/C mode and a cold temp setting to request compressor engagement. If the following conditions are met, the clutch should engage.
    - The engine is running at, or above 450 RPM for at least 5 seconds.
    - Refrigerant system high side pressure is above 20 psi (140 kPa). Pressure reading is taken at the binary switch.
    - Refrigerant system high side pressure is below 450 psi (3100 kPa). Pressure reading is taken at the binary switch.
    - Vehicle compressed air system is above 60 psi (414 kPa). Pressure is taken at the dash ECU, and transmitted on the J1587 databus.
    - Evaporator core temperature sensor above 44°F (6.5°C). Temperature is taken in the main heater box, as a direct input to the FCU.
    - The blower feedback from the main HVAC unit is connected, and the signal is meeting the minimum RPM requirements for each knob position.

At this point you should be seeing some indication of a problem, either electrical or refrigerant.

Electrical—If there are any faults that affect the front control unit (FCU) or any of the parallel systems that provide input information to the FCU, or if the system requirements are being met, but the clutch is still not engaging, there may be an electrical problem related to the FCU, or the voltage signal to the compressor.

Refrigerant—If the low side pressure is drawing down far below 20 psi (140 kPa), or if the high side pressure is rising above 450 psi (3100 kPa), there is a refrigerant related problem.

Post-Repair Procedures

After repair work is completed, verify that the repair resolved the problem.

1. Verify that all of the refrigerant connections removed during the service are properly sealed using an approved refrigerant leak detector.
2. Check for fault codes. There should be no active fault codes that indicate the problem still exists.
3. If there is still a problem, repeat the appropriate tests, and make repairs as needed.
4. Verify again.

Refrigerant System Tests

Use the following procedure to evaluate the performance of the air conditioning system. If the system does not operate within the following guidelines, further diagnosis and repair may be necessary. The dash outlet temperature will fluctuate during each clutch cycle, and the temperature reading should be taken at the lowest value.

1. Park the vehicle out of direct sunlight, shut down the engine, and chock the tires.
2. Open the hood and leave the hood open for the entire test.
3. Open the driver and passenger doors and leave the doors open for the entire test.
4. Note the current ambient air temperature.

NOTE: High relative humidity reduces cooling and could increase the dash outlet temperatures, and high-side system pressures.

5. Using the ambient air temperature readings noted in the previous step, find the temperature/pressure specifications in **Table 1** that best match your ambient conditions.
6. Connect the test gauges to the high and low side service ports.
7. Place a thermometer in the center dash outlet. If the vehicle is a SleeperCab, place another thermometer in the lower sleeper outlet.

NOTE: EPA07 and owner-set idle limits may prevent the warm-up run from continuing without occasional throttle inputs.

8. Start the engine and run the A/C for 15 minutes.
9. Set the engine speed to 1500 rpm and engage the engine fan.
10. Set the cab climate control panel to the following settings:
    - air selection switch to face mode
    - air conditioning on
    - blower speed switch to high
    - temperature control switch to full cold
    - recirculation switch off
11. On SleeperCabs, set the sleeper climate control panel to the following settings (or initiate "bunk override" mode):
    - blower speed switch to high
    - temperature control switch to full cold
12. Allow the system to stabilize at least five minutes or until the dash and sleeper outlet temperatures have reached a minimum, then compare the system values to the information in **Table 1**. The results should be close to those listed, but minor discrepancies are not a guarantee that the system has a refrigerant system problem.

    Possible causes of refrigerant system complaints:
    - Too much oil - High high-side pressure, poor heat rejection at the condenser
    - Too much refrigerant - High high-side pressure, good cooling
    - No enough refrigerant - Low high-side pressure, low low-side pressure, poor cooling
    - Debris in the system - TXV plugged or uncontrollable, compressor turns hard, receiver/dryer is icing
    - Contaminated or incorrect refrigerant - Very inconsistent system pressures and duct temps

Refrigerant System Tests

Approximate Temperature/Pressure Specifications at Moderate Humidity (less than 50%)					
Ambient Air Temp.	Center Dash Outlet Temp.	Service Port Pressures		A/C Compressor Status	A/C Compressor Status Comments
		High Side psi (kPa)	Low Side psi (kPa)		
65–75°F (18–24°C)	44–50°F (7–10°C)	94–124 (648–855)	18–25 (124–172)	approximately 50% duty cycle	Cycling on evaporator freeze protection
75–85°F (24–29°C)	45–60°F (7–16°C)	114–125 (786–862)	20–26 (138–179)	approximately 75% duty cycle	
85–95°F (29–35°C)	55–70°F (13–21°C)	135–170 (931–1172)	23–28 (158–193)	On	On steady
95–105°F (35–41°C)	65–80°F (18–27°C)	160–200 (1003–1379)	25–30 (172–207)	On	On steady

Table 1, Approximate Temperature/Pressure Specifications at Moderate Humidity (less than 50%)

Thermal Expansion Valve Testing

General

The thermostatic expansion valve (TXV) (see **Fig. 1**) is a controlling device that regulates the flow of refrigerant into the evaporator. It is actuated by changes in evaporator pressure and the superheat of the refrigerant gas leaving the evaporator. Superheat is defined as any temperature of a gas above the boiling point for that liquid. For example, when a refrigerant liquid boils at a low temperature of 40°F (4.5°C) in the evaporator and then the refrigerant gas increases in temperature, superheat has been added. If this refrigerant changed from a liquid to a gas or vapor at 40°F (4.5°C) and then the refrigerant vapor increased in temperature to 50°F (10°C), then it has been superheated by 10°F (6.5°C). The refrigerant entering the evaporator is metered at a rate that matches the amount of refrigerant being boiled off in the evaporator. In addition to metering refrigerant, the TXV also provides a pressure drop in the system, separating the high-pressure side of the system from the low-pressure side. To operate properly, the TXV must have a steady flow of liquid refrigerant supplied to it by the high side of the system. Issues such as an excessively low refrigerant charge, or contaminates in the system can interrupt this flow of liquid to the valve. In these cases, symptoms may surface making it seem as if the valve is inoperative or plugged. These symptoms can include poor performance, low low-side pressures (even a vacuum) ,etc. Before replacing a TXV, it is important to verify that there are no contaminates in the system and that the refrigerant charge is correct, by performing a refrigerant identification and thorough leak check of the entire system. The TXV is often incorrectly replaced as the primary failed part, but is rarely the cause of a performance issue. In rare instances the power element of the TXV can loose its charge, reducing the range of the TXV, but there is no other situation that can be considered a failure of the TXV. Due to the similarity of symptoms that these root causes have on A/C performance, proper diagnosis is essential to making the correct repairs to the A/C system.

Fig. 1, Thermal Expansion Valve Installation

Diagnostics

To determine if the TXV is functioning, watch the low-side pressure while the compressor is engaged. The influence from the TXV modulating can be seen as the low-side gage needle "wags." As the load on the system changes from ambient conditions, the TXV may not wag as much, and care must be taken to prevent false diagnosis. The function of the individual TXVs in a dual evaporator system will be combined to produce the total pressure needle waging that is observed. If a TXV failure is suspected, connect the gage set to the properly charged refrigerant loop, and run the compressor. Watch for the low-side gage needle to wag, indicating that the TXV is working. Depending on the load, the low-side pressure may progress from moderate to high, but the needle will simultaneously wag as the average pressure changes.

Leak Detection

General

The information in this section is intended to convey a general method of leak detecting that should be used to enhance the usefulness of a leak detector being used in accordance with operator's instructions provided by the manufacturer. No technician should attempt to perform leak detection without reading and understanding the owners manuals for the tools being used, and should expect to review those instructions from time to time, to ensure the proper method continues to be used. The process described here was developed using the published list of recommended tools and warranty evaluation guides as a basis for the expectations for repair competence. The only way to confirm that a refrigerant leak exists is by finding a failed or damaged component. A UV flashlight and goggles can be used to provide an indication of a leak, but a approved electronic leak detector must be used to confirm the existence of a leak, and approximate the leak rate. The connections used for A/C refrigerant are intended to seal properly, but given the high level of sensitivity provided by current leak detecting equipment, the detector may indicate a leak even though the connection meets the design specifications. To balance this, the "Acceptable Leak Rates by Component" table in **Specifications** contains the qualifying leak rates for the components used on P2 vehicles. The leak rates, in oz/yr, correspond to the sensitivity values required for all detectors that meet the SAE J2791 functional specifications. By switching between the sensitivity levels, it is possible to discern between leaks of varying sizes and qualify each potential leak. It is expected that a leak rate relates to each component, as it arrives at the factory, but the Mini-Statoseals that connect the components together are specified separately. Additionally, due to the possible difficulty of distinguishing between two minor leaks at a multi-port connection, the leak rate for two Mini-Statoseals should be considered a condemning value if it is not completely clear which seal is leaking.

Method

IMPORTANT: The refrigerant system should be warmed up from completion of the initial inspection, but the engine is off.

1. Shut down the engine.
2. Before testing for compressor leaks, blow shop air near the compressor shaft seal to clear any refrigerant that may have collected.
3. Install caps before testing the service ports.
4. Minimize the amount of wind blowing through the test area, as this will make small leaks harder to find.
5. Set the detector on the most sensitive setting.
6. Start at a point along the refrigerant loop, and methodically follow the refrigerant path, test all around O-ring connections and crimped ends until you reach the starting point.
7. When the detector indicates a suspected leak, move it away from the suspect area, then recheck to the location after the detector has cleared.
    - If the detector continues to indicate a leak, adjust the sensitivity of the detector to match the designed leak specifications shown in "Acceptable Leak Rates by Component" Table, in **Specifications**, and retest the suspected area to confirm the leak.
    - Mark any confirmed leaks, then change the sensitivity back to high and continue checking the system.
8. After the entire system has been checked, recover the refrigerant, investigate each leak point to determine what component failed, and how, then repair leak.

9. Recharge the refrigerant system, then use the electronic leak detector to confirm that each connection opened during the repair is sealed within the design specifications provided in the "Acceptable Leak Rates by Component" table in **Specifications**.

Sanden Compressor Testing, Pressure or Pumping Test

NOTE: This test is meant to be performed after a failure has been repaired, which may have caused damage to the compressor due to low refrigerant or oil levels.

Compressors cause refrigerant to flow through the system by creating a pressure differential, high and low pressures. If the compressor can be forced to produce a high pressure in excess of 350 psi (2415 kPa) it is a good compressor.

IMPORTANT: The compressor pumping test must be performed with the refrigerant system charged to the factory specifications, and functioning properly. This test should only be run for a short time period. Shut the system down immediately once 350 psi (2415 kPa) is achieved.

1. Confirm the system is charged per the OEM requirement before proceeding.
2. Disable the engine cooling fan. The condenser can also be blocked with sheet of cardboard. The purpose is to limit heat removal from the system and build compressor discharge pressure.
3. Start engine and engage the compressor clutch.

   Compressors operating within specification should be capable of reaching 350 psi (2415 kPa).
4. Shut the system down immediately, once 350 psi (2415 kPa) is achieved.

Electrical Component Checking

Blower Motor

General Information

The blower used in the blend air HVAC system is a brushless DC motor (BLDC). The FCU or ACU provides a DC voltage signal to the motor to control speed. This eliminates the need for a resistor block as used on the water-valve controlled HVAC system. The blower motor provides a feedback signal to the FCU or ACU to indicate blower speed and error conditions.

Delayed Speed Change

When the blower speed is changed on the control panel, a delay in actual speed change is normal. The speed will ramp up or down at 1000 rpm per second. Therefore, if the fan is off and then turned on high speed, it will take approximately six seconds for the fan to actually reach full speed.

Starting Sequence Protection Mode

In case the blower motor does not start (the feedback line indicates zero speed), the FCU or ACU will apply five consecutive starting sequences. If all five starting sequences are unsuccessful, the blower motor electronic module enters a starting sequence protection mode. The module will no longer attempt to start the blower motor until the control signal from the FCU or ACU is reset to zero. See "Blower Rotor Stall Protection Mode." This means one of the following must occur:

- Turn the blower speed switch to the off position, then back on.
- Cycle the ignition switch.
- Disconnect/reconnect the blower motor connector.

Possible reasons the blower motor may enter the starting sequence protection mode include:

- locked blower motor rotor
- open circuit in blower motor feedback signal line
- faulty blower motor

Temperature Protection Mode

The blower motor has an internal temperature sensor connected to the blower motor electronic module. The electronic module monitors the blower temperature and enters a protection mode when normal temperature is exceeded. When the blower motor enters protection mode, the blower speed is reduced to 1000 rpm to reduce the load on the motor. When the motor temperature has lowered to the normal range, the blower speed resumes operation according to the control panel settings.

If the temperature continues to rise or remains too high after the blower speed is initially reduced, then the speed is further reduced to minimum speed (about 400 rpm) and then the blower motor stops. Once the blower motor temperature returns to normal, the blower speed resumes operation according to the control panel settings. No reset is required.

Blower Motor Voltage Protection Mode

The blower motor electronic module monitors the voltage supply to the motor and enters a protection mode when the voltage is too high or too low. The protection mode works as described in **Table 1**.

Blower Motor Voltage Protection Mode Conditions

Voltage at the Motor	Results
under 8.5 VDC	Blower motor will shut off and will not restart until the voltage reaches 10.5 VDC and will operate at reduced speed if voltage is under 12VDC.
8.5 to 12.0 VDC	Blower motor will operate at reduced speed. The reduced speed varies with voltage. The lower the voltage, the slower the blower speed.
12.0 to 17.0 VDC	Blower motor operates normally at user selected speed.

Electrical System Tests

Blower Motor Voltage Protection Mode Conditions	
Voltage at the Motor	**Results**
over 17.0 VDC	Blower motor will shut off. Will not restart until voltage reaches 16 VDC.

Table 1, Blower Motor Voltage Protection Mode Conditions

Blower Motor Stall Protection Mode

The blower motor electronic module monitors the blower for a locked rotor condition. If the rotor is locked starting from an off condition, the electronic module will attempt a starting sequence before entering this protection mode. See "Starting Sequence Protection Mode." If the blower rotor locks up and stalls from a running condition, the blower will immediately enter this protection mode. The blower motor will not restart until the blower speed control signal has decreased to minimum by cycling the ignition, or turning the blower speed control from on to off, then back on, and the stall condition has disappeared.

Speed/Diagnostics Feedback Line

The blower motor supplies diagnostic and speed information to the FCU/ACU. See **Table 2** and **Table 3**.

Blower Motor Feedback Signal From Blower to FCU or ACU*		
Speed/Error Conditions	**Signal**	**Duty Cycle**
Blower Speed	Three one-millisecond pulses per revolution. Blower speed is determined by the time between each set of three pulses. Time can be viewed using an oscilloscope. rpm=1/(time between sets of three pulses) x 60	NA
Error—temperature protection mode	10Hz	25%
Error—voltage protection mode	10Hz	50%
Error—blocked rotor	10Hz	75%

* Blower speed and diagnostic information are both provided by the BLDC blower motor on the feedback signal wire; however, the FCU and ACU only use the blower speed information.

Table 2, Blower Motor Feedback Signal from Blower to FCU or ACU

Blower Speed Control Signal From FCU or ACU to Blower*†			
Knob Position	**FCU Signal (DC volts)‡**	**Blower Speed (rpm)**	**Blower Speed Comments**
0	0.0 to 0.74	0	Constant speed in this range
1	0.75 to 1.0	400	Constant speed in this range

Blower Speed Control Signal From FCU or ACU to Blower*†			
Knob Position	**FCU Signal (DC volts)‡**	**Blower Speed (rpm)**	**Blower Speed Comments**
2	1.5	800	Speed varies linearly with voltage in this range.
3	2.0	1200	
4	2.5	1600	
5	3.0	2000	
6	3.5	2400	
7	4.0	2800	
8	4.5	3200	
9	5.0+	3600	
10	5.5+	4000	Constant speed above this range

* Error conditions can be monitored on the feedback signal line using a digital multimeter equipped with a duty cycle function.

† Blower speed and diagnostic information are both provided by the BLDC blower motor on the feedback signal wire; however, the FCU and ACU only use the blower speed information.

‡ These values are based on a system operating voltage of 13.5 VDC.

Table 3, Blower Speed Control Signal from FCU or ACU to Blower

A/C Clutch Circuit

General Operation

The air conditioner compressor clutch is controlled by the FCU. When certain inputs to the FCU are met, the FCU sends the A/C request signal to the A/C clutch relay located in the PDM. This signal is +12 VDC. The request signal causes the A/C clutch relay to make contact between the common and normally open contacts of the relay. This allows current to flow through the relay, then through the binary pressure switch and to theA/C compressor clutch, thus engaging the compressor.

In steady state operation, compressor cycling is controlled by two things: evaporator temperature sensor and an internal FCU timer that prevents the compressor from cycling more than four times per minute. The A/C request signal does not become active until the evaporator temperature sensor is at least 44°F (7°C). See **Table 4**. Once the signal is active and as long as the other conditions are met, the signal remains active until the evaporator temperature sensor reaches 37°F (3°C), then becomes inactive. The A/C request signal does not activate again until the temperature is above 44°F (7°C). With the A/C on in warm or humid weather, the evaporator temperature will most likely remain between 37 to 44°F (3 to 7°C), thus keeping the compressor on continuously.

When the blower speed control is set to any speed other than off, and the air selection switch is set to any setting other than one of the defrost modes, then the user may request A/C by pressing the A/C button. The light on the button turns on and the FCU is placed in A/C mode, thus allowing the compressor to engage when other conditions are met. If the air selection switch is in any of the defrost settings, then the A/C mode is turned on automatically and cannot be turned off by pressing the A/C button.

FCU A/C Request Rules*		
Input	**Input Type**	**State All Inputs Must Be for the FCU to Send A/C Request Signal**
Ignition power	+12V	On
Engine speed	J1587	Above 450 rpm for at least 5 seconds

Electrical System Tests

FCU A/C Request Rules*		
Input	**Input Type**	**State All Inputs Must Be for the FCU to Send A/C Request Signal**
Low air	J1587	Not low
Evaporator temperature sensor	Sensor	Above 44°F (7°C)
A/C switch/light	Control panel	On
Air selection switch	Control panel	Any A/C or defrost setting except when rear override is active
Temperature control switch	Control panel	Any
Fan switch	Control panel	Any setting other than off except when rear override is active; fan will be at least minimum speed.
Compressor cycling timer	Internal FCU logic	15 seconds elapsed since A/C request last active
Main Blower Feedback Signal	Rotational Signal (Hz)	No active faults from the blower feedback signal

* If any input state does not meet the conditions listed in this table, A/C request will not be sent. The only exception is when the sleeper unit requests A/C support by going into rear override mode. See "Cab Override."

Table 4, A/C Request Rules

A/C Mode

The auxiliary HVAC system has the ability to request A/C causing the FCU to engage the compressor. For more information, see "Cab Override."

Once the HVAC system is in A/C mode, the system is able to send the A/C request when all the conditions are met. See **Table 4**. When the system is in A/C mode, the light on the A/C button comes on. Just because the system is in A/C mode does not necessarily mean that the A/C compressor should be engaged. See **Table 4** for A/C request rules.

NOTE: If the air selection switch is changed to defrost when in A/C mode, the A/C mode will remain active and the light on the A/C button will remain on. When in defrost, the user will not be able to cancel A/C mode by pressing the A/C button. If the mode is changed back to A/C, the A/C mode will remain on, but the user will be able to turn it off by pressing the A/C button. See **Fig. 1**.

NOTE: The A/C mode is remembered after an ignition cycle. If the A/C mode indicator was on because the A/C button was pressed before an ignition cycle or battery kill switch cycle, the FCU will remember this mode and activate it again after the cycle.

Defrost Mode

When the HVAC system is in defrost mode, A/C mode is automatically activated and the system is able to send the A/C request when all the conditions are met. When the system is in defrost mode, the light on the A/C button is on. Just because the system is in defrost mode does not necessarily mean that the A/C compressor should be engaged. See **Table 4** forA/C request rules.

NOTE: If the mode is taken out of defrost, A/C mode and the light will be deactivated unless the system was in A/C mode prior to being in defrost mode. When the system is in defrost mode, A/C mode cannot be disabled by pressing the A/C button. See **Fig. 2**.

A/C Request

Once A/C mode is activated, the A/C compressor clutch can be engaged when all the engagement rules are met. The A/C request rules are described in **Table 4**.

Recirculation

Recirculation Mode

Recirculation mode allows the driver to choose between fresh air or recirculated air moving through the HVAC system. When recirc mode is selected, all of the air through the front HVAC unit is recirculated

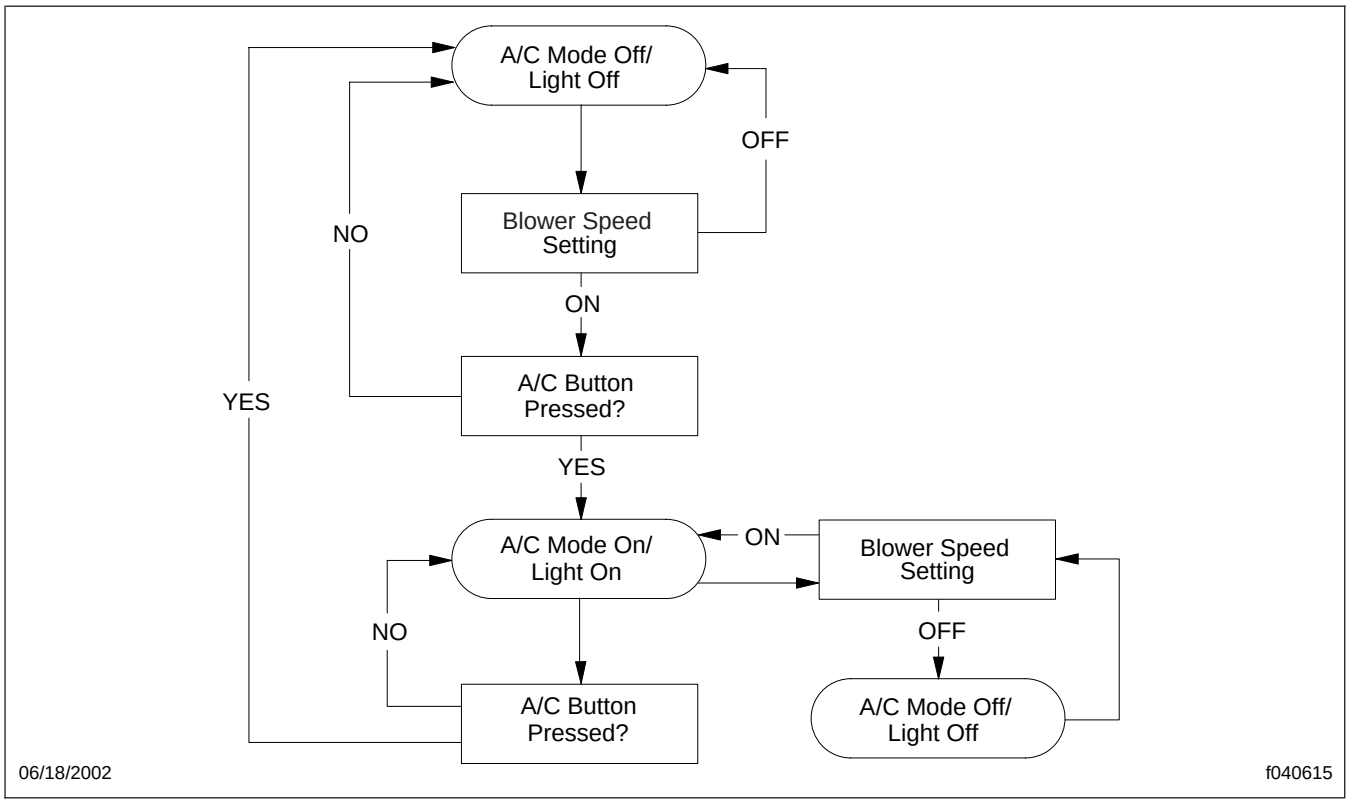

Fig. 1, A/C Mode Function When Not in Defrost Mode

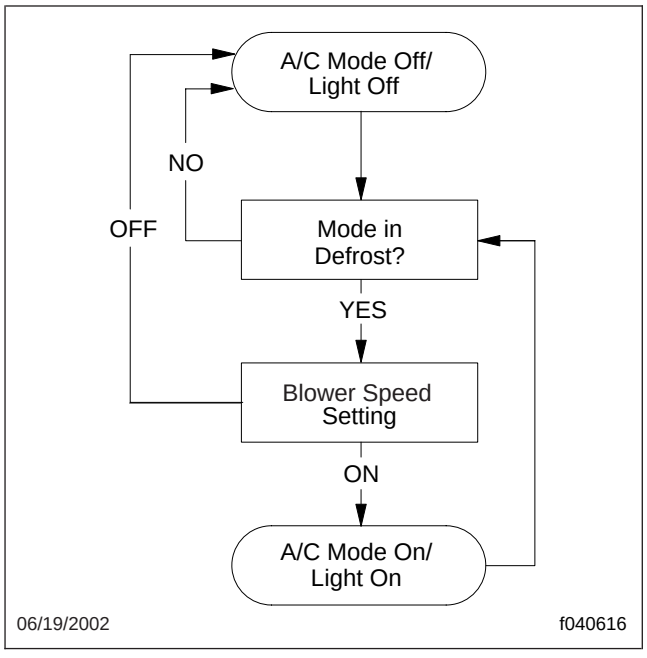

Fig. 2, A/C Mode Function When in Defrost Mode

within the cab, except when the unit is in partial recirc mode, which is explained in "Partial Recirc Mode."

Using the recirculation mode prevents dusty or smoky air from entering the cab and provides better air conditioning performance since the cab air is already cooled and less humid than outside air. Humidity holds a lot of heat.

Partial Recirc Mode

After recirc mode has been on for 20 minutes, the system enters partial recirc mode to introduce a controlled amount of fresh air to the cab. This prevents the air from becoming stagnant if left in recirc mode. The recirc door partially opens to one of two partially open positions depending on vehicle speed. When the vehicle is stopped or moving very slowly, the recirc door opens to its widest partially open position. When the vehicle is moving at slow to moderate speeds, the recirc door opens to its most narrow partially open position. Pressing the recirc button again

resets the 20-minute timer and the system goes into full recirc again. See **Table 5** for information on partial recirc.

Partial Recirc Operation			
Condition	**Vehicle Speed**	**Partial Recirc Door Opening**	**Partial Recirc Door Opening Approximate Height: inch (mm)**
Initial partial recirc position after 20 minutes of full recirculation	Under 5 mph (8 km/h)	Wide	1-1/4 (32)
	Over 5 mph (8km/h)	Narrow	1/8 to 1/4 (3 to 6)
Partial recirc position once initial position is reached	Under 2 mph (3 km/h)	Wide	1-1/4 (32)
	2–8 mph(3–13 km/h)	No change	Either 1-1/4 (32) or 1/8 to 1/4 (3 to 6) depending on vehicle speed prior to entering the 2 to 8 mph (3 to 13 km/h) range.
	Over 8 mph (13km/h)	Narrow	1/8 to 1/4 (3 to 6)

Table 5, Partial Recirc Operation

Recirc Diagnosis

To see the recirc door, remove the heater and air conditioner cover and the recirculation air filter. See **Fig. 3**. When the system is not in recirc mode, the recirc door is fully open. When the system is in recirc mode, the recirc door is closed tight. See **Fig. 3**.

To check partial recirc, turn the engine on and activate the full recirc mode for 20 minutes. After 20 minutes, with the vehicle idling in the shop, the recirc door should open to its widest partially open position. To check if the recirc door adjusts to the narrow, partially open position, have someone drive the vehicle over 8 mph (13 km/h) while observing the recirc door. See **Fig. 3**. Compare the width of the recirc door opening to the values in **Table 5**. If the recirc door does not function as described, check the recirc actuator motor and wiring. If okay, the FCU is probably faulty.

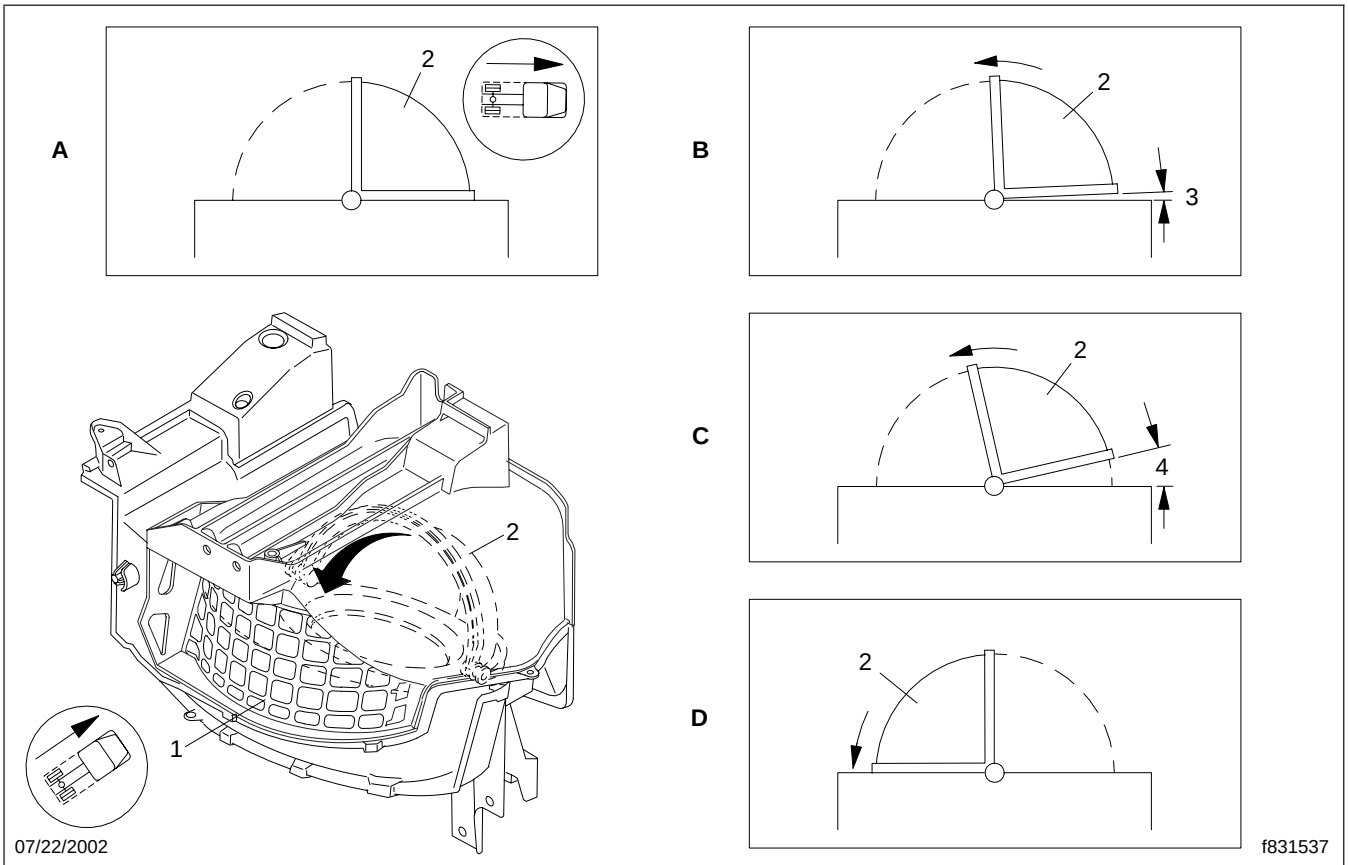
Override

Bunk Override

The auxiliary unit can be controlled from the front control panel by using the bunk override switch. When the upper half of the bunk override switch is pressed to the momentary on position, the front unit broadcasts a snapshot of the front temperature and blower speed settings to the auxiliary unit. The auxiliary unit matches these settings. The temperature and blower speed settings on the front unit can be changed without affecting the auxiliary unit, until the bunk override switch is pressed in the momentary on position again.

When the lower half of the bunk override switch is pressed, bunk override mode turns off and the auxiliary unit reverts to the auxiliary control settings. If the auxiliary control panel settings are changed when the system is in bunk override mode, bunk override will be canceled and the auxiliary unit will operate using the auxiliary control panel settings. See **Table 6** for information on bunk override functionality.

NOTE: If bunk override is activated and then the front blower or temperature settings are changed and the ignition key is cycled, then the bunk override will be active again, but the auxiliary unit will track the new front settings.



A. In recirc mode the recirc door is in the fully closed position.
B. Recirc door in the narrow, partially open position.
C. Recirc door in the widest, partially open position.
D. In non recirc mode the recirc door is in the fully open position.

1. Recirculation Air Filter Retainer
2. Recirc Door
3. Narrow Partially Open Position of approximately1/8 to 1/4 in (3 to 6 mm)
4. Widest Partially Open Position of approximately1-1/4 in (32 mm)

Fig. 3, Recirc Door Operation

Electrical System Tests

Bunk Override Functionality		
Action	**J1587 Messaging/Control**	**Bunk Override Indicator**
Press the upper half of the bunk override switch to turn it on; initially off	When the bunk override switch is pressed to the momentary on position (bunk override mode previously off), the FCU sends a J1587 message to the auxiliary unit requesting that the auxiliary unit go into bunk override mode. The auxiliary unit then goes into bunk override mode and sends a J1587 message to the front unit indicating that bunk override mode in the auxiliary unit is on. Upon receiving this message, the front unit responds by broadcasting a J1587 message that bunk override mode in the front unit is on as well. The front unit then sends a different J1587 message to the auxiliary unit containing the control set points as follows: • blower speed setting • temperature control setting • temperature door position	On NOTE: The indicator on the bunk override switch turns on when the upper half of the switch is pressed.
	The auxiliary unit receives this message and disregards its own temperature and blower speed settings and adjusts its settings to match the front unit settings. The auxiliary unit uses the temperature door position setting as a starting point, then it goes into CDTC operation to maintain the new desired temperature. Blower speed is adjusted to match the front control setting. At this point, the front control panel blower and temperature settings can be changed without affecting the auxiliary unit blower speed and temperature. NOTE: With DataLink Monitor connected to *some early blend air systems*, the auxiliary unit will continuously update its control settings to match the front unit when the system is in bunk override mode. This is not how the system operates without DataLink Monitor connected to the vehicle. The auxiliary unit will maintain the new temperature and blower settings until one of the following occurs: • temperature or blower speed settings changed on the auxiliary control panel • the bunk override switch is pressed to the momentary on or off position • ignition is cycled NOTE: If bunk override was active before an ignition cycle, it will also be active after the ignition cycle, but the auxiliary unit will track the current front setting at the time the ignition is switched on again.	

Bunk Override Functionality		
Action	**J1587 Messaging/Control**	**Bunk Override Indicator**
Press the upper half of the bunk override switch again to the momentary on position; bunk override was already on	When the system is already in bunk override mode and the upper half of the bunk override switch is pressed to the momentary on position, the front control unit sends a new J1587 to the auxiliary unit containing the following new set points: • blower speed setting • temperature control setting • temperature door position The auxiliary unit receives this message and disregards the previous temperature and blower control settings and adjusts its settings to match the new front unit settings (this assumes the front blower setting or temperature setting was changed after the initial bunk override). The auxiliary unit uses the temperature control door position setting as a starting point. Then it goes into CDTC operation to maintain the new desired temperature. Blower speed is adjusted to match the front control setting. NOTE: With DataLink Monitor connected to *some early blend air systems*, the auxiliary unit will continuously update its control settings to match the front unit when the system is in bunk override mode. This is not how the system operates without DataLink Monitor connected to the vehicle. On these early systems you will not be able to change the front settings and update the auxiliary unit with a press of the bunk override switch. The auxiliary unit will maintain the new temperature and blower settings until one of the following occurs: • temperature or blower speed settings changed on the auxiliary control panel • the bunk override switch is pressed to the momentary on or off position • ignition is cycled	On
Press the lower half of bunk override switch to the momentary off position; bunk override mode was on	When the bunk override switch is pressed to the momentary off position (bunk override mode previously on), the FCU sends a J1587 message to the auxiliary unit requesting that the auxiliary unit go out of bunk override mode. The auxiliary unit then goes out of bunk override mode and sends a J1587 message to the front unit indicating that bunk override mode in the auxiliary unit is off. Upon receiving this message, the front unit responds by broadcasting a J1587 message that it too is out of bunk override mode. The auxiliary unit now adjusts its temperature and blower speed to its own settings on the auxiliary control panel and resumes CDTC operation.	Off

Bunk Override Functionality		
Action	**J1587 Messaging/Control**	**Bunk Override Indicator**
Blower or temperature settings on auxiliary control panel changed; bunk override mode was on	When the system is in bunk override mode and the auxiliary blower speed or temperature settings are then changed on the auxiliary control panel, the auxiliary unit goes out of bunk override mode and sends a J1587 message to the front unit indicating that it is no longer in bunk override mode. The front unit receives this message and broadcasts a J1587 message that it too is out of bunk override mode. The indicator light on the bunk override switch turns off. Once out of bunk override mode, the auxiliary unit now adjusts its temperature and blower speed to its own settings on the auxiliary control panel and resumes CDTC operation.	Off
Ignition turned off then back on; bunk override mode was on before the ignition was turned off	When the system is in bunk override mode and the ignition is turned off, then back on, bunk override mode is off. The auxiliary unit will operate to its auxiliary control panel blower and temperature settings.	On

Table 6, Bunk Override Functionality

Cab Override

Rear override is used when the auxiliary unit requires minimum A/C support from the front unit. The front control unit controls the A/C compressor; therefore, if the auxiliary unit requires A/C when the front unit is not in A/C mode or if the front unit is off, then the auxiliary unit can request A/C by initiating rear override.

When the auxiliary unit requires minimum A/C support, it sends a J1587 message requesting that the front control unit go into rear override mode and also sends a message indicating that rear override mode is on in the auxiliary unit. The front unit receives this request and, if not already in A/C mode, goes into rear override mode and sends a J1587 message to the auxiliary unit indicating that rear override mode is on in the front unit. The front unit then sets the blower speed to minimum speed to prevent evaporator core freezing and to allow air to flow across the evaporator temperature sensor to allow compressor cycling. If the blower was previously set to a speed above minimum, that speed will be maintained. The front control unit also turns on the A/C mode indicator on the A/C switch. The front unit will now operate the A/C compressor per A/C request rules. See **Table 4**.

When the auxiliary unit no longer requires minimum A/C support, it sends a J1587 message requesting that the front unit go out of rear override mode and also sends a message indicating that rear override mode is off in the auxiliary unit. The front unit receives this request, goes out of rear override mode, and sends a J1587 message indicating that rear override mode is off in the auxiliary unit. If the front blower speed setting was in the off position, the blower will now shut off. The A/C mode indicator light will turnoff.

Actuator Stepper Motors–Temperature, Recirc, and Mode

General Information

The actuator stepper motors are used to precisely position the temperature control, recirc, and air selection mode doors within the front HVAC unit, and the temperature control door in the auxiliary (bunk) HVAC unit. The motors can operate in both forward and reverse direction. Each motor has four motor windings with diodes wired in series with each winding. The motor direction and position is controlled by the FCU/ACU by applying power and sequencing ground through the four motor windings.

Actuator Stepper Motor Test Procedures

Test the Battery in the Stepper Motor Tester

NOTE: It is very important to check the battery in the stepper motor tester before testing the stepper motor. A weak battery will lead to incorrect test results. See **Fig. 4**.

1. Press the toggle switch on the stepper motor tester to NORMAL and set the rotary switch to position 4.

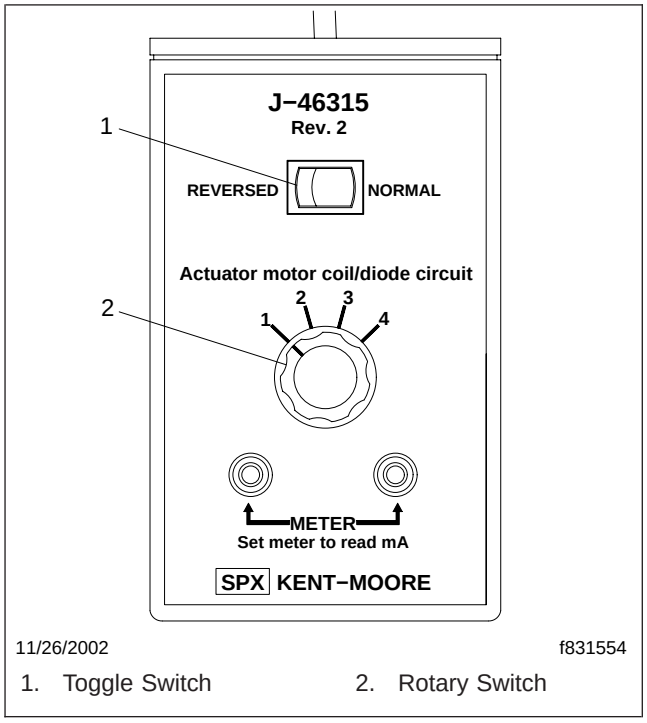


Fig. 4, Actuator Stepper Motor Tester

2. Connect a digital multimeter, set to read DC voltage, as follows:
   - positive lead to the red jack on the stepper motor tester
   - negative lead to pin 6 of the stepper motor tester lead (green wire). See **Fig. 5**.
3. The reading on the digital multimeter should be at least 1.5 VDC. If the reading is less than 1.5 VDC, replace the battery by removing the 4 cap-

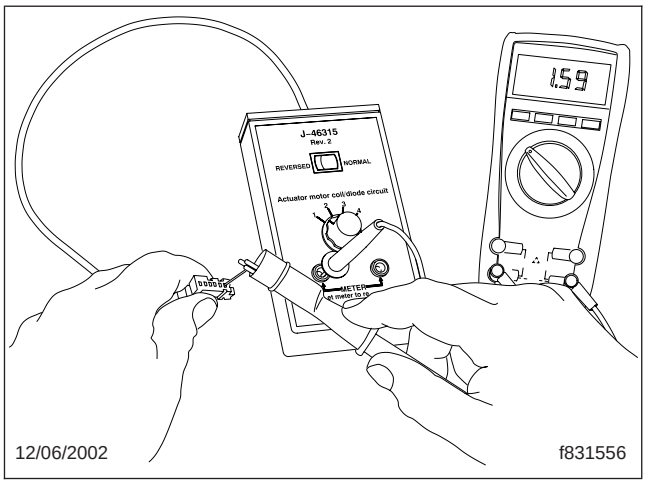

Fig. 5, Place the Negative Lead to Pin 6 of the Stepper Motor Tester Lead

screws that attach the back cover to the stepper motor tester.

The tester uses a single AA 1.5 VDC battery. It is recommended that you use an alkaline battery.

Test the Actuator Stepper Motor

NOTE: The stepper motor has four windings, each with an in-series diode. The stepper motor can be tested on or off the vehicle.

1. Connect the stepper motor tester to the stepper motor. If the stepper motor is being tested while on the vehicle, disconnect the electrical connector from the stepper motor.

   For locations of the actuators and actuator replacement instructions, see **Section 83.04**, Subject 150.
2. Set the digital multimeter to read **milliamps (mA) DC**. Make sure that the test leads on the multimeter are in the appropriate jacks for measuring amperage.
3. Connect the positive lead from the multimeter to the red jack on the stepper motor tester.
4. Connect the negative lead from the multimeter to the black jack. See **Fig. 6**.
5. Press the toggle switch to NORMAL.
6. Set the rotary switch to position 1 and note the reading on the multimeter.

Electrical System Tests

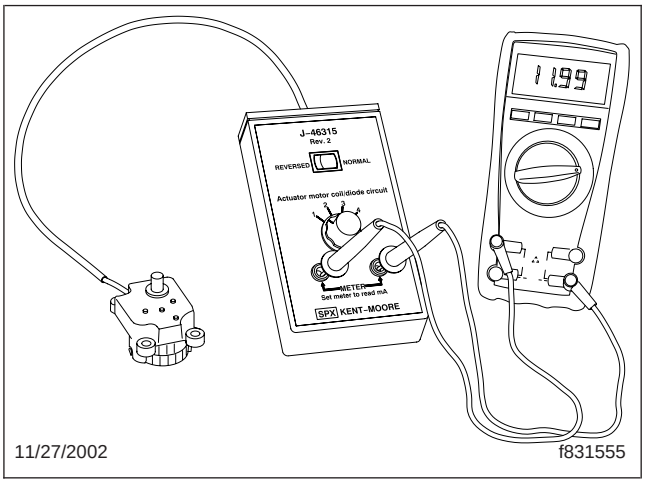

Fig. 6, Testing a Stepper Motor

7. Move the toggle switch to REVERSED and note the reading on the multimeter.
8. Repeat the previous three steps for the 2, 3, and 4 rotary switch positions on the tester. Compare your readings to the readings in **Table 7**.
9. If your readings do not match the readings in **Table 7**, replace the actuator. For instructions, see **Section 83.04**, Subject 150.
10. If the stepper motor was tested on the vehicle, connect the electrical connector to the stepper motor.

Acceptable Readings for the Actuator Stepper Motor Test				
Condition	**Toggle Switch Position**		**Conclusion**	**Action**
	Normal	**Reversed**		
If the readings in all four rotary switch positions are...	10–14 mA	less than 0.2 mA	Normal	None; actuator is okay electrically.
If the readings in any one or more of the rotary switch positions are...	15–350 mA	less than 0.2 mA	Shorted or partially shorted motor coil	Replace actuator.
	less than 0.2 mA	less than 0.2 mA	Open diode or motor coil*	
	0.3–9.9 mA	less than 0.2 mA	Check tester battery and retest. If battery okay, motor winding has high resistance.	
	19–24 mA	19–24 mA	Shorted diode	

* If the reading for each rotary switch and toggle switch position is less than 0.2 mA, check the fuse in the digital multimeter.

Table 7, Acceptable Readings for the Actuator Stepper Motor Test

For code **200 s009 06** disconnect the temperature actuator connector (auxiliary unit), check if fault no longer active (different fault may be active). See **Fig. 7**.	Fault no longer active (FMI06), different fault may be active (FMI 05).	Shorted actuator motor is likely. Perform "Actuator Stepper Motor Electrical Test" to confirm, then **go to test no. 9**.
			Fault still active (FMI06).	Check for short to ground in power wire between actuator and FCU/ACU. If no short is found, replace FCU/ACU, then **go to test no. 9**.
9	Verify repair. NOTE: In order to check if a fault status has changed from active to inactive, the recirc button, temperature control switch, or air selection switch needs to be moved while the ignition is on.	Verify that repair resolved the problem.	Problem resolved.	Done.
			Problem unresolved.	**Repeat test no. 1**.

Table 8, Actuator Circuit Test

Evaporator Temperature Sensor

General Information

The evaporator temperature sensor is located on the evaporator. The sensor input to the FCU is used to control the A/C compressor in order to prevent evaporator freezing. The sensor has a negative temperature coefficient (NTC), which means that its resistance decreases as temperature increases.

Evaporator Temperature Sensor Circuit Test

See **Table 9** for the evaporator temperature sensor circuit test procedures.

Evaporator Temperature Sensor Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Are evaporator temperature sensor fault codes active?	Check if fault code**146 s002 03** or **146 s002 04** is active.	Neither fault isactive.	**Go to test no. 2**.
			146s002 03 is active	Check for sensor signal wire shorted to power. If okay, **go to test no. 2**.
			146s002 04 is active.	Check for sensor signal wire shorted to ground. If okay, replace FCU. **Go to test no. 3**.
2	Check sensor reference voltage.	Disconnect the evaporator sensor. Turn the ignition on and measure the voltage across the sensor connector pins (harness side). The voltage should be 5V if the circuit and FCU are operating correctly.	5V	Perform "Evaporator Temperature Sensor Test."
			Less than 5V.	Check for open circuit in sensor signal and ground wires. If okay, replace FCU. **Go to test no. 3**.
3	Verify repair.	Verify that repair resolved the problem.	Problem solved.	Done.
			Problem unresolved.	**Repeat test no. 1**.

Table 9, Evaporator Temperature Sensor Circuit Test

Evaporator Temperature Sensor Test

When testing the evaporator temperature sensor (**Fig. 10**), the resistance will decrease as the temperature increases, as shown in **Fig. 11**.

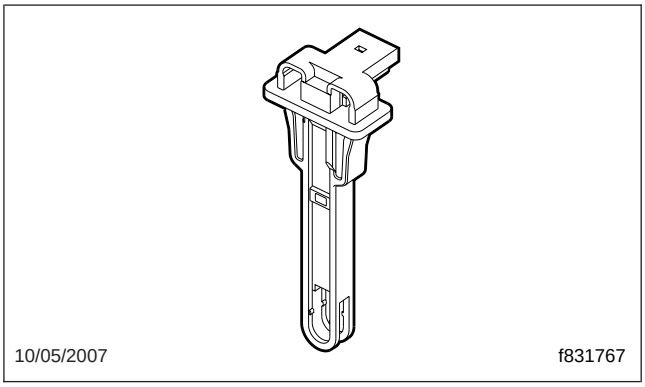

Fig. 10, Evaporator Temperature Sensor

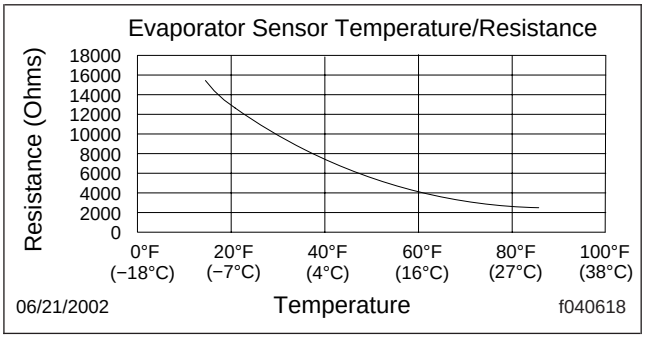

Fig. 11, Evaporator Sensor Temperature/Resistance

1. Remove the sensor and place it in a cup of ice water.
2. After the sensor has been in the ice water for five minutes, measure the sensor resistance.

   The resistance should be 9000 ohms at 32°F (0°C). See **Table 10**.
3. If the resistance differs significantly, replace the sensor.

Evaporator Temperature Sensor Temperature versus Resistance	
Temperature °F (°C)	**Resistance (ohms)**
32 (0)	**9000**
40 (4.4)	7183
50 (10)	5468
60 (15.6)	4209
70 (21.1)	3271
80 (26.7)	2566

Table 10, Evaporator Temperature Sensor Temperature versus Temperature Resistance

Constant Discharge Temperature Control

General Information

CDTC systems maintain a set outlet temperature based on the temperature control switch setting. This is a closed-loop system. The same CDTC sensor is used on both the front and auxiliary HVAC units.

CDTC Temperature Sensor Test

When testing the CDTC temperature sensor (**Fig. 12**), the resistance will decrease as the temperature increases, as shown in **Fig. 13**.

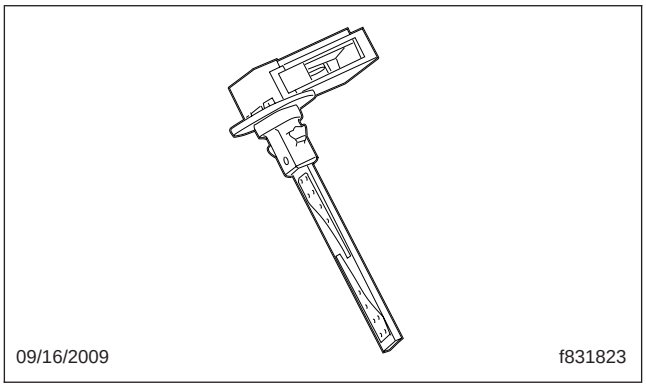

Fig. 12, CDTC Temperature Sensor

1. Allow the system to stabilize to ambient temperatures, and compare the bunk and main evaporator temperature sensor values using the templates in ServicePro. If the two values are significantly different, continue with step #2 to confirm the suspected sensor is not reading properly.

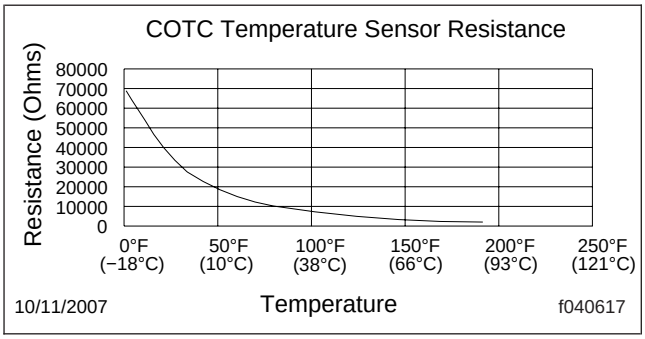

Fig. 13, CDTC Temperature Sensor Temperature vs. Resistance

NOTICE

Do not allow the CDTC temperature sensor to get wet. The circuitry will be damaged.

2. Remove the sensor and place it in a plastic bag, them put the bag and sensor in a cup of ice water.
3. After the sensor has been in the ice water for ten minutes, measure the sensor resistance.

   The resistance should be approximately 29,190 ohms at 32°F (0°C).See **Table 11**.
4. If the resistance differs significantly, replace the sensor.

CDTC Temperature Sensor Temperature versus Resistance	
Temp °F (°C)	**Resistance (ohms)**
32 (0)	**29190**
42 (6)	22180
53 (12)	17050
64 (18)	13250
75 (24)	10400
86 (30)	8240
96 (36)	6590
107 (42)	5320
113 (45)	4790

Table 11, CDTC Temperature Sensor Temperature versus Resistance

Calibration Procedure

When the front control head (FCU) or any actuator motor is replaced, the system must be recalibrated. The calibration procedure allows the FCU to learn the extreme positions of the actuator motors for the recirc door, temperature control door, and the air selection mode door.

Use the following procedure to recalibrate the system.

1. Turn the ignition on, engine off.
2. Set the blower speed to the off position (all the way counterclockwise).
3. Set the air selection switch to full defrost (all the way clockwise).
4. Set the temperature control switch to full hot (all the way clockwise).
5. Press the A/C and recirc buttons at the same time until the indicators on the buttons are both flashing.

   When the indicators on the recirc and A/C buttons start flashing, the FCU has entered calibration mode. Calibration takes place automatically at this point and the blower can be heard operating. When the unit is finished calibrating, the indicators and blower turn off and the system can be operated normally.

DataLink Monitor Templates

General Information

There are two DataLink Monitor templates available in ServiceLink 3.2 or higher, one for day cabs and one for SleeperCabs. The templates allow the technician to monitor temperature and blower speed settings, bunk and rear override mode, A/C mode and A/C request, as well as other information related to the HVAC system. See **Fig. 1** and **Fig. 2**.

DataLink Monitor Template Object Definitions

Front Temperature Control Setting Bar Graph

The front temperature control setting bar graph indicates the position of the temperature control switch in percentage of full hot. Zero percent equals full cold and 100 percent equals full hot. Viewing the bar graph can indicate whether or not the FCU is processing the temperature control switch setting.

When bunk override is initiated, the front temperature setting message is sent to the auxiliary unit. The auxiliary unit then attempts to match this temperature setting.

Front Temperature Mix Door Position Bar Graph

The front temperature mix door position bar graph indicates what the FCU thinks is the position of the temperature mix door in step counts. Step counts range from 0 (when the temperature mix door is in the full cold position) to 3800 (when the temperature mix door is in the full hot position). It is important to know that the actual door position may not be what is indicated by the temperature mix door position bar graph.

When bunk override is initiated, the front temperature mix door step count message is sent to the auxiliary unit. The auxiliary unit uses this as its initial temperature mix door setting to match the front temperature.

Front CDTC Discharge Temperature Bar Graph

The front CDTC discharge temperature bar graph indicates the temperature of the CDTC sensor downstream of the temperature mix door in the front unit. The system uses this temperature sensor to control the mix door to maintain the desired temperature setting of the temperature control switch.

Front Blower Speed Setting Bar Graph

The front blower speed setting bar graph indicates the position of the front blower speed switch in percentage of full speed. Zero percent equals off and 100 percent equals high. Viewing this bar graph can indicate whether or not the FCU is processing the blower speed control switch setting.

When bunk override is initiated, the front blower speed set point message is sent to the auxiliary unit. The auxiliary unit then attempts to match this blower speed setting.

Front Blower Speed Bar Graph

The front blower speed bar graph indicates the front unit blower speed feedback to the FCU.

Auxiliary Temperature Control Setting Bar Graph (SleeperCabs only)

The auxiliary temperature control setting bar graph indicates the position of the auxiliary temperature control switch in percentage of full hot. Zero percent equals full cold and 100 percent equals full hot. Viewing this bar graph can indicate whether or not the ACU is processing the auxiliary temperature control switch setting.

When bunk override is initiated, the front temperature setting message is sent to the auxiliary unit. The auxiliary unit then matches this temperature set point.

Fig. 1, Behr CDTC Blend Air HVAC System SleeperCab

Auxiliary Temperature Mix Door Position Bar Graph (SleeperCabs only)

The auxiliary temperature mix door position bar graph indicates what the ACU thinks is the position of the temperature mix door in step counts. Step counts range from 0 (when the temperature mix door is in the full cold position) to 3800 (when the temperature mix door is in the full hot position). It is important to know that the actual door position may not be what is indicated by the temperature mix door position bar graph.

When bunk override is initiated, the front temperature mix door step count message is sent to the auxiliary

unit. The auxiliary unit uses this as its initial temperature mix door setting to match the front temperature.

Auxiliary CDTC Discharge Temperature Bar Graph (SleeperCabs only)

The auxiliary CDTC discharge temperature bar graph indicates the temperature of the CDTC sensor downstream of the temperature mix door in the auxiliary unit. The system uses this temperature sensor to control the mix door to maintain the desired temperature setting of the temperature control switch.

Auxiliary Blower Speed Setting Bar Graph (SleeperCabs only)

The auxiliary blower speed setting bar graph indicates the position of the auxiliary blower speed control switch in percentage of full speed. Zero percent equals off and 100 percent equals high. Viewing this bar graph can indicate whether or not the ACU is processing the blower speed control switch setting.

When bunk override is initiated, the front blower speed set point message is sent to the auxiliary unit. The auxiliary unit then attempts to match this blower speed setting.

Fault Code Driven Diagnosis

Auxiliary Blower Speed Bar Graph (SleeperCabs only)

The auxiliary blower speed bar graph indicates the auxiliary unit blower speed feedback to the ACU.

A/C Mode Annunciator

The A/C mode annunciator indicates whether or not the FCU is in A/C mode. The front unit is in A/C mode whenever the A/C button on the climate control panel is pressed, when the front control panel is set to any of the defrost modes, or when the front unit is off and the auxiliary unit is initiated for minimum A/C support. When A/C mode is on, the compressor can operate when the compressor control rules are met.

The A/C mode annunciator has three possible conditions: ON, OFF, or NA/ERR (not available or error).

A/C Clutch Annunciator

The A/C clutch annunciator indicates whether or not the signal to the A/C clutch relay is active or not. The A/C relay controls the A/C compressor.

The A/C clutch annunciator has three possible conditions: ON, OFF, or NA/ERR (not available or error).

Recirc Annunciator

The recirc annunciator indicates whether or not the front unit is in recirculation mode. When the unit is in recirculation mode, the front unit will recirculate air within the cab. If recirc is on longer than 20 minutes, the front unit goes into partial recirc mode letting in a small amount of fresh air. When recirc mode is inactive, all of the air circulating through the unit is outside air.

The recirc annunciator has three possible conditions: ON, OFF, or NA/ERR (not available or error).

FCU Volts Annunciator

The FCU volts annunciator indicates the input voltage the front control unit senses. The annunciator will indicate low voltage below 9 volts and high voltage above 16 volts. The normal operating range for the front unit is 9 to 16 volts.

ACU Volts Annunciator (SleeperCabs only)

The ACU volts annunciator indicates the input voltage the auxiliary control unit senses. The annunciator will indicate low voltage below 9 volts and high voltage above 16 volts. The normal operating voltage range for the auxiliary unit is 9 to 16 volts.

Override Request (SleeperCabs only)

The override request annunciator indicates when the FCU sends a message to the ACU requesting that it go into or out of bunk override mode. The request is initiated when the FCU senses that the bunk override switch is in the on or off position.

The override request annunciator has three possible conditions: ON, OFF, or NA/ERR (not available or error). The annunciator normally shows NA/ERR except when requesting bunk override mode on or off. On or off is usually displayed briefly.

FCU Mode Annunciator (SleeperCabs only)

The FCU mode annunciator indicates the status of bunk override mode in the auxiliary unit (ACU). After the auxiliary unit receives the bunk override on request message from the front unit, it goes into bunk override mode and sends a message indicating that it is in bunk override mode indicated by the ACU mode annunciator. The front unit acknowledges the message sent by the auxiliary unit and indicates that it too is in bunk override mode indicated by the FCU mode annunciator. The FCU mode annunciator works similarly if bunk override is turned off.

The FCU mode annunciator has three possible conditions: ON, OFF, or NA/ERR (not available or error).

ACU Mode Annunciator (SleeperCabs only)

The ACU mode annunciator indicates the status of bunk override mode in the auxiliary unit (ACU). After the auxiliary unit receives the bunk override on request message from the front unit, it goes into bunk override mode and sends a message indicating that it is in bunk override mode indicated by the ACU

mode annunciator. The ACU mode annunciator works similarly if bunk override mode is turned off.

The ACU mode annunciator has three possible conditions: ON, OFF, or NA/ERR (not available or error).

Bunk Override Switch (SleeperCabs only)

The bunk override switch annunciator indicates the status of the bunk override switch. The bunk override switch controls the bunk override mode function. The annunciator has three possible conditions: ON, OFF, or NA/ERR (not available or error)

The annunciator normally shows NA/ERR except when in the on or off momentary positions.

Override Request (SleeperCabs only)

The override request annunciator indicates when the ACU sends a message to the FCU requesting rear override mode to be on or off. The request is initiated when the auxiliary unit requires minimum A/C support; that is, when it requires the A/C compressor to operate if the front unit is not already controlling the A/C compressor.

The override request annunciator has three possible conditions: ON, OFF, or NA/ERR (not available or error). The annunciator normally shows NA/ERR except when requesting rear override mode on or off. On or off is usually displayed briefly.

FCU Mode Annunciator (SleeperCabs only)

The FCU mode annunciator indicates the status of rear override mode in the front unit (FCU). After the front unit receives the rear override on request message from the auxiliary unit, it goes into bunk override mode and sends a message indicating that it is in rear override mode indicated by the FCU mode annunciator. The FCU mode annunciator works similarly if bunk override mode is turned off.

The FCU mode annunciator has three possible conditions: ON, OFF, or NA/ERR (not available or error).

ACU Mode Annunciator (SleeperCabs only)

The ACU mode annunciator indicates the status of rear override mode in the auxiliary unit (ACU). After the front unit receives the rear override on request message from the auxiliary unit, it goes into rear override mode and sends a message indicating that it is in rear override mode indicated by the ACU mode annunciator. The ACU mode annunciator works similarly if rear override mode is turned off.

The ACU mode annunciator has three possible conditions: ON, OFF, or NA/ERR (not available or error).

Engine Coolant Temperature Bar Graph

Engine coolant temperature is one of the inputs used by the front and auxiliary control units to control unit outlet temperature. It is provided on the template so the technician can be sure that all tests are performed when the engine is at normal operating temperature. Poor A/C performance and poor heater performance can be indicated by improper operating temperature.

Engine RPM Annunciator

The engine rpm annunciator is used to indicate engine rpm. Engine rpm is one of the inputs for controlling the A/C compressor clutch. The A/C compressor clutch does not engage when the engine speed is below 450 rpm.

Low Air Pressure Annunciator

The low air pressure annunciator is used to indicate low air pressure in the primary or secondary air system. The message that controls the low air pressure annunciator comes from the ICU. The message is one of the inputs used by the front control unit to control A/C compressor operation. The A/C compressor clutch does not engage when the system air pressure is low. The message is sent by the ICU, but at intervals long enough that may cause the annunciator to flash periodically. A flashing DLM template object indicates that a message is not being received.

Rear Override Mode ON Test Button (SleeperCabs only)

The rear override mode ON test button is used to manually send a rear override request to the FCU. This is the same message that the ACU sends to the FCU when it requests A/C support from the front unit. To use this test, turn off the front blower then press the rear override mode ON test button. After doing this, the FCU mode annunciator (item 21 in **Fig. 1**) should be in the on state. The A/C mode annunciator (item 11 in **Fig. 1**) should also be in the on state and the front blower should be at minimum speed. The A/C clutch annunciator (item 12 in **Fig. 1**) may or may not be in the on state depending on whether the A/C clutch rules have been met (engine running, adequate system air pressure, evaporator sensor in correct range). This test simulates the ACU. If the test is successful and rear override is not functioning, then the problem most likely is either that the ACU is not communicating on the J1587 databus, or there is a problem with the ACU itself or its control inputs.

Rear Override Mode OFF Test Button (SleeperCabs only)

The rear override mode OFF test button is used to manually send a rear override off request to the FCU. This is the same message the ACU sends to the FCU when it no longer requests A/C support from the front unit. The button should be used after initiating rear override mode with the ON test button.

Bunk Override Mode ON Test Button (SleeperCabs only)

The bunk override mode ON test button is used to manually send a bunk override request to the ACU. This is the same message that the FCU sends to the ACU when the driver presses the bunk override switch on the climate control panel. When the bunk override ON test button is pressed, ACU mode annunciator (item 18 in **Fig. 1**)should be in the ON state. The auxiliary unit should then begin matching the front temperature and blower speed settings.

Bunk Override Mode OFF Test Button (SleeperCabs only)

The bunk override mode OFF test button is used to manually send a bunk override OFF request to the ACU. This is the same message the FCU sends to the ACU when the bunk override switch on the climate control panel is pressed to the off position. The button should be used after initiating bunk override mode with the ON test button.

Fault Code Grid

Double click on the fault code grid to display J1587 fault codes.

Fault Code Diagnostics

Front Control Unit (FCU) (MID 146) J1587 Fault Codes by SID			
SID	**FMI**	**Fault Description**	**Action**
001	03	CDTC sensor: voltage above normal, shorted high, or open circuit	See CDTC Temperature Sensor Circuit Test table, in **Subject 350**, for diagnosis.
	04	CDTC sensor: voltage below normal, shorted low	See CDTC Temperature Sensor Circuit Test table, in **Subject 350**, for diagnosis.
002	03	Evap temp sensor: voltage above normal, shorted high, or open circuit	See Evaporator Temperature Sensor Circuit Test table, in **Subject 350**, for diagnosis.
	04	Evap temp sensor: voltage below normal, shorted low	See Evaporator Temperature Sensor Circuit Test table, in **Subject 350**, for diagnosis.

Front Control Unit (FCU) (MID 146) J1587 Fault Codes by SID			
SID	**FMI**	**Fault Description**	**Action**
005	05	Recirc/OSA door actuator: current below normal or open circuit	See Actuator Circuit Test table, in **Subject 350**, for diagnosis.
	06	Recirc/OSA door actuator: current above normal or circuit shorted to ground	See Actuator Circuit Test table, in **Subject 350**, for diagnosis.
006	05	Mode door actuator: current below normal or open circuit	See Actuator Circuit Test table, in **Subject 350**, for diagnosis.
	06	Mode door actuator: current above normal or circuit shorted to ground	See Actuator Circuit Test table, in **Subject 350**, for diagnosis.
009	05	Temperature control door: current below normal or open circuit	See Actuator Circuit Test table, in **Subject 350**, for diagnosis.
	06	Temperature control door: current above normal or circuit shorted to ground	See Actuator Circuit Test talbe, in **Subject 350**, for diagnosis.
010	02	Blower motor: output data erratic or intermittent	The FCU compares the analog output signal (speed signal) with what it thinks it should be. If determined to be in error, this fault will become active. To diagnose: 1. Disconnect blower motor. If fault is no longer active, replace the blower motor. If still active, go to step 2. 2. Disconnect the blower speed signal output wire (pin A11) from the FCU connector. Make sure connector is plugged into FCU after removing wire. If fault is no longer active, check for short to power or short to ground on output wire. If fault is still active, replace FCU.
	12	Blower motor: bad component, speed is invalid or incorrect	This fault can occur if the blower speed feedback differs from the speed control signal being sent by the FCU. See Diagnosis for Blower Speed is Not Available table, in **Subject 350**.
011	05	A/C clutch relay: current below normal or open circuit	This fault indicates an open circuit in one of the following: circuit 97T between the FCU and the A/C clutch relay, open relay coil, or open relay coil ground circuit. See A/C Request Circuit Test table, in **Subject 350**, for diagnosis.
	06	A/C clutch relay: current above normal or circuit shorted to ground	This fault indicates that there is a short to ground in circuit 97T between the FCU and the A/C clutch relay, or a shorted relay. See A/C Request Circuit Test table, in **Subject 350**, for diagnosis.
250	02	J1587 databus: data erratic, intermittent, or incorrect	Check J1587 databus, repair as necessary. See **Group 54** for more information on troubleshooting the J1587 databus.
	12	Bad ECU/EEPROM error	Replace FCU.

Table 1, Front Control Unit (FCU) (MID 146) J1587 Fault Codes by SID

Fault Code Driven Diagnosis

Front Control Unit (FCU) (MID 146) J1587 Fault Codes by PID			
PID	**FMI**	**Fault Description**	**Action**
168	03	Supply voltage too high (above 16.0 VDC)	Check vehicle charging system, repair as necessary. See **Group 15** for more information.
	04	Supply voltage too low (below 9.0 VDC)	Check vehicle batteries and charging system. If okay, check power and ground circuits to HVAC system. Use voltage drop tests to isolate problem.

Table 2, Front Control Unit (FCU) (MID 146) J1587 Fault Codes by PID

Auxiliary Control Unit (ACU) (MID 200) J1587 Fault Codes by SID			
SID	**FMI**	**Fault Description**	**Action**
001	03	CDTC sensor: voltage above normal, shorted high, or open circuit	See CDTC Temperature Sensor Circuit Test table, in **Subject 350**, for diagnosis.
	04	CDTC sensor: voltage below normal, shorted low	See CDTC Temperature Sensor Circuit Test table, in **Subject 350**, for diagnosis.
009	05	Temperature actuator: current below normal or open circuit	See Actuator Circuit Test in **Subject 350**, for diagnosis.
	06	Temperature actuator: current above normal or circuit shorted to ground	See Actuator Circuit Test table, in **Subject 350**, for diagnosis.
010	02	Blower motor: output data erratic or intermittent	The ACU compares the analog output signal (speed signal) with what it thinks it should be. If determined to be in error, this fault will become active. To diagnose: 1. Disconnect blower motor. If fault is no longer active, replace the blower motor. If still active, go to step 2. 2. Remove the blower speed signal output wire (pin B4) from the ACU connector. Make sure connector is plugged into ACU after removing wire. If fault is no longer active, check for short to power or short to ground on output wire. If fault is still active, replace ACU.
	12	Blower motor: bad component, speed is invalid or incorrect	This fault can occur if the blower speed feedback differs from the speed control signal being sent by the ACU. See Diagnosis for Blower Speed is Not Available table, in **Subject 350**.
250	02	J1587 databus: data erratic, intermittent, or incorrect	Check J1587 databus, repair as necessary.
	12	Bad ECU/EEPROM error	Replace ACU.

Table 3, Auxiliary Control Unit (ACU) (MID 200) J1587 Fault Codes by SID

Auxiliary Control Unit (ACU) (MID 200) J1587 Fault Codes by PID			
PID	**FMI**	**Fault Description**	**Action**
168	03	Supply voltage too high (above 16.0 VDC)	Check vehicle charging system, repair as necessary. See **Group 15** for more information.
	04	Supply voltage too low (below 9.0 VDC)	Check vehicle batteries and charging system. See **Group 15** for more information. If okay, check power and ground circuits to HVAC system. Use voltage drop tests to isolate problem.

Table 4, Auxiliary Control Unit (ACU) (MID 200) J1587 Fault Codes by PID

A/C Performance Diagnosis

IMPORTANT: Before using the symptom driven diagnostics tables, perform the appropriate procedures in "Preliminary Checks" and "Refrigerant System Tests" for each complaint.

Problem—Warm Airflow When the Air Conditioner is On, A/C Not Working, or Poor A/C Performance (dash outlet temperature is too high)

Problem—Warm Airflow When the Air Conditioner is On, A/C Not Working, or Poor A/C Performance (dash outlet temperature is too high)	
Possible Cause	**Remedy**
Refrigerant charge too low.	Perform leak test. Repair any leaks, evacuate the system, replace the receiver-drier (only if color indicates it is saturated with moisture), add a full charge of refrigerant.
Contaminated refrigerant.	Check refrigerant for moisture and/or mixed refrigerant contamination, repair as necessary.
Refrigerant charge too high.	Evacuate the system, charge system with proper amount of refrigerant.
Moisture in the system.	Moisture in the system may cause ice crystals to form and possibly block the flow of refrigerant at the expansion valve or other places in the system. Recover the refrigerant, replace the receiver-drier, evacuate the system, and add a full charge of refrigerant.
A/C compressor not working.	The refrigerant charge is too high or too low (will cause the binary pressure switch to open and prevent the compressor from operating).
	Worn or loose A/C compressor drive belt, tighten or replace as necessary.
	Faulty A/C compressor or clutch, repair as necessary.
	A/C compressor clutch not engaging. See "A/C Clutch Circuit" for diagnosis.
Ice formed on evaporator core.	Ice buildup on the evaporator core can block airflow through the evaporator, thus producing little or no cooling. This may occur if the compressor is not cycling off at the correct temperature. For evaporator sensor testing, see "Evaporator Temperature Sensor."
Temperature door not operating correctly, front and auxiliary units.	Electrical problem with temperature actuator. Check for fault codes. See fault code tables, in **Subject 340**, for diagnosis.
	Mechanical problem with temperature door. Check for obstructions or broken components, repair as necessary. NOTE: The actuator has no feedback to the FCU/ACU to verify position. If there are no fault codes and the actuator signal appears to be working in the DataLink Monitor template, then suspect a mechanical problem.
Wiring problem between climate control panel and ACU, auxiliary unit only.	See **Table 11**, Sleeper Climate Control Panel Circuit Diagnosis.
Faulty temperature control potentiometer.	See **Table 11**, Sleeper Climate Control Panel Circuit Diagnosis.
Blockage or restriction in refrigerant system.	A blockage or restriction can usually be found by locating an abrupt temperature change at a location in the system; for example, in a line or the condenser. Repair as necessary.
Blower motor in protection mode (reduced airflow).	See "Blower Motor."
System out of calibration, front unit only.	See "Calibration Procedure."

Symptom Driven Diagnosis

Problem—No Fresh Air, Front Unit Only (nonrecirculation mode)

Problem—No Fresh Air, Front Unit Only (nonrecirculation mode)	
Possible Cause	**Remedy**
Recirc door not operating correctly.	Electrical problem with recirc door actuator. Check for fault codes. See fault code tables, in **Subject 340**, for diagnosis. Also see "Recirculation" and "Actuator Stepper Motors—Temperature, Recirc, and Mode."
	Mechanical problem with recirc door. Check for obstructions or broken components, repair as necessary. NOTE: The actuator has no feedback to the FCU/ACU to verify position. If there are no fault codes and the actuator signal appears to be working in the DataLink Monitor template, then suspect a mechanical problem.
Restricted filter or intake.	Clean as necessary.
System out of calibration.	See "Calibration Procedure."

Problem—Low Side Pressure Too Low

Problem—Low Side Pressure Too Low	
Possible Cause	**Remedy**
Refrigerant system restriction or blockage.	Check the expansion valve and other components for blockage (blockage may be due to moisture causing ice buildup).
Refrigerant charge too low.	Perform leak test. Repair any leaks, evacuate the system, replace the receiver-drier (only if color indicates it is saturated with moisture), add a full charge of refrigerant.

Problem—High Side Pressure Too High

Problem—High Side Pressure Too High	
Possible Cause	**Remedy**
Restricted airflow through condenser.	Check for dirt and debris buildup in front of condenser, clean as necessary.
	Check engine fan operation.
Restriction or blockage in condenser or line from condenser to receiver-drier.	Restriction or blockage will usually be indicated by a cool spot or ice buildup near the restriction or blockage. Repair as necessary. NOTE: If the compressor has recently failed, the restriction may be due to leftover debris from the failed compressor.
Air in refrigerant.	Check refrigerant purity, evacuate, and charge as necessary.
Engine overheating.	Check engine cooling system.
Engine fan not working correctly.	See **Group 20**, check fan cycling switch.

Problem—Compressor Runs Continuously

Problem—Compressor Runs Continuously*	
Possible Cause	**Remedy**
Refrigerant charge too high.	Evacuate the system, replace the receiver-drier (only if color indicates it is saturated with moisture), add a full charge of refrigerant.
Faulty evaporator temperature sensor.	See "Evaporator Temperature Sensor."

* This is normal when the ambient temperature and/or relative humidity is high.

Problem—Little or No Heat, Front and Auxiliary Units

Problem—Little or No Heat, Front and Auxiliary Units	
Possible Cause	**Remedy**
Low engine coolant.	Check coolant level.
Plugged heater core.	Flush coolant system or replace heater core as necessary. NOTE: This can be checked by feeling the inlet and outlet heater hoses. There should be a slight temperature difference when the temperature is set to hot and the fan is on high (engine at operating temperature). A large temperature difference indicates a blockage.
Faulty engine thermostat.	Check if thermostat is stuck open, this may cause the engine to not reach operating temperature under light load or when ambient temperatures are low.
Temperature door not operating correctly.	Electrical problem with temperature actuator. Check for fault codes. See fault code tables, in **Subject 340**, for diagnosis. Also see "Override."
	Mechanical problem with temperature door. Check for obstructions or broken components, repair as necessary. NOTE: The actuator has no feedback to the FCU/ACU to verify position. If there are no fault codes and the actuator signal appears to be working in the DataLink Monitor template, then suspect a mechanical problem.
System out of calibration, front unit only.	See "Calibration Procedure."

Problem—Water or Engine Coolant Leaking from HVAC Unit Inside the Cab, Front and Auxiliary Units

Problem—Water or Engine Coolant Leaking from HVAC Unit Inside the Cab, Front and Auxiliary Units*	
Possible Cause	**Remedy**
Plugged drain tubes.	Clean as necessary.
Leaking heater core.	Replace heater core.

* Clear water dripping from the HVAC unit under the hood is normal when the A/C is on. This is from moisture condensing out of the air as it cools going through the evaporator.

Symptom Driven Diagnosis

Problem—Recirculation Mode Not Working, Front Unit Only

Problem—Recirculation Mode Not Working, Front Unit Only	
Possible Cause	**Remedy**
Recirc door not operating correctly.	Electrical problem with recirc actuator. Check for fault codes. See fault code tables, in **Subject 340**, for diagnosis. Also see "Recirculation" and "Actuator Stepper Motors—Temperature, Recirc and Mode." Mechanical problem with recirculation door. Check for obstructions or broken components, repair as necessary. NOTE: The actuator has no feedback to the FCU/ACU to verify position. If there are no fault codes and the actuator signal appears to be working in the DataLink Monitor template, then suspect a mechanical problem.
System out of calibration.	See "Calibration Procedure."

Problem—Air Does Not Come Out of Correct Outlets, Front Unit Only

Problem—Air Does Not Come Out of Correct Outlets, Front Unit Only*	
Possible Cause	**Remedy**
Mode door not operating correctly.	Electrical problem with mode actuator. Check for fault codes. See fault code tables, in **Subject 340**, for diagnosis. Also see "Recirculation" and "Actuator Stepper Motors—Temperature, Recirc and Mode."
	Mechanical problem with mode door. Check for obstructions or broken components, repair as necessary. NOTE: The actuator has no feedback to the FCU/ACU to verify position. If there are no fault codes and the actuator signal appears to be working in the DataLink Monitor template, then suspect a mechanical problem.
Broken or disconnected duct.	Repair as necessary.
System out of calibration.	See "Calibration Procedure."

* For example, air directed to windshield outlets when air selection switch is set to floor outlets.

Problem—Warm Air from Outlets When Temperature is Set to Cold (A/C not on)

Problem—Warm Air from Outlets When Temperature is Set to Cold (A/C not on)	
Possible Cause	**Remedy**
Temperature door not operating correctly.	Electrical problem with temperature actuator. Check for fault codes. See fault code tables, in **Subject 340**, for diagnosis. Also see "Actuator Stepper Motors—Temperature, Recirc, and Mode."
	Mechanical problem with temperature door. Check for obstructions or broken components, repair as necessary. NOTE: The actuator has no feedback to the FCU/ACU to verify position. If there are no fault codes and the actuator signal appears to be working in the DataLink Monitor template, then suspect a mechanical problem.

Problem—Warm Air from Outlets When Temperature is Set to Cold (A/C not on)	
Possible Cause	**Remedy**
System out of calibration, front unit only.	See "Calibration Procedure."
Wiring/temperature control problem, auxiliary unit only.	See **Table 11**, Sleeper Climate Control Panel Circuit Diagnosis.

Problem—No Backlighting, Front Unit Only

Problem—No Backlighting, Front Unit Only	
Possible Cause	**Remedy**
Dim signal not reaching the FCU or faulty FCU.	See "Backlighting Diagnosis."

Problem—Blower Not Working, Operates at Reduced Speed, or Runs Then Shuts Off, Front and Auxiliary Units

Problem—Blower Not Working, Operates at Reduced Speed, or Runs Then Shuts Off, Front and Auxiliary Units	
Possible Cause	**Remedy**
Blower in protection mode.	Check for fault codes.
Wiring problem.	See fault code tables, in **Subject 340**, for diagnosis.
Faulty blower motor.	If there are no active fault codes, refer to "Blower Motor" for more information.
Wiring problem between sleeper climate control panel and ACU, auxiliary unit only.	See **Table 11**, Sleeper Climate Control Panel Circuit Diagnosis.
Faulty blower control potentiometer, auxiliary unit only.	See **Table 11**, Sleeper Climate Control Panel Circuit Diagnosis.

Problem—Bunk Override Does Not Work, SleeperCab Only (cannot override auxiliary blower and temperature settings from the front)

Problem—Bunk Override Does Not Work, SleeperCab Only (cannot override auxiliary blower and temperature settings from the front)	
Possible Cause	**Remedy**
Faulty bunk override switch.	Check switch. See "Override" for diagnosis. Verify switch operation using DataLink Monitor template.
Wiring problem.	Check wiring between override switch and FCU.
No J1587 databus communication between FCU and ACU.	Using ServiceLink, make sure both the FCU (MID 146) and ACU (MID 200) appear in the ECU list. If one ECU does not appear in the list, troubleshoot the J1587 databus. See **Group 54** for more information. Also see "Override" for diagnosis. NOTE: Vehicles without a sleeper do not have an ACU.
Faulty FCU.	See "Override" for diagnosis.
Faulty ACU.	See "Override" for diagnosis.

Symptom Driven Diagnosis

Problem—Rear Override Does Not Work, SleeperCab Only (minimum A/C support)

Problem—Rear Override Does Not Work, SleeperCab Only (minimum A/C support)*	
Possible Cause	**Remedy**
Front not providing A/C support for auxiliary (rear override not working).	Check rear override function. See "Override" for diagnosis. Problem may be no J1587 databus communication between the ACU and FCU.

* Rear cannot override to request A/C compressor when front unit is off. This should also cause front unit to operate at minimum blower speed if off.

A/C Clutch Circuit Diagnosis

Before performing tests on the A/C clutch circuit, perform the diagnostic tests in **Table 1**.

NOTE: Do not perform the test procedures in **Table 3** before performing the test procedures in **Table 1**.

A/C Clutch Does Not Engage				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Check control settings.	In order for the A/C compressor to operate, the controls must be set as follows: • blower speed at any setting other than off • air selection in one of A/C or defrost settings • A/C button is pressed; light on • engine running above 450 rpm • ambient temperature at the evaporator sensor must be above 44°F (7°C) forA/C compressor to engage If these conditions are met, the A/C compressor should engage. It may cycle on/off.	Conditions met, A/C compressor engages.	No problem found.
			Conditions met, A/C compressor does not engage.	**Go to test no. 2**.
2	Check for fault codes.	Connect ServiceLink and check for fault codes. Check if one of the following fault codes is active: • 146 s011 05 • 146 s011 06 NOTE: See Front Control Unit (FCU) (MID 146) J1587 Fault Codes by SID table, in **Subject 340**, for fault code descriptions.	One of these faults is active.	See **Table 3**.
			Faults other than these are active.	Repair fault before proceeding.
			No active faults.	**Go to test no. 3**.

A/C Clutch Does Not Engage				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
3	Check if A/C request is being sent.	Connect PC to vehicle and open the Behr CDTC Blend Air HVAC System DataLink Monitor template. Do the following: • Start the engine. • Set the blower to any speed except off. • Set the air selection switch to face mode. • Press the A/C button; the light should be on. Observe the A/C request annunciator in the template. The A/C request signal should be active and the A/C compressor should engage when the previous conditions are met and the following conditions are met: • Evaporator sensor is above 44°F (7°C). • Engine speed above 450 rpm. See template. • Low air pressure signal is not being broadcast by the instrument cluster. See template.	A/C request signal is active.	See **Table 4**.
			A/C request signal is not active.	**Go to test no. 4**.
4	Check evaporator sensor.	Note the ambient air temperature. Measure the resistance of the evaporator temperature sensor and compare the reading with the value in **Table 2** or **Fig.1**. The reading should correspond to a temperature approximately equal to the ambient temperature. NOTE: The evaporator sensor temperature must be above 44°F (7°C) before the FCU will send the A/C request signal to the A/C clutch relay. Therefore the sensor resistance must be below approximately 6500 ohms. See **Table 2** or **Fig. 1**. Also see **Fig. 2**.	Less than 6500 ohms	Check wiring between FCU and evaporator temperature sensor. If okay and all other inputs are met, such that the A/C request signal should be sent, then replace the FCU.**Go to test no. 5**.
			More than 6500ohms	The FCU is not sending an A/C request signal because the sensor is indicating the temperature is below 44°F (7°C). If temperature is known to be well above this temperature, then replace the sensor. **Go to test no. 5**.

Symptom Driven Diagnosis

A/C Clutch Does Not Engage				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
5	Verify repair.	Verify that repair resolved the problem.	Problem resolved	Done
			Problem unresolved	**Repeat test no. 1**.

Table 1, A/C Clutch Does Not Engage

Evaporator Temperature Sensor Temperature versus Resistance			
Temperature °F (°C)	**Resistance (ohms)**	**Temperature °F (°C)**	**Resistance (ohms)**
20 (–6.7)	12,814	55 (12.8)	4792
25 (–3.9)	11,036	60 (15.6)	4209
30 (–1.1)	9535	65 (18.3)	3706
32 (0)	**9000**	70 (21.1)	3271
35 (1.7)	8265	75 (23.9)	2894
40 (4.4)	7183	80 (26.7)	2566
45 (7.2)	6259	85 (29.4)	2281
50 (10)	5468		

Table 2, Evaporator Temperature Sensor Temperature versus Temperature Resistance

A/C Request Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Which fault code is active?	NOTE: Circuit problems between the FCU and A/C clutch relay (coil side) will activate fault codes.	146 s011 05 is active	**Go to test no. 2**.
			146 s011 06 is active	**Go to test no. 5**.
2	Check A/C clutch relay.	Remove the A/C clutch relay from the PDM. Measure the resistance across the relay coil (pins 85 and 86). NOTE: If the relay coil is open, the resistance will be approximately 680 ohms.	72–87 ohms	**Go to test no. 3**.
			Not 72–87 ohms	Replace relay.**Go to test no. 7**.
3	Check A/C clutch relay coil ground.	With the A/C clutch relay removed, check resistance between the ground side of the relay coil (PDM side) and the negative battery terminal. Make sure the batteries are disconnected or result may be inconclusive.	Less than 1 ohm	**Go to test no. 4**.
			More than 1 ohm	Repair relay coil ground circuit. **Go to test no. 7**.

A/C Request Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
4	Check circuit 97T.	Remove the A/C clutch relay. Disconnect the B connector from the back of the FCU. Measure resistance between the power side of the relay coil (PDM side) and pin B10 at the FCU B connector.	Less than 1 ohm	No problem found.**Repeat test numbers 1 through 4**.
			More than 1 ohm	Locate and repair high resistance or open in circuit 97T. **Go to test no. 7**.
5	Check A/C clutch relay.	Remove the A/C clutch relay from the PDM. Measure the resistance across the relay coil (pins 85 and 86). NOTE: If the relay coil is open, the resistance will be approximately 680 ohms.	72–87 ohms	**Go to test no. 6**.
			Not 72–87 ohms	Replace relay.**Go to test no. 7**.
6	Check circuit 97T for short to ground.	Disconnect the B connector from the back of the FCU. Measure resistance between pin B10 of the FCU B connector and the negative battery terminal. Make sure batteries are disconnected or result may be inconclusive.	72–87 ohms	No problem found. Repeat tests and look for possible intermittent short to ground in circuit 97T. **Go to test no. 7**.
			Less than 72 ohms	Locate short to ground in circuit 97T. Repair as necessary. **Go to test no. 7**.
7	Verify repair.	Verify that repair corrected the fault code and the problem is resolved.	Problem resolved	Done.
			Problem unresolved	**Repeat test no. 1**.

Table 3, A/C Request Circuit Test

NOTE: Do not perform the test procedures in **Table 4** before performing the test procedures in **Table 1**.

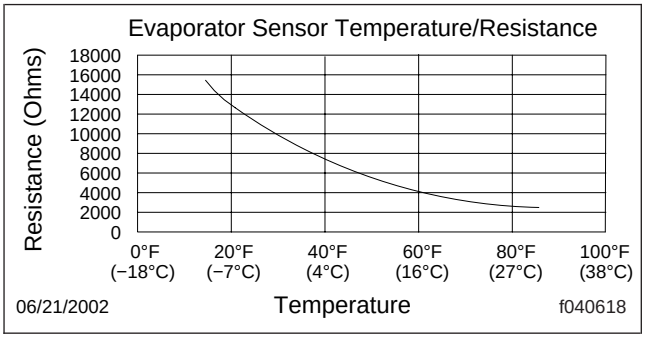

Fig. 1, Evaporator Sensor Temperature/Resistance

Symptom Driven Diagnosis

A/C Clutch Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Check power to A/C clutch relay.	Remove the A/C clutch relay from the PDM. Turn the ignition on and check for voltage on the PDM socket that corresponds to pin 87 A/C clutch relay.	No voltage	**Go to test no. 2**.
			12V	**Go to test no. 3**.
2	Check A/C clutch fuse.	Check the 20A A/C clutch fuse in the PDM (fuse 55).	Fuse okay	Check to make sure power is getting to fuse. If okay, check circuit between fuse and A/C clutch relay. Repair as necessary, then **go to test no. 6**.
			Fuse blown	Locate source of high current between the PDM and the A/C compressor clutch. The circuit may be shorted to ground. Repair as necessary, then **go to test no. 6**.
3	Check A/C clutch circuit resistance.	Remove the A/C clutch relay from the PDM. Measure the resistance between the PDM socket that corresponds to circuit 97T and the negative battery terminal. NOTE: Make sure batteries are disconnected. Failure to do so may give inconclusive results.	2.85 to 4 ohms	Check the A/C clutch relay. Make sure pin 87 is making contact with pin 30 when the relay is energized. Replace as necessary, then **go to test no. 6**.
			More than 4 ohms	**Go to test no. 4**.
4	Check binary switch.	Disconnect the binary switch and check continuity across the switch terminals.	Continuity	**Go to test no. 5**.
			No continuity	Check refrigerant pressures. If pressure is below the binary switch cutout pressure, the system is severely undercharged. Locate source of leak and recharge. If pressures are within the binary switch range, replace the binary switch then **go to test no. 6**.

A/C Clutch Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
5	Measure resistance of the A/C clutch.	Disconnect the connector at the A/C compressor. Measure resistance on the compressor side of the connector.	2.85–3.33 ohms	Problem is most likely high resistance or open circuit in wiring between the A/C clutch relay in the PDM and the A/C compressor. Be sure to check A/C compressor clutch ground circuit. The most definitive way to isolate the problem is to manually energize the circuit at the relay and use voltage drop measurements to isolate the problem, then **go to test no. 6**.
			Not 2.85–3.33 ohms	Replace A/C compressor clutch, then **go to test no. 6**.
6	Verify repair.	Verify that repair corrected the fault code and the problem is resolved.	Problem resolved	Done.
			Problem unresolved	**Repeat test no. 1**.

Table 4, A/C Clutch Circuit Test

Bunk Override Diagnosis

The front control unit will remember bunk override setting after an ignition cycle and initiate bunk override again. Both the front and auxiliary units will be in bunk override mode.

See **Table 5** for bunk override diagnosis procedures.

Bunk Override Diagnosis				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Check bunk override function with DataLink Monitor Test.	Open the DataLink Monitor template for this system. Turn the ignition on. Set the front blower to high and the temperature to hot. Set the auxiliary blower to off and the temperature to cold. In the template, press the bunk override ON test button. The ACU bunk override mode annunciator state should be ON and the auxiliary blower and temperature settings should match the front settings (can be observed on the template. Note that it takes about a minute for the settings to completely change.)	The ACU bunk override mode state is ON and auxiliary blower and temperature settings closely match front settings.	**Go to test no. 3**.
			The ACU bunk override mode state is ON and auxiliary blower and/or temperature settings do not match the front unit.	Replace ACU, then **go to test no. 5**.
			The ACU bunk override mode state is OFF or NA/ERR.	**Go to test no. 2**.

Symptom Driven Diagnosis

Bunk Override Diagnosis				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
2	Verify J1587 communication.	Connect ServiceLink to the vehicle. Check if both the FCU (MID 146) and ACU (MID 200) appear in the ECU list.	Both ECUs appear in the ECU list.	**Go to test no. 3**.
			One or both ECUs do not appear in the ECU list or ServiceLink is unable to connect to vehicle.	Troubleshoot and repair J1587 databus. Refer to **Group 54** for more information. **Go to test no. 5**.
3	Check override switch operation.	Open the DataLink Monitor template for this system. While observing the bunk override switch annunciator in DLM, press the switch to the momentary on position, then to the momentary off position. The annunciator should indicate switch position. When the switch is in the normal position, the annunciator should indicate NA/ERR.	Switch functions as described.	**Go to test no. 4**
			Switch does not function as described.	Check override switch and wiring. Repair as necessary. If okay, replace the FCU. **Go to test no. 5**.
4	Check if FCU is sending bunk override request.	Open the DataLink Monitor template for this system. While observing the Bunk O/R Request annunciator, press the bunk override switch to the momentary on position then release it. The O/R request annunciator should be in the ON state then read NA/ERR.	Bunk O/R request annunciator briefly indicates ON then goes to NA/ERR and FCU and ACU bunk override mode state is ON.	Problem not found. Verify complaint, check for intermittent problems, repeat tests if necessary.
			Bunk O/R request annunciator remains in the ON state.	Check ACU; it is not responding to the bunk override request. Make sure it has power and ground andJ1587 databus communication. If okay, replace ACU. **Go to test no. 5**.
			Bunk O/R request annunciator does not ever indicate it is in the ON state.	Repeat test 3. If okay, replace FCU, then **go to test no. 5**.
5	Verify repair.	Verify that repair corrected the fault code and the problem is resolved.	Problem resolved.	Done.
			Problem unresolved.	**Repeat test no. 1**.

Table 5, Bunk Override Diagnosis

See **Table 6** for rear override diagnosis procedures.

Rear Override Diagnosis				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Check rear override function with DataLink Monitor Test. NOTE: If the front unit diagnoses a bad blower motor, then it will not go into rear override mode and will not activate the A/C request signal.	Open the DataLink Monitor template for this system. Turn the ignition on. Set the front blower to off. Set the auxiliary blower to high and the temperature to full cold. In the template, press the rear override ON test button. On the template, the FCU rear override mode annunciator state should be ON and the A/C mode annunciator should be ON. The A/C clutch annunciator will not be on unless the A/C request rules are met (engine running, air pressure up, etc.). The front blower should be on low speed and the A/C indicator light on the A/C button should be on.	FCU rear override mode state annunciator in ON and A/C mode annunciator is ON.	**Go to test no. 3**.
			FCU rear override mode state annunciator is ON and A/C mode annunciator is OFF.	Replace FCU, then **go to test no. 4**.
			FCU rear override mode state annunciator is OFF.	**Go to test no. 2**
2	Verify J1587 communication.	Connect ServiceLink to the vehicle. Check if both the FCU (MID 146) and ACU (MID 200) appear in the ECU list.	Both ECUs appear in the ECU list.	Replace FCU, then **go to test no. 4**.
			One or both ECUs do not appear in the ECU list or ServiceLink is unable to connect to vehicle.	Troubleshoot and repair J1587 databus. Refer to **Group 54** for more information. **Go to test no. 4**.

Symptom Driven Diagnosis

Rear Override Diagnosis				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
3	Check if ACU is sending rear override request.	Open the DataLink Monitor template for this system. Start the engine. Turn the front blower off. While observing the Rear Override O/R Request annunciator in DataLink monitor, set the auxiliary temperature control switch to full cold and the auxiliary blower speed to high. The O/R Request annunciator should momentarily be in the ON state, then read NA/ERR. It may take a moment for this to happen.	O/R Request annunciator briefly indicates ON , then goes to NA/ERR, and FCU and ACU rear override mode state annunciators are ON, and A/C mode state annunciator is ON.	Problem not found. Rear override is functioning normally.
			O/R Request annunciator stays in the ON state.	Check FCU. It is not responding to the rear override request. Make sure it has power and ground andJ1587 databus communication. If okay, replace FCU. **Go to test no. 4**.
			O/R Request annunciator does not ever indicate it is in the ON state.	Repeat test no. 3. If ambient temperature is low, the auxiliary unit may not request rear override. Replace ACU if repeated test fails. **Go to test no. 4**
4	Verify repair.	Verify that repair resolved the problem.	Problem resolved.	Done.
			Problem unresolved.	**Repeat test no. 1**.

Table 6, Rear Override Diagnosis

Actuator Diagnosis

See **Table 7** for the actuator circuit test procedures.

Actuator Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Check for fault codes.	Check if any one of the following fault codes is active: **Group A**: 146 s005 05; 146 s006 05; 146 s009 05; 200 s009 05 **Group B**: 146 s005 06; 146 s006 06; 146 s009 06; 200 s009 06 07/02/2002 f040619	Single fault in Group A isactive.	**Go to test no. 2**.
			All three MID 146 faults are active in Group A.	**Go to test no. 6**.
			Single fault in Group B is active.	**Go to test no. 8**.
			No faults listed in Group A or B are active.	No problem found.

Actuator Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
2	Check voltage to the actuator. NOTE: In order to measure a valid voltage, it may be necessary to move the respective control :for recirc, press the recirc button; for mix door actuator, move the temperature control switch; for the mode actuator, move the air selection switch.	For code **146s005 05** (front unit) disconnect the recirc actuator connector, turn the ignition on, measure voltage between connector pin 1 and ground. For code **146 s006 05** (front unit) disconnect the mode actuator connector, turn the ignition on, measure voltage between connector pin 1 and ground. For code **146 s009 05** (front unit) disconnect the temperature actuator connector, turn the ignition on, measure voltage between connector pin 1 and ground. For code **200 s006 05** (auxiliary unit) disconnect the temperature actuator connector, turn the ignition on, measure voltage between connector pin 1 and ground. NOTE: See **Fig. 2**, **Fig. 3**, and **Fig. 4**.	Approximately 12V	**Go to test no. 3**.
			Much less than 12V.	Check wire between pin 1 of the actuator and the FCU/ACU for open circuit. If okay, replace FCU/ACU. **Go to test no. 9**.

Symptom Driven Diagnosis

Actuator Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
3	Check for short to ground on return side of actuator.	For code **146s005 05** (front unit) disconnect all three actuator connectors and the FCU connector. At the recirc actuator connector, check continuity between connector pin 3 and ground. Repeat for pins 4, 5, and 6. For code **146 s006 05** (front unit) disconnect all three actuator connectors and the FCU connector. At the mode actuator connector, check continuity between connector pin 3 and ground. Repeat for pins 4, 5, and 6. For code **146 s009 05** (front unit) disconnect all three actuator connectors and the FCU connector. At the temperature actuator connector, check continuity between connector pin 3 and ground. Repeat for pins 4, 5, and 6. For code **200 s009 05** (auxiliary unit) disconnect the temperature actuator connector and the ACU connector. At the temperature actuator connector, check continuity between connector pin 3 and ground. Repeat for pins 4, 5, and 6. NOTE: See **Fig. 2**, **Fig. 3**, and **Fig. 4**.	Continuity to ground on any pin.	Locate short to ground, repair as necessary, then **go to test no. 9**.
			No continuity to ground on any pin.	**Go to test no. 4**.

<tr><td>No continuity to ground on any pin.</td><td>Replace FCU, thengo to test no. 9.</td></tr>
</table>

Actuator Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
8	Check for shorted actuator coil.	For code **146s005 06** disconnect the recirc actuator connector, check if fault no longer active (different fault maybe active). For code **146 s006 06** disconnect the mode actuator connector, check if fault no longer active (different fault may be active). For code **146 s009 06** disconnect the temperature actuator connector, check if fault no longer active (different fault may be active). For code **200 s009 06** disconnect the temperature actuator connector (auxiliary unit), check if fault no longer active (different fault may be active). See **Fig. 2**.	Fault no longer active (FMI06), different fault may be active (FMI 05).	Shorted actuator motor is likely. Perform "Actuator Stepper Motor Electrical Test" to confirm, then **go to test no. 9**.
			Fault still active (FMI06).	Check for short to ground in power wire between actuator and FCU/ACU. If no short is found, replace FCU/ACU, then **go to test no. 9**.
9	Verify repair. NOTE: In order to check if a fault status has changed from active to inactive, the recirc button, temperature control switch, or air selection switch needs to be moved while the ignition is on.	Verify that repair resolved the problem.	Problem resolved.	Done.
			Problem unresolved.	**Repeat test no. 1**.

Table 7, Actuator Circuit Test

Temperature Sensor Diagnosis

See **Table 8** for the evaporator temperature sensor circuit test procedures.

Symptom Driven Diagnosis

Evaporator Temperature Sensor Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Are evaporator temperature sensor fault codes active?	Check if fault code**146 s002 03** or **146 s002 04** is active.	Neither fault isactive.	**Go to test no. 2**.
			146s002 03 is active	Check for sensor signal wire shorted to power. If okay, **go to test no. 2**.
			146s002 04 is active.	Check for sensor signal wire shorted to ground. If okay, replace FCU. **Go to test no. 3**.
2	Check sensor reference voltage.	Disconnect the evaporator sensor. Turn the ignition on and measure the voltage across the sensor connector pins (harness side). The voltage should be 5V if the circuit and FCU are operating correctly.	5V	Perform "Evaporator Temperature Sensor Test."
			Less than 5V.	Check for open circuit in sensor signal and ground wires. If okay, replace FCU. **Go to test no. 3**.
3	Verify repair.	Verify that repair resolved the problem.	Problem solved.	Done.
			Problem unresolved.	**Repeat test no. 1**.

Table 8, Evaporator Temperature Sensor Circuit Test

See **Table 9** for the CDTC temperature sensor circuit test procedures.

CDTC Temperature Sensor Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Are CDTC temperature sensor fault codes active?	Check if one of the following fault codes is active: **146 s001 03**, **146 s001 04**, or**200 s001 03**, **200 s001 04**.	None of these faults isactive.	**Go to test no. 2**.
			146s001 03 or **200 s001 03** is active.	Check for sensor signal wire shorted to power. If okay, **go to test no. 2**.
			146s001 04 or **200 s001 04** is active.	Check for sensor signal wire shorted to ground. If okay, replace FCU/ACU. **Go to test no. 3**.
2	Check sensor reference voltage.	Disconnect the CDTC sensor. Turn the ignition on and measure the voltage across the sensor connector pins (harness side). The voltage should be 5V if the circuit and FCU/ACU are operating correctly.	5V	Perform "CDTC Temperature Sensor Test."
			Less than 5V.	Check for open circuit in sensor signal and ground wires. If okay, replace FCU/ACU. **Go to test no. 3**.

CDTC Temperature Sensor Circuit Test				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
3	Verify repair.	Verify that repair resolved the problem.	Problem resolved.	Done.
			Problem unresolved.	**Repeat test no. 1**.

Table 9, CDTC Temperature Sensor Circuit Test

Backlighting Diagnosis

See **Table 10** for backlighting diagnosis.

Backlighting Diagnosis				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Check backlighting operation.	Turn on the headlights and check for the following conditions: • Condition 1—all backlighting (instrument cluster, panel switches, and HVAC FCU) not working • Condition 2—HVAC FCU and bunk override switch backlighting not working • Condition 3—only HVAC FCU backlighting not working • Condition 4—only bunk override switch backlighting not working	Condition 1	See Group 54 for backlighting diagnosis.
			Condition 2	**Go to test no. 2**.
			Condition 3	**Go to test no. 3**.
			Condition 4	**Go to test no. 4**.
2	Check circuits 29A and GND1.	Disconnect AS2 connector. Turn headlights on. Measure voltage at pins A(+) and F(–) of the AS2 connector on the main cab harness side.	9–16V	Check AS2 connector for damaged pins. If damaged pins are found, repair as necessary then **go to test no. 5**. If no damage is found, **repeat test no. 1**.
			Less than 9V (0V)	Check for open in circuits 29A and GND1 in the main cab harness. Repair as necessary, then **go to test no. 5**.
3	Check circuits DIM+ and GND1 to FCU.	Disconnect the FCU connector. Turn headlights on. Measure voltage at pins A6(+) and A7(–) of the FCU connector.	9–16V	Replace FCU, then **go to test no. 5**.
			Less than 9V (0V)	Check circuits DIM+ and GND1 between the FCU connector and the AS2 connector for circuit fault (open or short). Repair as necessary, then **go to test no. 5**.

Symptom Driven Diagnosis

Backlighting Diagnosis				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
4	Check circuits DIM+ and GND1 to override switch.	Disconnect the override switch connector. Turn headlights on. Measure voltage at pins 10(+) and 8(–) of the override switch connector.	9–16V	Replace the override switch, then **go to test no. 5**.
			Less than 9V (0V)	Check circuits DIM+ and GND1 between the override switch and AS2 connectors for circuit faults (open or short). Repair as necessary, then **go to test no. 5**.
5	Verify repair.	Verify that repair solved the backlighting problem.	Problem resolved.	Done.
			Problem unresolved.	**Repeat test no. 1**.

Table 10, Backlighting Diagnosis

Sleeper Climate Control Panel Circuit Diagnosis

See **Table 11** for sleeper climate control panel circuit diagnosis.

Sleeper Climate Control Panel Circuit Diagnosis				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Does the symptom involve both the blower and temperature control?	—	No, affects only one of these	**Go to test no. 4**.
			Yes, affects both	**Go to test no. 2**.
2	Check the 12VDC ignition supply to the control panel.	Gain access to the back of the sleeper control panel. Disconnect the blower and temperature potentiometer connectors. Turn the ignition on. At the blower speed potentiometer connector, check for voltage at pin A (circuit 98N). Repeat test for temperature potentiometer connector pin A (circuit 98N).	Voltage at both pins	**Go to test no. 3**.
			Voltage at only one pin	Check circuit 98N between connector with no voltage and splice in harness. Repair as necessary.
			No voltage at either pin	Check 10A fuse in B-pillar PDM. If blown, check for short in circuit 98N. If okay, check circuit 98N for open and check ignition supply to fuse panel. Repair as necessary.

Sleeper Climate Control Panel Circuit Diagnosis				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
3	Check control panel ground circuit.	Make sure the ignition is off and the batteries are disconnected. Failure to do this may give inconclusive test results. Disconnect the blower and temperature potentiometer connectors. At the blower speed potentiometer connector, check resistance between pin C (circuit GND) and the battery negative terminal. Repeat test for temperature potentiometer connector pin C (circuit GND).	Both less than one ohm	Check ACU power and ground wiring. ACU may be malfunctioning.
			One more than 1 ohm	Check GND circuit between affected potentiometer circuit and the splice in the harness. Repair as necessary.
			Both more than 1 ohm	Check GND wiring to potentiometers. Check ACU ground circuit.
4	Which potentiometer circuit is affected?		Blower control	**Go to test no. 5**.
			Temperature control	**Go to test no. 6**.
5	Check for blower potentiometer voltage signal at the ACU.	Remove the ACU from the HVAC unit; leave the connector plugged in. Turn the ignition on. Backprobe ACU connector pin A2 and check for voltage while rotating the blower speed control knob from low to high.	Voltage ranges from 0.5 to 12.5VDC	Sleeper climate control panel circuit is not the problem. Check for fault codes and see "Blower Motor Diagnostics–Front and Auxiliary Units."
			Voltage does not vary; remains steady regardless of value	Check circuit 98M between blower speed potentiometer and ACU. Repair as necessary. If okay, replace potentiometer.
6	Check for temperature potentiometer voltage signal at the ACU.	Remove the ACU from the HVAC unit; leave the connector plugged in. Turn the ignition on. Backprobe ACU connector pin A5 and check for voltage while rotating the temperature control knob from cold to hot.	Voltage ranges from 0.5 to 12.5 VDC	Sleeper climate control panel circuit is not the problem. Check for fault codes and see "Actuator Stepper Motors—Temperature, Recirc, and Mode" for temperature actuator diagnostics.
			Voltage does not vary; remains steady regardless of value	Check circuit 98T between temperature potentiometer and ACU. Repair as necessary. If okay, replace potentiometer.

Table 11, Sleeper Climate Control Panel Circuit Diagnosis

Blower Motor Diagnostics—Front and Auxiliary Units

See **Table 12** and **Table 13** for blower motor diagnostics.

Symptom Driven Diagnosis

Blower Will Not Operate or Operates at Reduced Speed				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Is fault 146 s010 02 or 200 s010 02 active?	—	Yes	See fault code tables, in **Subject 340**, for diagnosis.
			No	**Go to test no. 2**.
2	Check power and ground.	Disconnect the blower motor connector. Turn ignition on. Check for voltage across pins 3 and 4 of the connector. NOTE: If system voltage is too high or too low, this may cause the blower motor to enter voltage protection mode. This will cause the blower to operate at reduced speed or stop working altogether.	12–17V (should be approx. battery voltage)	**Go to test no. 3**.
			0V	Check 30A blower motor fuse in PDM. Check blower motor power and ground circuits for open (circuits 98 and GND). Repair as necessary, then **go to test no. 7**.
			Less than 12V (not 0) or more than 17V	Blower has most likely entered voltage protection mode. Correct voltage problem as necessary, then **go to test no. 7**.
3	Check speed control signal at blower motor.	Disconnect the blower motor connector. Turn ignition on. Check voltage between connector pin 6 and ground while rotating the blower control switch from off to full speed. The voltage should be approximately 0V (off) to 5V+ (high).	Voltage full range (0–5V+)	**Go to test no. 4**.
			Voltage stays at 0V	Check speed control wire for open circuit between blower motor and FCU or ACU. If okay, check FCU/ACU. Repair/replace as necessary, then **go to test no. 7**.
4	Check for mechanical obstruction/locked rotor.	Remove the blower motor from the HVAC housing. Check for obstruction preventing blower from turning. Check if rotor spins freely by hand.	Obstruction	Remove obstruction as necessary, then **go to test no. 7**.
			Rotor locked	Replace blower motor, then **go to test no. 7**.
			Neither	**Go to test no. 5**.

Blower Will Not Operate or Operates at Reduced Speed				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
5	Check voltage drop.	Remove the blower motor from the HVAC housing. Turn ignition on, set blower speed to high. Check voltage on the power and ground circuits by back-probing the blower motor connector. Check between the positive and negative battery posts. NOTE: High voltage drop may cause the blower motor to enter voltage protection mode. This will cause the blower to operate at reduced speed and, if severe enough, may stop the blower altogether.	Less than 0.2V	**Go to test no. 6**.
			More than 0.2V	Locate source of high resistance causing voltage drop. Repair as necessary then **go to test no. 7**.
6	Does the blower motor operate at all?	—	Yes	Check if blower motor feels hot and make sure there are no obstructions to airflow. If no obstructed airflow or blower feels hot, replace blower motor then**go to test no. 7**.
			No	Replace blower motor, then **go to test no. 7**.
7	Verify repair.	Verify that repair resolved the problem.	Problem resolved	Done
			Problem unresolved	**Repeat test no. 1**.

Table 12, Blower Will Not Operate or Operates at Reduced Speed

Diagnosis for Blower Speed is Not Available				
Test No.	**Test**	**Test Procedure**	**Test Result**	**Action**
1	Does blower operate at all?	—	Yes	**Go to test no. 2**.
			No	Perform the tests in **Table 12**.
2	Check feedback speed/diagnostic circuit.	Check for open or short circuit in blower motor feedback speed/ diagnostic circuit between the blower motor and the FCU/ACU.	Circuit is open or shorted	Repair blower motor feedback speed/diagnostic circuit then, **go to test no. 3**.
			Circuit okay	Perform the tests in **Table 12**.
3	Verify repair.	Verify that repair resolved the problem.	Problem resolved	Done
			Problem unresolved	**Repeat test no. 1**.

Table 13, Diagnosis for Blower Speed is Not Available

Specifications

Acceptable Leak Rates by Component	
Component	**Acceptable Leak Rates**
J-Block Body	0.25 oz/yr and greater condemns these components
Evaporators (main and auxiliary)	
Condenser	
Receiver Dryer (Body)	
Lines/Hoses	
Capped Charge Ports	
Mini-Stato seal (1 - when the leak can be tied to a single seal)	
Mini-Stato seals (2 - when the leak cannot be tied to a single seal)	0.50 oz/yr and greater condemns these components
Compressor (shaft seal, housing, etc.)	
TXV (Power Valve and Super Heat Cap)	
Sensor/Switches (O-ring and crimped body connections)	

Table 1, Acceptable Leak Rates by Component

Overview

The Bergstrom NITE (No Idle Thermal Environment) parked, or no-idle, air conditioning system is a compact, electrically powered, 3000-BTU system. It is designed to provide a means of air conditioning to the sleeper area without having the engine running. It is completely self-contained, and runs on 12-volt deep-cycle batteries. The system is designed to maintain cool air in the sleeper interior. For optimal operation, the curtain between the cab and the sleeper must be closed when using the A/C system. The parked A/C unit will not cool down a hot sleeper that has been sitting in the sun without the vehicle A/C running. If the interior temperature is higher than desired, start the engine and run the vehicle A/C system until the desired sleeper temperature is achieved. This will help cool the sleeper to a temperature the parked A/C system can maintain. Once the sleeper temperature is lowered, the system will maintain a comfortable setting.

The unit is located under the lower bunk in the sleeper compartment. The unit gets its intake air from the under-bunk area through a grate in the top panel. An air intake grille is located on the front panel of the lower bunk. The outlet ducting runs from the left side of the unit to an outlet near the bunk occupant's face on the back wall of the sleeper. It is important to keep the air intake grille, and the area under the bunk, free of objects that might block air flow or put objectionable odors into the cooling air. Air for the condenser is taken in from under the cab and exhausted through another opening in the cab floor.

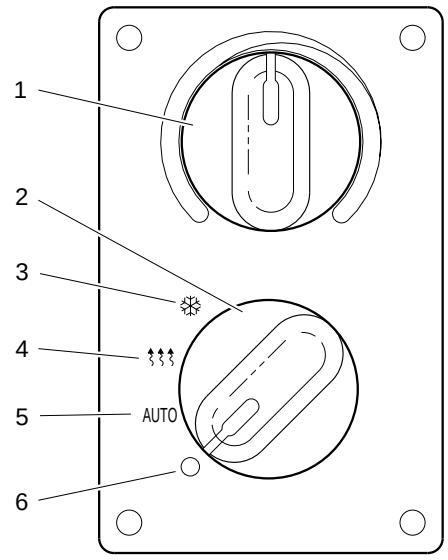
The system receives power from four deep-cycle batteries located between the frame rails. These batteries are completely isolated from the starting batteries to keep the starting batteries from being drawn down during operation.

IMPORTANT: The refrigerant system in the parked A/C unit is a sealed system, it is not serviceable. If problems occur; contact the NITE line at 1-866-204-8570, or visit www.nitesystem-.com.

Operation

The control panel for the parked A/C and heater is located on the back wall of the sleeper near the left side. It has a temperature control dial, and a four-position mode selector switch. Turn the temperature control dial to the left for cooling, and to the right for heat. See **Fig. 1**. See **Table 1** for a description of the function of the mode switch.

The system must be turned off whenever it is not in use, or the batteries may not charge properly. After using the system, turn the mode switch to the OFF position, even if the unit is not running.



1. Temperature Control Dial
2. Mode Switch
3. A/C Only
4. Heat Only
5. AUTO
6. Off

Fig. 1, Parked A/C and Heater Control Panel

Parked A/C and Heater Mode Switch Operation	
Mode	**Function**
Off	Turns the unit off.
AUTO	Allows the unit to automatically heat or cool the sleeper, depending on the temperature setting and the sleeper temperature. Adjusts the compressor, heater, and fans to keep temperature constant.
Heat Only	Allows only the heat portion of the system to run. Adjusts the heater only to keep the temperature constant.

General Information

Parked A/C and Heater Mode Switch Operation	
Mode	**Function**
A/C Only	Allows only the A/C portion of the system to run. Adjusts compressor and fans only to keep the temperature constant.

Table 1, Parked A/C and Heater Mode Switch Operation

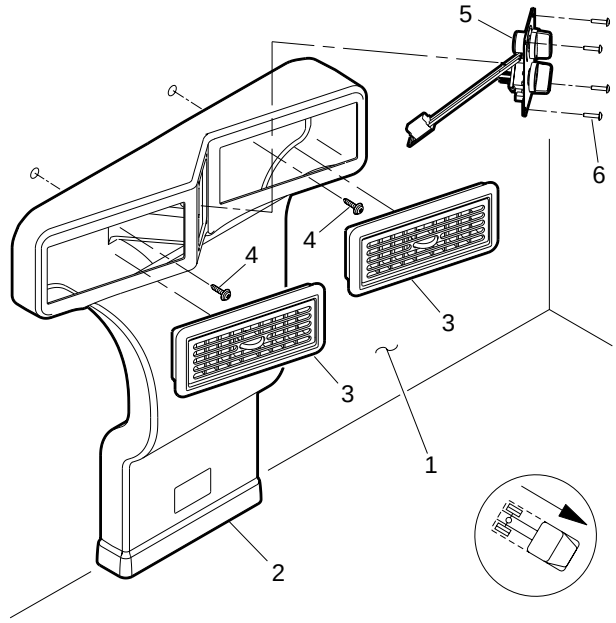
Safety Precautions

IMPORTANT: The refrigerant system on this unit is **not** servicable. Do not attempt to open the refrigerant system. The only reason you should come in contact with the refrigerant is if there is a leak in the system.

Control Panel Removal and Installation

Removal

1. Park the vehicle on a level surface, shut down the engine, set the parking brakes, and chock the tires. Disconnect the vehicle batteries.
2. Remove the outlet grilles. See **Fig. 1**.



1. Sleeper Back Wall
2. Plenum
3. Grille
4. Plenum Screws
5. Control Panel
6. Control Panel Screws

Fig. 1, Plenum and Control Panel Installation

3. Remove the screws that hold the plenum to the back wall of the sleeper.
4. Tilt the plenum out from the wall, and disconnect the wires.
5. Remove the fasteners, and remove the control panel.

Installation

1. Position the control panel in the opening in the housing, and install the fasteners.
2. Connect the wires to the control panel.
3. Position the plenum, and install the fasteners.
4. Install the outlet grilles.
5. Connect the batteries.

Replacement

1. Park the vehicle on a level surface, shut down the engine, set the parking brakes, and chock the tires. Disconnect the vehicle batteries.

NOTE: Mark all wires for reference before disconnecting them.

2. Disconnect the harness and the battery cables at the terminals under the sleeper floor. See **Fig. 1**.

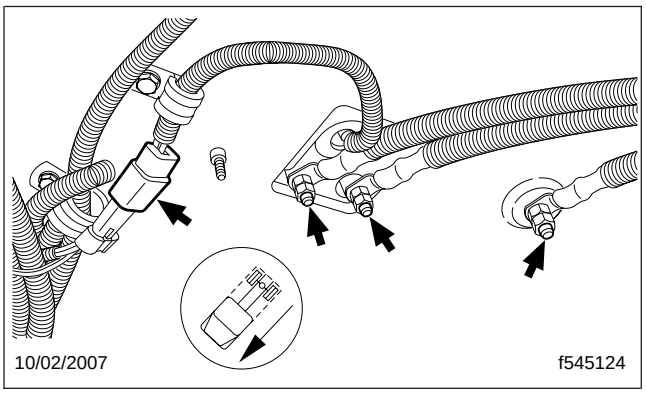


Fig. 1, Harness and Battery Cables

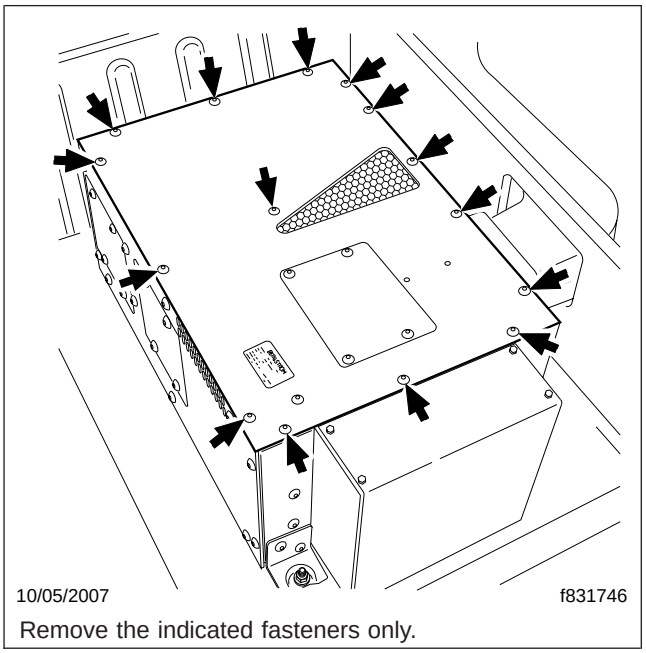
3. Raise and secure the lower bunk.
4. Disconnect the air duct from the outlet opening on the left side of the unit.
5. Disconnect the wires that go to the control panel.
6. Remove the nuts at the corners of the unit.

NOTE: The unit weighs approximately 70 lb (32 kg), and it is awkward to handle in the tight confines of the sleeper. Be careful when lifting it, to avoid personal injury or damaging the cab interior parts.

7. Lift the unit out of the under-bunk area.
8. Position the unit on the mounting studs in the under bunk area, and install the mounting nuts.
9. Connect the wires to the control panel.
10. Attach the air duct to the outlet opening in the left side of the unit.
11. Connect the harness and the battery cables to the terminals under the sleeper floor.
12. Connect the batteries.
13. Lower the bunk.

Replacement

1. Park the vehicle on a level surface, shut down the engine, set the parking brakes, and chock the tires. Disconnect the vehicle batteries.
2. Raise and secure the lower bunk.
3. Remove the top panel. See **Fig. 1**.



Remove the indicated fasteners only.

Fig. 1, Top Access Panel

4. Remove the two fasteners on the inside panel of the unit. See **Fig. 2**.
5. Remove the two fasteners on the outside of the unit, below the outlet duct.
6. Disconnect the wire connector at the blower.
7. Lift the blower assembly out of the unit housing.
8. Position the blower assembly in the unit housing.
9. Connect the wire connector at the blower.
10. Install the blower mounting fasteners; two inside, and two outside.
11. Connect the batteries.
12. Install the top panel.
13. Lower the bunk.

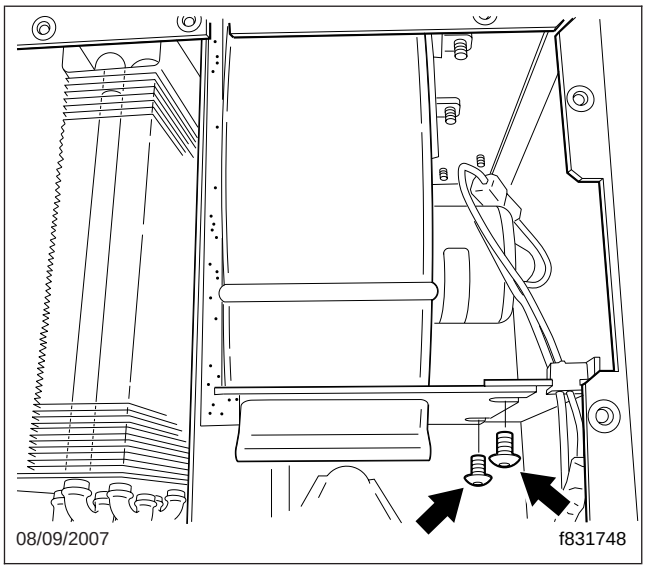


Fig. 2, Inside Blower Fasteners

Replacement

1. Park the vehicle on a level surface, shut down the engine, set the parking brakes, and chock the tires. Disconnect the vehicle batteries.
2. Raise and secure the lower bunk.
3. Remove the top panel. See **Fig. 1**.

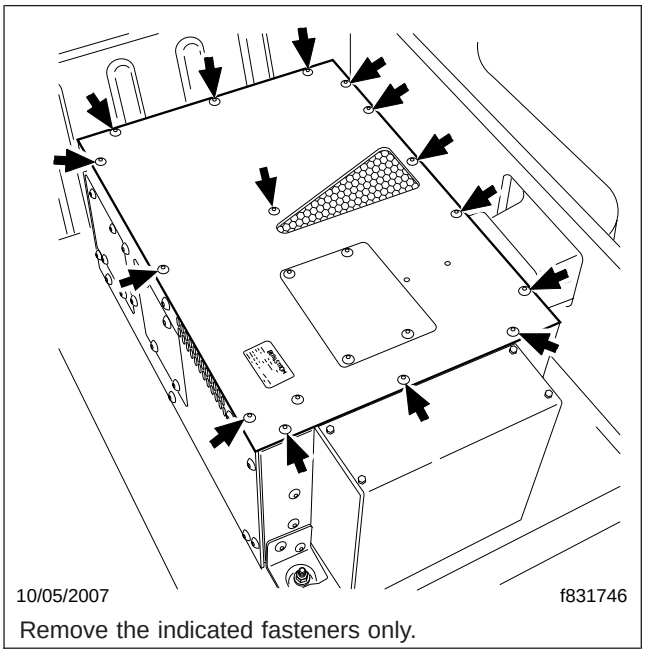

Fig. 1, Top Access Panels

4. Remove the fasteners from the condenser fan assembly. See **Fig. 2**.
5. Cut any wire ties as needed, and disconnect the wire connector from the condenser fan.
6. Remove the condenser fan assembly from the unit housing.
7. Position the condenser fan assembly in the unit housing, and install the fasteners.
8. Connect the wire connector and install wire ties as needed.
9. Connect the batteries.
10. Install the top panel.
11. Lower the bunk.

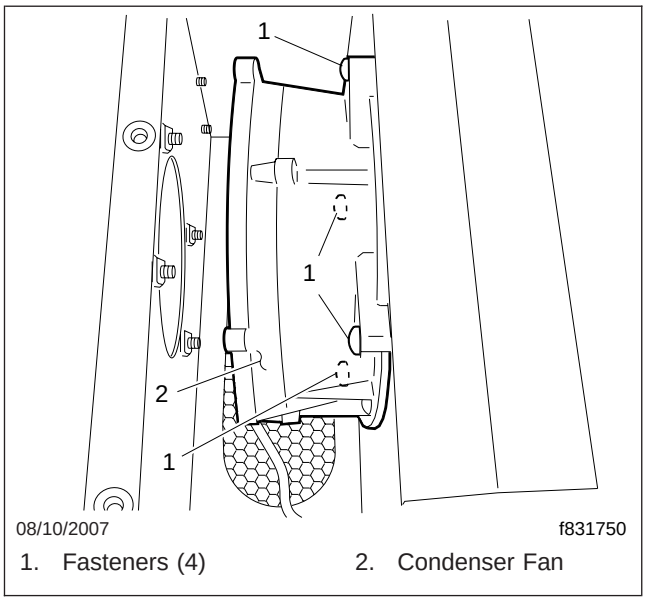

Fig. 2, Condenser Fan Installation

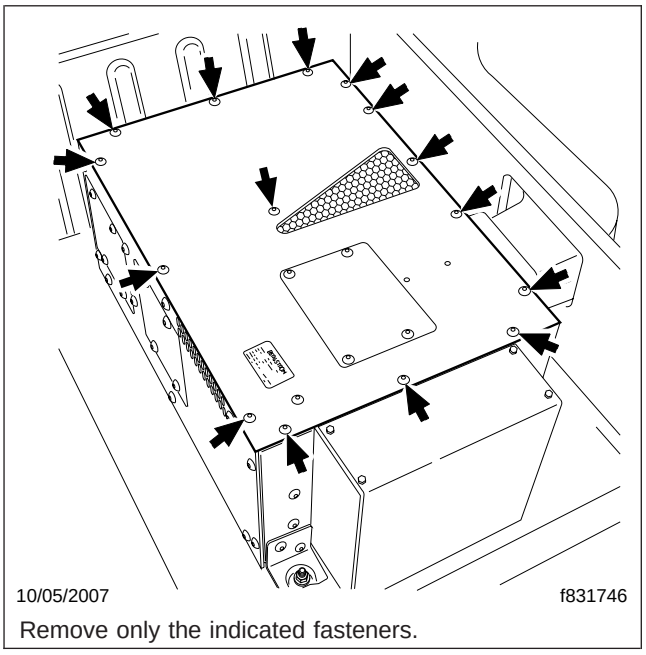
Compressor Control Module Replacement

Replacement

NOTICE

When removing or installing the control module housing, be very careful not to damage the exposed control board. Even a small chip or crack in the control board can ruin it.

1. Park the vehicle on a level surface, shut down the engine, set the parking brakes, and chock the tires. Disconnect both sets of vehicle batteries.
2. Raise and secure the lower bunk.
3. Remove the top panel. See **Fig. 1**.



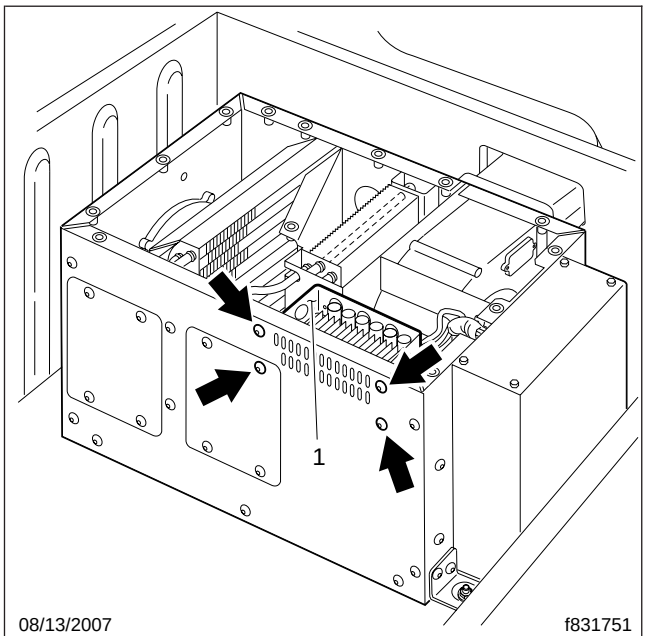
10/05/2007 f831746

Remove only the indicated fasteners.

Fig. 1, Top Access Panels

4. Remove the four control module housing fasteners on the side panel. See **Fig. 2**.

IMPORTANT: Make sure to note the positions of the wires to the compressor motor. Connecting them incorrectly will cause the compressor to malfunction. The wires to the temperature sensor can go either way. See **Fig. 3** for wire positions.



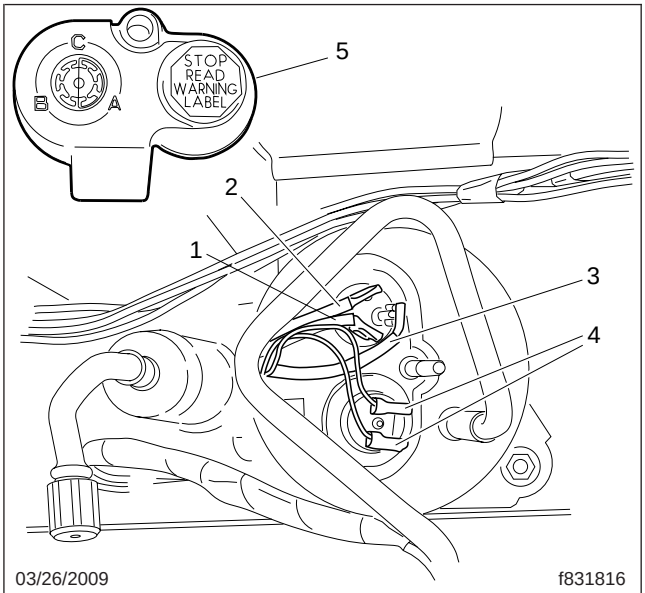
08/13/2007 f831751

1. Compressor Control Module

Fig. 2, Control-Module-Housing Fasteners

5. Remove the connector cap from the compressor, and disconnect the wires to the motor and temperature sensor.
6. Disconnect the power supply wires from the compressor.
7. Disconnect the connector from the harness to the control board.
8. Carefully remove the compressor control module.
9. Connect the power supply wires to the compressor. See **Fig. 3** for wire positions.
10. Install the compressor cap and nut.
11. Position the compressor control module in the unit housing.
12. Connect the wire connectors to the power supply and the control board.
13. Install the compressor control module fasteners.
14. Connect the batteries.
15. Install the top panel.
16. Lower the bunk.

Compressor Control Module Replacement



1. Blue Wire (position A)
2. Orange Wire (position B)
3. Yellow Wire (position C)
4. Black Wires, Temperature Sensor
5. Connector Cap

Fig. 3, Compressor Wire Connections

Replacement

1. Park the vehicle on a level surface, shut down the engine, set the parking brakes, and chock the tires. Disconnect the vehicle batteries.
2. Raise and secure the lower bunk.
3. Remove the top panel. See **Fig. 1**.

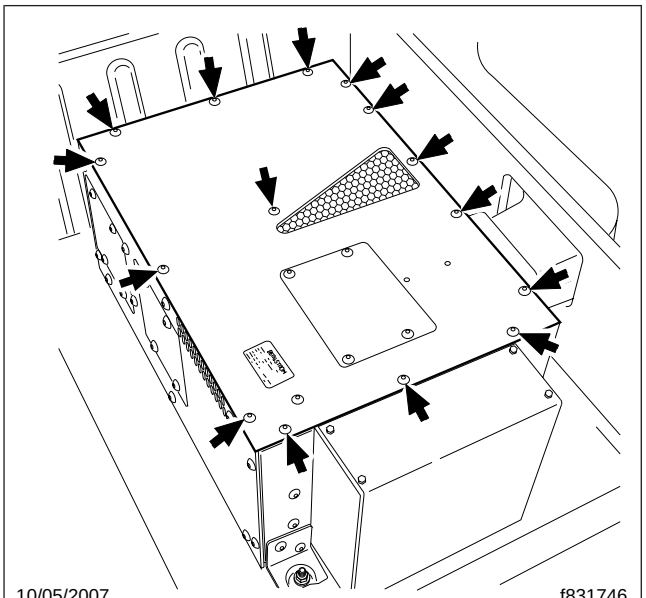


Fig. 1, Top Access Panels

4. Unplug the freeze switch.
5. Remove the fastener. See **Fig. 2**.
6. Remove the freeze switch probe from the evaporator coil, and pull the probe, wire, and rubber grommet out the hole on the panel. See **Fig. 3**.
7. Remove the freeze switch.
8. Insert the probe into the evaporator core in the same location as the original. Install the grommet in the hole in the panel.
9. Position the new freeze switch and install the fastener.
10. Connect the wire into the switch.
11. Connect the batteries.
12. Install the top panel.
13. Lower the bunk.

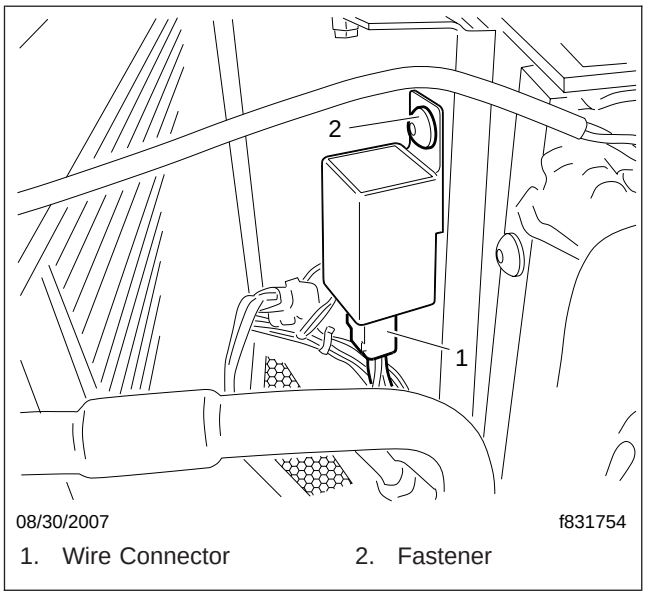

Fig. 2, Freeze Switch

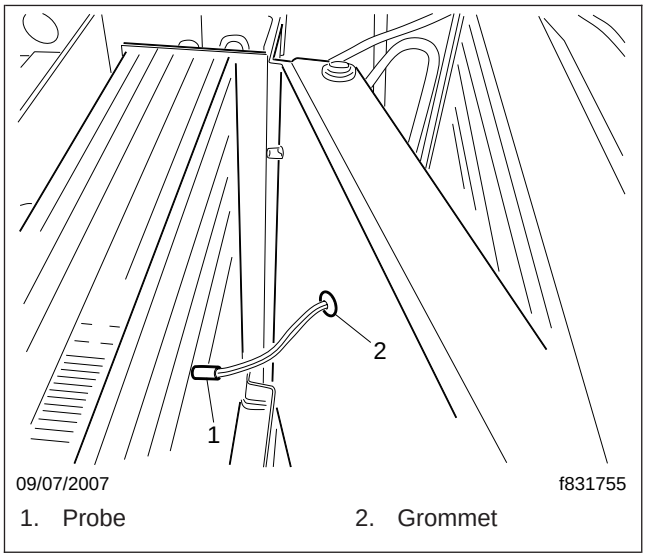

Fig. 3, Freeze Switch Probe

Replacement

1. Park the vehicle on a level surface, shut down the engine, set the parking brakes, and chock the tires. Disconnect both sets of vehicle batteries.
2. Raise and secure the lower bunk.
3. Remove the top panel. See **Fig. 1**.

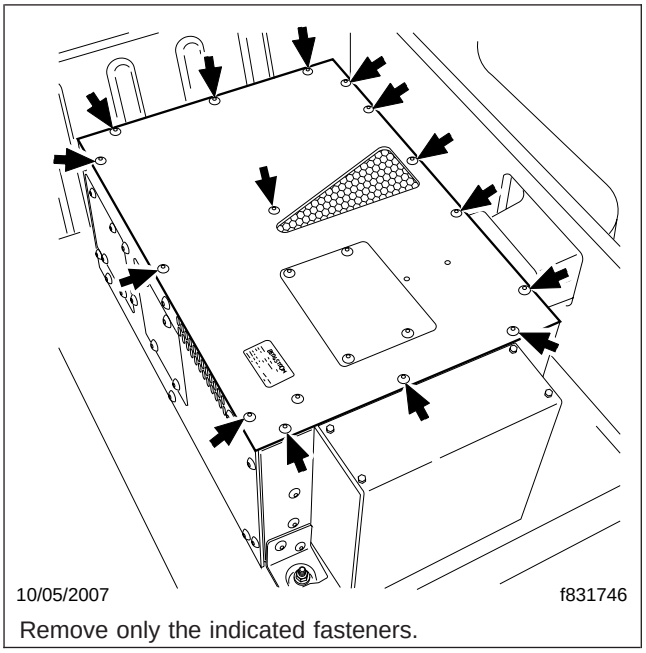

Fig. 1, Top Access Panel

4. Disconnect the three wire connectors from the unit control module. See **Fig. 2**.
5. Remove the electrical box cover. See **Fig. 3**.
6. Disconnect the wires that connect to the bottom of the electrical box, under the sleeper. See **Fig. 4**.

NOTE: There may be a vapor barrier affixed to the bottom of the unit, including electrical box. If so, carefully cut it loose in order to be able to tilt the electrical box out from the unit without damaging the vapor barrier.

7. Remove the four sheetmetal screws that hold the electrical box to the front of the unit, and tilt the electrical box away from the unit. See **Fig. 5** or **Fig. 6**.

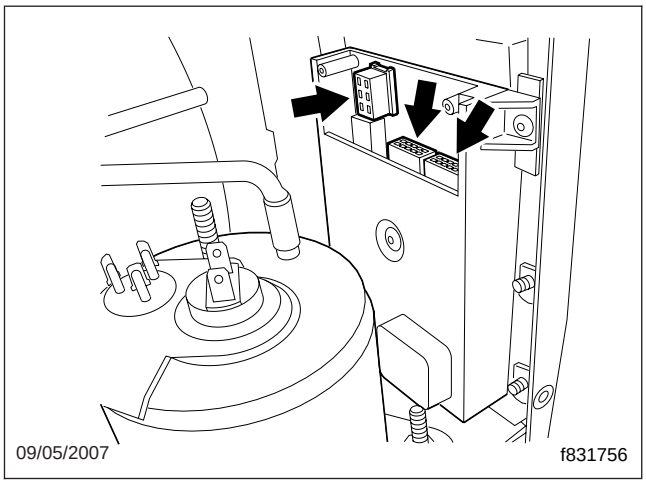

Fig. 2, Control Module Wiring

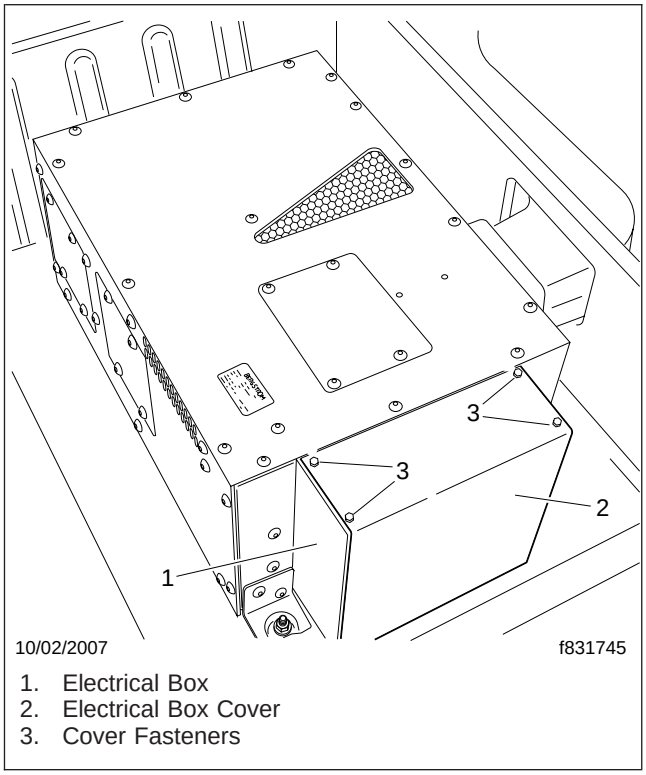

Fig. 3, Electrical Box Installation

8. Remove the fasteners for the control module mounting plate from the outside of the unit. See **Fig. 7**. Slide the mounting plate out of the unit with the control module attached.

Unit Control Module Replacement

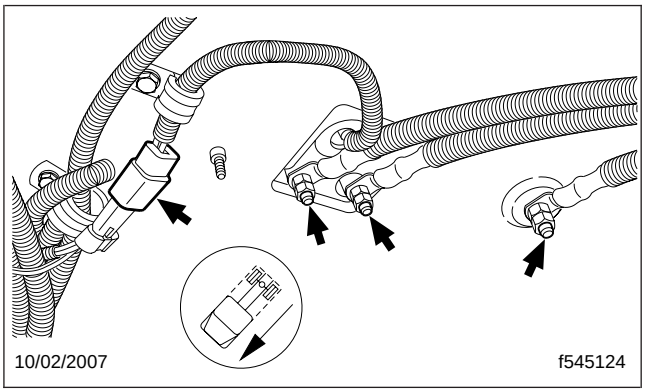

Fig. 4, Under Cab Wires (internal separator wiring shown)

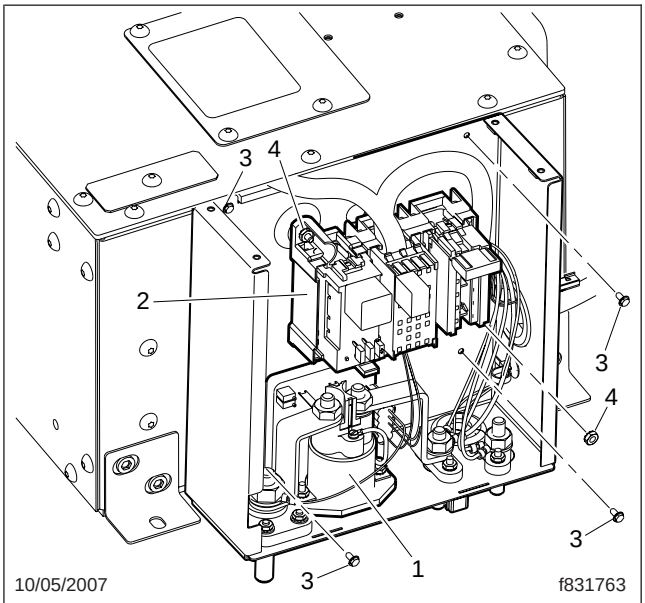

1. Separator
2. Fuse Panel
3. Sheetmetal Screws, Electrical Box (4)
4. Fuse Panel Nuts

Fig. 5, Fuse Panel and Separator

9. Remove the control module fasteners, and remove the control module from the mounting plate. See **Fig. 8**.
10. Position the control module on the mounting panel, and install the fasteners.
11. Position the mounting panel in the unit housing, and install the fasteners from the outside.
12. Position the electrical box, and install the screws.

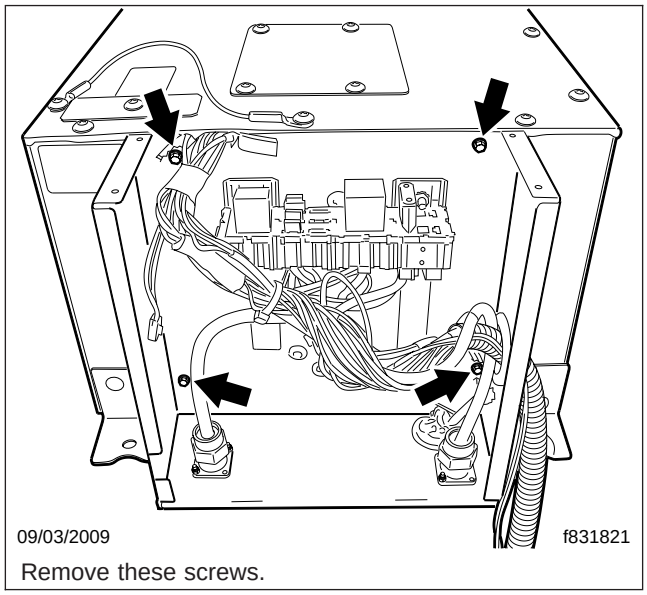

Fig. 6, Electrical Box, Frame-Rail Mounted Separator

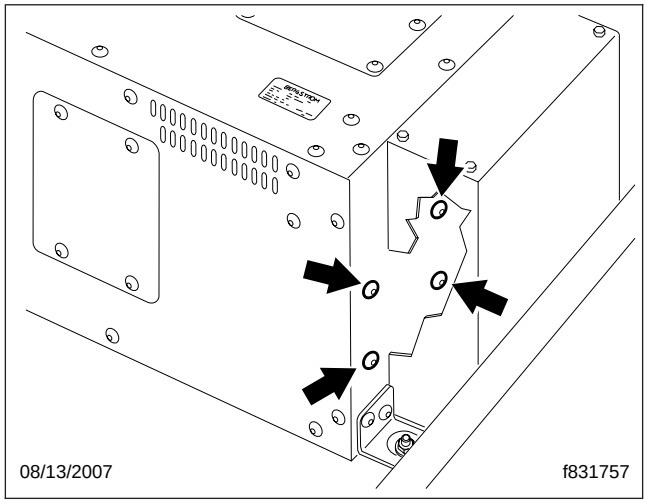

Fig. 7, Control Module Mounting-Plate Fasteners

13. Connect the wires to the bottom of the electrical box, under the sleeper.
14. Connect the three wiring connectors to the control module.
15. Connect the batteries.
16. Install the top panel and electrical box cover.
17. Lower the bunk.

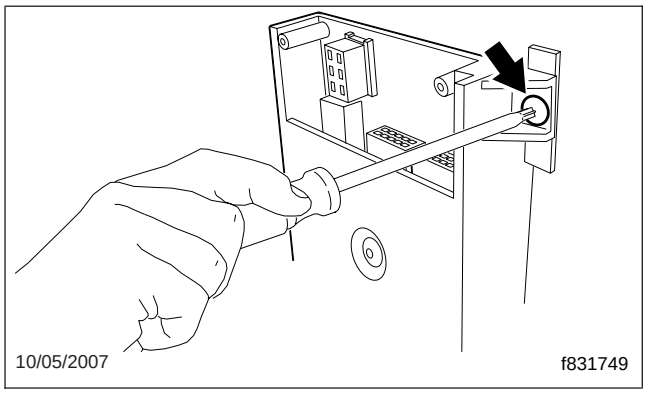

Fig. 8, Control Module Fastener

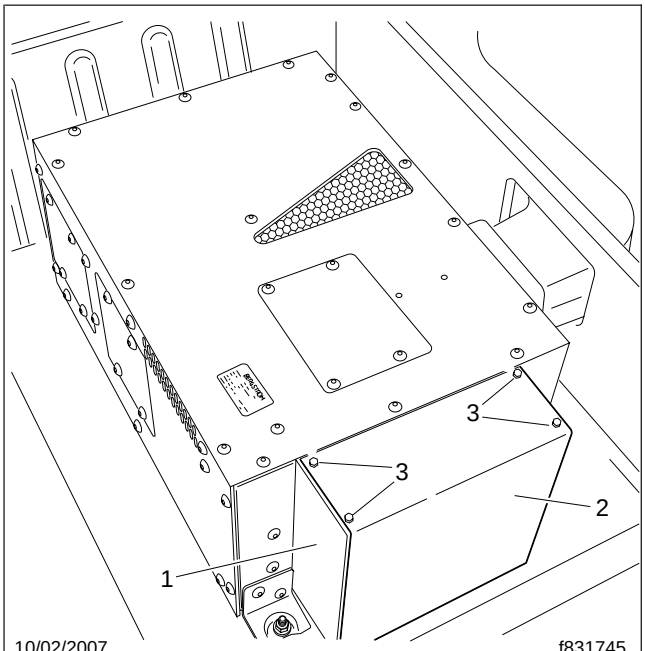
Interconnect Controller Replacement

On early installations of the NITE system, the interconnect controller, also know as the separator, is installed in the electrical box on the side of the unit under the bunk. On later models, it is installed on the left-hand side of one of the crossmembers under the back of the cab. It is a sealed unit, and is not serviceable. If the controller fails, replace it.

Electrical Box Mounted Interconnect Controller Replacement

1. Park the vehicle on a level surface, shut down the engine, set the parking brakes, and chock the tires. Disconnect both sets of vehicle batteries.
2. Raise and secure the lower bunk.
3. Remove the electrical box cover. See **Fig. 1**.

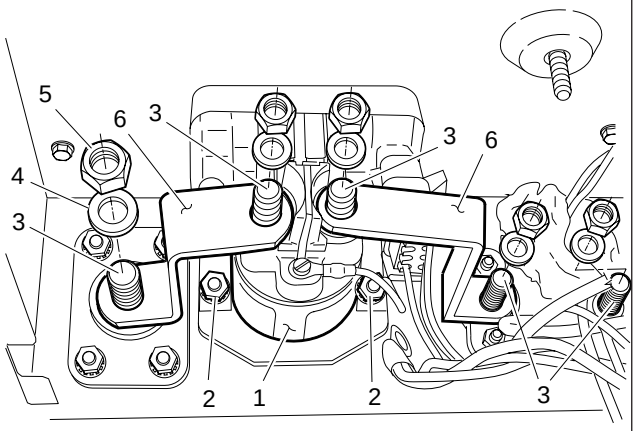


10/02/2007 f831745

1. Electrical Box
2. Electrical Box Cover
3. Cover Fasteners

Fig. 1, Electrical Box Cover

4. Remove the nuts and washers from the terminals, and remove the two copper buss bars. See **Fig. 2**.



09/13/2007 f545123

1. Separator
2. Separator Mounting Nut
3. Terminal
4. Washer
5. Terminal Nut
6. Copper Buss Bars

Fig. 2, Separator Installation

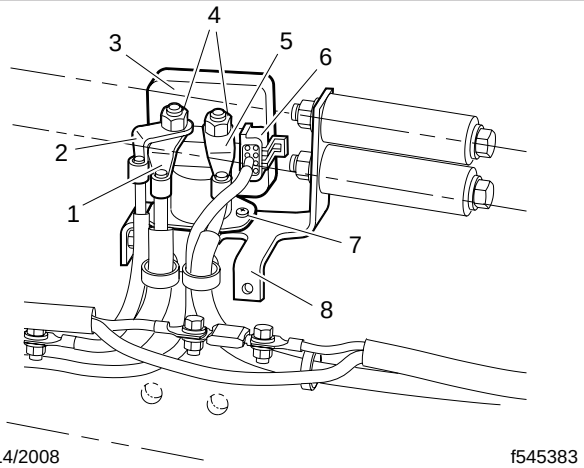
5. Remove the separator mounting nuts, and remove the separator.
6. Position the new separator, and install the mounting nuts.
7. Position the buss bars and install the mounting nuts and washers.
8. Connect the batteries.
9. Install the electrical box cover.
10. Lower the bunk.

Crossmember Mounted Interconnect Controller Replacement

The battery interconnect controller is located on the left-hand side of one of the crossmembers under the back of the cab. See **Fig. 3**.

1. Apply the parking brakes, and chock the tires.
2. Disconnect the vehicle batteries.
3. Disconnect the parked HVAC batteries.
4. Remove the cover from the interconnect controller.
5. Unplug the controller-to-PHVAC unit harness.

Interconnect Controller Replacement



1. Cable, Controller-to-PHVAC Unit
2. Harness, Controller-to-Battery
3. Interconnect Controller
4. Controller Posts and Nuts
5. Cable, Battery-to-Controller
6. Harness, Controller-to-PHVAC Unit
7. Fasteners
8. Bracket

Fig. 3, Interconnect Controller Installation (typical)

6. Remove the nuts and washers, and disconnect the battery cables and controller-to-battery harness from the controller posts.
7. Remove the mounting fasteners and remove the controller.
8. Position the new controller and install the mounting fasteners. Tighten 4 to 5 lbf·in (6 to 7 N·cm).
9. Connect the battery cables and controller-to-battery harness to the controller posts, and install the nuts and washers. Tighten 112 lbf·in (1270 N·cm).
10. Connect the controller-to-PHVAC unit harness.
11. Install the controller cover.
12. Connect both sets of batteries.

Operational Checks

Table 1 explains how to check the main components of the system for proper operation.

Operational Checks		
Component	**Function**	**Operational Check**
Evaporator Blower	Draws cab air through the evaporator coils and blows it through the ducting back to the cab. The system is 100% recirculation. There are two air intakes; one on the unit, and one on the front lower panel of the bunk.	Switch the NITE control to position 1; you must feel air coming out of the duct louvers. Then switch the NITE control to position 2; you must feel an increase of the airflow coming out of the duct louvers. NOTE: Make sure nothing blocks the air intake opening (recirculation) on the NITE unit or the bunk.
Condenser Fan	Takes ambient outside air from under the sleeper floor and blows it through the condenser coil to cool it, then exhausts it through the floor outside the vehicle.	With the unit running, go under the sleeper and check that air is flowing into the unit at the intake, and out of the condenser air outlet.
Compressor	Compresses the refrigerant and moves it through the system.	With the compressor running at LOW speed, listen or feel the compressor speed by its sound and vibration. Wait 1 minute. Then set the control to HIGH speed: you must notice a change in the sound and/or vibration of the unit when the compressor speed changes.

Table 1, Operational Checks

Unit Electrical Power Checking

1. Check the NITE unit voltage.
   - 1.1 Locate the power supply cables (red and black cables) close to the unit.
   - 1.2 Check the voltage.

     When the NITE batteries are fully charged, and when the control position is on HIGH, you must read between 12 and 12.5 volts.
2. Check the NITE unit current.
   - 2.1 Switch the NITE unit control to the HIGH position.
   - 2.2 Using a clamp-on inductive ammeter, measure the current on the NITE unit power supply (red) cable. You must read between 27 and 35 Amps.

Air Temperature at the Louvers

Check the louvers temperature: when the NITE unit control is on HIGH position, when the sleeper temperature is between 75 and 80°F (24 and 27°C), and when the outside temperature is between 90 and 95°F (195 and 205°C), measure the temperature directly at one of the duct louvers. You must read between 55 and 62°F (13 and 17°C).

Condenser Outlet Temperature

As described earlier in this document the NITE unit pulls air from outside, under the sleeper floor, to cool down the condenser coil, then the air is rejected to the outside from the sleeper floor too. When the NITE unit is running in HIGH position, go under the sleeper and locate the condenser air outlet (rectangle opening with a screen). The temperature at the condenser outlet must be 10 to 20°F (6 to 12°C) higher than the outside temperature.

Temperature/Amperage Testing

1. Set mode to A/C only.
2. Set the temperature setting to max cold.
3. Place your hand on the sensor so it detects high temperature.

4. Open the vehicle doors and allow the ambient temperature to stabilize on the condenser and unit.
5. Let the unit run about 10 minutes before measuring the temperature and current.

   Table 2 shows temperature and amperage parameters for testing the system.

Separator Electrical Checking, Engine OFF

1. Check for loose electrical connections.
2. Check that the installation is wired according to the electrical diagram. See **Specifications, 400** for wiring diagrams.
3. Check that the 16 gauge ground wire is connected to the bottom blade terminal of the separator on one end, and to a good ground on the other end.
4. Check that the batteries are properly connected.
5. Make sure the battery ground cable is connected to a good ground.
6. Make sure the NITE unit power cables are connected to the correct terminals of the NITE batteries. The red cable goes to the positive terminal; the black cable goes to the ground.
7. Check that the voltage on the vehicle batteries is the same as the voltage at the separator (main batteries side). When checking the voltage on the separator, use the ground terminal on the separator. Both voltage readings should be the same.
8. Check that the voltage on the NITE batteries is the same as the voltage on the separator ("AUX" batteries side). When you check the voltage at the separator, use the ground terminal on the separator. Both voltage readings should be the same (approximately 12 volts).

Separator Electrical Checking, Engine Running

The separator controls the charging of the batteries as follows.

- When the engine is running, the alternator charges the vehicle batteries only, until the vehicle battery voltage reaches 13.2 volts. During this period, the separator is open and the NITE batteries are not being charged.
- When the vehicle batteries reach 13.2 volts, the separator closes, allowing the NITE batteries to charge.

1. With the engine running, check the voltage of the vehicle batteries. It should be higher than the voltage when the engine is OFF, more than 13 volts.
2. Check that the separator is operating properly. When the vehicle battery voltage reaches 13.2 volts, the separator closes, and the system starts charging the NITE batteries. There is an audible “click” when the separator closes.
3. With the engine running, check the voltage of the NITE batteries. It should be higher than the voltage when the engine is OFF, and approximately the same as the vehicle batteries.
4. Verify that the separator is allowing the NITE batteries to charge. Using a clamp-on-type inductive ammeter, on the cable that connects the separator to the NITE batteries positive terminal, measure the amps going to the NITE batteries. It should read more than 0 amps.

Temperature and Amperage Parameters

General Description

The hoods on these vehicles are made of fiberglass, and are manufactured by the SMC process.

SMC, which stands for "sheet molding compound," is a fiberglass and thermosetting polyester material. SMC hoods are easily recognized by their smooth inner surface. To make each part, SMC sheets first are placed between matching mold halves. Then, heat and pressure are applied to the mold in order to cure (solidify) the SMC resin. At the end of the process, an in-mold coating is injected onto the part to prepare it for priming and topcoating.

Hood Mounting and Components

The hood assembly is mounted on two pivot brackets. The brackets are on the outside of the frame rails on older Century Class Conventionals and inside the frame rails on newer Century Class Conventionals and Coronados. The pivot brackets are attached to the front cross-member gusset. The hood pivots work in conjunction with the tilt-assist and tilt-limiting mechanisms to allow a forward hood tilt adequate for vehicle service.

In the operating position, the rear of the hood is supported by hood mounting brackets, which are attached to the cab. The rear brackets hold the hood in the correct position for operation. The hood is held in place with latches, one on each side.

The hood hinge brackets are adjustable forward and backward. The rear hood mounting brackets are adjustable up and down.

The Century Class hood assembly is equipped with a polished and anodized aluminum grille. The grille is attached to the hood with four fasteners. The hood is also equipped with a headlight bucket assembly, that features a headlight and turn signal/parking light combination on each fender.

The Coronado hood assembly is a higher, more classic design with separate, full fenders that are bolted to the sides of the hood. It is equipped with a polished stainless steel grille that attaches to the hood with two fasteners at the top and an isolator which fits into a hole at the bottom. The hood features chrome air scoops and accent lights on both sides, a chrome grille surround, chrome headlight bezels, headlight recesses integral with the fenders, and a hood ornament.

Hood Removal, Installation, and Adjustment

These procedures apply to the following vehicle models, as specified:

- All Century Class Conventionals
- Coronado

The hood pivot assembly is slightly different for each application.

⚠ WARNING

Do not attempt to lift the hood; it weighs about 150 lb (68 kg). Lifting the hood could result in personal injury or damage to the hood assembly and other components.

Removal

1. Drive the vehicle back and forth to settle the frame and suspension. Park the vehicle on a flat, level surface. Shut down the engine, apply the parking brake, and chock the tires.
2. Remove the grille; see **Subject 110**.
3. For Century Class Conventionals, remove the bumper; see **Section 31.03** (aerodynamic bumper), or **Section 31.12** (non-aerodynamic bumper).
4. Place a support between the floor and the front of the hood. The support should be as wide and as long as the front of the hood, and should be at the same height as the lowest edge of the hood in the fully open position. Place cardboard, carpet, rags, or other padding on top of the support to protect the hood.
5. Release the hood latches, and tilt the hood completely open.
6. Disconnect the headlight wiring from both sides of the hood.
7. For Century Class Conventionals built in or after September 2000, and Coronados, remove the torsion bars; see **Subject 120**.
8. Move the hood to a less than full-tilt position to allow slackness in the tilt-limiting straps. Disconnect the straps by removing the fasteners attached to the inside surface of the hood.
9. Tilt the hood fully open, and rest it on the support.
10. For Century Class Conventionals built before September 2000, remove the washers and nuts from the hood hinge shoulder bolts, then use a punch and hammer to tap the shoulder bolts from the hood hinges; see **Fig. 1**.

    For Century Class Conventionals built in or after September 2000, and Coronados, remove the cotter pins and washers from the clevis pins, then use a punch and hammer to tap the clevis pins from the hood hinges. See **Fig. 2** and **Fig. 3** for Century Class Conventionals and **Fig. 4** for Coronados.
11. Carefully roll or slide the hood support away from the vehicle; do not try to lift the hood.

Installation

1. With the tires chocked, place the disconnected electrical wiring onto the front crossmember to avoid problems during hood installation.
2. With the hood in the forward-tilt position and resting on the support at about the same height as the top of the bumper, move the support and hood into alignment with the front of the vehicle. Do not try to lift the hood.
3. For Century Class Conventionals built before September 2000, tap the shoulder bolts into place in the hood hinges, using a rubber hammer, then install the washers and nuts; see **Fig. 1**. Tighten the nuts 26 lbf·ft (35 N·m).

    For Century Class Conventionals built in or after September 2000, and Coronados, tap the clevis pins into place in the hood hinges. Install the washers and new cotter pins. See **Fig. 2** and **Fig. 3** for Century Class Conventionals and **Fig. 4** for Coronados.
4. Lower the hood until it is balanced over the pivots, between the full-tilt and closed positions. Have an assistant hold the hood in this position.
5. Attach the two tilt-limiting straps to the inside surface of the hood.
6. Open the hood to the full-tilt position.
7. For Century Class Conventionals built in or after September 2000, and Coronados, install the torsion bars; see **Subject 120**.
8. Connect the headlight wiring.

Hood Removal, Installation, and Adjustment

2. Hood Hinge Bracket
3. Washer
4. Nut
5. Hood Hinge Bushing
6. Hood

Fig. 1, Hood Installation (Century Class Conventional built before September 2000)

9. For Century Class Conventionals, install the bumper; see **Group 31**.
10. Close and latch the hood.
11. Install the grille; see **Subject 110**.
12. Remove the chocks.

Adjustment

NOTE: If the vehicle has had damage to the chassis, the frame must be straightened before adjusting the hood.

1. Drive the vehicle back and forth to settle the frame and suspension. Park the vehicle on a flat, level surface. Shut down the engine, apply the parking brakes, and chock the tires.
2. Verify that the cab ride height and alignment are correct, as follows.
   - 2.1 Check the cab ride height, and adjust it, if necessary; see **Section 60.01, Subject 100**.
   - 2.2 Inspect the front cab mounts. The outboard edge of the cab mount assembly should be parallel to the grooves inscribed on the top surface of the frame rail bracket, and the same number of grooves should be visible on the bracket on each side of the vehicle; see **Fig. 5**.
3. Check that the hood is straight and aligned with the cab. Check the gap between the hood and the cowl (**Fig. 6**, Ref. A). It should be the same on both sides of the vehicle.
4. If adjustment is necessary, loosen the hood to adjust the alignment, as follows.
   - 4.1 Remove the bumper; see **Section 31.03** (aerodynamic bumper), or **Section 31.12** (non-aerodynamic bumper).

2. Cotter Pin
3. Washers
4. Hood Hinge Bushing
5. Hood Hinge Bracket
6. Hood

Fig. 4, Hood Installation (Coronado)

4.2 Open the hood, and remove the torsion bar assemblies; see **Subject 120**.

4.3 With the help of an assistant, close the hood.

4.4 Loosen the bolts that attach the hood hinge brackets to the front crossmember.

4.5 Move the hood until the hood-to-cowl gap spacing is equal on both sides of the vehicle.

4.6 Tighten the bolts that attach the hood hinge brackets to the front crossmember.

4.7 With the help of an assistant, open the hood.

4.8 Install the torsion bar assemblies; see **Subject 120**.

4.9 Install the bumper; see **Section 31.03** (aerodynamic bumper), or **Section 31.12** (non-aerodynamic bumper).

5. Check the position of the cab-mounted hood rear isolator (**Fig. 7**), as follows.

5.1 Clean the grease from the isolator and hood-mounted rear support.

5.2 Apply large dabs of silicone-based grease to the flat top surfaces on the isolator.

5.3 Close and open the hood.

5.4 Check the grease marks on the hood-mounted rear support to see where the isolator and the hood support meet. The flat spots on the hood-mounted rear support should touch the flat spots on the top surface of the isolator. The rib on the support should align with the groove in the isolator.

6. If necessary, adjust the isolator positioning.

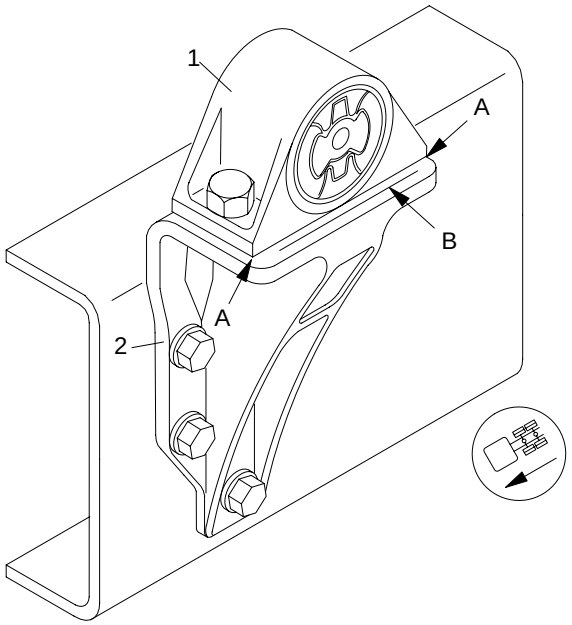
6.1 Loosen the carriage bolts that attach the isolator to the cab.

6.2 Adjust the isolator position.

6.3 Tighten the carriage bolts that attach the isolator to the cab.

7. Spread silicone-based grease on the top surface and notch of the isolator. Wipe off excess grease.

8. Lower the hood and fasten the hood latches.



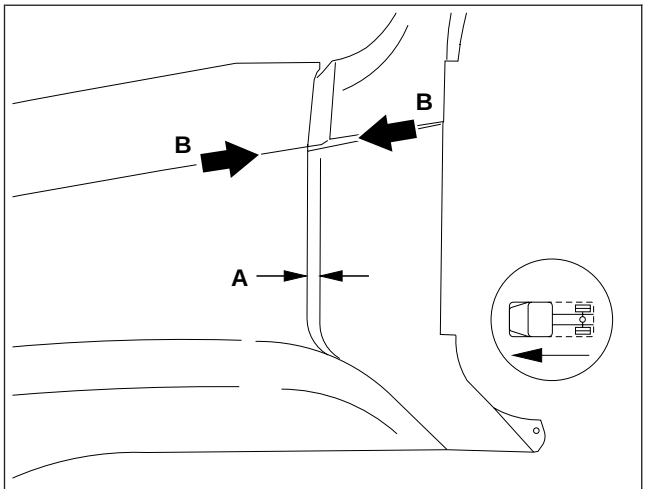
11/09/95 f310504

A. The edge of the cab mount assembly should be parallel to the grooves on the bracket.
B. The same number of grooves should be visible on the bracket on each side of the vehicle.

1. Cab Mount Assembly 2. Frame Rail Bracket

Fig. 5, Forward Cab Mount

9. Check the hood vertical alignment. With the hood closed and latched, inspect the connecting seam in the hood. The seam should align with the bottom edge of the A-pillar cover (**Fig. 6**, Ref. B).
10. If necessary, adjust the vertical alignment of the hood, as follows.
    - 10.1 Open the hood.
    - 10.2 Loosen the carriage bolts on both hood rear isolators enough to allow the isolators to move when a slight force is applied; see **Fig. 7**.
    - 10.3 Raise the isolators to the highest position.
    - 10.4 With the help of an assistant, slowly lower the hood until the seam on the hood aligns with the lower A-pillar cover, then return the hood to the full-open position.
    - 10.5 Tighten the carriage bolts on the isolators.



01/11/2006 f880697

A. The gap between the hood and cowl should be the same on both sides of the vehicle.
B. The seam on the hood and the bottom of the B-pillar cover should line up.

Fig. 7, Hood Rear Isolator (Century Class shown)

- 10.6 Lower the hood and fasten the hood latches.

Hood Removal, Installation, and Adjustment

11. Remove the chocks.

Procedures under these headings apply to the following vehicle models, as specified:

- Century Class Conventional built before November 2003
- Century Class Conventional built in or after November 2003
- Coronado

Century Class Conventional Built Before November 2003

Removal

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.
2. Remove the four fasteners that attach the grille to the hood; see **Fig. 1**. Remove the grille.

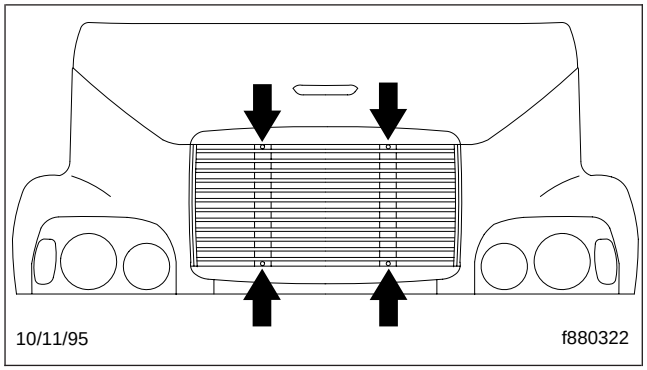

Fig. 1, Location of Grille Fasteners (Century Class Conventional built before November 2003)

Installation

1. With the tires chocked, place the grille on the hood, and line up the fastener holes with the holes on the hood.
2. Install the fasteners into the threaded isolators. Tighten the fasteners 48 lbf·in (540 N·cm).
3. Remove the chocks.

Century Class Conventional Built In or After November 2003

Removal

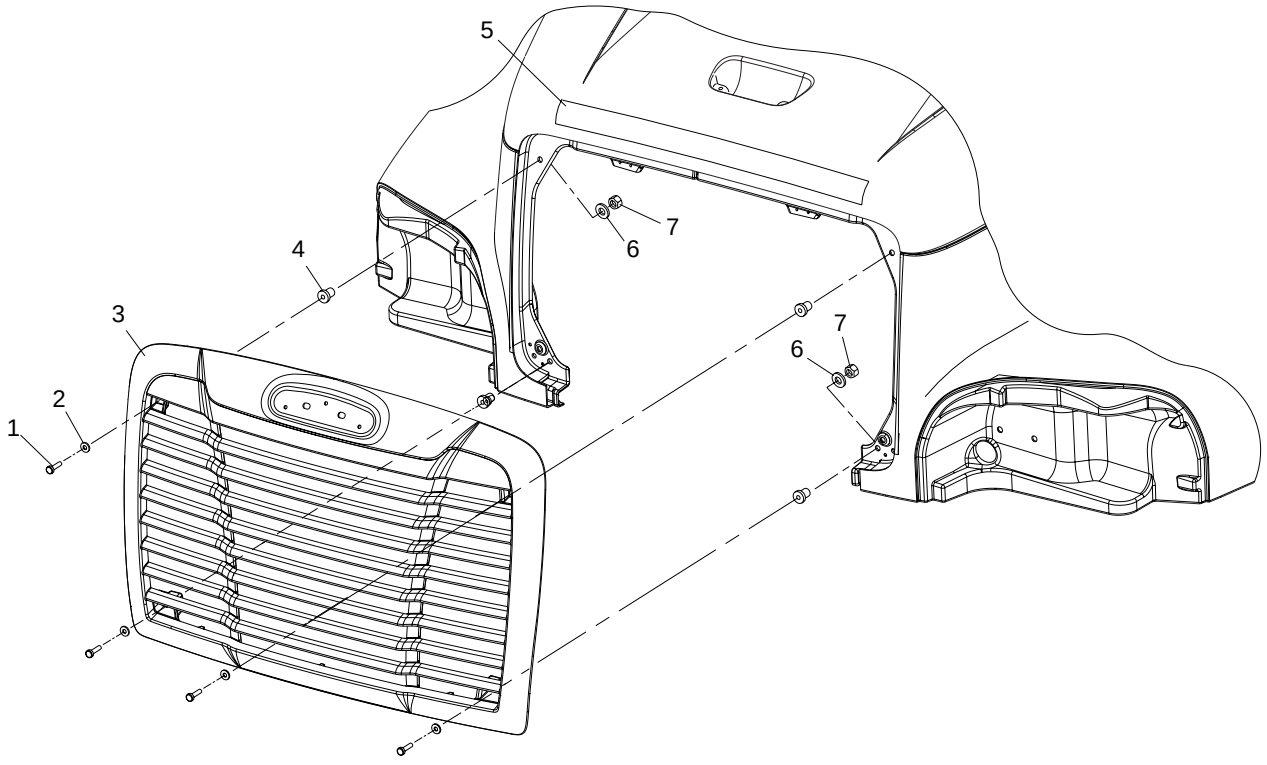
1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.
2. Open the hood. Check the back of the grille. If there are two nuts and washers that attach the grille to the hood, one on the upper right and one on the lower left, remove them. Close the hood.
3. Remove the four screws and washers that attach the grille to the hood; see **Fig. 2**.
4. Lift up on the top lip of the grille to loosen the double-sided tape on the underside, and remove the grille from the hood.
5. Remove any adhesive tape left on the hood surface or the underside of the grille.

Installation

1. With the tires chocked, using soap and water, clean the hood surface area that is covered by the grille, then wipe the surface with a fifty-percent solution of isopropyl alcohol and water.
2. If a new grille is being installed, remove the backing from the adhesive strip on the underside of the new grille.

   If the original grille is being reinstalled, clean and dry the underside surface of the grille and affix a piece of double-sided tape to it.
3. Place the grille in position on the hood, with the grille fastener holes lined up with the holes on the hood; see **Fig. 2**.
4. Install the fasteners into the threaded isolators and tighten them 12 lbf·in (135 N·cm).
5. Install the two nuts and washers, if such were removed, on the back of the grille.
6. Apply firm pressure to the top of the grille over the adhesive strip to ensure good adhesion.
7. Remove the chocks.

Grille Removal and Installation



01/13/2006 f880644

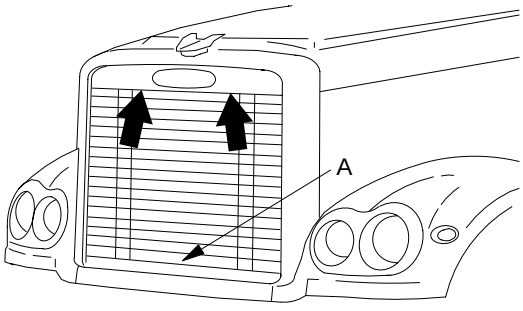
1. Machine Screw
2. Washer
3. Grille
4. Wellnut
5. Adhesive Tape
6. Washer (some installations)
7. Nut (some installations)

Fig. 2, Grille Mounting (Century Class Conventional, built in or after November 2003)

Coronado

Removal

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.
2. Remove the two upper fasteners that hold the grille in place; see **Fig. 3**.
3. With the hood open, push the top of the grille up into the hood while pulling the bottom of the grille forward, to remove the isolator stud from its mount.
4. Pull the grille through the hood opening.



03/05/2002 f880582

A. An isolator stud fits into the hole on the hood hinge here.

Fig. 3, Location of Grille Fasteners (Coronado)

Installation

1. With the tires chocked and the hood open, fit the isolator stud at the bottom of the grille into the hole on the hood hinge, then align the holes at the top of the grille with those in the hood; see **Fig. 3**.
2. Install the fasteners into the threaded isolators. Tighten the fasteners 48 lbf·in (540 N·cm).
3. Close and latch the hood.
4. Remove the chocks.

Hood Torsion Bar Tilt-Assist Mechanism Removal and Installation

Procedures under these headings apply to the following vehicle models, as specified:

- Century Class Conventional built before September 2000
- Century Class Conventional built from September 2000, with an engine manufactured through December 31, 2006
- Century Class Conventional with an EPA07 compliant engine
- Coronado

Century Class Conventional Built Before September 2000

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Remove the grille; see **Subject 110**.
3. Tilt the hood completely open.
4. Remove the four bolts that secure the center bracket; see **Fig. 1**.
5. Rotate the center bracket 180 degrees.
6. Pull the torsion bar free from the center bracket.
7. Rotate the torsion bar, then slide it through and out of the hood-hinge mounting bracket.
8. Repeat the procedure on the opposite side.

Installation

1. With the tires chocked, the hood open, and the center bracket rotated, move the torsion bars into an approximate position.
2. Rotate the center bracket into position, and install the four bolts.
3. Tap each torsion bar on the outer end, until the L-shaped end of the bar is firmly held in position by the center bracket.
4. Close and latch the hood.
5. Install the grille; see **Subject 110**.
6. Remove the chocks.

Century Class Conventional Built From September 2000, with an Engine Manufactured Through December 31, 2006

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Remove the grille; see **Subject 110**.
3. Tilt the hood completely open.
4. Remove the four mounting bolts that attach the torsion bar assemblies to the hood crossbar; see **Fig. 2**.
5. Slide each torsion bar assembly out of the slot in the pivot bracket.

NOTE: If the torsion bars are pushing against the pivot brackets, slightly close the hood to loosen them.

Installation

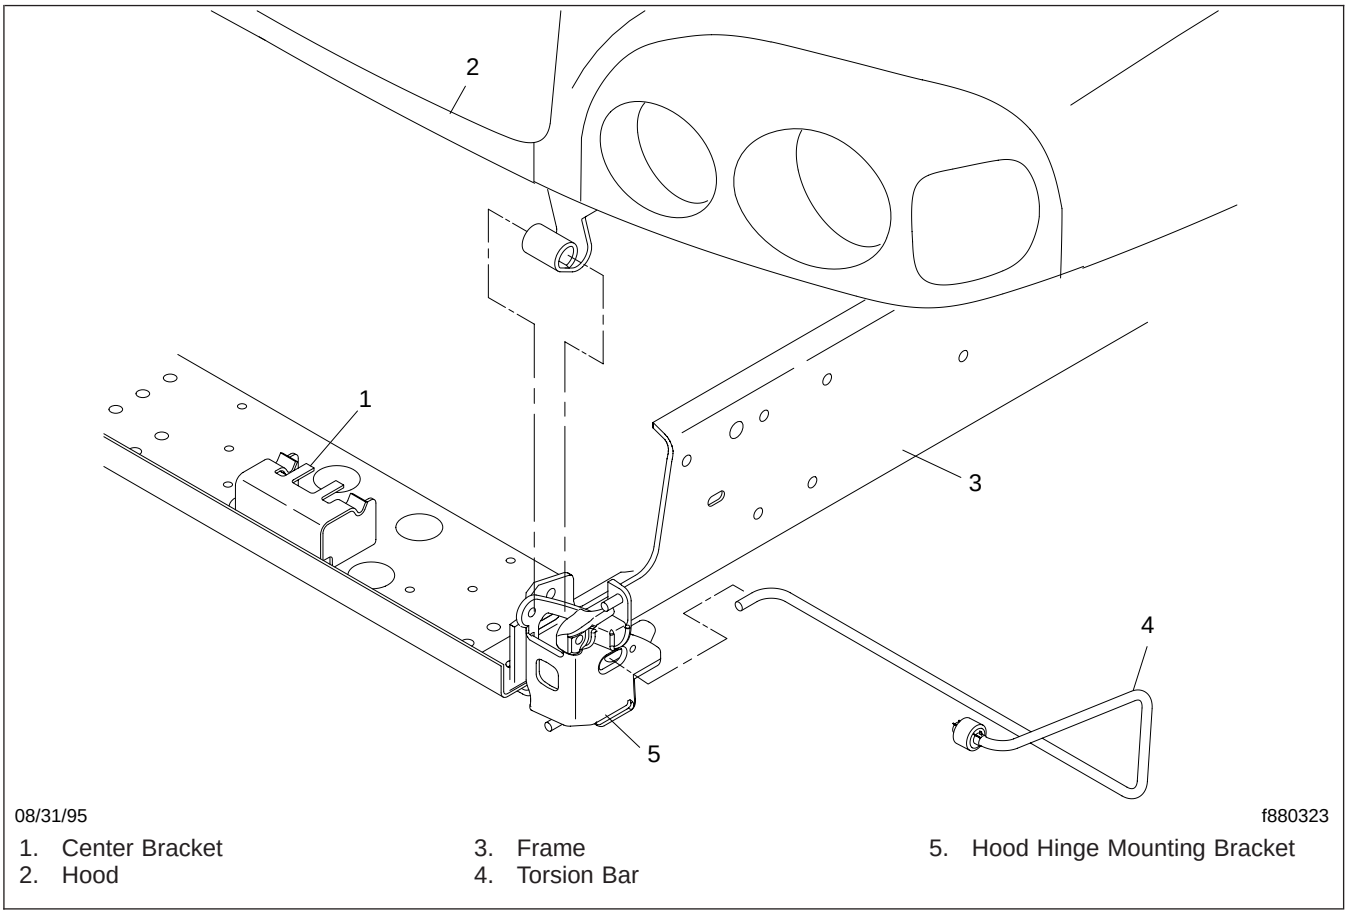
1. With the tires chocked and the hood open, on each side of the vehicle, slide the torsion bar assembly into the slot in the pivot bracket.
2. Install the four bolts that attach the torsion bar assemblies to the hood crossbar; see **Fig. 2**. Tighten the bolts 68 lbf·ft (92 N·m).
3. Close and latch the hood.
4. Install the grille; see **Subject 110**.
5. Remove the chocks.

Century Class Conventional with an EPA07 Compliant Engine

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Remove the grille; see **Subject 110** .
3. Tilt the hood completely open.

Hood Torsion Bar Tilt-Assist Mechanism Removal and Installation



1. Center Bracket
2. Hood
3. Frame
4. Torsion Bar
5. Hood Hinge Mounting Bracket

Fig. 1, Torsion Bar Tilt-Assist Mechanism (Century Class Conventional built before September 2000)

4. Remove the fasteners that attach the torsion bars to the pivot-end clamps/hood hinges; see **Fig. 3**.
5. Slide each torsion bar, first out of the pivot-end clamp, then out of the slot in the pivot bracket.

NOTE: If the torsion bars are pushing against the pivot brackets, slightly close the hood to loosen them.

Installation

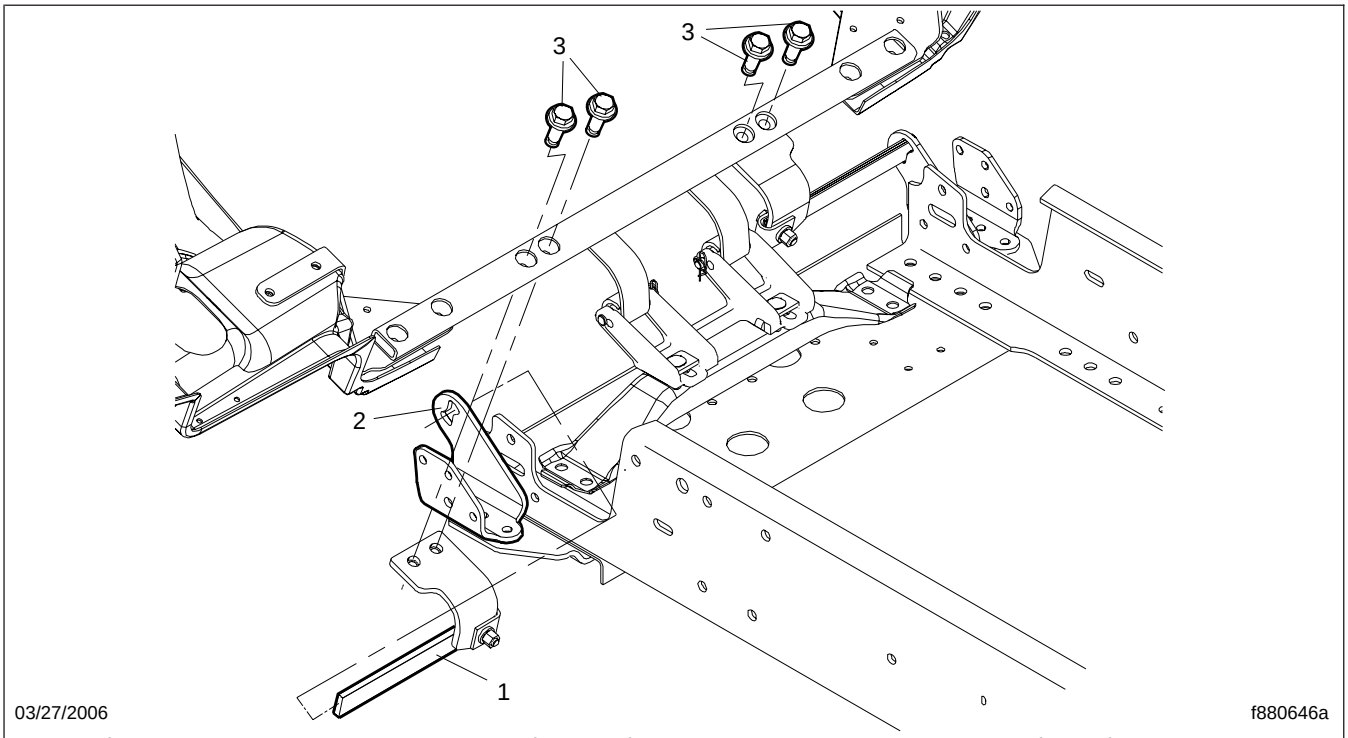
1. With the tires chocked and the hood open, on each side of the vehicle, slide the torsion bars into the slot in the pivot bracket, and then into the pivot-end clamp.
2. Install the fasteners that attach the torsion bars to the pivot-end clamps/hood hinges; see **Fig. 3**.
3. Close and latch the hood.
4. Install the grille; see **Subject 110**.
5. Remove the chocks.

Coronado

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Remove the grille; see **Subject 110**.
3. Tilt the hood completely open.
4. On one side of the vehicle, remove the fasteners that hold the inboard end of the torsion bar, the bearing block, and the pivot end to the hood pivot assembly; see **Fig. 4**.

Hood Torsion Bar Tilt-Assist Mechanism Removal and Installation



1. Torsion Bar
2. Pivot Bracket
3. Mounting Bolt

Fig. 2, Hood Tilt-Assist Assembly (Century Class Conventional Built From September 2000, with an Engine Manufactured Through December 31, 2006)

5. Repeat the procedure on the other side of the vehicle.
6. On one side of the vehicle, remove the fasteners that hold the outboard end of the torsion bar to the actuator.
7. Repeat the procedure on the other side of the vehicle.
8. Remove the torsion bars.
9. If replacing the pivot ends, remove the shoulder bolts that hold them in place.

Installation

1. With the tires chocked and the hood open, install the pivot ends (if they were removed). Tighten the 3/8–16 nut on the shoulder bolt 28 lbf·ft (38 N·m).
2. Attach the outboard ends of the torsion bars to the actuators.
3. Open the hood to the full-tilt position.
4. On one side of the vehicle, attach the inboard end of the torsion bar and the bearing block to the hood-pivot assembly. Tighten the fasteners 91 lbf·ft (123 N·m). Repeat on the other side of the vehicle.
5. Close and latch the hood.
6. Install the grille; see **Subject 110**.
7. Remove the chocks.

Hood Torsion Bar Tilt-Assist Mechanism Removal and Installation

Hood Repair Safety Precautions

Precautions

Before performing any fiberglass repairs, read the following precautions. Observe any additional precautions given by the manufacturers of the repair materials used.

1. All of the raw materials used in repairing fiberglass are harmful to the eyes and could cause blindness. Wear goggles or other protective eye shields to reduce the chances of splash contacting your eyes.
2. Wear protective gloves, as some people may have skin sensitivity to resin. Also, don't allow the hardener to contact your skin. The hardener can be a skin irritant.

IMPORTANT: In case the hardener or resin contacts your skin, wash with soap and water. If the hardener or resin should contact your eyes, rinse with plenty of water (15 minutes), and call a doctor.

3. When working with fiberglass materials, wear old clothing, since the resin may damage garment material. Wash the clothing before wearing again.
4. Most of the liquids involved in fiberglass repair and cleanup (especially when using acetone as a solvent) are flammable; some are also toxic. Don't perform repairs in areas where exposed (or stored) flammable liquids may contact an open flame or any burning material, such as a cigarette. Don't perform repairs in areas that are not well-ventilated.

⚠ WARNING

WARNING: Do fiberglass repairs in a safe workshop area to prevent severe personal injury due to explosion of flammable liquids or breathing of toxic fumes.

5. Do not use electric tools when the fumes of flammable solvents are present. The heat or sparks generated by the tools could create a fire hazard.
6. When grinding or sanding fiberglass surfaces, wear goggles or other protective eye shields, and also an air purifying respirator, either a throwaway type or one with a replaceable particulate filter(s). Don't breath grinding dust or particles, otherwise irritation may occur. Also, during grinding and sanding operations, wear a disposable (paper) shop coat to keep dust and fiber slivers off your clothing.
7. Because fiberglass dust can shorten the life of electrical units, air-powered tools are preferred (for frequent use).
8. Unless fiberglass repairs are done on a regular (daily) basis, don't save leftover liquids. If liquids must be saved, store them in cool, dark areas, away from direct sunlight.

General Information

If a joint between two parts has separated and there is no damage at the joint area, the parts can be rebonded. Or, if a part is damaged and the adjoining parts are not damaged, the damaged part can be separated from the hood and new or used parts can be bonded in place. A section of a part can be replaced as long as the section does not include a joint between two parts. Fenders and headlight reinforcements are available as replacement parts or for use in section replacements. If the damage is such that the parts cannot be replaced, or a section replacement cannot be done, replace the entire hood assembly.

For minor surface cracks (cracks that do not go through the laminate) see *Surface Damage Repair*.

For cracks that go through the laminate, or large damaged areas, see *Structural Damage Repair*.

For section replacement or to rebond parts see *Hood Component Rebonding*.

Before performing any fiberglass repairs, read the precautions listed in **Subject 130**. Observe any additional precautions given by the manufacturers of the repair materials used.

Surface Damage Repair

Surface damage refers to scratches, chips, or nicks on the outer surface of the hood. Use the following instructions to repair surface damage:

1. Inspect the damaged area. If the cracks go all the way through the hood see *Structural Damage Repair* for instructions.
2. Clean the area with 3M™ General Purpose Adhesive Cleaner. Inspect the area closely.
3. Using 220-grit or finer sandpaper, remove all of the paint around the damaged area to a distance of about 1-1/2 inches (4 cm).
4. Clean the area with dry compressed shop air.
5. Apply 3M Automix 08275 (400 ml syringe) or 08266 (600 ml syringe) adhesive and spread a thin layer using a squeegee applicator. Cover the entire damaged area, overlapping onto the painted surface. Leave a crowned excess of adhesive, slightly higher than the painted surface.

NOTE: When dispensing 3M Automix two-part adhesives, the first few inches to come from the cartridge will be discolored; discard this adhesive. Continue to dispense the adhesive, producing a continuous bead of uniform size and uniform color.

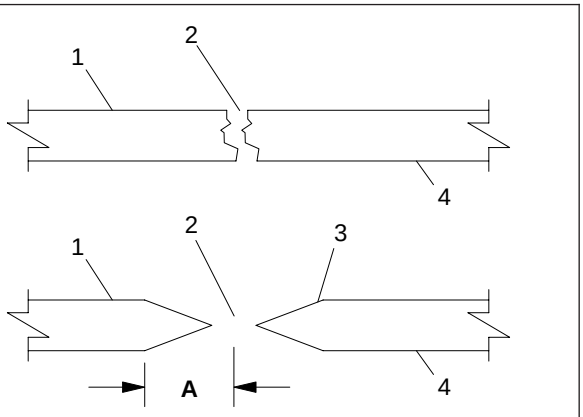
6. After the adhesive dries (about 35 minutes), sand it with a hand-held disc pad. Use 320-grit or finer sandpaper. Feather the edges of the fill so there are no visible sharp edges.
7. Clean the area with dry compressed shop air. Mask the area, then spot prime and paint it. Primer can be applied immediately after sanding.

Structural Damage Repair

Structural damage refers to any type of damage, from hairline cracks to large fractures or punctures that penetrate through the laminate and affect the structural soundness of the damaged part. For large damaged areas it may be easier to replace the panel. In such cases see *Hood Component Rebonding*.

1. If a sound-absorbent liner is present on the underside of the damaged area, remove the panel(s) to provide an adequate working area.
2. Clean both sides of the damaged area with 3M General Purpose Adhesive Cleaner. Inspect the area closely; all dirt, water, grease, and oils must be removed.
3. Inspect the area to determine the extent of the damage by pushing on the surfaces immediately surrounding and underneath the damaged area. All ragged edges, cracks, and unsound fragments will need to be removed. Using a marking pen, mark a circle on both sides of the hood, 3 to 4 inches around the damaged area.
4. Using a grinder on both sides of the hood, grind through the hood at the point of damage, and taper out to the marked circle. In some cases it will be necessary to greatly enlarge the hole in order to grind back to sound material. See **Fig. 1**.
5. Using dry compressed shop air, blow off the area and inspect for any remaining cracks. If cracks still exist, grind the area tapering out towards sound material.

Repair of SMC Hoods



03/31/2003 f880640

A. Grind a recess one-half the depth of the laminate and extending 3 to 4 inches outward in all directions from the damaged area.

1. Laminate
2. Crack
3. Taper
4. Engine Side of Hood

Fig. 1, Tapered Hole

6. Sand the surface of the tapered area around the hole, using a DA sander with 80-grit or less sandpaper, to even out the tapers and leave a rough bonding surface.
7. Clean the sanded areas using dry compressed shop air and wipe the area with a clean cloth.
8. Cut a series of patches for the underside of the hood out of fiberglass mat. The first patch should be about 2-inches larger than the hole, but still able to fit in the sanded area. Cut additional sections from the mat, cutting each section progressively smaller.
9. On the outside of the hood, tape over the damaged area using aluminum panel repair tape.
10. Apply 3M Automix 08277 adhesive to the underside of the area to be repaired.

NOTE: When dispensing 3M Automix 08277 adhesive, the first few inches to come from the cartridge will be discolored. Discard this adhesive. Continue to dispense the adhesive until a continuous bead of uniform size and color is produced.

11. Use a plastic squeegee applicator to spread a thin layer of the 3M Automix 08277 adhesive over the damaged area.
12. Lay the largest piece of fiberglass matting on a piece of clean cardboard and work a generous amount of 3M Automix 08277 adhesive into the matting. On the underside of the hood, center the matting over the repair area, and apply the adhesive-embedded matting over the work area, working out any air bubbles.
13. Apply adhesive to the next smaller section of fiberglass matting using the same technique as the larger piece.
14. Apply the next smaller section of fiberglass matting to the larger piece, again working out any air bubbles.
15. Add a final thin layer of adhesive to the embedded sections of matting until the damaged area is even with the surrounding surfaces. The adhesive should be hard enough in 50 minutes to allow sanding.
16. Remove the tape backing from the outside surface.
17. Re-wipe the outside surface of the repair area with 3M General Purpose Adhesive Cleaner.
18. Using a DA sander with 80-grit sandpaper, sand the adhesive on the outside of the hood.
19. Clean the sanded area using dry compressed air, and wipe with a clean cloth.
20. Use a plastic squeegee applicator to spread a thin layer of the adhesive over the scuffed area.
21. Add a generous amount of 3M Automix 08275 adhesive over the entire repair area, building it up slightly above the level of the hood panel surface.
22. Allow the hood to dry for 30 minutes before sanding.
23. After the adhesive dries, sand the repaired area to a smooth flat surface. Prime and paint the surfaces on both sides of the hood.

Hood Component Rebonding

1. If rebonding a joint that has separated, or if replacing a damaged part, completely separate each part, using a heat gun and putty knife. Remove all of the old adhesive. The heat gun will soften the adhesive and allow it to be peeled from the fiberglass.

2. Clean the surfaces to be bonded with 3M General Purpose Adhesive Cleaner. Inspect the area closely to be sure all of the old adhesive, dirt, water, grease, and oils are removed.
3. Scuff the surfaces with 80- to 220-grit sandpaper.
4. Before applying adhesive, test fit the parts by clamping the replacement part in position. Remove the replacement part for application of the adhesive.
5. Select a 3M Automix adhesive based on the desired working time, and apply the adhesive to the areas to be bonded. See **Table 1** for open times.

NOTE: Open time is affected by temperature only. The open time is cut in half for every 20°F over 72°F (6°C over 22°C). The time doubles for every 20°F below 72°F (6°C below 22°C). The adhesive is not recommended for use when the temperature is less than 62°F (16°C).

6. Clamp the parts together and remove any excess adhesive that squeezes out.

NOTE: When clamping parts together there should be a gap between parts for the adhesive to bond properly. The gap should be about the spacing of a paper clip. If necessary, cut a paper clip in half and place the paper clip sections at two places along the bond seam to act as spacers.

7. Let the adhesive dry for 5 times the specified open time. For example, if using 3M Automix 08277 adhesive: open time X 5 = drying time; so 10 minutes open time is 50 minutes drying time.

3M™ Part Number	Syringe Size	Open Time	Use
08270	400 ml	1.5 min.	Minor crack repair and small part replacement
08271	400 ml	3.5 min.	Inner hood structure replacement
08267	600 ml	3.5 min.	Inner hood structure replacement
08277	400 ml	10.0 min.	Inside crack repair (self leveling)
08272	400 ml	10.0 min.	Fender replacement
08268	600 ml	10.0 min.	Fender replacement
08273	400 ml	35.0 min.	Large part replacement
08269	600 ml	35.0 min.	Large part replacement
08275	400 ml	10.0 min.	Permanent adhesive (not for removable sections)

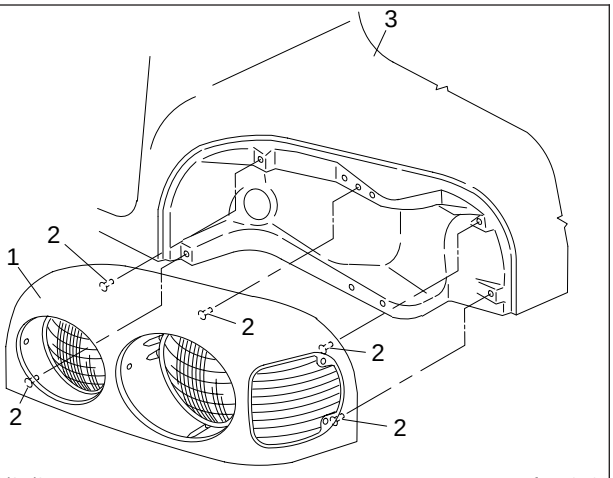
Table 1, Adhesive Open Times

Headlight Bucket Assembly Removal and Installation

NOTE: This procedure applies only to the Century Class Conventionals.

Removal

1. Tilt the hood fully open.
2. Disconnect the headlight wiring connectors from the hood.
3. Remove the five screws and nuts that attach the headlight bucket assembly to the hood. See **Fig. 1**.



1. Headlight Bucket Assembly
2. Screw
3. Hood

Fig. 1, Headlight Bucket Assembly-to-Hood Attachment

4. Remove the headlight bucket assembly from the hood.

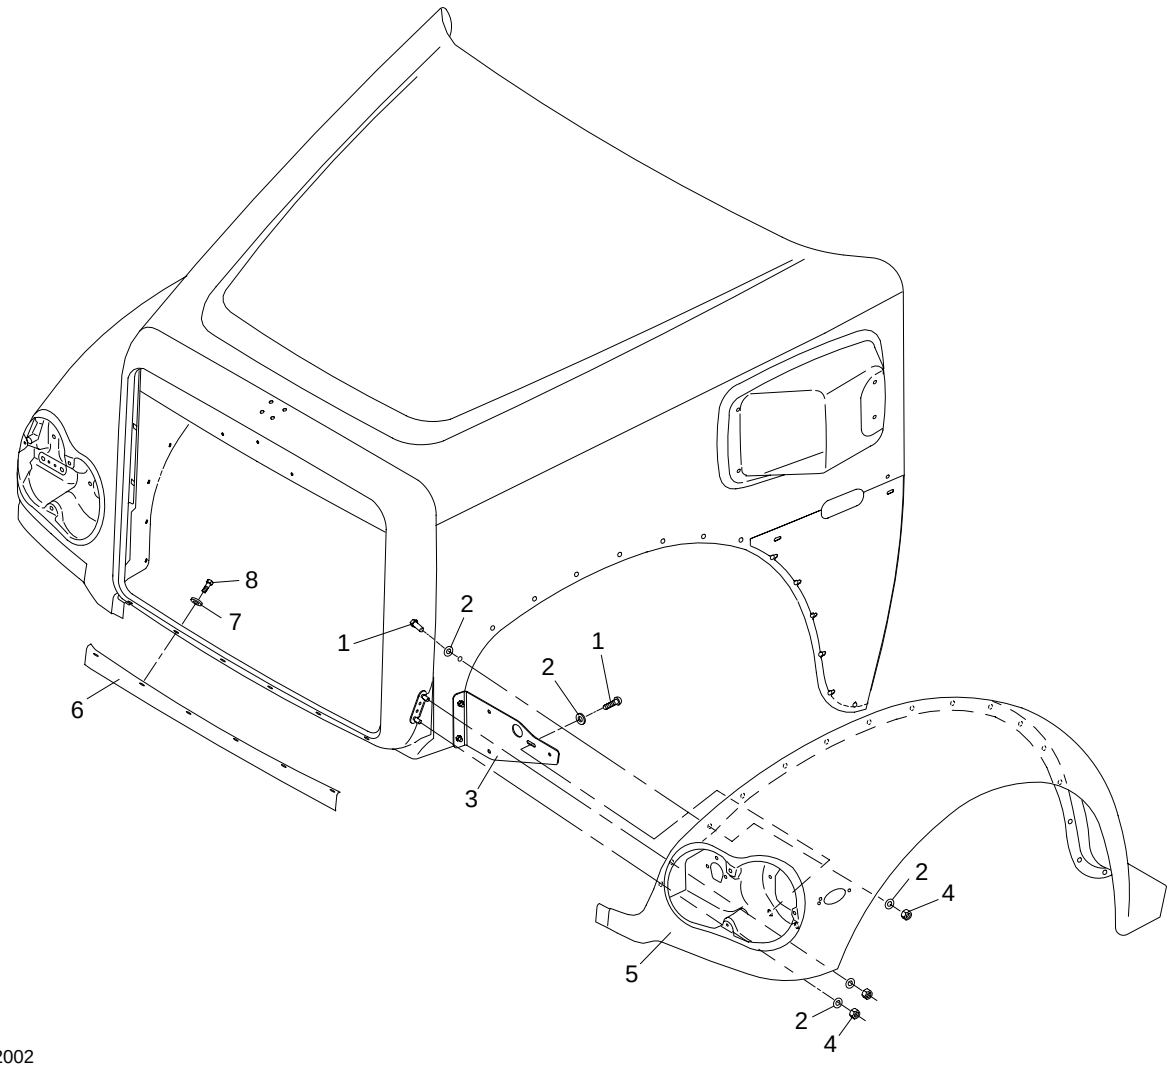
Installation

1. Install the headlight bucket assembly on the hood.
2. Tighten the five screws and nuts until snug.
3. Connect the headlight wiring connectors.
4. Return the hood to the operating position.

Coronado Fender Replacement

Replacement

NOTE: See **Fig. 1** for this procedure.



1. Torx-Head Screw
2. Washer
3. Headlight Support Bracket
4. Hexnut
5. Fender
6. Bottom Panel
7. Flatwasher
8. Hexbolt

Fig. 1, Fender Installation, Coronado

1. Park the vehicle on a level surface, shut down the engine, set the parking brake, and chock the tires.
2. Remove the grille. For instructions, see **Subject 110**.
3. Tilt the hood.
4. Remove the extreme outboard bottom fastener for the grille surround. This also holds the bottom inboard fender tab in place.
5. Remove the headlight bezel.
6. Disconnect the headlight and turn-signal wiring.

Coronado Fender Replacement

7. Remove the rubber splash shield from the back of the headlight assembly.
8. Remove the headlight and turn-signal assemblies from the fender.
9. Remove all the fasteners holding the fender to the hood, except for the nuts on the two studs at the inboard edge of the headlight assembly recess and those holding the fender to the headlight support bracket.

IMPORTANT: The hexbolts are different lengths. Mark the location of the longer hexbolts before removing them. They are used to attach the wiring brackets to the hood.

10. Close the hood.
11. Remove the nuts and washers from the two studs at the inboard edge of the headlight assembly recess.
12. Remove the two outboard fasteners holding the fender to the headlight support bracket.
13. Remove the fender from the vehicle.
14. With the hood lowered, and using an assistant, put the fender in place. Make sure the inboard lower tab on the fender fits under the grille surround.
15. Install the one rear fender fastener, bolt head inboard.
16. Install the two hexnuts on the studs at the inboard side of the headlight recess. Tighten them firmly.
17. Tilt the hood and install the remaining fasteners.

    Install the fasteners, bolt heads outboard, in an alternate pattern, starting at the center and working your way outward on both sides. Make sure the longer fasteners are used for the wiring brackets.

    Tighten the fasteners 26 lbf·ft (35 N·m).
18. Install the headlight and turn signal assemblies, and connect the wiring.
19. Install the rubber splash shield onto the rear side of the headlight recess.
20. Install the two fasteners that attach the fender to the headlight support bracket.
21. Install the headlight bezel.
22. Install the grille. For instructions, see **Subject 110**.
23. Close the hood and secure the hood latches.
24. Remove the chocks from the tires.

Repair Tools, Materials (SMC Hood)

SURFACE DAMAGE

Required tools and materials:

- Xylene, acetone, or equivalent solvent
- 220 or finer grit sandpaper
- 320 or finer grit sandpaper
- Hand-held disc pad
- Self-leveling adhesive [1]
- Applicator squeegee
- Primer [2]

STRUCTURAL DAMAGE

Section Replacement (Punctures and Large Fractures)

Required tools and materials:

- Scrap SMC from a damaged hood
- Xylene, acetone, or equivalent solvent
- Saber saw
- Router bit
- Razor-blade knife
- Woven fiberglass cloth
- Clamps
- 80 to 220 grit sandpaper
- 220 or finer grit sandpaper
- 320 or finer grit sandpaper
- Hand-held disc pad
- Adhesive for bonding strips (if needed) [3]
- Self-leveling adhesive [1]
- Applicator squeegee
- Primer [2]

Crack or Small Hole

Required tools and materials:

- Xylene, acetone, or equivalent solvent
- 1/8-inch diameter drill bit
- Router bit
- Razor-blade knife
- Woven fiberglass cloth
- 80 to 220 grit sandpaper
- 220 or finer grit sandpaper
- 320 or finer grit sandpaper
- Hand-held disc pad
- Self-leveling adhesive [1]
- Applicator squeegee
- Primer [2]

HOOD COMPONENT REBONDING

Required tools and materials:

- Solvent [4]
- 80 to 220 grit sandpaper
- Clamps, clamping bolts with washers
- 0.030" (0.76 mm) diameter glass beads
- Adhesive [3]
- Primer [2]
- Heat gun
- Putty knife, hacksaw blade

[1] Use Ashland Pliogrip 7775L self-leveling urethane adhesive. 7775L has no sag resistance and, therefore, is useful for filling cracks and channels, and for bonding glass-fiber reinforcing fabrics. Ashland products are available through Freightliner dealers. See **Table 2** and **Table 3**.

[2] Use Sherwin Williams BB–11 black conductive primer. Contact your local Sherwin Williams automotive paint distributor to purchase this primer.

[3] Ashland Pliogrip 7773 or 7779 adhesives are recommended for this application, but 7771 and 7770 may be substituted. A heat gun may be used to speed curing times. Ashland products are available through Freightliner dealers. See **Table 2**.

[4] Use Ashland 6036 primer or methylene chloride. Contact Ashland Merchandising Group, telephone (419) 289–9588, to purchase this primer.

Specifications

NOTE: Ashland Pliogrip 7700 and 8000 Series adhesives and accessories are available through Freightliner dealers and PDCs. The 7700 Series adhesives are two-part urethane adhesives, specially formulated and packaged for repair of hoods and other fiber-reinforced plastics. Adhesive 7775L is a self-leveling mixture that is appropriate when a surface filler or glass fabric reinforcement repair is required. The 8000 Series adhesives are also two-part urethane adhesives, available for those who prefer to use these earlier-generation adhesives. Descriptions, working times, and curing times (sanding and repainting) for the various adhesives are shown below in **Table 2** and **Table 4**.

Ashland adhesive accessories are listed in **Table 3** and **Table 5**.

NOTE: All of the adhesives develop the same bonding strength; specific adhesives may be preferred to change working times.

NOTE: All working and curing times correspond to an ambient temperature of 73°F (23°C) in the workplace; humidity level will NOT affect working or curing times.

IMPORTANT: While a heat gun may be used to speed adhesive curing time, do not overheat the adhesive. The maximum allowable temperature is 180°F (82°C).

Table 5, 8000 Series Accessories

General Description

The Twinflow midship-mounted fire pump is a centrifugal pumping system designed to deliver large volumes of water under pressure. See **Fig. 1**.

Generally, the pump consists of the following major components:

- cast-iron pump body
- bronze impeller(s) and a stainless steel shaft
- pump gear box
- priming system
- pressure control device
- valves

There are numerous other components, such as the AutoLube and the mechanical seal.

Pump type is determined by the number of impellers on a common shaft. The impeller, which is mounted on a shaft rotated by the vehicle's engine via the driveline, provides velocity to the water causing it to build enough pressure and volume to be used for firefighting applications. See **Fig. 2**.

Bearings support and align the impeller shaft and other components. The bearings must be maintained on a scheduled basis.

The pump body is split horizontally in two sections for the ease of removal of the impeller assembly, including the bearings and the clearance rings.

The pump gear box and the impeller assembly are removable from the bottom of the vehicle in order to avoid interference with the pump plumbing and control mechanisms.

The pump has two large suction inlets, one on each side of the vehicle, though other inlets may be present. The inlets and the internal pump outlets are on opposite sides of the pump to balance forces caused by the intake and the discharge of water.

The AutoLube is built into the pump assembly to continuously force oil to the impeller shaft bushing to lubricate and cool the impeller bushing.

Principles of Operation

A centrifugal pump such as the Twinflow fire pump operates on the principle wherein centrifugal force is created by a rapidly spinning disk, or impeller. Water is routed to the center of the impeller, which throws the water outward from the center of the impeller. When water is confined in a closed container, in this instance, the pump body, the water pressure increases. The pressure level depends on how fast the impeller is rotating.

Water enters the spinning impeller at the intake and is confined by shrouds and vanes in the impeller, which, in turn, builds pressure.

The vanes guide the water away from the inlet to the discharge to reduce the water's turbulence and to move the water toward the outer edge of the impeller.

The shrouds serve as the sides of the impeller and confine the water to the centrifugal acceleration.

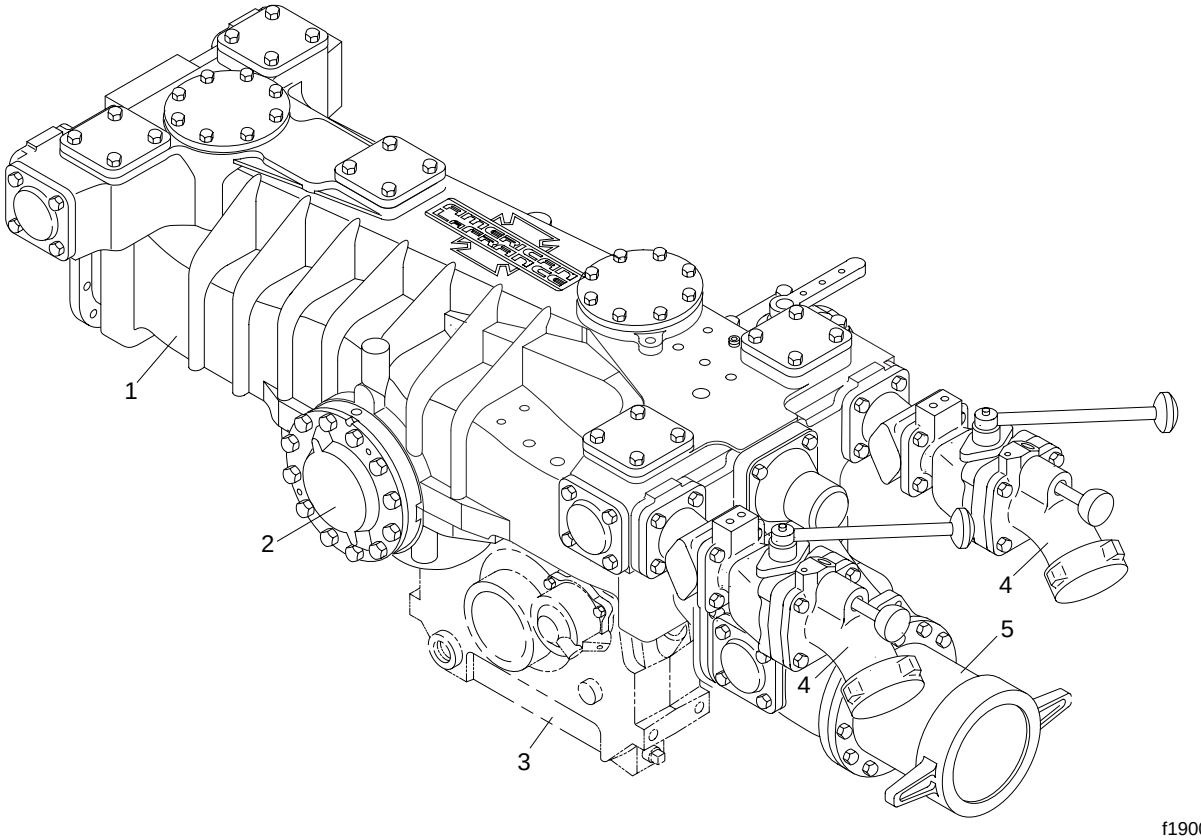
Single-stage pumps provide the same operating and rating-test pressures as a two-stage pump, but the two-stage pump offers additional operating (water) pressure.

The primary difference between a single-stage and a two-stage pump is that the single-stage has only one impeller and no transfer valve to switch between volume and pressure operation. A transfer valve is a two-position valve that permits the impellers in a two-stage pump to operate in parallel (volume) or series (pressure).

In two-stage pumps, the volume operation results in the pressure at the pump intake being added to the equal pressure developed by the impellers, and the amount of water sent to the discharge being the sum of the flows of the two impellers. The pressure operation features the impellers operating in series, or the output of the primary impeller supplied from the pump intake is supplied to the input of the secondary impeller. Thus, the pressure at the pump discharge is the sum of the pressures of the two impellers plus the pressure at the intake. The flow is then half of the volume operation.

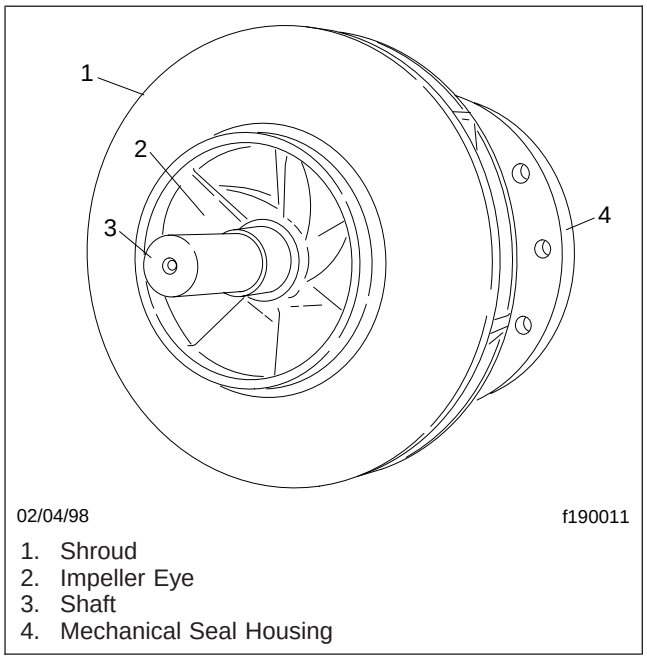
In both types of pumps, the pressurized water is prevented from returning to the intake of the impeller(s) by clearance rings. Centrifugal pumps have clearance rings mounted between the spinning impeller and the pump body. Clearance rings and the hubs of the impeller(s) will, over time, become worn or pitted and may need to be replaced or machined to a smaller diameter.

General Information



1. Pump Body
2. AutoLube
3. Gear Box
4. Discharge
5. Intake

Fig. 1, Twinflow Fire Pump (single-stage shown)



1. Shroud
2. Impeller Eye
3. Shaft
4. Mechanical Seal Housing

Fig. 2, Twinflow Fire Pump Gear Box

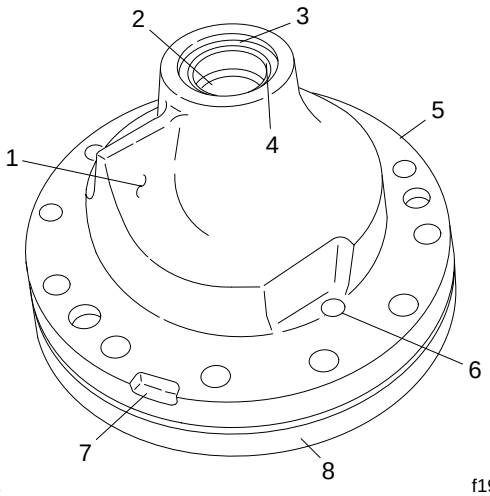
Replacement

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Drain the water from the pump.
3. Remove the fill and drain plugs from the AutoLube reservoir and drain the oil.
4. Use a center punch to mark the AutoLube cover and the front bearing housing for proper alignment during assembly.

⚠ CAUTION

Do not use a chisel to separate the AutoLube from the pump body because the mating surfaces may be scratched or gouged, which could result in a leak. The AutoLube is manufactured from cast metal and if it becomes necessary to pry the AutoLube apart from the pump body, pry between the AutoLube and the pump body or at the AutoLube notches.

5. Remove the 1/2–13 x 2 capscrews attaching the AutoLube to the pump body and gently pry the AutoLube from the pump body and impeller shaft.
6. Place the AutoLube face down on a work bench and remove the two 3/8–16 x 3/4 allen-head capscrews from the impeller side. Separate the two halves and remove the diaphragm.
7. Remove the seal lock ring.
8. Remove the oil seal from the inner half of the AutoLube.
9. Check the impeller shaft bushing for wear.
10. Clean the inner and outer halves of the AutoLube.
11. Clean the gasket surfaces of the AutoLube and the pump body.
12. Check for restrictions in the water passages to the rear half of the AutoLube.
13. If it is necessary to replace the impeller shaft bushing, press the bushing from the inner side of the inner half of the AutoLube (on the side opposite of the impeller). Install the bushing from the impeller side of the inner half of the AutoLube. See **Fig. 1**.



1. Cut Water
2. Bushing
3. Lock Ring
4. Seal
5. Front Bearing Housing
6. Water Passage
7. Pry Notches
8. AutoLube Cover

Fig. 1, Impeller Shaft Bushing

⚠ CAUTION

The impeller shaft bushing seats against a shoulder in the inner half of the AutoLube and can only be removed and installed as described or the AutoLube may be damaged.

14. Install the new oil seal in the inner half of the AutoLube.
15. Install the seal lock ring.
16. Position the diaphragm on the inner half of the AutoLube.
17. Line up the marks and place the outer half of the AutoLube onto the inner half. Apply Loctite® 242 to the two 3/8–16 x 3/4 allen-head capscrews. Tighten 30 lbf·ft (41 N·m).
18. Install the new gasket on the AutoLube and position the assembly (with the top up) onto the impeller shaft. Attach the AutoLube with 1/2–13 x 2 capscrews and tighten 80 lbf·ft (108 N·m).

AutoLube Seal Replacement

CAUTION

Do not damage the oil seal. A damaged oil seal could result in damage to the AutoLube assembly as well as the pump.

19. To fill the AutoLube with 90w oil, pump the oil in from the bottom plug opening until the oil spills from the top opening. This eliminates air pockets and false readings.

CAUTION

Purge the air from the AutoLube while filling it with oil or a "false-fill" situation will develop, which could cause damage to the AutoLube and other components.

20. Add water to the pump.
21. Operate the fire pump and check the AutoLube for water or oil leaks.
22. Remove the tire chocks.

Fire Pump Gearbox Removal, Disassembly, Assembly, and Installation

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Drain the water from the pump.
3. Drain the gearbox lubricant to prevent contamination.
4. Disconnect the pressure lubrication line to the gearbox cover. Keep the line primed with lubricant.
5. Disconnect the drive shafts from the gearbox.
6. Disconnect the electrical switches and the air lines. Mark the switches and air lines for assembly.
7. Disconnect the pump gearbox cooling lines.

⚠ WARNING

The gearbox is heavy. Support the gearbox with a lifting or supporting device while removing it from the pump body. Failure to do so could result in the gearbox falling, which could result in personal injury or property damage.

NOTE: Before removing the gearbox, use a center punch to mark the rear bearing housing, the mechanical seal housing, the oil pump cover, and the pump body to ensure proper alignment during reassembly.

8. Support the gearbox with an appropriate device.
9. Remove the six 1/2–13 x 1-3/4 capscrews that attach the gearbox cover to the top of the gearbox.
10. Remove the 7/16–14 x 1-1/4 capscrews that attach the gearbox to the rear bearing housing.
11. Lower the gearbox. Be sure to balance the gearbox so that it does not tip from the lowering device. See **Fig. 1**.
12. Remove the gearbox cover.

NOTE: The threaded holes may need to be cleaned.

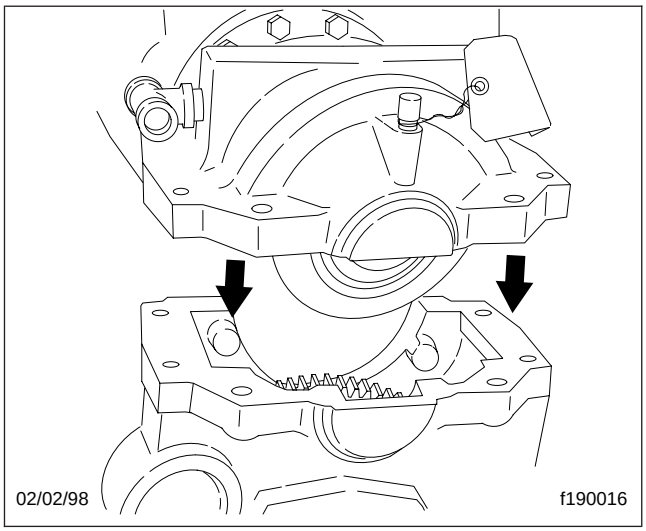


Fig. 1, Lowering the Fire Pump Gearbox

Disassembly

1. Remove and disassemble the intermediate shaft assembly.
   - 1.1 Disconnect the oil suction line from the lubrication pump.
   - 1.2 Remove the capscrews attaching the front bearing housing to the lubrication pump. Then remove the housing and pump assembly.

   NOTE: The rear bearing housing has threaded holes for 1/4–20 jackscrews to assist in removal.

   - 1.3 Remove the capscrews attaching the rear bearing housing to the lubrication pump.
   - 1.4 Reach into the top of the gearbox housing and remove the intermediate gear and shaft assembly. The bearing inner cups are pressed onto the shaft, so care must be taken not to damage the cups during removal.
   - 1.5 Using a bearing splitter, clamp the halves of the splitter onto the back edge of the intermediate shaft bearing cup. Attach a crossbar puller to the bearing splitter halves and remove the cup. Care must be taken when removing the cup not to damage the lubrication pump spline in the cen-

Fire Pump Gearbox Removal, Disassembly, Assembly, and Installation

ter of the intermediate shaft. Repeat the procedure for the opposite side bearing cup.

1.6 Using a gear puller with reversed jaws, remove the intermediate shaft bearing cone from the intermediate shaft rear cover.

⚠ CAUTION

Lubrication pump impeller vanes are fragile and may break or chip. Impeller vanes are installed only one way. If removal of the vanes is necessary, note the installation direction of the vanes (rounded edge). Failure to install the vanes properly will result in pump gearbox failure.

1.7 When disassembling the lubrication pump, be sure to note the number of gaskets and shims that are under the cover. Set these components aside for reassembly.

1.8 Using a centerpunch, mark the lubrication pump position and remove the six 1/4–20 x 5/8 capscrews.

1.9 Remove the lubrication pump cover.

1.10 Remove the lubrication pump impeller and the shaft, being careful not to damage the impeller vanes.

1.11 Using a gear puller with reversed jaws, remove the intermediate shaft bearing cone from the intermediate shaft front cover. Care must be taken when removing the cup so as not to damage the lubrication pump spline in the center of the intermediate shaft cover.

2. Remove and disassemble the output shaft assembly.

2.1 Remove the manual shift eye from the rear of the shift yoke shaft.

2.2 Remove the detent allen-head screw, spring and detent ball from the top of the output shaft housing.

2.3 Remove the shift and interlock switches on the output shaft housing.

2.4 Remove the 7/16–14 x 2-1/4 capscrews retaining the output shaft and the housing to the gearbox housing. Carefully remove the output shaft housing by sliding the housing from the shift yoke shaft.

2.5 Remove the input shaft pilot bearing from the output shaft.

2.6 Remove the 3/4–10 x 1-1/2 capscrew retaining the rear driveline yoke to the output shaft and remove the yoke.

2.7 Remove the output shaft seal.

2.8 Remove the output shaft by sliding it from the output shaft housing from the rear to the front. Use caution when sliding the output shaft through the bearing cones and spacer(s).

⚠ CAUTION

Bearing cups, cones, and spacers are factory preset for end play and are only provided as a matched set. It is important that bearing cups, bearing cones, and spacers, when removed, be kept together in matched sets. Input and output shaft bearing and spacer sets are different. Failure to keep matched sets together or to not use factory preset and matched bearing and spacer sets will void warranty and may result in gearbox failure.

2.9 Remove the inner and outer bearing cones.

2.10 Using a brass drift, carefully drive out the outer bearing cup from the inside out. Remove the internal retaining ring and then the spacer(s).

2.11 Using a brass drift, carefully drive out the inner bearing cup from the outside in.

2.12 Remove the shaft seal from the output shaft housing.

3. Remove and disassemble the input shaft assembly.

3.1 Remove the three 5/16–18 x 1 capscrews from the shift cylinder and carefully slide the shift cylinder from the piston.

3.2 Remove the nut and then remove the piston from the shift shaft. Remove the seal ring from the piston.

Fire Pump Gearbox Removal, Disassembly, Assembly, and Installation

⚠ CAUTION

Do not remove the piston from the shift yoke shaft unless it is damaged and replacement is mandatory. When installing a new piston, replace the locknut and tighten snugly, but do not overtighten as the nut can become distorted, which can cause shift failures.

3.3 Remove the shift shaft, the shift fork, and the shift ring assembly from the gearbox. Make sure the shift ring does not get dropped or damaged.

3.4 Note the location and orientation of the shift fork on the shaft, then remove the 3/8–16 x 1-1/4 screw from the shift fork and remove the fork from the shift shaft.

3.5 Remove the shift shaft support block. Then remove the seal from the support block.

NOTE: One ear of the shift yoke is machined and will fit one way. Make a note of the location of the machined ear when removing the shift yoke.

3.6 Remove the 3/4–10 x 1-1/2 capscrew attaching the front driveline yoke to the input shaft. Remove the yoke.

3.7 Remove the input shaft by sliding the input shaft from the output shaft housing opening at the rear of the gearbox. Use caution when sliding the input shaft through the bearing cones, the thrustwasher, and the drive gear. Place wooden blocks to support the drive gear and to protect the windage tray, and force the shaft loose.

⚠ CAUTION

Bearing cups, cones, and spacers are factory preset for end play and are only provided as a matched set. It is important that bearing cups, bearing cones, and spacers, when removed, be kept together in matched sets. Input and output shaft bearing and spacer sets are different. Failure to keep matched sets together or to not use factory preset and matched bearing and spacer sets will void warranty and may result in gearbox failure.

There are two bearings of different widths supporting the drive gear on the input shaft. It is important that these bearings be installed in the drive gear in the proper location. Note the location of the bearings when removed. Failure to install the bearings properly can result in gearbox failure.

3.8 Reaching through the top of the gearbox housing, carefully remove the drive gear, the inner bearing cone, and thrustwasher. Remove the drive gear bearings.

3.9 Using a magnet, remove the positioning pins from the windage tray. Then remove the windage tray and the positioning springs.

3.10 Remove the input shaft seal.

3.11 Remove the outer bearing cone.

3.12 Using a brass drift, carefully drive out the outer bearing cup from the inside out. Remove the internal retaining ring and the spacer(s).

3.13 Using a brass drift, carefully drive out the inner bearing cup from the outside in.

4. Inspect the cooling tube for damage and leaks.
5. Remove the gearbox lubrication oil filter from the suction inlet on the gearbox housing.
6. Clean and inspect each component of the gearbox assembly. Inspect the bearing cups and the cones for wear, pitting, and damage. Inspect the gear tooth surfaces for wear damage and pitting. Inspect the shift shaft block for wear. Inspect the gasket surfaces for nicks and gouges. Replace all components that are worn, damaged, or pitted.

Assembly

1. Install a new transmission lubrication oil filter.
2. Assemble and install the input shaft assembly.

⚠ CAUTION

Bearing cups, cones, and spacers are factory preset for end play and are only provided as a matched set. It is important that bearing cups, bearing cones, and spacers, when removed, be

Fire Pump Gearbox Removal, Disassembly, Assembly, and Installation

kept together in matched sets. Input and output shaft bearing and spacer sets are different. Failure to keep matched sets together or to not use factory preset and matched bearing and spacer sets will void warranty and may result in transmission failure.

2.1 Using a brass drift or a bearing cup installation tool, install the inner bearing cup from the inside out. Then install the spacer(s) and insert the retaining ring.

2.2 Using a brass drift or a bearing cup installation tool, install the outer bearing cup from the outside in.

2.3 Coat the outer bearing cone with oil. Install the outer bearing cone.

2.4 Install the input shaft seal.

2.5 Install the windage tray positioning springs and windage tray. While holding the windage tray in place against the positioning springs, install the windage tray positioning pins.

⚠ CAUTION

There are two bearings of different widths supporting the drive gear on the input shaft. It is important that these bearings be installed in the drive gear in the proper location. The location of the bearings should have been noted when removed from the assembly. Make sure that the lubrication holes are aligned in the center of the larger bearing. Failure to install the bearings properly may result in transmission failure.

2.6 Coat the new drive bearings with oil and install in the drive gear.

2.7 Coat the inner bearing cone with oil and install. Then install the thrustwasher.

2.8 Reaching through the top of the transmission housing, install the drive gear into position against the thrustwasher, being careful not to dislodge the windage tray.

2.9 Slide the input shaft through the output shaft housing opening at the rear of the transmission through the drive gear, the thrustwasher, and the bearing cones and spacer(s).

2.10 Install the front driveline yoke on the input shaft, being careful to not damage the input shaft seal. Apply Loctite® 242 to the 3/4–10 x 1-1/2 yoke retaining capscrew. Then install the capscrew and washer and tighten 225 lbf·ft (305 N·m).

NOTE: Apply a coat of Loctite® to all screws prior to reassembly.

NOTE: One ear of the shift yoke is machined and it will only fit one way. Make sure the yoke is oriented on the shaft in the position noted during disassembly.

2.11 Make sure the shift fork is properly aligned (the machined side should be toward the threaded end of the shift shaft) and slide the new shift fork on the shift shaft. Align the shift fork with the groove in the shaft and secure the shift fork in place with a 3/8–16 x 1-1/4 screw. Tighten the screw 33 lbf·ft (45 N·m).

2.12 Install a new seal on the shift shaft support block. Install a new gasket on the shift shaft support block. Install the shift shaft support block and gasket in the gearbox using two 1/4–20 x 5/8 capscrews. Tighten the capscrews 96 lbf·in (1085 N·cm).

2.13 Place the shift ring into the shift fork grooves. While holding the shift ring in place, insert the shift shaft into the gearbox through the bushing. Make sure the teeth on the shift shaft ring line up with the teeth on the input shaft and gear.

2.14 Apply a light coating of grease to the new seal ring, then install the seal ring on the shift piston. Install the piston on the shift shaft end.

⚠ CAUTION

When installing the piston, use a new locknut and tighten snugly but do not overtighten. Overtightening the locknut may distort the piston and cause shift failures.

2.15 Secure the piston in place with a new locknut.

2.16 Apply a light coating of grease to the shift cylinder seal and install the seal in the groove on the shift cylinder.

2.17 Install the shift cylinder using three 5/16–18 x 1 screws. Tighten the screws 17 lbf·ft (23 N·m).

3. Assemble and install the output shaft assembly.

3.1 Install a new shift shaft seal in the output shaft housing.

⚠ CAUTION

Bearing cups, cones, and spacers are factory preset for end play and are only provided as a matched set. It is important that bearing cups, bearing cones, and spacers, when removed, be kept together in matched sets. Input and output shaft bearing and spacer sets are different. Failure to keep matched sets together or to not use factory preset and matched bearing and spacer sets will void warranty and may result in transmission failure.

3.2 Using a brass drift or a bearing cup installation tool, install the inner bearing cup from the inside out. Install the spacer(s). Then install the retaining ring.

3.3 Using a brass drift or a bearing cup installation tool, install the outer bearing cup from the outside in.

3.4 Coat the outer bearing cone with oil and then install it.

3.5 Install the output shaft seal.

3.6 Apply a coating of oil to the inner bearing cone and install.

3.7 Apply a coating of oil to the input shaft pilot bearing and then install the bearing into the output shaft.

3.8 Install the output shaft by sliding the shaft in through the output shaft housing from the front to the rear. Be careful when sliding the output shaft through the bearing cones and spacer(s).

3.9 Install the rear driveline yoke on the output shaft, taking care not to damage the output shaft seal. Apply Loctite® 242 to the 3/4–10 x 1-1/2 capscrew. Then install the capscrew and washer and tighten 225 lbf·ft (305 N·m).

3.10 Install a new gasket onto the output shaft housing.

3.11 Apply Loctite® 242 to the two 7/16–14 x 2-1/4 and the four 7/16–14 x 1-3/4 capscrews. Then install the output shaft and housing, sliding the housing onto the shift yoke shaft. Install and tighten the 2-1/4-inch capscrews 50 lbf·ft (68 N·m) and the 1-3/4-inch capscrews 53 lbf·ft (72 N·m).

3.12 Install the shift and interlock switches on the output shaft housing.

3.13 Apply Loctite® 242 to the detent allen-head screw and install the detent ball, spring, and allen-head screw.

3.14 Install the manual shift eye from the rear of the shift yoke shaft.

3.15 Rotate the input shaft to check for proper movement.

4. Assemble and install the intermediate shaft assembly.

4.1 Press a new bearing cone into the intermediate shaft rear cover, coat the cone with oil and install a new cover seal.

4.2 Press a new bearing cone into the intermediate shaft front cover, coat the cone with oil and install a new cover seal.

⚠ CAUTION

Lubrication pump impeller vanes are fragile and may break or chip. Impeller vanes are installed only one way. If removal of the vanes is necessary, note the installation of the vanes. Failure to install the vanes properly will result in transmission failure.

IMPORTANT: To ensure proper operation of the oil pump, use the same number of gaskets and shims that were removed when the oil pump was disassembled.

4.3 Install the lubrication pump impeller assembly, vanes, and shaft into the front cover aligning the matchmarks. Apply Loctite® 242 to the six 1/4–20 x 5/8 capscrews and tighten 8 lbf·ft (11 N·m).

Fire Pump Gearbox Removal, Disassembly, Assembly, and Installation

4.4 Press the new bearing cups onto the intermediate shaft, one on each side of the intermediate gear.

4.5 Reaching through the top of the transmission housing, install the intermediate gear and shaft assembly taking care not to damage the bearing cups.

4.6 Holding the intermediate gear assembly in place, install the rear intermediate shaft cover. Apply Loctite® 242 to the three 7/16–14 x 1-1/4 capscrews and install but do not torque.

4.7 Install the front intermediate shaft cover, aligning the lubrication pump shaft spline with the intermediate shaft spline. Apply Loctite® 242 to the three 7/16–14 x 1-1/4 capscrews and tighten all six capscrews 53 lbf·ft (72 N·m).

4.8 Connect the oil suction line to the lubrication pump.

4.9 Rotate the input shaft and manually shift the transmission to check for proper movement and operation.

Installation

1. Install a new gasket on the seating surface of the rear bearing housing.

⚠ CAUTION

Properly align the rear bearing housing. If the rear bearing housing is not aligned with the matchmarks, the gear tooth mesh could be incorrect and may result in damage to the gearbox.

2. Using a lifting device, lift the gearbox into position (around the rear bearing housing). Apply Loctite® 242 to the six 1/2–13 x 1-3/4 capscrews and attach the gearbox cover to the gearbox. Tighten finger-tight, but do not torque.
3. Apply Loctite® 242 to the twelve 7/16–14 x 1-1/4 capscrews and insert the capscrews through the rear bearing housing cover and gasket into the gearbox. Tighten 53 lbf·ft (72 N·m).
4. Tighten the six 1/2–13 x 1-3/4 capscrews 65 lbf·ft (88 N·m).
5. Connect the pump gearbox cooling lines.
6. Connect the air lines and electrical switches.
7. Connect the drive shafts. Tighten the yoke fasteners 225 lbf·ft (305 N·m) and tighten the bearing retaining strap capscrews 40 to 48 lbf·ft (54 to 65 N·m).
8. Connect the lubrication line to the gearbox cover.
9. Fill the gearbox with the necessary lubricant.
10. Operate the pump and check for leaks. Verify the oil pressure at 25 to 35 psi (172 to 241 kPa) at the oil injection point.
11. Remove the chocks from the front and rear tires.

Replacement

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Drain the water from the pump.

⚠ WARNING

The gearbox assembly is heavy. Support the lower gearbox assembly with a lifting device. Failure to do so could result in the assembly falling, which could result in personal injury or property damage.

3. Remove the gearbox. See **Subject 110** for information.
4. Remove the 5/8–11 x 1-1/4 capscrew and bearing retaining washer from the end of the impeller shaft.
5. Remove the twelve 1/2–13 x 1-3/4 capscrews that attach the rear bearing housing to the pump body.
6. Install two 1/2–13 x 3 jackscrews into the 1/2–13 threaded holes provided in the rear bearing housing. See **Fig. 1**.
7. Use a centerpunch to mark the rear bearing housing, the mechanical seal housing, and the pump body so that the components are properly aligned during assembly.
8. Turn the two jack screws evenly, clockwise, to push the rear bearing housing from the impeller shaft and pump body.

NOTE: To prevent damage to components as the rear bearing housing is pushed from the impeller shaft, place your hands under the gear opening to catch the gear, key, and bearings.

NOTE: It may be necessary to use pry bars to gently assist in removing the inner bearings and gear.

9. Remove the jack bolts.
10. Remove the slinger from the impeller shaft.
11. Remove the four 7/16–14 x 1-1/4 capscrews from the mechanical seal cover. See **Fig. 2**. Use a center punch to mark the seal cover for proper alignment during installation.
12. Use pry bars if necessary in the provided slots to loosen the mechanical seal cover from the impeller shaft and the pump body.
13. Remove the old mechanical seal, being careful not to damage the impeller shaft. Use two small hook-tools positioned about 180 degrees apart to pull the mechanical seal from the seal cavity if necessary.
14. Clean the seal cavity and the impeller shaft.
15. Inspect the retaining ring on the shaft.
16. Remove the burrs at the gear key slot and the bearing lands, and remove the oil seal in the rear bearing housing. See **Fig. 3**.

IMPORTANT: Always replace the entire mechanical seal with a new Twinflow mechanical seal assembly.

⚠ CAUTION

When installing a new mechanical seal do not touch the sealing surface of the carbon seal ring or the metal seat while handling or installing. Oil and grease can damage the bellows of the mechanical seal. Use only a soap-and-water solution to lubricate the mechanical seal.

17. Clean the housing and the impeller shaft, and lubricate the impeller shaft and the new mechanical seal with a soap-and-water solution.
18. Install the new mechanical seal bellows over the end of the impeller shaft with the spring oriented toward the impeller. Using a soft pusher tube and keeping your fingers away from the carbon seal, carefully push the mechanical seal assembly into the mechanical seal cavity. If binding occurs, apply more soap-and-water solution to the impeller shaft and the bellows.
19. Install the steel cup and seat it into the mechanical seal cover. Lubricate with a soap-and-water solution.
20. Remove and replace the seal rings in the mechanical seal cover. Apply the soap-and-water solution to the seal rings and then slide over the

28. Drive Unit Oil Seal

Fig. 1, Impeller Shaft Assembly (exploded view)

end of the impeller shaft. Make sure the mechanical seal remains seated in the bore of the cover.

21. Insert the mechanical seal cover into the mechanical seal cavity aligning it with the bolt holes and the orientation marks.
22. Insert the bolts in the mechanical seal housing to prevent the housing from rotating.
23. Install the four 7/16–14 x 1-1/4 capscrews. Tighten 53 lbf·ft (72 N·m).
24. Install the new slinger onto the impeller shaft. Then remove the retaining bolts.
25. Install the new gasket and oil seal in the rear bearing housing. Slide the housing and front bearing onto the rear impeller shaft. The bearing is a press-fit onto the impeller shaft and slip-fit in the housing.

IMPORTANT: Do not allow the weight of the rear bearing housing to rest on the oil seal.

26. Insert the gear through the opening in the housing and align it with the impeller shaft. Slide the

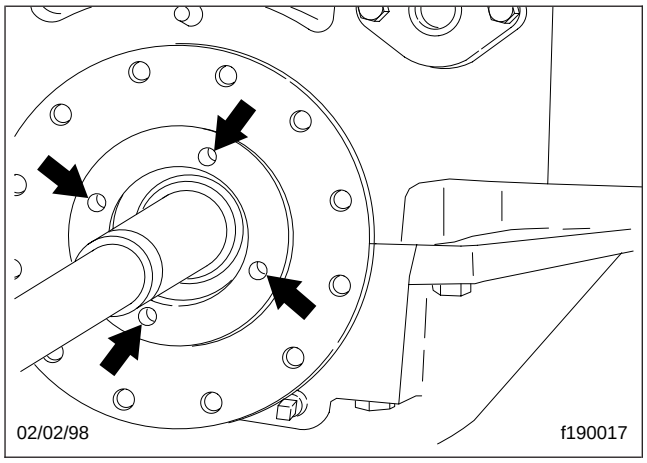

Fig. 2, Remove Four Capscrews

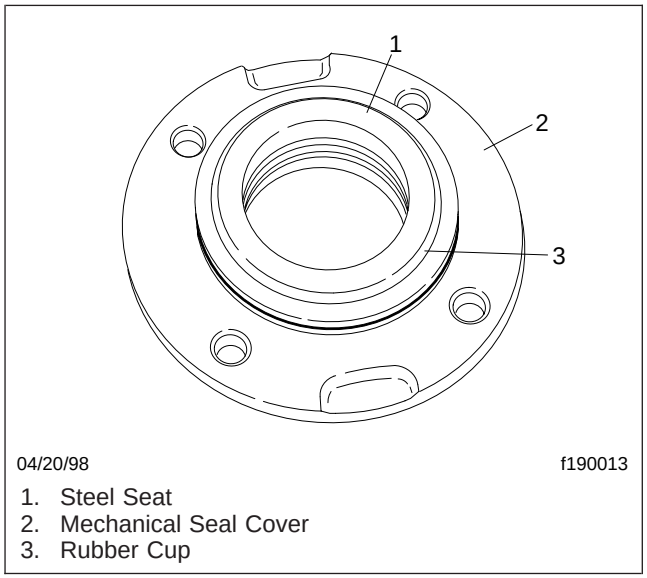

1. Steel Seat
2. Mechanical Seal Cover
3. Rubber Cup

Fig. 3, Mechanical Seal Assembly

housing, front bearing and gear onto the shaft. The front bearing will stop when the inner race contacts the seat on the impeller shaft.

27. Line up the keyway in the gear and install the key into the keyway.
28. Slide one of the two rear bearings onto the impeller shaft and into the housing. The rear bearings are a press-fit onto the shaft and a slip-fit in the housing.
29. Using a series of different length capscrews, install the rear bearing housing to the pump body. When it is possible, install the four capscrews (approximately 90 degrees apart). These bolts, in combination with the rear bearing, will center the housing. Double check to be sure the housing is centered and will clear the mechanical seal assembly.
30. Install the pusher bolt in the rear of the impeller shaft. Tighten the nut on the pusher bolt while holding the pusher bolt, pushing the rear bearing into the housing. Remove the pusher bolt and install the second of the two rear bearings. Then install the pusher bolt and tighten the nut while holding the pusher bolt to install the bearing.
31. Continue to tighten the nut on the pusher bolt while making sure the housing is aligned and centered. Once the pusher bolt is snug, the rear housing assembly, the gear, and the bearings should be in place. Remove the pusher bolt and rotate the impeller assembly by placing a large screwdriver between the housing and the gear. The impeller assembly should rotate.

NOTE: A new impeller will have some resistance when the impeller shaft is rotated.

32. Apply Loctite® 242 to the 5/8–11 x 1-1/4 bearing retainer capscrew. Install and tighten 80 lbf·ft (108 N·m).
33. Apply Loctite® 242 to the twelve 1/2–13 x 1-3/4 capscrews, install and tighten 80 lbf·ft (108 N·m).
34. Install the gearbox. See **Subject 110** for information.
35. Perform the annual service test on the pump. Check for leaks. Verify the oil pressure at 25 to 35 psi (172 to 241 kPa) at the oil injection point.
36. Remove the chocks from the front and rear tires.

Removal

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Drain the water from the pump.

⚠ WARNING

The gearbox assembly is heavy. Support the lower gearbox assembly with a lifting device. Failure to do so could result in the assembly falling, which could result in personal injury or property damage.

3. Remove the gearbox. See **Subject 110** for information.

⚠ WARNING

The lower pump body is heavy. Support the lower pump body and impeller assembly with a lifting device. Failure to do so could result in the lower pump body and impeller assembly falling, which could result in personal injury or property damage.

4. Remove the drain lines from the lower pump body. See **Fig. 1**.
5. Drain the oil from the AutoLube and remove the 1/2–13 x 2 capscrews from the upper half of the AutoLube and pump body.
6. Remove the 7/16–14 x 1-1/2 capscrews from the upper half of the rear bearing housing and pump body.
7. Remove the 1/2–13 x 1-1/4 capscrews from the lower pump body.

⚠ WARNING

Do not remove the four capscrews, one in each corner of the lower pump body, until the lifting device is in position. Failure to do so could result in the lower pump body and impeller assembly falling, which could result in personal injury or property damage.

8. Position the lifting device into place with the lower pump body lifting adapter between the lifting device and the lower pump body.
9. Remove the 5/8–11 x 5 capscrews in each corner of the lower pump body.
10. Lower the lower pump body and impeller assembly. Be sure to balance the assembly so that it does not tip from the lifting device.
11. Remove the remaining capscrews from the lower half of the AutoLube, the rear bearing housing, and the lower pump body.

⚠ WARNING

The impeller assembly is heavy. Do not attempt to lift the assembly without the aid of another person or persons, or a lifting device. Failure to do so could result in the impeller assembly falling, which could result in personal injury or property damage.

12. Remove the remaining screws from the rear bearing housing and then from the lower pump body.
13. Lift the impeller assembly from the lower pump housing. See **Fig. 2**. Set the assembly aside.
14. Clean all gasket surfaces of the upper and lower pump bodies, as well as those on the AutoLube and the rear bearing housing face.
15. Clean the clearance ring and clearance ring seats in both the upper and lower pump body halves to remove all the buildup material so that the new clearance ring will seat properly.

NOTE: Pitting of the clearance rings may occur from the buildup material and the effects of corrosion. Once the seats are cleaned, any pitting on the clearance rings is considered normal.

Installation

1. Install the pump body gaskets to the lower pump body, trimming as necessary to fit.

⚠ CAUTION

Failure to line up the clearance ring lock notches with the pump body tabs (as described in the next step) may result in pinched clearance rings, which could result in pump damage and pump failure.

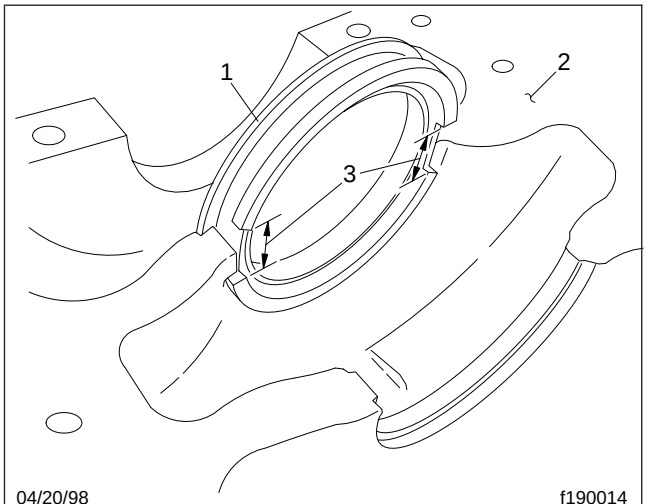
3. Lower Pump Housing
4. Cut Water

Fig. 2, Lifting the Impeller Assembly from the Lower Pump Housing

2. Install the impeller assembly into the lower pump housing carefully aligning the clearance ring lock-notch with the clearance ring lock tabs in the lower pump body. Then rotate the clearance rings to one side to open up lock notches to line up with the lock tabs in the upper pump body. See **Fig. 3**.
3. Install the 1/2–13 x 1-3/4 capscrews through the rear bearing housing and the mechanical seal housing. Do not tighten.
4. Make sure the dowel pins are in the upper pump body to assist in aligning the lower pump body with the upper pump body.
5. Using a lifting device, slowly raise the lower pump body and the impeller assembly into place, making sure that the lower pump body aligns with the dowel pins and the clearance ring notches align with the clearance ring lock tabs in the upper pump body.
6. Rotate the impeller and check for freedom of movement when the lower pump body and the impeller assembly is in place.



1. Clearance Ring
2. Lower Pump Housing
3. Clearance Ring Notch

Fig. 3, Clearance Ring Mounted in Pump Housing

7. Apply Loctite® 242 and install the four 5/8–11 x 5 capscrews (one at each corner of the lower pump body). Tighten snug but do not fully torque.
8. Install the 1/2–13 x 1-3/4 screws in the rear bearing housing and mechanical seal housing. Tighten 53 lbf·ft (72 N·m).
9. Remove the lifting device.
10. Apply Loctite® 242 to the 1/2–13 x 1-3/4 lower pump body capscrews and install them. Tighten snug but do not torque.
11. Torque the 5/8–11 x 5 capscrews 150 lbf·ft (203 N·m) then, starting from the center and moving outward, tighten the lower pump body capscrews 65 lbf·ft (88 N·m).
12. Install the AutoLube. See **Subject 100** for instructions.
13. Install the gearbox. See **Subject 110** for instructions.
14. Operate the pump and check for leaks. Verify the oil pressure at 25 to 35 psi (172 to 241 kPa) at the oil injection point.
15. Remove the chocks.

Single-Stage Pump

Disassembly

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Remove the AutoLube. See **Subject 100** for instructions.
3. Remove the fire pump gear box. See **Subject 110** for instructions.
4. Remove the impeller assembly. See **Subject 130** for instructions and see **Fig. 1**for an exploded view of the assembly.
5. Place the impeller shaft on a work bench.
6. Note the orientation of the impeller vanes.
7. Remove the outer retaining ring.

⚠ WARNING

Wear protective, heat-resistant gloves while heating the impeller to remove it from the impeller shaft. Heated metal can cause injury to your hands.

⚠ CAUTION

Do not overheat the impeller. The impeller is constructed of bronze. If the impeller is overheated and turns red or blue during removal from the shaft, it has been weakened and must be replaced.

8. Using an acetylene torch, carefully heat the "eye" of the impeller for approximately two minutes.
9. When heated properly, the impeller will slide free of the shaft. If the impeller moves but does not slide free, do not immediately reheat. Allow the complete assembly to cool to room temperature then reheat and remove the impeller.
10. Allow the components to cool to room temperature.
11. Remove the inner clearance ring.
12. Remove the key.
13. Remove the inner retaining ring and slide the mechanical seal housing from the impeller shaft

Assembly

1. Clean the impeller shaft, the keyway, and the mechanical seal housing and face.
2. Check the waterway in the mechanical seal housing for restrictions.
3. Install the mechanical seal housing onto the impeller shaft.
4. Install the inner retaining ring.
5. Install the new gasket on the mechanical seal housing face.
6. Install the key into the keyway.

⚠ CAUTION

If the impeller or clearance rings are dropped, damaged, or deformed, they will need to be replaced.

7. Install the inner clearance ring.

⚠ WARNING

Wear protective, heat-resistant gloves while heating the impeller to install it onto the impeller shaft. Heated metal can cause injury to your hands.

8. Using the torch, heat the "eye" of the new impeller for approximately two minutes. Then slide the impeller onto the shaft with vanes in proper orientation. If the impeller does not fully slide onto the shaft allow the assembly to cool to room temperature before reheating.
9. Install the outer retaining ring.
10. Install the impeller assembly. See **Subject 130** for instructions.
11. Install the outer clearance ring.
12. Install the impeller shaft assembly.
13. Install the fire pump gear box. See **Subject 110** for instructions.
14. Install the AutoLube. See **Subject 100** for instructions.
15. Remove the chocks from the front and rear tires.

Fig. 1, Impeller Shaft Assembly (exploded view)

Two-Stage Pump

Disassembly

1. Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.
2. Remove the AutoLube. See **Subject 100** for instructions.
3. Remove the fire pump gear box. See **Subject 110** for instructions.
4. Remove the impeller assembly. See **Subject 130** for instructions.
5. Place the impeller shaft assembly on a work bench.
6. Note the position of the impeller vanes.
7. Remove the inner and the outer retaining rings and then remove the mechanical seal housing.

⚠ WARNING

Wear protective, heat-resistant gloves while heating an impeller to remove it from the impeller shaft. Heated metal can cause injury to your hands.

⚠ CAUTION

Do not overheat the impeller. An impeller is constructed of bronze. If the impeller is overheated and turns red or blue during removal from the shaft, it has been weakened and must be replaced.

8. With an acetylene torch, carefully heat the "eye" of the impellers for approximately two minutes.

IMPORTANT: Mark the impellers as to whether they are the primary or secondary impeller in relation to the AutoLube. Improper or backward installation of the impellers affects pump performance.

9. When heated properly, an impeller will slide free of the shaft. If the impeller moves but fails to slide free, do not immediately reheat. Allow the complete assembly to cool to room temperature then reheat and remove the impellers. Heat the secondary impeller and remove. Then rotate the impeller shaft assembly end for end and heat and remove the primary impeller.
10. Remove the center support bearing.
11. Remove mechanical seal housing and then the inner clearance ring.
12. Remove the key.
13. Remove the inner retaining ring and slide the mechanical seal housing from the impeller shaft.

Assembly

1. Clean the impeller shaft, the keyway, and the mechanical seal housing and face.
2. Check the waterway in the mechanical seal housing for restrictions.
3. Install the new gasket on the mechanical seal housing face.
4. Install the key into the keyway.

⚠ CAUTION

If the impellers or the clearance rings are dropped, damaged, or deformed, they require replacement.

5. Install the inner clearance ring.

⚠ WARNING

Wear protective, heat-resistant gloves while heating the impeller to install it onto the impeller shaft. Heated metal can cause injury to your hands.

6. Using the torch, heat the "eye" of each impeller for approximately two minutes. Then slide the individual impellers onto the shaft. If an impeller does not fully slide onto the shaft allow the assembly to cool to room temperature before reheating.
7. Install the outer retaining ring.
8. Install the outer clearance ring.
9. Install the impeller assembly. See **Subject 130** for instructions.
10. Install the mechanical seal housing onto the impeller shaft.
11. Install the impeller shaft assembly.
12. Install the fire pump gear box. See **Subject 110** for instructions.
13. Install the AutoLube. See **Subject 100** for instructions.
14. Remove the chocks from the front and rear tires.

Pilot Valve

Park the vehicle on a level surface. Shut down the engine. Set the parking brake and chock the front and rear tires.

1. Drain the fire pump.
2. Rotate the adjustment handwheel counterclockwise to remove the spring tension.
3. Remove the capscrew and nut attaching the adjustment handwheel to the adjustment shaft. Then remove the handwheel.

⚠ CAUTION

Identify and mark the line connections on the control body before removing. Improper connection of lines may result in the failure of the pilot valve, which could cause damage to the fire pump.

4. Remove the pump discharge pressure line and the relief valve line from the control body of the pilot valve.
5. While holding the pilot valve, remove the four 1/4–20 x 5/8 machine screws attaching the valve and cover plate to the Pump Operator's Panel, and separate the valve, plate, and the relief valve setting indicator (if equipped with PMD) from the panel.
6. Disassemble the pilot valve.
   - 6.1 Remove the four 5/16–18 x 1 allen-head capscrews securing the control body to the rear of the spring housing. Then remove the control body.

⚠ CAUTION

Do not use pliers to unscrew the control valve from the diaphragm clamp. Damage to the control valve will render the pilot valve inoperative.

   - 6.2 Unscrew the control valve from the diaphragm clamp. Remove the diaphragm washer and the diaphragm.
   - 6.3 Remove the retaining ring, the seal, and the bearing.

⚠ WARNING

Use a spring compressor to remove the pilot valve spring. The spring is under compression and could become uncompressed, which could result in personal injury.

   - 6.4 Turn the adjustment handwheel clockwise to unscrew the adjustment shaft from the adjustment nut. From the handwheel end, remove the adjustment shaft from the spring housing.
   - 6.5 Remove both springs, the adjustment nut, and diaphragm clamp as an assembly from the spring housing and then separate.
7. Clean all the pilot valve components. Inspect and lubricate with grease the threads on the adjustment shaft.
8. Assemble the pilot valve.

⚠ WARNING

Use a spring compressor to install the pilot valve spring. The spring is under compression and could become uncompressed, which could result in personal injury.

⚠ CAUTION

Always remove the pilot valve discharge pressure inlet screen, which is located in the top of the discharge side of the pump. Clean or replace as necessary. Failure to do so could render the pilot valve inoperative.

   - 8.1 Combine both springs, the adjustment nut and the diaphragm clamp as an assembly and install into the spring housing. Align the guide pin-in adjustment nut with the slot in the spring housing and the indicator plate on the PMD.
   - 8.2 Slide the adjustment shaft into the spring housing from the handwheel end. Turn the adjustment handwheel counterclockwise in order to screw the adjustment shaft into the adjustment nut until it bottoms in the diaphragm clamp. Do not put the springs under tension.

Valve Removal, Disassembly, Assembly and Installation

8.3 Lubricate the new bearing and slide the new bearing and bearing washer over the adjustment shaft into the spring body housing. Install the retaining ring. Then install the new seal washer and rotate the adjustment shaft in both directions to check for freedom of movement.

8.4 Install the new diaphragm washer and diaphragm. Screw the control valve into the diaphragm clamp.

8.5 Install the control body. Apply Loctite® 242 to the four 5/16–18 x 1 allen-head capscrews attaching the control body to the rear of the spring housing.

9. Holding the pilot valve, align the cover plate and install the four 1/4–20 x 5/8 machine screws attaching the pilot valve and cover plate to the Pump Operator's Panel.
10. Install the pump discharge pressure line and relief valve line to the control body of the pilot valve.
11. Slide the adjustment handwheel onto the adjustment shaft and then install the retaining capscrew and nut.
12. Fill the pump and test the valve for proper operation and leaks.

Transfer Valve

See **Fig. 1** for an exploded view of the transfer valve.

1. Drain the fire pump.

IMPORTANT: The transfer valve is a timed device. It is therefore important during disassembly to note the location of the transfer bracket locating pin, the transfer drum stop pin, the transfer drum sleeve locating pin, and the transfer drum stem key. It is not necessary to remove the transfer bracket locating pin, the transfer drum sleeve locating pin, or the transfer drum stop pin during disassembly.

2. Turn the adjustment handwheel clockwise until it stops. The transfer indicator should be at the top of the slotted guide in the cover plate.
3. Remove the two allen-head set screws from the transfer indicator guide. Slide the transfer indicator guide (on an adjustment stem) towards the transfer valve.
4. Remove the stem drive gear lock pin. Slide the adjustment stem from the stem drive, the support, and the transfer indicator guide, being careful not to drop or damage the transfer indicator guide and transfer indicator.
5. Remove the four 7/16–14 x 1-1/4 capscrews retaining the transfer bracket assembly to the pump body. Carefully remove the transfer bracket and the transfer valve drum.
6. Disassemble the valve.

   6.1 Remove the locating pin that secures the countershaft in place.

   6.2 Remove the countershaft from the countershaft gear.

   6.3 Remove the countershaft gear and the countershaft gear spring from the transfer bracket assembly.

   6.4 Remove the allen-head set screw from the transfer drum gear. Slide the transfer drum gear from the drum stem. Remove the woodruff key from the transfer drum stem.

   6.5 Separate the transfer bracket from the transfer drum by sliding it from the transfer drum stem.

   6.6 Slide the transfer drum from the transfer sleeve.

7. Assemble the valve.

   7.1 Clean and inspect all sealing surfaces, the mating surfaces of the transfer valve drum and sleeve. Clean and inspect the transfer bracket bushings and bushing surface on the transfer valve stem and the transfer valve adjustment stem.

   7.2 Install new O-ring seals on the transfer valve drum stem and the transfer valve bracket.

   7.3 Slide the transfer drum into the transfer bracket, being careful not to damage the bearing surfaces. Then rotate the transfer drum until the drum stop pin is in the correct position.

   7.4 Install the woodruff key into the transfer drum stem. Install the transfer drum gear

26. Support Stem
27. Adjusting Wheel Assembly

Fig. 1, Transfer Valve

onto the transfer drum stem. Apply Loctite® 242 to the allen-head set screw and install the transfer drum gear.

7.5 Assemble the countershaft gear spring in the countershaft gear and position the assembly into place in the transfer bracket. Then install the countershaft and the

Valve Removal, Disassembly, Assembly and Installation

countershaft locating pin to lock the countershaft in place.

8. Install the transfer valve.
   - 8.1 Align the transfer drum stop pin, the transfer bracket locating pin, and the transfer drum sleeve locating pin into proper position.
   - 8.2 Install the transfer valve drum and bracket assembly into the pump body.
   - 8.3 Apply Loctite® 242 to the four 7/16–14 x 1-1/4 transfer bracket capscrews and install and tighten 53 lbf·ft (72 N·m).
   - 8.4 Slide the adjustment stem through the cover plate, the transfer indicator guide, and the support and transfer bracket.
   - 8.5 Insert the stem drive gear into place in the transfer bracket and then slide the adjustment stem through the stem drive gear.
   - 8.6 Insert the stem drive gear lock pin into place, locking the stem drive gear onto the adjustment stem.
   - 8.7 Apply Loctite® 242 to the transfer indicator guide set screws and install. Do not tighten.
   - 8.8 Turn the adjustment handwheel counterclockwise until it stops. Make sure the transfer indicator is at the top of the slotted guide toward the transfer indicator, making certain that the transfer indicator engages the transfer indicator guide in the top groove. Then tighten the inside set screw in the transfer guide indicator.
   - 8.9 Rotate the adjustment handwheel from stop to stop. The transfer indicator should move freely from the top to the bottom of the slotted guide in the cover plate.
   - 8.10 Tighten the outside set screw in the transfer indicator guide, and recheck the movement of the transfer indicator.
9. Fill the pump and test the valve for proper operation and leaks.

Back Flow Valve

1. Drain the water tank and the pump.
2. Disconnect the control linkage at the Tank-to-Pump valve.
3. Disconnect both ends of the flexible hose connecting the water tank to the tank-to-pump valve. Then slide the flexible hose toward the water tank outlet or the tank-to-pump valve plumbing.

NOTE: If the tank-to-pump valve is air-operated, drain the vehicle's air system and disconnect the supply and the return line on the valve actuator, but do not remove the actuator from the valve. Also, the tank-to-pump valve may be connected to the pump body by capscrews or studs with nuts. If studs are used, it may be necessary to remove some or all of the studs to remove the valve. If so, remove only the studs necessary to remove the valve as any studs left will assist in realigning the valve during installation.

4. Remove the eight 7/16–14 x 1-1/2 capscrews retaining the tank-to-pump valve to the pump body.
5. Remove the tank-to-pump valve and associated plumbing.

NOTE: The back flow valve is a flat butterfly plate with two pivots attached at the top. These pivots fit into two open pivot sockets in the pump body. When the gasket is removed, the back flow valve may fall out.

6. Remove the old gasket from the pump body.
7. Remove the back flow valve.
8. To install the back flow valve, first clean all of the gasket surfaces on the pump body and the tank-to-pump flange.
9. Install the back flow valve. Using two fingers, hold the pivots in the pivot sockets and check the valve for freedom of movement.
10. Install a new gasket.
11. Apply Loctite® 242 to the eight 7/16–14 x 1-1/2 capscrews and attach the tank-to-pump valve to the pump body. Tighten 53 lbf·ft (72 N·m).
12. Slide the flexible connection hose so it is evenly spaced and secured on the water tank outlet and the tank-to-pump valve plumbing.

13. Attach the tank-to-pump valve controls and linkage.
14. Fill the pump and test the valve for proper operation and leaks.

Sensing Valve

1. Disconnect the following lines at the sensing valve:
    - pilot valve discharge line
    - QG relief valve line
    - PG relief valve line
    - sensing valve pump suction line
    - drain lines
2. Remove the 7/16–14 x 2 sensing valve mounting capscrew.
3. Remove the four 5/16–18 x 1 capscrews attaching the control body to the rear of the spring housing. Remove the control body, being careful not to lose the sensing valve spring.
4. Remove the control valve from the sensing valve body.
5. Unscrew the sensing valve from the diaphragm, being careful not to damage the control valve. Remove the diaphragm.
6. Before installing the sensing valve, clean all components.

⚠ CAUTION

Always remove the sensing valve suction inlet screen. Clean or replace as necessary. The screen is located in the suction side of the pump. Failure to do so may render components inoperative.

7. Install a new diaphragm on the diaphragm clamp. Apply Loctite® to the threads on the control valve and install the control valve into the sensing valve body.
8. Install the sensing valve spring into the valve body cover.
9. Apply Loctite® 242 to the four 5/16–18 x 1 capscrews and attach the control body to the rear of the spring housing. Make sure that the sensing valve spring properly aligns with the diaphragm clamp.
10. Make sure the up arrow is aligned properly.
11. Apply Loctite® 242 to the 7/16–14 x 2 sensing valve mounting capscrew. Tighten 40 lbf·ft (54 N·m).
12. Connect all lines.
13. Fill the pump and test the valve for proper operation and leaks.

TPM Relief Valve

1. Disconnect the line to the sensing valve and drain the fire pump. Make note of the wire connections.
2. Disconnect the indicator light switch.
3. Remove the four 7/16–14 x 1-1/4 capscrews attaching the relief valve assembly to the pump body.
4. Using a twisting motion, remove the relief valve assembly.
5. To disassemble the valve, remove the indicator light switch and remove the cover retaining ring and slide the cover out of the relief valve body.
6. Apply a small amount of pressure to the relief valve piston and remove the piston retaining ring. Carefully release the pressure held to the piston by the spring.
7. Remove the relief valve from the opposite end, sliding the relief valve stem out of the piston.
8. Reach through the center hole of the piston and pull the piston out of the indicator switch end of the relief valve body. Then remove the piston spring.
9. To assemble and install the valve, first clean and inspect all components.
10. Clean all sealing surfaces and install new O-rings seals.
11. Install the relief valve into the relief valve body.
12. Install the piston spring by sliding the piston into the relief valve body while at the same time sliding the piston onto the relief valve system.

Valve Removal, Disassembly, Assembly and Installation

13. Apply light pressure to the piston to compress the piston spring and install the piston retaining ring.
14. Slide the cover into the relief valve body. Then install the cover retaining ring.
15. Using a powered test light, screw the indicator light switch in until the light goes out. Then turn an additional 3/4 to 1-1/4 turn. Apply Loctite® to the jamnut and tighten.
16. Slide the relief valve assembly into the pump body with the side marked "top" up, being careful not to damage the O-rings.
17. Apply Loctite® 242 to the four 7/16–14 x 1-1/4 capscrews and install the assembly in the pump body. Tighten 53 lbf·ft (72 N·m).
18. Connect the indicator light switch.
19. Fill the pump and test the valve for proper operation and leaks.

QD Relief Valve

See **Fig. 2** for an exploded view of the QD relief valve.

1. Drain the pump.
2. Note the location of the wires and disconnect the indicator light switch.
3. Disconnect the relief valve supply line from the pilot valve and drain the line.
4. Remove the two 7/16–14 x 1-1/4 capscrews attaching the relief valve indicator light switch and the mounting bracket assembly to the relief valve cover. Remove the light switch and the bracket.
5. Compress the relief valve return spring by hand and remove the E-clip and washer. Then remove the return spring.
6. Remove the two remaining 7/16–14 x 1-1/4 capscrews retaining the relief valve cover to the pump body. Using a twisting motion, carefully remove the relief valve cover.

⚠ CAUTION

Do not push the relief valve too far into the pump body as it may fall into the pump body and become lodged or damaged. The relief valve is made of brass and is easily damaged by prying or hammering. Damaged valves must be replaced.

7. Remove the retaining ring securing the relief valve piston to the relief valve. Gently push the relief valve into the pump body approximately 1 inch (25 mm) and then pull it back out in a snap-motion. This should pop the relief valve piston out of the relief valve body. Repeat if necessary.

NOTE: It is not necessary to remove the relief valve unless it is damaged. To remove the relief valve, the relief valve body will have to be removed and the complete relief valve assembly will need to be replaced as it will be necessary to pry the relief valve body from the pump body, which will likely damage it.

8. Clean and inspect all of the relief valve assembly components.
9. Clean all sealing surfaces and install new O-rings and Quad-ring seals.
10. Install the relief valve piston in the stem of the relief valve. Do not push the relief valve into the pump body. As it is necessary to start the piston onto the relief valve stem, push the piston until you can grasp the relief valve stem. Then pull the relief valve stem outward while pushing on the relief valve piston. Once the relief valve piston is seated against the shoulder of the relief valve stem, install the retaining ring.
11. Operate the relief valve by hand to check for freedom of movement.
12. Slide the relief valve cover gasket and cover over the top of the relief valve stem to align the relief valve supply line from the pilot valve in the original position. Then apply Loctite® 242 to two 7/16–14 x 1-1/4 capscrews and install opposite of each other. Tighten, but do not torque.
13. Compress and install the return spring and secure it with a washer and E-clip.
14. Align the indicator light switch mounting bracket and switch with the two empty holes in the relief valve cover. Install the two remaining capscrews. Tighten all capscrews 53 lbf·ft (72 N·m).
15. Connect the relief valve supply line from the pilot valve. Also connect the drain line.
16. Connect the indicator light switch.

Valve Removal, Disassembly, Assembly and Installation

17. Fill the pump and test the valve for proper operation and leaks.

TPM Dump Valve

1. Drain the pump.
2. Disconnect the indicator light switch.
3. Disconnect the line to the sensing valve.
4. Remove one 7/16–14 x 2 sensing valve mounting capscrew.
5. Remove the four 7/16–14 x 1-3/4 capscrews retaining the relief valve assembly to the atmosphere dump.
6. Remove the four 7/16–14 x 1-1/2 relief valve mounting capscrews to remove the relief valve from the pump body.
7. Remove the relief valve assembly
8. Remove the four 7/16–14 x 1-3/4 capscrews retaining the relief valve cover to the relief valve body.
9. Remove the indicator light switch assembly.
10. Apply a small amount of pressure to the relief valve spring and remove the spring retaining ring and washer. Carefully release the pressure held on the spring and then remove the spring.
11. Remove the relief valve cover.
12. Remove the piston retaining ring.
13. Remove the relief valve from the opposite end, sliding the relief valve stem out of the piston.
14. Reaching through the center hole of the piston, gently pull the piston from the indicator switch end of the relief valve body.
15. Before assembling and installing the valve, clean and inspect all components of the relief valve assembly.
16. Clean all sealing gasket surfaces and install new O-rings and gaskets.
17. Install the relief valve into the relief valve body.
18. Slide the piston into the relief valve body while at the same time sliding the piston onto the relief valve stem. Then install the piston retaining ring.
19. Install the new gasket and then install the cover onto the relief valve body.
20. Install two 7/16–14 x 1-3/4 capscrews finger-tight to keep the relief valve cover aligned with the valve body.
21. Install the valve spring over the relief valve stem. Then apply pressure to the valve spring to compress the spring.
22. Install the spring washer and the retaining ring.
23. Remove the two 7/16–14 x 1-3/4 capscrews installed to keep the relief valve cover aligned with the valve body. Place the indicator switch assembly into position on the relief valve cover. Apply Loctite® 242 to the four capscrews, install, and tighten 53 lbf·ft (72 N·m).
24. Apply Loctite® 242 to the four 7/16–14 x 1-1/2 capscrews to install the new gasket for the relief valve to the pump surface.
25. Apply Loctite® 242 to the four 7/16–14 x 1-1/2 capscrews and install the new gasket and relief valve assembly to the atmosphere dump. Tighten 53 lbf·ft (72 N·m).
26. Apply Loctite® 242 to the 7/16–14 x 2 capscrew, install the sensing valve and tighten 40 lbf·ft (54 N·m). Make sure the arrow points upward.
27. Connect the indicator light switch.
28. Connect the line to the sensing valve.
29. Fill the pump and test the valve for proper operation and leaks.

Check Valves (two-stage only)

1. Drain the pump.

NOTE: There are two check valves (one on each side) in the suction side on the front of the two-stage pump body. The following procedure is used for both check valves.

2. Remove the four 1/2–13 x 1-1/4 capscrews from the check valve cover on the front side of the pump body.
3. Remove the check valve.
4. Clean the gasket surfaces and inspect the check valve pivots and pivot sockets.

5. Install the check valve.
6. Install the new gasket in the pump body.
7. Apply Loctite® to the four capscrews and secure the check valve cover to the pump body with the capscrews, being careful to align the check valve pivot with the pivot socket in the check valve cover. Tighten 53 lbf·ft (75 N·m).
8. Fill the pump and test the valve for proper operation and leaks.

SPV Priming Valve

1. Drain the pump.
2. Disconnect the 3/4-inch (19 mm) vacuum hose connecting the priming valve to the primer.
3. Remove two 7/16–14 nuts attaching the priming valve to the studs in the pump body. If the studs are damaged, replace them with 7/16–14 x 1-3/4 zinc plated studs.

NOTE: If the valve strainer and O-ring seal remains on the pump body, remove it carefully for cleaning and installation. If the valve strainer is removed as part of the priming valve, remove it from the body and set it aside. Use care as the valve strainer is easily damaged.

4. Note the location of the drain hole on the diaphragm cover and then remove the eight 5/16–18 x 3/4 capscrews securing the diaphragm cover to the valve body. Remove the diaphragm cover and the diaphragm.
5. Hold pressure on the diaphragm washer to compress the valve spring then remove the diaphragm washer retaining screw. Remove the diaphragm washer and valve spring. From the opposite side of the valve body, remove the valve.
6. Clean all the components of the priming valve and mating surfaces. Inspect the valve seat and replace if worn or damaged.
7. Install the valve into the valve body from the pump side of the body.
8. Install the valve spring and diaphragm washer onto the valve. Apply Loctite® 242 to the diaphragm washer retaining screw, compress the valve spring with the diaphragm washer, and install the valve.
9. Align the diaphragm holes with the capscrew holes in the diaphragm cover. Apply Loctite® 242 to the eight 5/16–18 x 3/4 capscrews and install the diaphragm cover and diaphragm valve body. Tighten 17 lbf·ft (23 N·m).
10. Install the valve strainer and O-ring seal onto the pump side of the priming valve.
11. Apply Loctite® 242 on the two 7/16–14 priming valve mounting nuts and install the priming valve into the pump body. Tighten 40 lbf·ft (54 N·m).
12. Connect the vacuum hose to the primer.
13. Fill the pump and test the valve for proper operation and leaks.

Troubleshooting

Lack of use causes many problems for fire pumps and fire pump components.

IMPORTANT: The entire pumping system should be exercised on a regular basis, at least weekly. This routine procedure should include all discharge valves and suction valves.

Abuse of the fire pump is rarely a problem. If the pump and pump components have been abused, indications of problems may be fairly obvious. For example, bent controls are a common indicator.

Simultaneous oil and water leaks are uncommon. Normally, a water leak indicates that a line has come loose or is broken. Gaskets are used between mating surfaces *without* sealant. If a leak is present at a gasket-mating surface, whether oil or water, the components should be disassembled and repaired.

Be certain when a device indicates it is not working that it is not asimple electrical problem, such as a burned-out indicator bulb.

Troubleshooting Tables

Problem—Pump Will Not Engage

Problem—Pump Will Not Engage	
Possible Cause	**Remedy**
Parking brake not set.	Set the parking brake.
Transmission not in neutral.	Shift transmission to neutral.
Insufficient air supply.	Repeat the recommended shift procedure: Check the air pressure gauges. This procedure requires at least 100 psi (689 kPa), and shut the engine down and check for air leaks.
Pump shift or application of parking brake attempted before apparatus was stopped.	Release the braking system momentarily and repeat the recommended shift procedure. *

* This condition is known as "Butt Tooth," which occurs when the transmission shifts and the shift gear-teeth and the teeth on the drive gear do not line up and butt up against each other. The Twinflow fire pump transmission is designed with a sliding shift collar. Therefore, the occurrence of "Butt Tooth" will be rare.

Problem—Pump Will Not Shift

Problem—Pump Will Not Shift	
Possible Cause	**Remedy**
Battery voltage low.	Turn off accessories. Check the charging system of the apparatus. Inspect the batteries. If okay, recharge and try shift again.
Interface/Interlock module not receiving proper inputs.	Check the Officers Information Center output.
Transmission not receiving lock-up input.	Check output to transmission with Prolink.

Problem—Pump Will Not Prime

Problem—Pump Will Not Prime	
Possible Cause	**Remedy**
Low battery voltage.	Increase the engine speed 1000 to 1200 rpm for temporary support for electrical system requirements and primer operation. *
Worn or damaged priming system.	Perform the "Dry Vacuum Test" which follows the troubleshooting tables in this subject. If pump is tight but primer develops less than 22 inches of vacuum, the primer pump, motor, or Priming Valve may be worn or damaged.

Troubleshooting

Problem—Pump Will Not Prime	
Possible Cause	**Remedy**
Primer not operated long enough.	Operate for 30 seconds for pump up to 1250 gpm or for 45 seconds for 1500 and up gpm pump. Add 15 additional seconds if priming from front or rear suction. Do not run primer over 45 seconds. Stop and check for causes.
Suction lifts too high.	Do not attempt lifts exceeding 22 feet, except at low elevations.
Suction strainer blocked.	Check and clean.
Air pocket in suction hose or pump.	Place suction hose lower than suction intake. Slightly open a discharge valve momentarily to release trapped air.
Air leaks.	Perform the "Dry Vacuum Test" which follows the troubleshooting tables in this subject. Then shut engine off and listen for air leaks. Pressurize the discharge side of the pump with approximately 100 psi (689 kPa) from the hydrant and check for water leaks. Check connections and gaskets.

* Electric primer does not require engine speed to be increased for operation. A primer can and will draw in excess of 300 amps and primer operation can last 45 seconds.

Problem—Pump Loses Prime

Problem—Pump Loses Prime	
Possible Cause	**Remedy**
Suction lifts too high.	Do not attempt lifts exceeding 22 feet except at low elevations.
Suction strainer blocked.	Check and clean.
Air leaks.	Check all connections and gaskets. Perform the "Dry Vacuum Test" which follows the troubleshooting tables in this subject.
Pump pressure is too low when discharge appliance is opened.	Prime the pump again. Raise pump pressure higher and open the discharge appliance slowly.

Problem—Pump Primer Does Not Operate Properly

Problem—Pump Primer Does Not Operate Properly	
Possible Cause	**Remedy**
Does not operate electrically.	Check the battery, connections, primer, and primer control. Check the control switch and solenoid on the primer. If the primer has not been used recently, it could be frozen. It should, if contact is still being made internally, show heavy current draw.
Primer is slow or lower than normal.	Check batteries, wiring, and connections. A large quantity of suction hoses or suction pipes can exceed primer capabilities. Too small diameter or too long a length of piping between primer and pump can exceed primer capabilities. Lift not to exceed 20 feet (6 m) and 10 feet (3 m) for testing. The primer pump itself may be worn out.
Pulls some prime.	The primer pump could be in need of repairs or cleaning. Check for air leaks and verify that the Priming Valve is not sticking.
Pulls full prime.	Check for air leaks. Check for clogged inlet strainer and screens. Check that the suction hose is submerged in adequate water supply. Check for air pockets and air accumulation in piping. Check for turbulence in piping. The pump impeller may be damaged or severely worn.

Problem—Insufficient Capacity or Pressure

Problem—Insufficient Capacity or Pressure	
Possible Cause	**Remedy**
Insufficient engine power.	Check engine performance.
Improperly set relief valve.	Readjust the relief valve to a higher pressure setting. If the relief valve is set too low it will open to relieve pressure and reduce capacity.
Transmission in incorrect range.	Check the transmission selector for correct range recommended for pumping procedure. Check that the Fourth range lockup has occurred. If the transmission shifts while increasing engine speed, lock up has not occurred. Check engine speed or drive shaft speed for correct transmission range and inaccurate tachometer.
Air leaks.	Perform the "Dry Vacuum Test" which follows the troubleshooting tables in this subject.
Transfer valve in incorrect position.	Transfer valve must be in the "parallel or volume" setting for capacity in the "series or pressure" setting for pressure. The transfer valve indicator may be out of adjustment. At idle, shift the transfer valve back and forth. You should hear the check valves close and see a change in pressure on the Master Pressure gauge.
Tank fill valve leaking.	Repair the leak.

Problem—Engine Speed Too High for Capacity or Pressure

Problem—Engine Speed Too High for Capacity or Pressure	
Possible Cause	**Remedy**
Impeller blockage.	Check and clean. Backflushing through the discharge side of the pump may clear the obstruction. It may require disassembly of the pump.
Worn impeller or clearance rings.	Overhaul the pump. All other possibilities should be eliminated before overhauling the pump.
Suction strainer blocked.	Clean and check.
Lift too high.	Lifts over 10 feet will cause higher engine speeds and vacuum.
Transmission in incorrect range.	Check the transmission selector for correct range for recommended pumping procedure. Check that Fourth range lockup has occurred. If the transmission shifts while increasing engine speed, lockup has not occurred. Check engine speed or drive shaft speed for correct transmission range and inaccurate tachometer.
Check Valves damaged or missing.	At idle, shift the transfer valve back and forth. You should detect a change in the engine/pump sound, hear the check valves close, and see a change in the pressure on the Master Pressure gauge. If no apparent change occurs, remove the suction inlet cap and visually inspect the check valves. Insert a broom handle in the suction inlet and gently push each check valve open and let it close. Check valves should move freely.
Tank fill valve leaking.	Repair the leak.

Troubleshooting

Problem—Relief Valve Does Not Relieve When Valves are Closed

Problem—Relief Valve Does Not Relieve When Valves are Closed	
Possible Cause	**Remedy**
Incorrect pilot valve setting.	Repeat the proper procedure for setting the relief valve.
Pilot valve inoperative.	Disassemble, clean, and lubricate. Inspect the control valve diaphragm for wear or damage.
Relief valve inoperative.	Disassemble, clean, and lubricate.

Problem—Relief Valve Does Not Recover When Valves are Opened

Problem—Relief Valve Does Not Recover When Valves are Opened	
Possible Cause	**Remedy**
Dirt in system resulting in slow or sticky operation.	Disassemble, clean and lubricate.

Problem—Unable to Attain Proper Setting

Problem—Unable to Attain Proper Setting	
Possible Cause	**Remedy**
Incorrect procedure.	Check procedure and reset.
Blocked strainer.	Disconnect the pilot valve supply line from the discharge side of pump. Remove the 90-degree fitting where the supply line connects to the pump. The strainer is attached to this fitting. Clean or replace the strainer and fitting assembly.
Dirt in pilot valve.	Disassemble, clean, and lubricate.
Hunting condition.	Insufficient water supply to the pilot valve. Check strainer and supply lines. If there is dirt in the pilot valve, disassemble, clean, and lubricate.

Problem—TPM Valve Does Not Relieve

Problem—TPM Valve Does Not Relieve	
Possible Cause	**Remedy**
Sensing valve inoperative.	Disassemble, clean, and lubricate. Inspect the control valve diaphragm for wear or damage.
PG relief valve inoperative.	Disassemble, clean, and lubricate.
PG relief valve sluggish.	Check and clean the discharge and suction strainers in the pump body.

Problem—TPM Valve Does Not Recover

Problem—TPM Valve Does Not Recover	
Possible Cause	**Remedy**
Dirt in system resulting in slow or sticky operation.	Disassemble, clean, and lubricate. Check and clean the discharge and suction strainers in the pump body.

Problem—AutoLube

Problem—AutoLube	
Possible Cause	**Remedy**
External leaks.	External leaks are the result of gasket failures. Disassemble and repair.
Internal leaks.	If water is leaking, replace the diaphragm. If oil is leaking, replace the AutoLube seal and the impeller bushing. Heavy oil usage by the AutoLube or oil present in the water when the pump master drain is opened indicates that the AutoLube seal and possibly the impeller bushing is damaged.

Problem—Mechanical Seal Leaks

Problem—Mechanical Seal Leaks	
Possible Cause	**Remedy**
Leak at mechanical seal.	If the mechanical seal is leaking it will have to be replaced. If properly cared for, the mechanical seal should be almost maintenance free. Water quality will greatly affect seal life. The most common failure of the mechanical seal is from thermal-shock. That is running the pump dry, heating up the seal and then opening to a cool or cold water supply. The seal may shatter. Check the AutoLube. If the bushing is worn or missing, the impeller shaft will wobble and fracture the mechanical seal.

Problem—Pump Gear Box Does Not Function Properly

Problem—Pump Gear Box Does Not Function Properly	
Possible Cause	**Remedy**
Water in gear box.	Locate and repair the leak. Remove and clean the gear box filter. Replace the transmission oil. Water leaking onto the input drive shaft of the pump gear box will actually be screwed into the pump transmission past the oil seals. This is not a seal problem. Be certain the slinger(s) are in place. Check the pump gear box cooling line for internal fractures. Pump gear box will fill with water and overflow through breather.
Whine in gear box.	Check the oil level. If oil is low, helical gears and/or tapered bearings will whine. Check oil pressure. If the filter is clogged, oil pressure will be low. Drain oil and check for metal. Remove filter and check for metal. If metal is detected, pump gear box will have to be disassembled for complete inspection and repairs.
Knock or rattle in gear box.	Check for gears missing teeth. Check for damaged bearings. Disassemble and repair. *

* The cause may include foreign objects, low or contaminated oil, or low oil pressure. Low oil level or pressure will result in the transmission being damaged due to overheating.

Dry Vacuum Test

1. Open all the intake valves.
2. Cap all intakes, and close and uncap all discharge valves.

Troubleshooting

3. Using the pump's priming devices, develop a vacuum of at least 22 inHg (74.5 kPa) for 30 seconds for pumps up to 1250 gpm or 45 seconds for pumps 1500 gpm or greater.
4. Reduce the maximum vacuum attained by 1 inHg (3.4 kPa) for each 1,000 ft. (305 m) of elevation of the test site above 2,000 ft. (610 m).

NOTE: The vacuum should not drop more than 10 inHg (33.9 kPa) in five minutes. Do not operate the pump priming device once the five-minute test has begun.

Specifications

See **Fig. 1** for the fire pump wiring diagram.

See **Fig. 2** for the fire pump controls wiring diagram. See **Fig. 3** for a detailed view of the RH switch panel for the fire pump controls and **Fig. 4** for a detailed view of the electrical center.

General Information

National Cush-N-Aire II air suspension seats (see **Fig. 1**) offer adjustment features for height, fore and aft positioning, back cushion tilt, lumbar support, and seat cushion tilt. The air suspension and height-adjustment features are provided by an inflatable air spring (air bag) that receives air pressure from the vehicle air system; pressure in the air spring is controlled by a set of switches attached to the seat frame. Each seat is equipped with a shock absorber to dampen unwanted up and down motion of the seat. An isolator (Chugger-Snubber®) allows the seat to move in a simple pendulum motion to isolate its occupant from the cab's fore and aft motion; at the side of the seat's lower frame is an isolator lockout handle that can be used whenever the isolator feature is not desired.

For a complete description of, and operating instructions for, all seat adjustment features, refer to the vehicle driver's manual.

General Information

37. Pin Clip
38. Seat Base

Fig. 1, National Cush-N-Aire II Seat

Removal

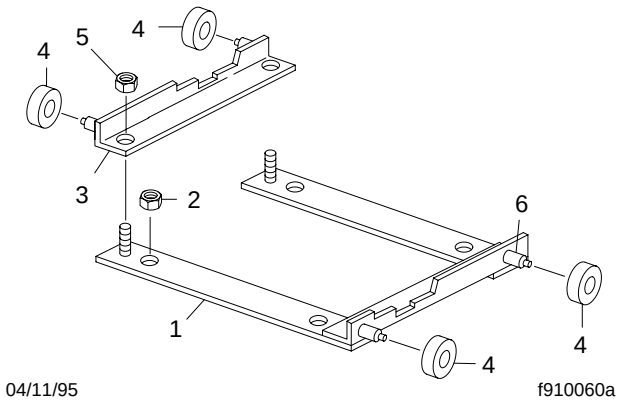
1. Apply the parking brakes, and chock the tires.
2. Push in on the top of the seat ride-height rocker switch until the seat is adjusted to its maximum height.
3. If the seat is equipped with a seat suspension shroud, remove the shroud. It is held in place with Velcro and upholstery-panel fasteners.
4. Cut a wooden block to the length required to support the seat at its maximum height, and place the block between the air suspension seat base and the rear crosstube of the lower arm.
5. Drain the vehicle air reservoirs. Then push in on the bottom of the seat ride-height rocker switch until all air is exhausted from the air spring.
6. Disconnect the air valve air-supply hose at the quick-connect union behind the seat.
7. Using an 11/16-inch wrench or a T50 Torx wrench, unscrew the capscrews that attach the seat-belt straps and tether straps to the intermediate-connecting-point threaded rod.
8. Remove the capscrews and washers that attach the seat to the cab deck. Remove the seat from the cab.

Installation

1. Place the seat on the cab deck. Insert the capscrews through the washers and the seat base. Tighten the capscrews 27 lbf·ft (37 N·m).
2. Attach the brackets of the seat-belt straps and tether straps to the intermediate-connecting-point threaded rod. Tighten the capscrews 40 lbf·ft (54 N·m).
3. Attach the air valve air-supply hose by pressing the pneumatic tubing into the quick-connect union behind the seat.
4. Start the engine and allow the air reservoirs to fill. Push in on the top of the seat ride-height rocker switch until the seat is adjusted to its maximum height, then remove the wooden block that supports the seat suspension.
5. If the seat is equipped with a seat suspension shroud, install the shroud.

Isolator Assembly (Chugger-Snubber®) Replacement

Replacement (see Fig. 1)



1. Welded Bearing Support Frame
2. Locknut
3. Bearing Support Rail
4. Bearing
5. Hexnut
6. Bearing Stud

Fig. 1, Isolator Assembly

1. Remove the air spring supply hose from the seat.
2. Cut off the air spring supply hose close to the barbed fitting; minimize hose length loss. Remove the scrap hose from the barbed fitting. Tape the hose and fitting ends to prevent dirt or other matter from entering.
3. Remove the hexnuts that attach the isolator bearing support rail to the studs on the isolator bearing support frame.
4. Lift up on the side of the seat's lower frame, to slide the bearing support rail up and off the bearing support frame.

NOTE: Two of the isolator bearings will fall off when the bearing support rail is removed.

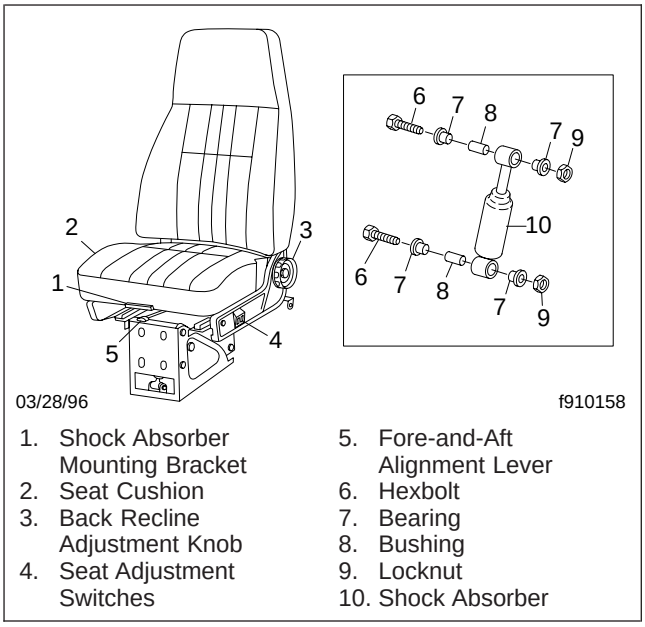
5. Push the seat's upper seat frame toward the opposite side, to remove the other two bearings. Remove the bearings and the unattached upper seat components.
6. Remove the four 5/16–18 locknuts from the bearing support frame. Remove the bearing support frame.
7. Using a multi-purpose chassis grease, lubricate the bearing cups and new isolator bearings.
8. Install the welded bearing support frame on the track assembly. Tighten the four 5/16–18 locknuts 15 lbf·ft (20 N·m).
9. Install two of the isolator bearings on the bearing studs of the bearing support frame, then align the bearing cups on the upper seat frame over the bearings.
10. Assemble the isolator bearing support rail and the two remaining isolator bearings. With the seat cushion tilted forward, install the support rail's bearings in the upper seat frame, and lower the seat frame and support rail assembly onto the isolator bearing support frame. Install the 5/16–18 hexnuts, and tighten them finger-tight.

    Push the isolator assembly fore and aft, and check the position of the isolator bearing support rail before tightening the hexnuts. The isolator should be tight enough to eliminate side play without interfering with the fore-and-aft movement of the seat. Tighten the 5/16–18 hexnuts 15 lbf·ft (20 N·m).
11. Install the air spring supply hose.

Shock Absorber Removal and Installation

Removal (see Fig. 1)

1. Move the fore-and-aft adjustment lever to the right, and slide the upper seat assembly back as far as possible.
2. Raise the upper seat assembly to maximum height. Support the seat in this position by placing a wooden block between the lower arm and the seat base.
3. Remove the shock absorber, bushings, and bearings.



1. Shock Absorber Mounting Bracket
2. Seat Cushion
3. Back Recline Adjustment Knob
4. Seat Adjustment Switches
5. Fore-and-Aft Alignment Lever
6. Hexbolt
7. Bearing
8. Bushing
9. Locknut
10. Shock Absorber

Fig. 1, Shock Absorber Removal/Installation

3.1 Remove the nuts and bolts that attach the shock absorber to the upper arm and the seat base. Remove the shock absorber.

3.2 Remove the bushings and bearings from the shock absorber.

Installation (see Fig. 1)

1. Check the operation of the shock absorber, and replace it if needed.
2. Install the shock absorber and new bearings and bushings.

2.1 Install new bearings and bushings in the shock absorber eyes.

2.2 With the upper arm blocked up, position the shock absorber so its piston-rod end is in the mounting bracket of the upper arm. Install the bolt and locknut to attach the shock absorber to the bracket. Tighten the locknut 25 lbf·ft (34 N·m).

2.3 Position the cylinder end of the shock absorber in the mounting bracket of the seat base. Attach the shock absorber to the seat base. Tighten the locknut 25 lbf·ft (34 N·m).

3. Raise the seat. Remove the wooden block.

Replacement (see Fig. 1)

1. Raise the upper seat assembly to maximum height. Support the seat in this position by placing a wooden block between the lower arm and the seat base.
2. Remove the seat from the vehicle as instructed in **Subject 100**.
3. Lay the seat on its side, with the wooden block still in place.
4. Remove, as an assembly, the fitting and the air hose from the air spring. Tape the end of the fitting to prevent dirt or other matter from entering.
5. Pry the pin clip from the bottom of the air spring.
6. Remove the retaining ring that secures the air spring to the upper arm. Remove the air spring.
7. Position the new air spring in the seat base, and secure it with a new pin clip.
8. Insert the top of the air spring in the opening of the upper arm. Install the retaining ring on the air spring.
9. Install the air spring fitting and air hose in the top of the air spring.
10. Install the seat as instructed in **Subject 100**.
11. Raise the seat. Remove the wooden block.

Base Assembly Bearing/Sleeve Replacement

Replacement (see Fig. 1)

1. Remove the shock absorber as instructed in **Subject 120**.
2. Remove the seat as instructed in **Subject 100**.
3. Remove the four locknuts that attach the track assemblies, seat track stop, belt bar and bearings, and upper seat assembly to the seat support. Remove the upper seat assembly, track assemblies, seat track stop, and belt bar and spacers.
4. Remove the retaining ring that secures the air spring to the upper arm.
5. Remove the bearings and/or sleeves from the seat support and the seat base and the upper and lower arms.
   - 5.1 Use snap ring pliers to remove the four snap rings from the connected shaft assemblies. Then, using a drift punch, drive out the shaft assemblies from the seat support and the seat base.

   NOTE: Place the punch against the snap ring end of the shafts. Drive each shaft end a little at a time; the two shafts are connected to each other on the opposite side.

   - 5.2 Remove the seat support, and the upper and lower arms from the air spring and seat base.
   - 5.3 Remove the bearings/sleeves from the upper and lower arms. Discard the bearings/sleeves.
   - 5.4 If so equipped, remove the sleeves/bearings from the seat support and the seat base. Discard the sleeves/bearings.
6. Install new bearings/sleeves, as equipped. See **Fig. 1**.
   - 6.1 Install new bearings/sleeves in the upper and lower arm tubes.
   - 6.2 If so equipped, install new sleeves/bearings in the seat support and the seat base.
   - 6.3 Align the tubes of the lower and upper arms with the holes in the seat base. Be sure the notch in the lower arm is forward and up, and the notch in the upper arm is to the rear and down.
   - 6.4 Install the connected shaft assembly through the seat base and the upper and lower arm forward tubes.
   - 6.5 Align the holes of the seat support with the rear tubes of the lower and upper arms.
   - 6.6 As equipped, install and tighten the pivot bolts, or install the connected shaft assembly through the seat support and the upper and lower arm tubes.
   - 6.7 For connected shaft assemblies, use snap ring pliers to install the snap rings that secure the shafts and the arms to the seat base and the seat support.
7. Insert the top of the air spring through the upper arm. Install the retaining ring.
8. Set the seat base assembly upright.
9. Install the shock absorber as instructed in **Subject 120**.
10. Place the belt bar and bearings, seat track stop, track assemblies, and upper seat assembly on the seat base. Install the locknuts, and tighten 15 lbf·ft (20 N·m).
11. Install the seat as instructed in **Subject 100**.

Fig. 1, Upper Seat Frame Assembly (exploded view)

1. Remove the suspension shroud (if equipped) from the seat base.
2. Remove the plastic tie strap that attaches the seat cushion to the upper seat frame assembly.
3. Remove the fasteners that attach the seat cushion to the front cushion adjustment rod. Remove the seat cushion.
4. Disconnect the air spring supply hose from the air spring.
5. Remove the four locknuts from under the top flange of the seat support assembly.
6. Remove the lower frame from the seat base.

Installation

1. Place the lower frame on the seat support assembly. Install the locknuts under the top flange of the seat support assembly. Tighten the locknuts 10 lbf·ft (15 N·m).
2. Attach the air spring supply hose to the air spring. Make sure that the air hose moves without any restrictions when the seat is moved forward or rearward.
3. Position the seat cushion, then install the fasteners that attach the seat cushion to the front cushion adjustment rod.
4. Install a new plastic tie strap to secure the seat cushion to the lower frame assembly.
5. Install the suspension shroud (if equipped) on the seat base.

8. Belt Bar
9. Seat Support

Fig. 1, Track Assembly (exploded view)

1. Raise the upper seat assembly to maximum height. Support the seat in this position by placing a wooden block between the lower base and lower arm.
2. Pull up and support the rear edge of the seat cushion as needed to gain access to the isolator-assembly-to-track-assembly 5/16–18 locknuts.
3. Remove the air spring supply hose from the seat.
   - 3.1 Cut and remove the tie strap that attaches the air spring supply hose to the track assembly latch mechanism.
   - 3.2 Remove the air spring supply hose (as an assembly), and lay it on the cab deck, behind the seat.
4. Remove the four 5/16–18 locknuts that attach the isolator assembly to the top of the track assemblies. Remove the upper seat assembly.
5. Remove the four 5/16–18 locknuts that attach the track assemblies to the top of the seat support. Remove the track assemblies.
6. With the holes in the belt bar, belt bar spacers, and seat track stop aligned with the holes in the seat support, install the new track assemblies on the seat support. Install and tighten the four 5/16–18 locknuts 15 lbf·ft (20 N·m).
7. Move the upper half of the track assemblies as needed to align their studs with the holes in the isolator assembly. Place the upper seat assembly on the track assemblies. Install and tighten the four 5/16–18 locknuts 15 lbf·ft (20 N·m).
8. Install the air spring supply hose.
   - 8.1 Install a new tie strap to attach the air spring supply hose to the track assembly latch mechanism.
   - 8.2 Install a new tie strap to attach the air valve supply hose to the belt bar.
9. Move the fore-and-aft adjustment lever to the right, and slide the upper seat assembly forward and rearward while making sure that the air hose moves without restriction. Return the seat cushion to its original position.
10. Raise the seat. Remove the wooden block.

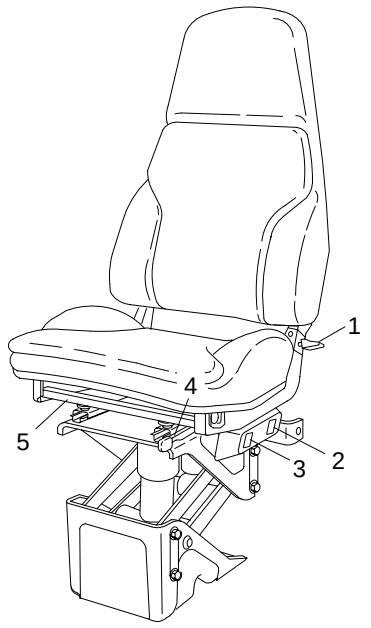
General Information

NOTE: Call Dura-Form Customer Service at 800–553–3013 to answer any questions concerning any Dura-Form seat style not covered by the information provided.

The Dura-Form Fleetcruiser air suspension seats offer lumbar support, back cushion tilt adjustment, height adjustment, a fore and aft isolator system, and seat cushion adjustment. See **Fig. 1**.



03/07/97 f910213

1. Back Cushion Tilt Adjustment
2. Lumbar Support
3. Height Adjustment
4. Isolator and Fore-Aft Adjustment
5. Seat Cushion Adjustment

Fig. 1, Dura-Form Fleetcruiser Seat

For complete operating instructions, see the vehicle driver's manual.

Removal

NOTE: Call Dura-Form Customer Service at 800–553–3013 to answer any questions concerning any Dura-Form seat style not covered by the information provided.

1. Apply the parking brakes, and chock the tires.
2. Press the seat height adjustment rocker switch until the seat is adjusted to its maximum height.
3. If the seat is equipped with a seat suspension shroud, remove the shroud. It is held in place with Velcro and upholstery-panel fasteners.

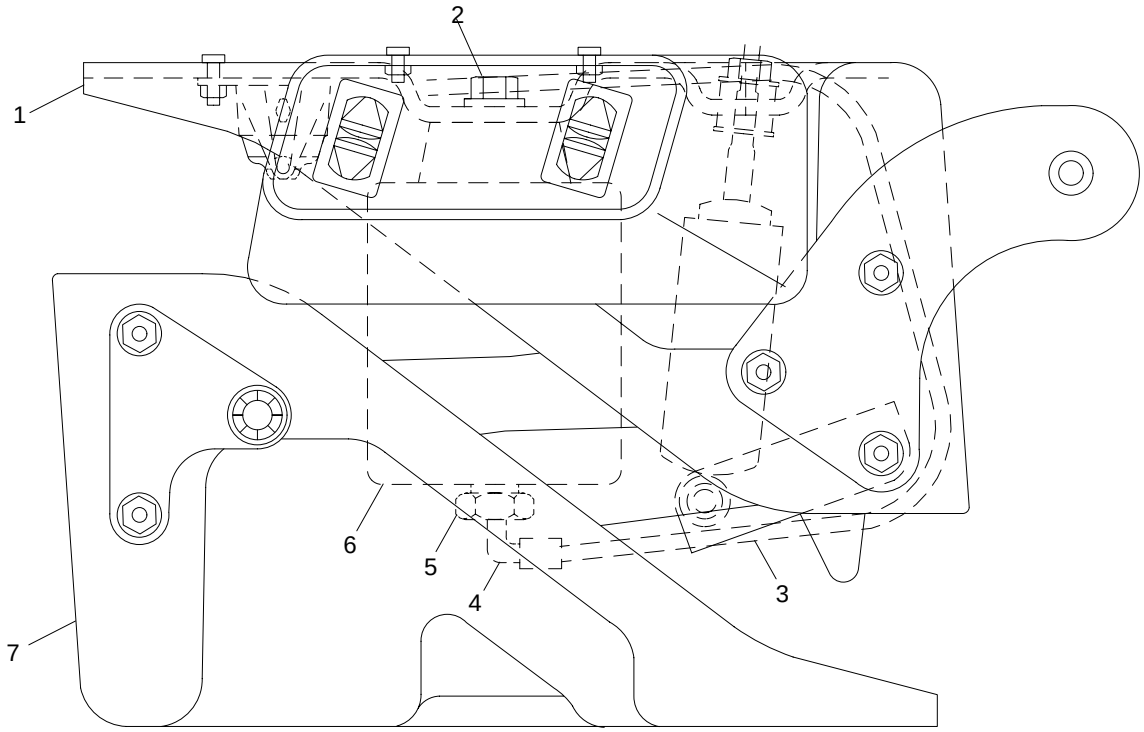
   If the seat is equipped with a rubber bellows seat suspension cover, raise the rubber bellows.
4. Cut a wooden block to the length required to support the seat at its maximum height, and place the block between the air suspension lower base and the rear crosstube of the lower arm.
5. Drain the vehicle air reservoirs. Then, press the seat height adjustment rocker switch until all air is exhausted from the air spring.
6. Disconnect the air valve air-supply hose at the quick-connect union behind the seat.
7. Using an 11/16-inch wrench or a T50 Torx® wrench, unscrew the capscrews that attach the seat-belt straps and tether straps to the intermediate-connecting-point threaded rod.
8. Remove the capscrews and washers that attach the seat to the cab deck. Remove the seat and both mounting support channels from the cab.

Installation

1. Place the seat on the cab deck. Position a mounting support channel at the front edge, and another at the rear edge of the seat base. Insert the capscrews through the washers, the support channels, and the seat base. Tighten the capscrews 27 lbf·ft (37 N·m).
2. Attach the brackets of the seat-belt straps and tether straps to the intermediate-connecting-point threaded rod. Tighten the capscrews 40 lbf·ft (54 N·m).
3. Connect the air valve air-supply hose by pressing the pneumatic tubing into the quick-connect union behind the seat.
4. Start the engine and allow the air reservoirs to fill. Press the seat height adjustment rocker switch until the seat is adjusted to its maximum height. If the seat is equipped with a rubber bellows seat suspension cover, raise the rubber bellows. Remove the wooden block that supports the seat suspension.
5. If the seat is equipped with a seat suspension shroud, install the shroud.
6. Remove the chocks from the tires.

Air Spring Removal and Installation

Removal (See Fig. 1)



03/06/97 f910211

1. Upper Housing
2. Hexhead Bolt
3. Tubing, Valve To Spring
4. Elbow
5. Jam Nut
6. Air Spring
7. Lower Housing

Fig. 1, Air Spring Assembly

NOTE: Call Dura-Form Customer Service at 800–553–3013 to answer any questions concerning any Dura-Form seat style not covered by the information provided.

1. Apply the parking brakes, and chock the tires.
2. Press the seat height adjustment switch until the seat is adjusted to its maximum height.
3. Cut a wooden block to the length required to support the seat at its maximum height, and place the block between the lower housing and the upper housing.
4. Drain the vehicle air reservoirs. Then press the seat height adjustment switch until all the air is exhausted from the air spring.
5. Disconnect the 7/16-inch air fitting at the bottom of the air spring. Remove the 3/4-inch jam nut.
6. Remove the 1/2-inch hexhead bolt and lockwasher at the top of the air spring.
7. Compress the air spring and rotate it forward to lift it out.

Installation (See Fig. 1)

1. Compress the air spring and install it by rotating it rearward.
2. Install the 1/2-inch hexhead bolt and lockwasher at the top of the air spring. Tighten 15 to 20 lbf·ft (20 to 27 N·m).

Air Spring Removal and Installation

3. Apply pipe sealant to the threads of the elbow. Insert the tube into the fitting until the tube bottoms in the fitting, then tighten one wrench turn past finger tight. Tighten the pipe threads on the fitting 12 to 18 lbf·ft (16 to 24 N·m).
4. Connect the air fitting to the air spring with the 3/4-inch jam nut. Tighten 72 to 96 lbf·in (800 to 1100 N·cm).
5. Start the engine and allow the air reservoirs to fill. Press the seat height adjustment switch until the seat is adjusted to its maxium height, then remove the wooden block.
6. Remove the chocks from the tires.

Removal (See Fig. 1)

Fig. 1, Shock Absorber Assembly

NOTE: Call Dura-Form Customer Service at 800–553–3013 to answer any questions concerning any Dura-Form seat style not covered by the information provided.

1. Apply the parking brakes, and chock the tires.
2. Press the seat height adjustment switch until the seat is adjusted to its maximum height.
3. Cut a wooden block to the length required to support the seat at its maximum height, and place the block between the lower housing and the upper housing.
4. Remove the 5/16-inch nut at the top of the shock absorber.
5. Remove the retaining ring and the shock pin at the bottom of the shock absorber.
6. Remove the shock absorber.

Installation (See Fig. 1)

1. Install the shock absorber.
2. Install the 5/16-inch nut at the top of the shock absorber. Tighten 10 to 15 lbf·ft (14 to 20 N·m).

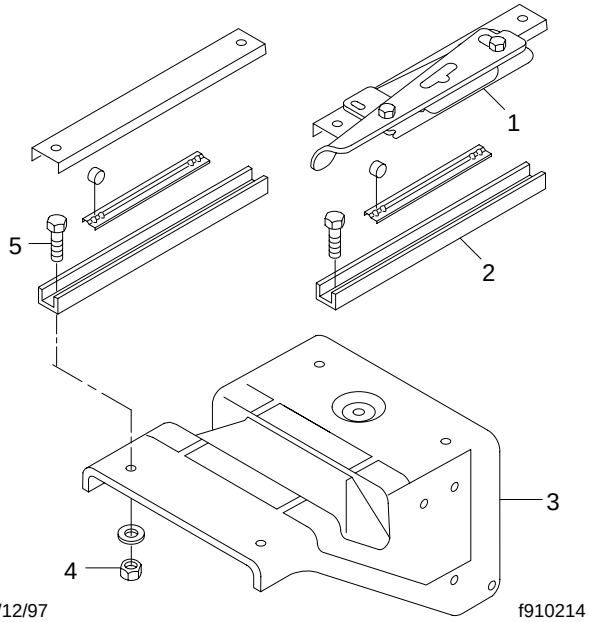
NOTE: The pin hole closest to the air spring is the firmer ride.

3. Install the shock pin and the retaining ring at the bottom of the shock absorber.

Shock Absorber Removal and Installation

4. Remove the wooden block from the seat, and the chocks from the tires.

Removal (See Fig. 1)



1. Isolator Plate and Handle
2. Slide
3. Upper Housing
4. Nut
5. Screw

NOTE: Call Dura-Form Customer Service at 800–553–3013 to answer any questions concerning any Dura-Form seat style not covered by the information provided.

1. Apply the parking brakes, and chock the tires.
2. Press the seat height adjustment switch until the seat is adjusted to its maximum height.
3. Cut a wooden block to the length required to support the seat at its maximum height, and place the block between the lower housing and the upper housing.
4. Remove the seat/back assembly using the instructions in **Subject 140**.
5. Remove the isolator assembly using a 1/2-inch socket and a 1/2-inch wrench.

Installation (See Fig. 1)

1. Install the isolator assembly using a 1/2-inch socket or wrench and a screwdriver.
2. Install the seat/back assembly using the instructions in **Subject 140**.
3. Remove the wooden block from the seat, and the chocks from the tires.

Seat/Back Assembly Removal and Installation

Removal

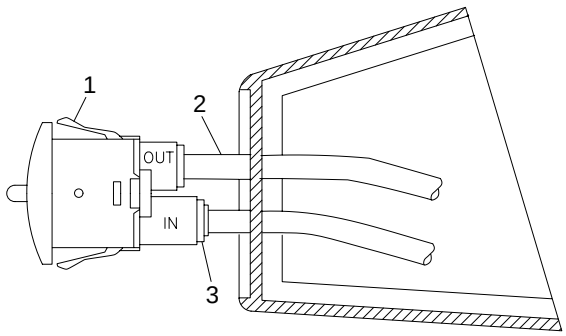
NOTE: Call Dura-Form Customer Service at 800–553-–3013 to answer any questions concerning any Dura-Form seat style not covered by the information provided.

1. Apply the parking brakes, and chock the tires.
2. Remove the four mounting bolts using a 1/2-inch socket and a 1/2-inch wrench.
3. Remove the seat/back assembly.

Installation

1. Place the seat/back assembly onto the isolator assembly.
2. Install the four mounting bolts using a 1/2-inch socket and a 1/2-inch wrench.
3. Remove the chocks from the tires.

Removal (See Fig. 1)



1. Retaining Fingers
2. Air Hose
3. Retaining Ring

Fig. 1, Air Valve Assembly

NOTE: Call Dura-Form Customer Service at 800–553–3013 to answer any questions concerning any Dura-Form seat style not covered by the information provided.

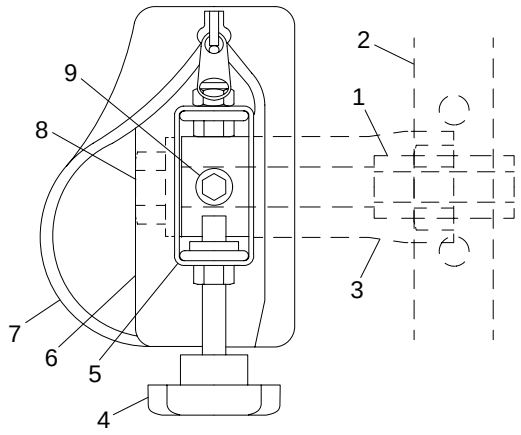
1. Apply the parking brakes, and chock the tires.
2. Drain the vehicle air reservoirs. Then press the seat height adjustment rocker switch until all air is exhausted from the air spring.
3. Reach behind and inside the air control panel and compress the two retaining fingers together on the air valve.
4. Remove the air valve by pushing it outward through the slot in the control panel.
5. Compress the gray retaining ring on the valve body inlet port toward the valve, and pull on the air hose to remove it from the valve.
6. Repeat the previous step for the outlet port.

Installation (See Fig. 1)

IMPORTANT: When installing the air lines, make sure they are connected to the same valve port they were removed from, and are firmly pressed into place. The new air line will insert approximately 1/2-inch when installed properly.

1. Install the air lines in the valve. Pull outward slightly on the new air lines to ensure a solid installation. Do not compress the air line retaining rings when verifying the installation.
2. Make sure the valve is properly oriented, and firmly press the complete valve back into the slot in the air control panel until you hear a "click." The "click" assures the valve retaining fingers are properly secured to the air control panel.
3. Start the engine and allow the air reservoirs to fill.
4. Remove the chocks from the tires.

Removal (See Fig. 1)



03/13/97 f910216

1. Coupling Nut (welded to seat frame assembly)
2. Seat Frame Assembly
3. Pivot Bar
4. Adjustment Knob
5. Armrest Tube
6. Armrest Foam
7. Armrest Cover
8. Armrest Bolt
9. Socket Head Screw

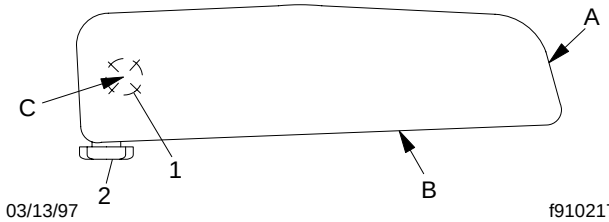
Fig. 1, Armrest, Rear View

NOTE: Call Dura-Form Customer Service at 800–553–3013 to answer any questions concerning any Dura-Form seat style not covered by the information provided.

1. Apply the parking brakes, and chock the tires.
2. Unzip the armrest cover.
3. Remove the socket head screw from the pivot bar in the armrest.
4. Loosen the armrest bolt.
5. Remove the armrest.
6. Remove the pivot arm from the seat back.

Installation

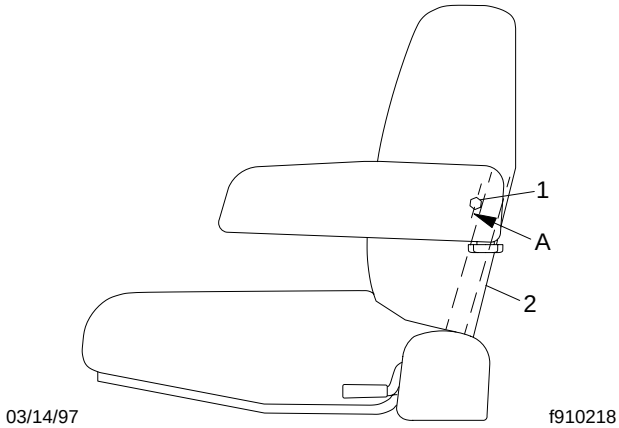
1. Locate the hole in the side of the armrest foam and make an incision. See **Fig. 2**.
2. Locate the coupling nut (welded to the seat frame assembly). Make an incision in the seat back cover. See **Fig. 3**.



03/13/97 f910217

A. Front
B. Bottom
C. Place incision on this side for the left-hand armrest. Place on the opposite side for the right-hand armrest.
1. Hole
2. Adjustment Knob

Fig. 2, Armrest



03/14/97 f910218

A. Place incision on this side for the left-hand armrest. Place on the opposite side for the right-hand armrest.
1. Coupling Nut (welded to seat frame assembly)
2. Seat Back

Fig. 3, Coupling Nut Location

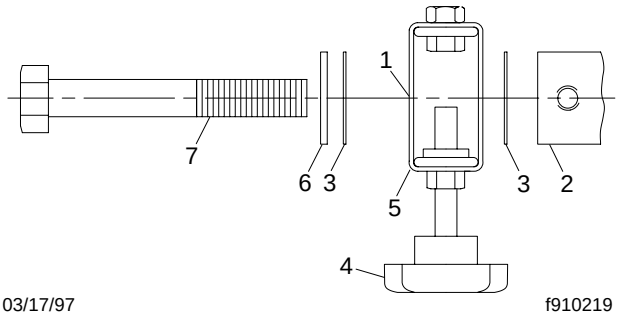
3. Insert the pivot bar through the incision in the seat back cover. Slide the pivot bar over the coupling nut with the hole for the socket head screw facing rearward. See **Fig. 1**.

NOTE: The seat back cover and foam will hold the pivot bar in place while the remainder of the armrest is prepared for assembly.

4. Unzip the armrest cover and assemble the armrest bolt, the metal washer, and the plastic washers through the hole in the side of the armrest tube. See **Fig. 4**. The armrest tube must be

Armrest Removal and Installation

clamped between the two plastic washers when assembly is complete.



1. Small Hole
2. Pivot Bar
3. Plastic Washer
4. Adjustment Knob
5. Armrest Tube
6. Metal Washer
7. Armrest Bolt

Fig. 4, Armrest Assembly

5. Slide the assembled armrest over the pivot bar. Tighten the armrest bolt 22 to 23 lbf·ft (29 to 31 N·m). See **Fig. 1**.

IMPORTANT: The pivot bar must be seated against the seat frame while the armrest bolt is tightened.

6. Install the socket head screw into the pivot bar. See **Fig. 1**. Tighten 10 to 16 lbf·ft (13 to 21 N·m).
7. Zip up the armrest cover.
8. Remove the chocks from the tires.

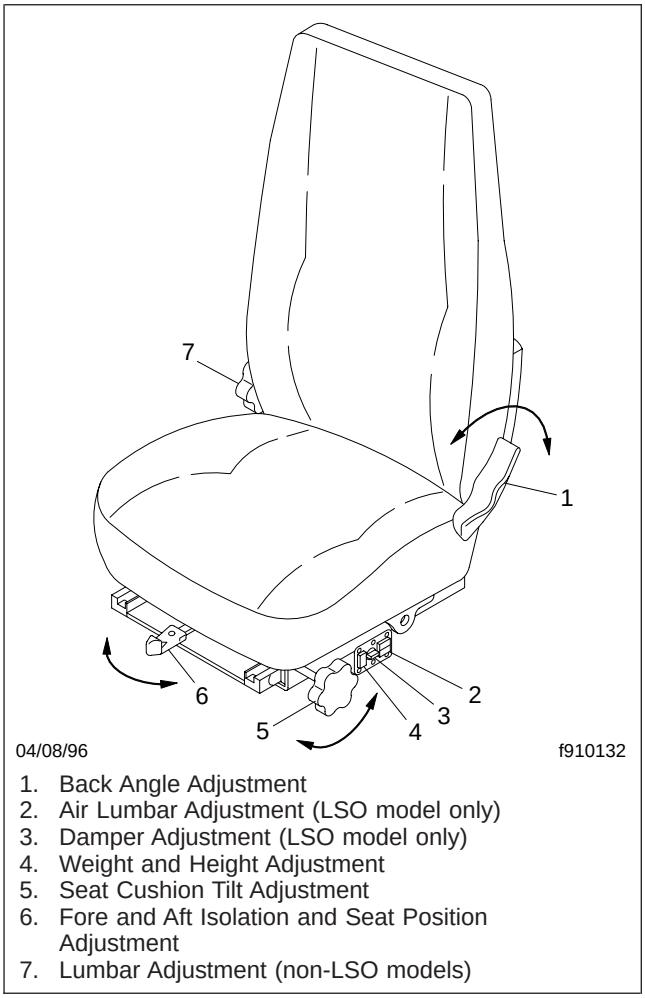
Specifications

Fastener Torques		
Description	**Size**	**Torque**
Seat Base Hexhead Capscrews	3/8–16	27 lbf·ft (37 N·m)
Intermediate-Connecting-Point Rod Capscrews	11/16	40 lbf·ft (54 N·m)
Air Spring Hexhead Bolt	1/2	15–20 lbf·ft (20–27 N·m)
Air Spring Fitting Pipe Threads	—	12–18 lbf·ft (16–24 N·m)
Air Fitting to Air Spring Jam Nut	3/4	72–96 lbf·in (800–1100 N·cm)
Shock Absorber Nut	5/16	10–15 lbf·ft (14–20 N·m)
Armrest Bolt	—	22–23 lbf·ft (29–31 N·m)
Socket Head Screw	—	10–16 lbf·ft (13–21 N·m)

Table 1, Fastener Torques

General Information

The Bostrom Talladega 900 series air suspension seats offer weight-height adjustment, infinite adjustment Parabar II lumbar support and a fore and aft roller track isolator system. See **Fig. 1**.

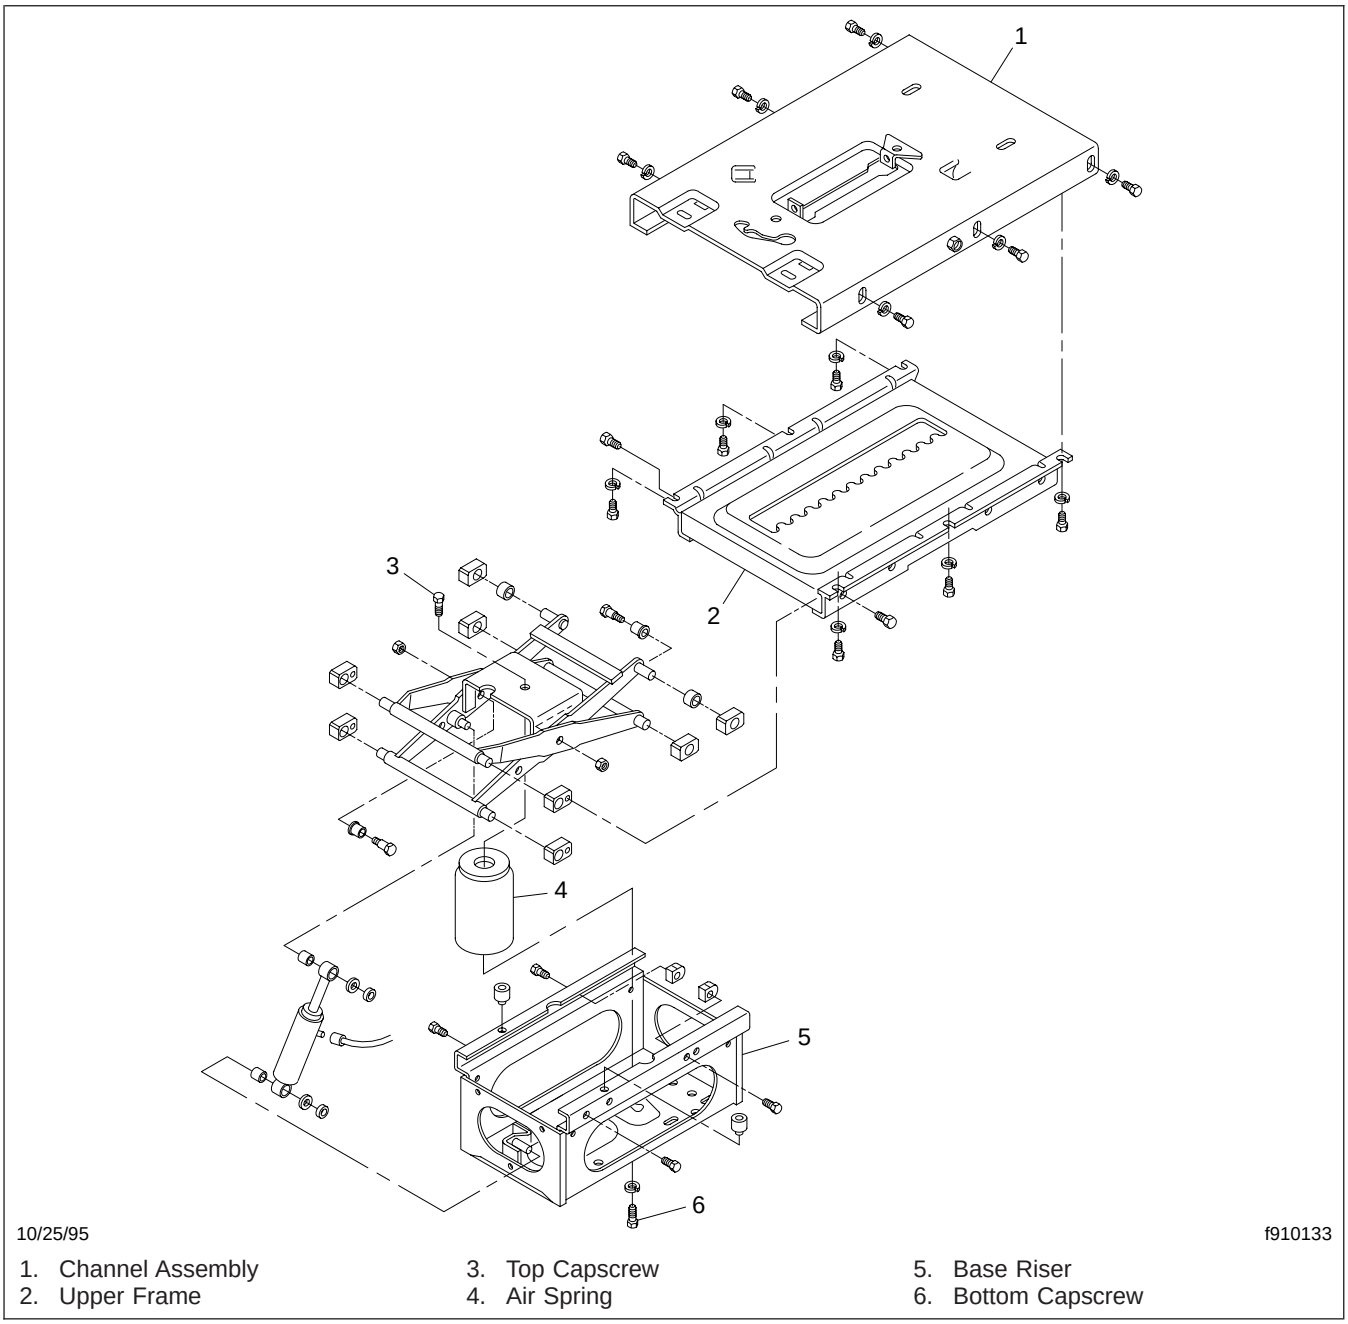


1. Back Angle Adjustment
2. Air Lumbar Adjustment (LSO model only)
3. Damper Adjustment (LSO model only)
4. Weight and Height Adjustment
5. Seat Cushion Tilt Adjustment
6. Fore and Aft Isolation and Seat Position Adjustment
7. Lumbar Adjustment (non-LSO models)

Fig. 1, Bostrom Talladega 900 Series Seat

For complete operating instructions, refer to the vehicle driver's manual.

Removal (See Fig. 1)



1. Channel Assembly
2. Upper Frame
3. Top Capscrew
4. Air Spring
5. Base Riser
6. Bottom Capscrew

Fig. 1, Bostrom Talladega 900 Series Seat Air Spring

NOTE: The seat, the seat/back assembly, and the channel assembly do not need to be re-

Air Spring Removal and Installation

moved. Move the channel assembly to the rearmost position to provide access to the air spring.

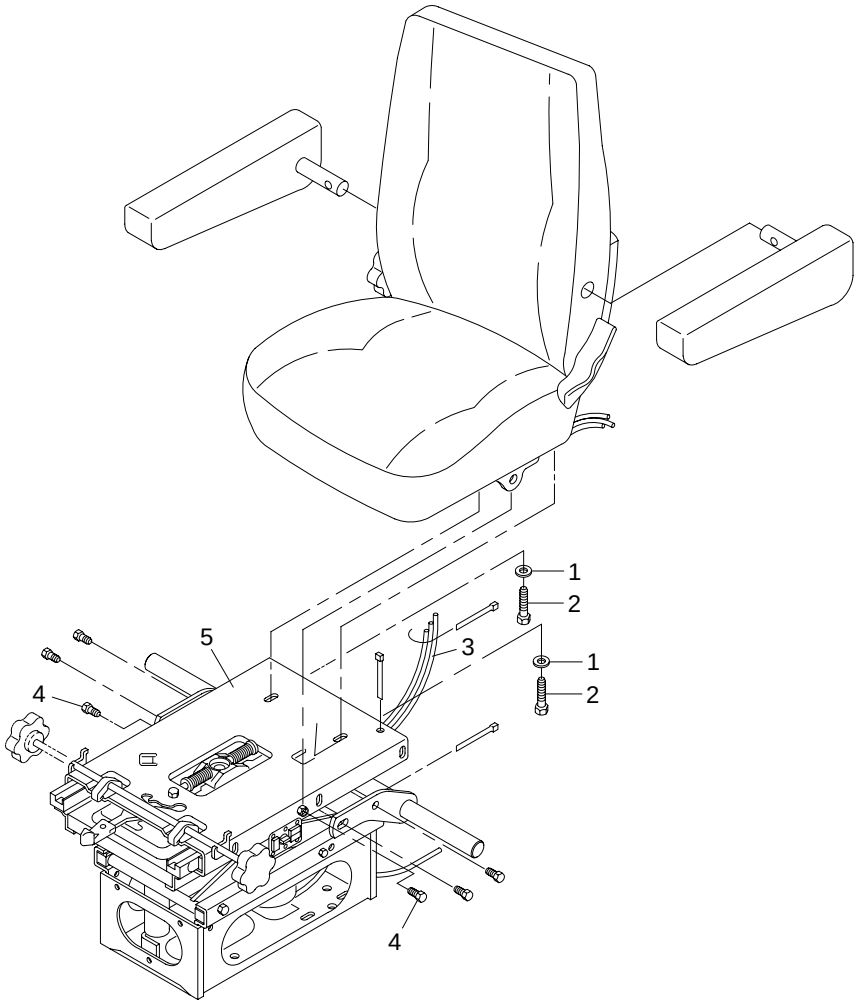
1. Fill the air spring so that the seat is at maximum height.
2. Block the suspension up with a spacer placed between the base riser and the upper frame .
3. Release the air pressure from the air spring so that the seat is supported by the spacer.
4. Disconnect the air line from the air spring by pushing in the collar of the fitting while pullling the air line out of the fitting.
5. Remove the top capscrew, and loosen the bottom capscrew through the rear opening in the base riser. Remove the air spring from the suspension.

Installation (See Fig. 1)

1. Assemble the bottom capscrew to the new air spring. Install the air spring by fitting the bottom capscrew into the key hole opening in the bottom of the base riser. Position the air spring so the fitting at the bottom of the air spring is toward the front of the seat.
2. Tighten the bottom capscrew 9 to 11 lbf·ft (12 to 15 N·m).
3. Install the top capscrew and torque 15 to 19 lbf·ft (20 to 26 N·m).
4. Connect the air line to the fitting in the air spring by pushing the tube into the fitting.
5. Fill the air spring and remove the spacer block.

Seat/Back Assembly Removal and Installation

Removal (See Fig. 1)



04/08/96 f910134

1. Flatwasher
2. Capscrew
3. Air Lines
4. Shoulder Bolt
5. Channel Assembly

Fig. 1, Bostrom Talladega 900 Series Seat

1. Adjust the seat/back assembly to the most rearward position and remove the two capscrews and flatwashers from the underside of the channel assembly.
2. Remove the two shoulder bolts from the channel assembly.
3. Disconnect the air lines.
4. Remove the seat/back assembly.

Installation (See Fig. 1)

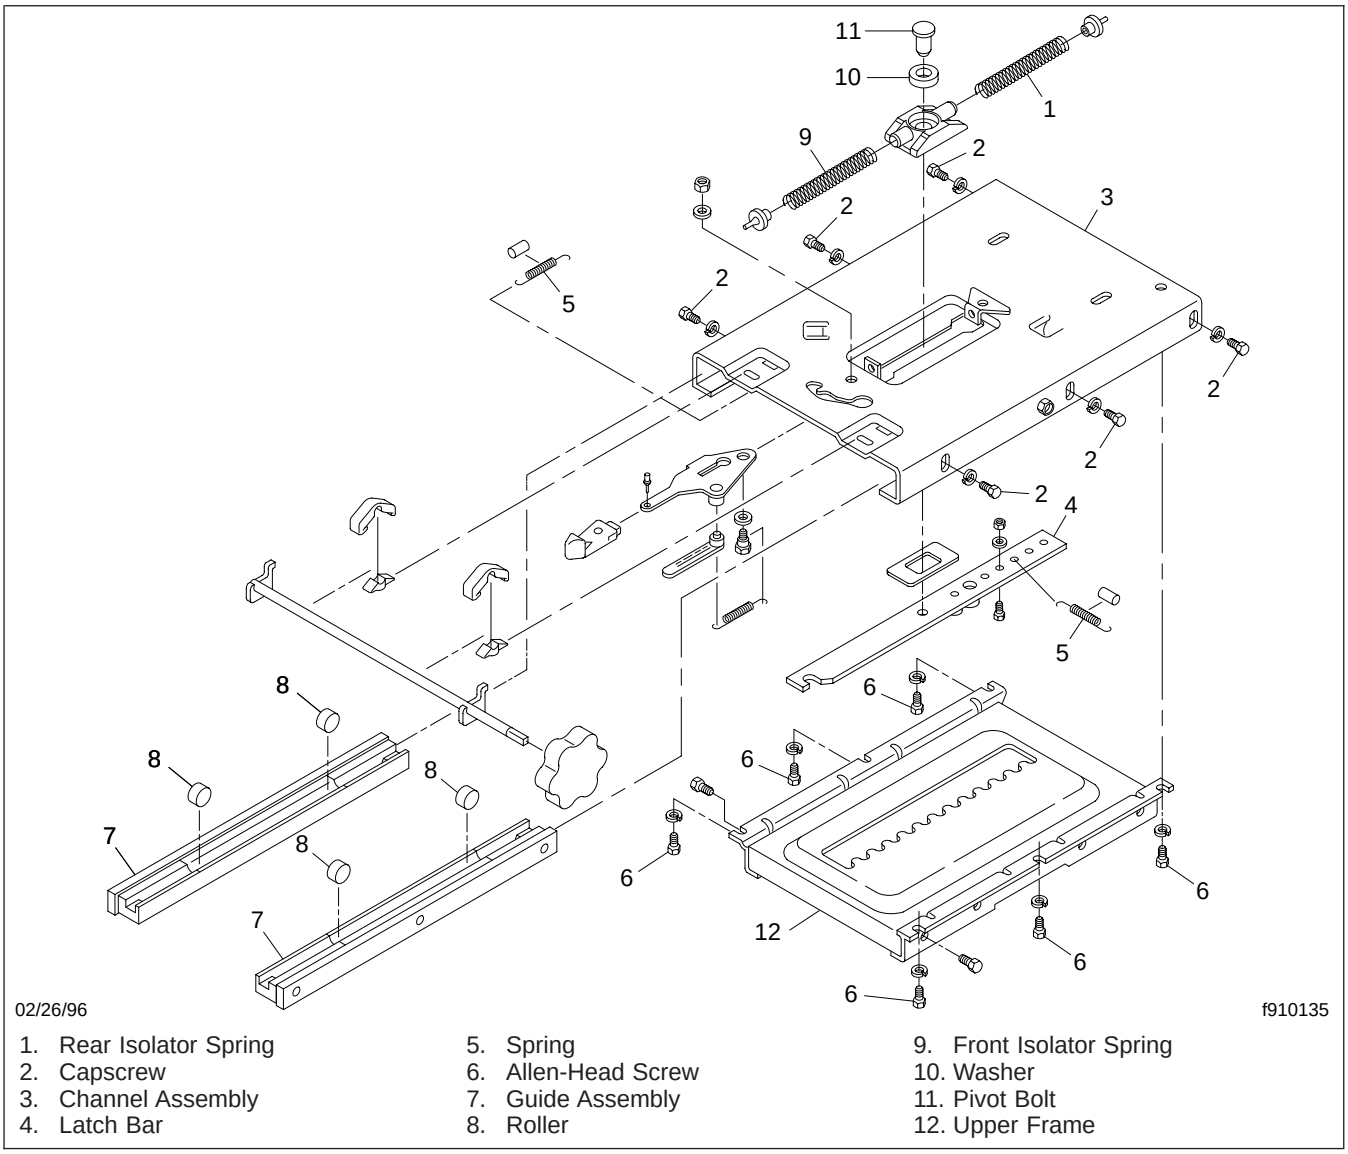
1. Place the seat/back assembly onto the channel assembly.
2. Connect the air lines to the air spring, and the air line to the vehicle air supply.

Seat/Back Assembly Removal and Installation

3. Install the two shoulder bolts in the channel assembly.
4. Install the two capscrews and flatwashers in the underside of the channel assembly.

Fore and Aft Isolation Channel Removal and Installation

Removal (See Fig. 1)



1. Rear Isolator Spring
2. Capscrew
3. Channel Assembly
4. Latch Bar
5. Spring
6. Allen-Head Screw
7. Guide Assembly
8. Roller
9. Front Isolator Spring
10. Washer
11. Pivot Bolt
12. Upper Frame

Fig. 1, Channel Assembly (exploded)

1. Remove the seat/back assembly. See **Subject 110**.
2. With the channel assembly set in its unlocked position, or in the "isolation position," push the channel assembly rearward and remove the rear isolator spring. Pull the channel assembly forward and remove the front isolator spring.
3. Adjust the channel assembly until the cutouts in the underside of the channel line up with the allen-head screws. Remove the allen-head screws.
4. Remove the three capscrews on each side of the channel assembly.

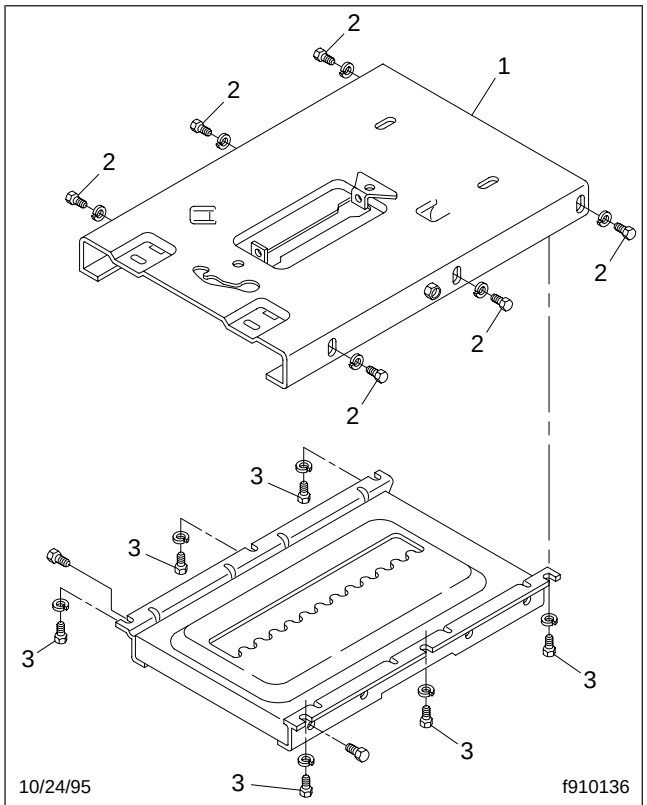
Fore and Aft Isolation Channel Removal and Installation

5. Remove both guide assemblies and the four rollers.
6. Disconnect the spring from the latch bar.
7. Remove the pivot bolt and washer, slide the latch bar out, and remove the channel assembly.

Installation (See Fig. 1)

1. Place the channel assembly onto the upper frame, slide the latch bar in, and install the pivot bolt and washer. Torque the bolt 26 to 34 lbf·ft (36 to 46 N·m).
2. Connect the springs to the latch bar.
3. Install both guide assemblies and the four rollers.
4. Install the three screws on each side of the channel assembly. Torque the screws 15 to 17 lbf·ft (20 to 23 N·m).
5. Install the six allen-head screws on the underside of the channel assembly. Torque the screws 15 to 17 lbf·ft (20 to 23 N·m).
6. With the channel assembly in the isolation position, pull the assembly forward and install the front isolator spring. Push the assembly rearward and install the rear isolator spring.
7. Adjust the channel assembly using the instructions in **Subject 130**.
8. Install the seat/back assembly. See **Subject 110**.

Adjustment (See Fig. 1)

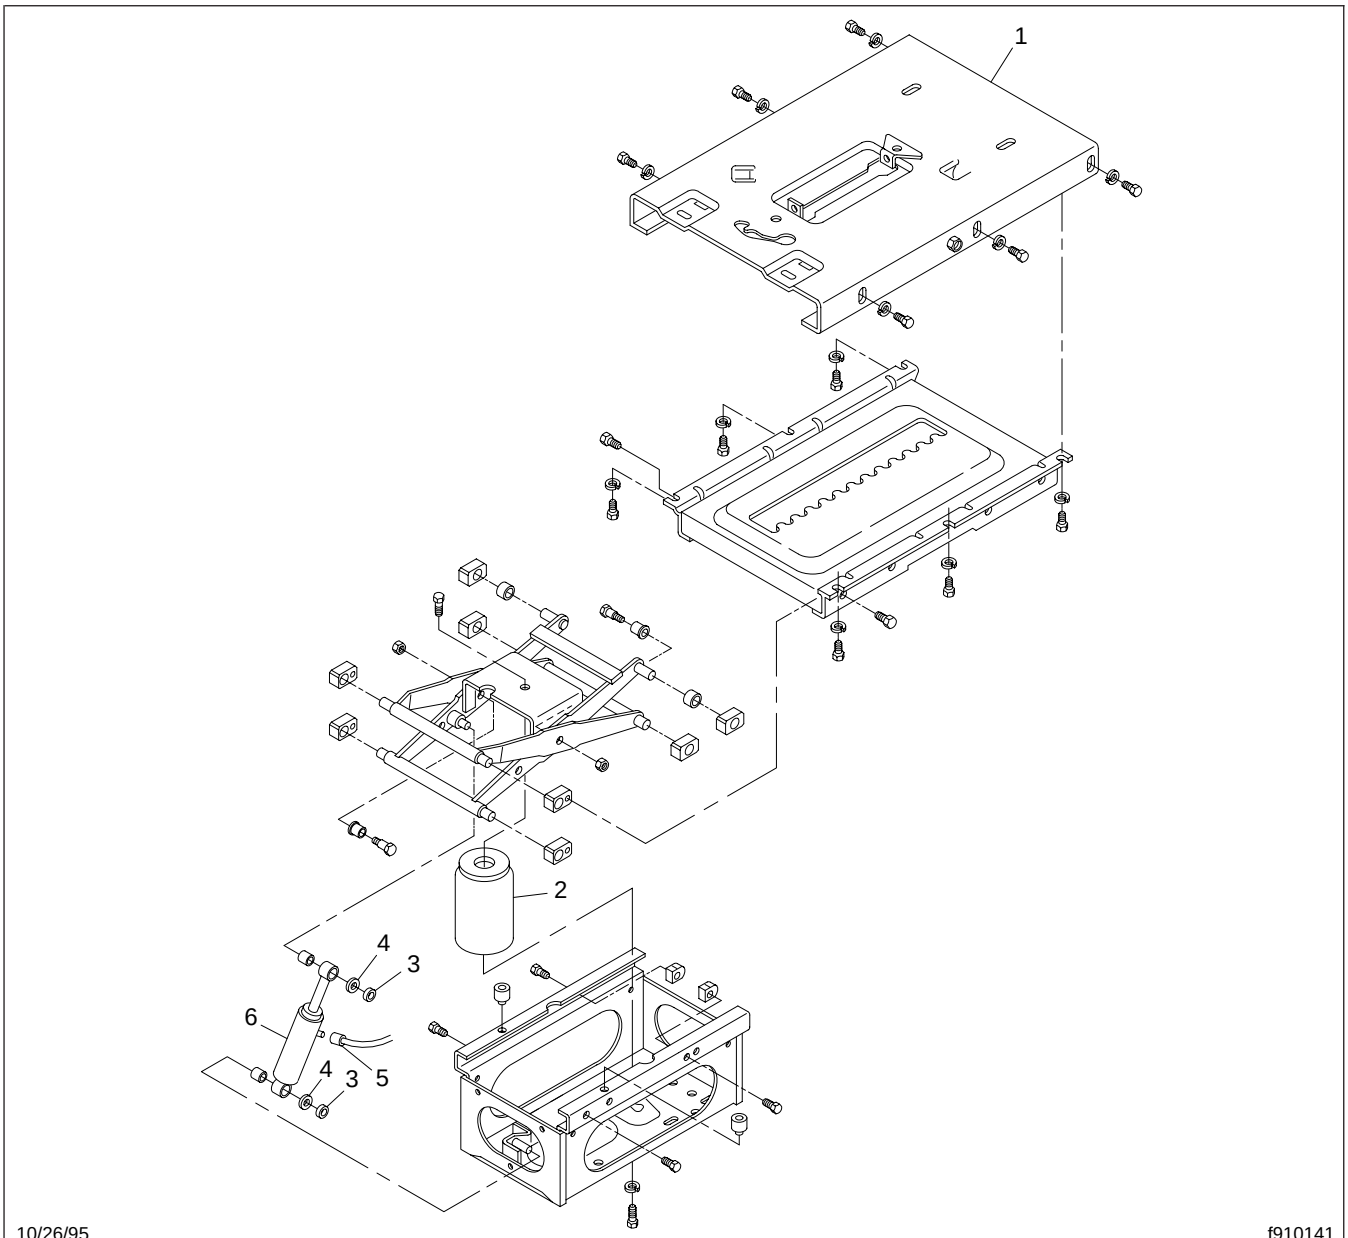


1. Channel Assembly
2. Capscrew
3. Allen-Head Screw

Fig. 1, Channel Assembly

1. Remove the seat/back assembly from the channel assembly using the instructions in **Subject 110**.
2. Adjust the channel assembly so the cutouts in the underside of the channel assembly line up with the Allen-head screws.
3. Use a 5/32-inch Allen wrench to loosen the six screws underneath the channel assembly.
4. Push the slide track outward to take up excessive lateral movement and retighten the six screws. Torque the screws 5 to 7 lbf·ft (7 to 9 N·m).
5. Loosen the six capscrews along the side of the channel assembly.
6. Push down on the channel assembly to adjust vertical play and tighten the six capscrews 5 to 7 lbf·ft (7 to 9 N·m).

Removal (See Fig. 1)



1. Channel Assembly
2. Air Spring
3. Push-On Fastener
4. Thrust Washer
5. Control Cable (LSO model only)
6. Damper

Fig. 1, Channel Assembly (exploded)

NOTE: The seat/back assembly does not need to be removed.

1. Move the channel assembly to the rearmost position to provide access to the damper assembly.

Damper Removal and Installation

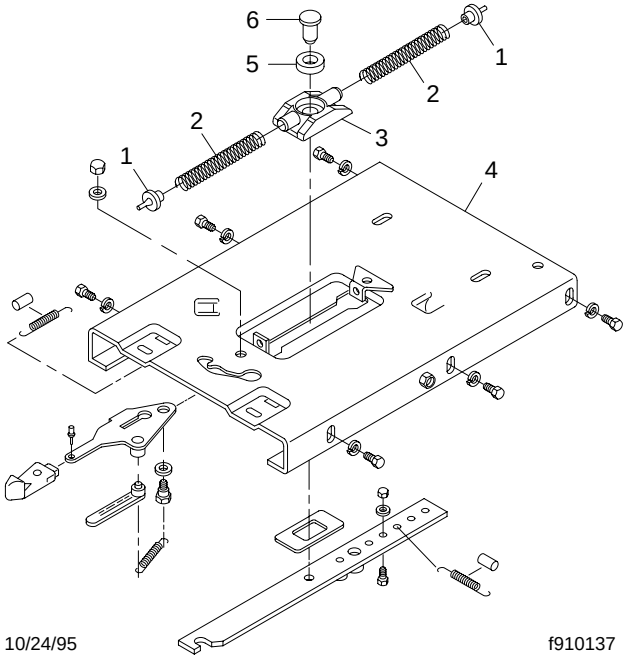
2. Fill the air spring so that the seat is at maximum height.
3. Use pliers or a screwdriver to twist off the push-on fasteners. The push-on fasteners are not reusable.
4. On LSO models only, disconnect the control cable from the damper. Remove the damper.

Installation (See Fig. 1)

1. Install the new damper with the flanges of the bearings to the outside of the suspension. On LSO model only, connect the control cable.
2. Install the thrustwashers and the new push-on fasteners until they seat. A 1/2-inch box-end wrench works well to push the fasteners on.

Isolation Bumper Removal and Installation

Removal (See Fig. 1)



1. Isolation Bumper
2. Isolation Spring
3. Pivot Block
4. Channel Assembly
5. Washer
6. Pivot Bolt

Fig. 1, Channel and Isolation Bumper Assembly

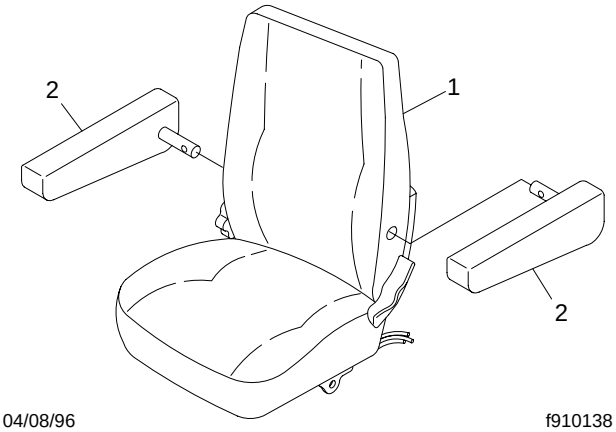
1. Remove the seat/back assembly using the instructions in **Subject 110**.
2. Remove the two isolation springs by pushing the channel assembly rearward to remove the rear spring and pulling the channel assembly forward to remove the front spring.
3. Remove the isolation bumpers.

Installation (See Fig. 1)

1. If the pivot block was removed, install the pivot block with the pivot bolt and washer. Torque the bolt 26 to 34 lbf·ft (36 to 46 N·m).
2. Install the isolation bumpers.
3. Install the two isolation springs by pulling the channel assembly forward to install the front spring and pushing the channel assembly rearward to install the rear spring.
4. Install the seat/back assembly using the instructions in **Subject 110**.

Back Cover/Pad Assembly Removal and Installation

Removal (See Fig. 1)



1. Upper Seat Assembly
2. Armrest

Fig. 1, Upper Seat Assembly (armrests removed)

1. Remove the seat/back assembly from the suspension, using the instructions in **Subject 110**. Remove the armrests if the seat assembly has armrests.
2. Remove the back cover and pad from the seat frame assembly. Note the location of the fasteners on the existing back cover.

Installation (See Fig. 1)

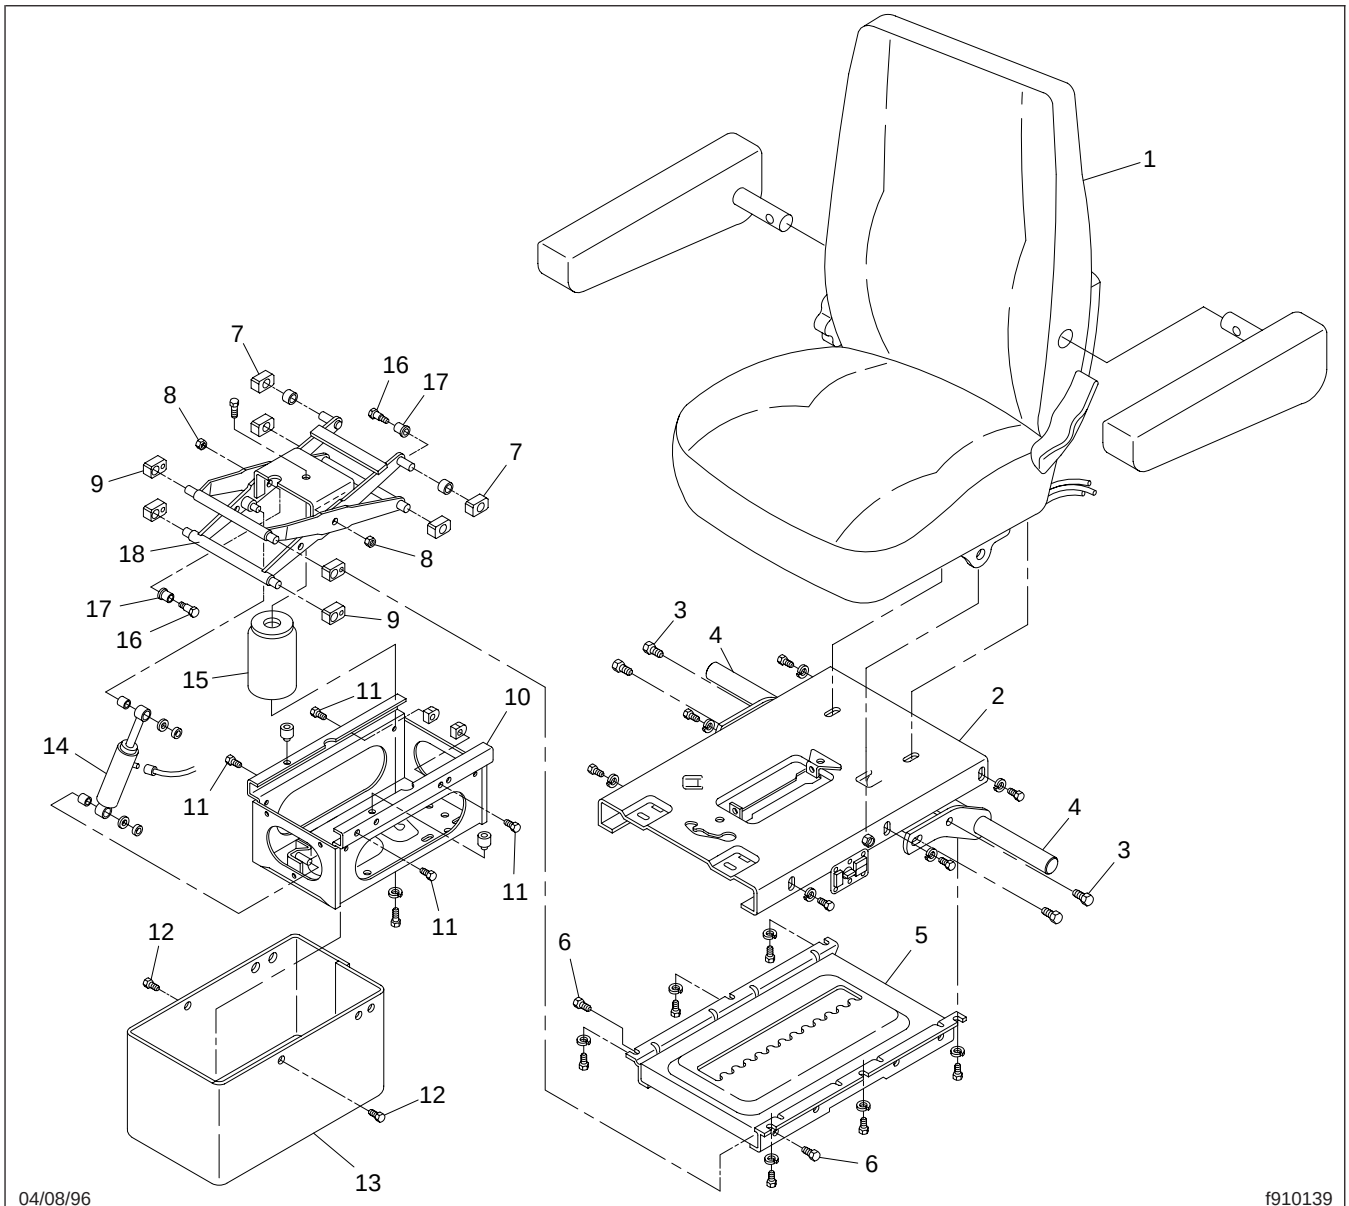
1. Place a new pad over the back frame. If the seat has lumbar adjustment, make a cut in the edge of the pad to fit around the handle.
2. Place the cover (inside out) over the top of the back pad. Pull down the cover until the three tie-down tabs are even with the three slots in the pad. Pull the tie down tabs through the slots in the pad and run a short wire through all three tabs. Continue to pull the cover down completely over the pad. Tuck the front flap of the back cover between the seat cushion and the bottom of the back pad and lock the J welt together.

NOTE: If the seat is a high back, there will be two sets of tie down tabs (six total with two wires) to be pulled through the back pad and wired.

3. Attach the upper seat assembly to the suspension using the instructions in **Subject 110**. Install the armrests if the seat has armrests.

Suspension Rebuild Bearing/Slide Block Removal and Installation

Removal (See Fig. 1)



1. Seat/Back Assembly
2. Channel Assembly
3. Capscrew
4. ICP Bracket
5. Upper Frame
6. Capscrew
7. Slide Block
8. Nut
9. Bearing Block
10. Base Riser
11. Capscrew
12. Fastener
13. Suspension Cover
14. Damper
15. Air Spring
16. Shoulder Bolt
17. Bearing
18. Slide Lever Assembly

Fig. 1, Bostrom Talladega 900 Series Seat (exploded)

Suspension Rebuild Bearing/Slide Block Removal and Installation

1. Bleed all the air from the supply line. Disconnect the air supply line from the seat. Using the air valve, exhaust all air from the air spring. Remove the complete seat assembly from the vehicle.
2. Remove the seat/back assembly using the instructions in **Subject 110**.
3. Remove the channel assembly using the instructions in **Subject 120**.
4. Remove the capscrews and the ICP bracket. If the seat assembly has a suspension cover, remove the fasteners and the suspension cover.
5. Block the suspension up with a spacer block placed between the base riser and the upper frame.
6. Remove the capscrews from the upper bearing blocks.
7. Remove the upper frame assembly by sliding it forward off the bearing blocks and the slide blocks.
8. Remove the air spring using the instructions in **Subject 100**. Mark the air lines for reassembly.
9. Remove the damper using the instructions in **Subject 140**.
10. Remove the capscrews from the lower bearing blocks and slide the lever assemblies forward until the bearing blocks are removed from the channel on the base riser. Slide the lever assemblies rearward to remove the slide blocks from the channel.
11. Remove the shoulder bolts and nuts from the pivots of the lever assemblies and inspect the bolts. If the bolts are worn, replace them.

Installation (See Fig. 1)

1. Replace the bearings at the pivots on the lever assembly by pushing out the old bearings and pressing in the new bearings. The flange of the bearings should be on the outside of the lever assembly.
2. Install the shoulder bolts and nuts into the pivots of the lever assemblies. Torque the bolts 18 to 22 lbf·ft (24 to 30 N·m).
3. Install new bearing blocks, spacers, and slide blocks on the levers with the beveled surfaces outward, then slide the levers with blocks into the channel on the base riser. Torque the capscrews 27 to 33 lbf·ft (37 to 45 N·m).
4. Slide the upper frame assembly over the blocks. Line up the capscrews with the bearing blocks (Ref. 9) and torque the capscrews 27 to 33 lbf·ft (37 to 45 N·m).
5. Manually move the suspension up and down to make sure there are no clearance problems.
6. Block the suspension up with a spacer block placed between the base riser and the upper frame. Install the air spring using the instructions in **Subject 100**.
7. Install the damper using the instructions in **Subject 140**.
8. Install the ICP bracket and capscrews. If the seat assembly has a suspension cover, install the suspension cover and the fasteners.
9. Install the channel assembly using the instructions in **Subject 120**.
10. Install the seat/back assembly using the instructions in **Subject 110**.
11. Adjust lateral (side) play using the instructions in **Subject 130**.
12. Install the seat assembly in the vehicle. Connect the air supply line to the seat.

Basic Wiring Diagram

For the basic wiring diagram for the Bostrom power seat, see **Fig. 1**.

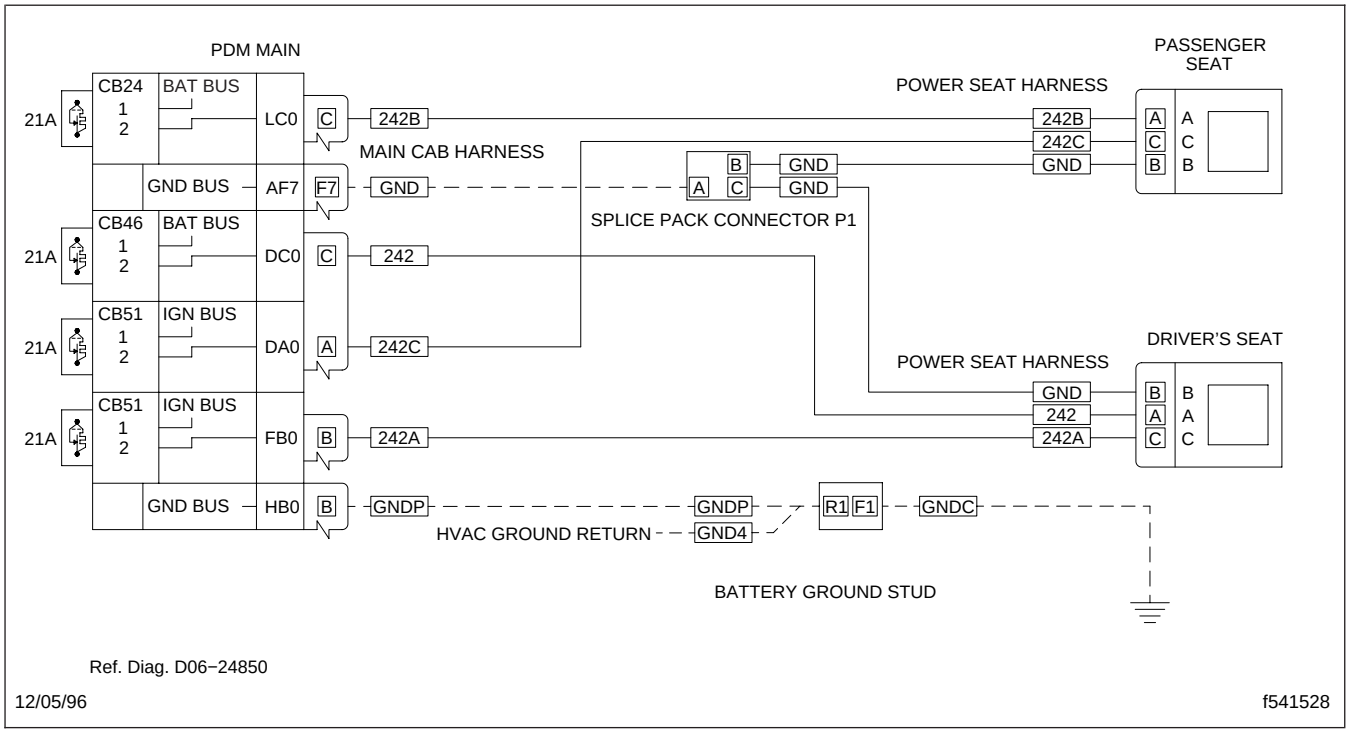


Fig. 1, Basic Wiring, Bostrom Power Seat

Recaro Seat Removal and Installation

Seat Removal

1. Apply the parking brakes, and chock the tires.
2. Press the seat ride-height rocker switch until the seat is adjusted to its maximum height.
3. Cut a wooden block to the length required to support the seat at its maximum height, and place the block in the seat suspension.
4. Drain the vehicle air reservoirs. Then press the seat ride-height rocker switch until all air is exhausted from the air spring.
5. Disconnect the air valve air-supply hose at the quick-connect union behind the seat.
6. Pull apart the connector for the wiring that provides electrical power to the seat. The connector is under the lower B-pillar cover.
7. If the seat is being replaced, use a T50 Torx wrench to unscrew the capscrews that attach the seat-belt straps to the seat belt connection brackets.
8. Remove the capscrews and washers that attach the seat to the cab deck. Remove the seat from the cab.

Seat Installation

1. Place the seat on the cab deck. Insert the capscrews through the washers and the seat base. Tighten the capscrews 27 lbf·ft (37 N·m).
2. If the seat belts were removed, attach the brackets of the seat-belt straps to the seat belt connection brackets on the seat. Tighten the Torx capscrews 40 lbf·ft (54 N·m).
3. Push together the halves of the connector for the wiring that provides electrical power to the seat.
4. Attach the air valve air-supply hose by pressing the pneumatic tubing into the quick-connect union behind the seat.
5. Start the engine and allow the air reservoirs to fill. Press the seat ride-height rocker switch until the seat is adjusted to its maximum height. Remove the wooden block that supports the seat suspension.

General Information

WARNING

Inspect and maintain seat belts. When any part of a seat belt system needs replacement, the entire seat belt must be replaced, both retractor and buckle side. Any time a vehicle is involved in an accident, and the seat belt system was in use, the entire vehicle seat belt system must be replaced before operating the vehicle. Do not attempt to modify the seat belt system; doing so could change the effectiveness of the system. Failure to replace worn or damaged seat belts, or making any modifications to the system, may result in personal injury or death.

Although the three-point seat belts installed in Freightliner vehicles appear similar to the seat belts used in passenger cars, there are some important differences that can affect service life:

- A heavy truck can travel more miles in a year than a car might go in its lifetime.
- There is more movement in a truck seat belt system, especially with air ride seats.
- Trucks often operate in more severe environments than cars, such as gravel pits, cement plants, and grain elevators, where the belts are exposed to abrasive dirt and dust.

Because of these factors, truck seat belt systems need to be inspected regularly to ensure that they are in proper condition; see **Subject 130**.

IMPORTANT: When any part of a seat-belt system needs replacement, the entire seat-belt system must be replaced—both the retractor side and the buckle side and, if equipped, both tether belts.

Replacement

IMPORTANT: When any part of a seat-belt system needs replacement, the entire seat-belt system must be replaced—both the retractor side and the buckle side, and if equipped, both tether belts. See **Fig. 1** and **Fig. 2**.

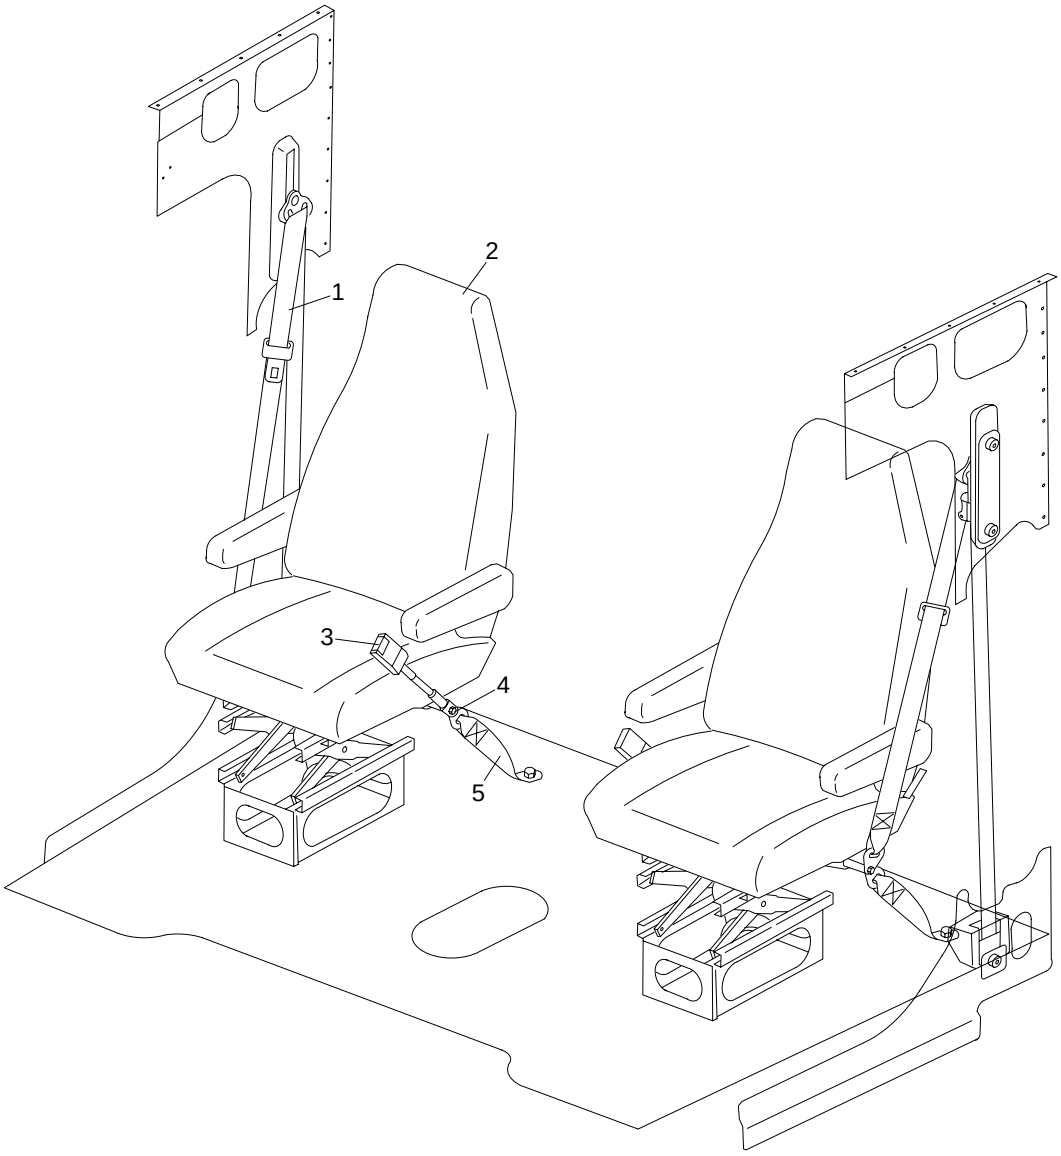
Any time a vehicle is involved in an accident, the entire vehicle's seat-belt system must be replaced before again operating the vehicle.

1. Apply the parking brakes, and chock the tires.
2. If the seat belts are for an air-adjustable seat, use an 11/16-inch socket or a T50 Torx wrench to unscrew the capscrews that attach the brackets of the seat-belt straps, and if equipped, the tether belts, to the intermediate-connecting-point threaded rod. Remove and discard the buckle-side of the seat belt.

   If the seat belts are for a static passenger seat, use an 11/16-inch socket or a T50 Torx wrench to unscrew the capscrews that attach both seat-belt angled brackets to the cab deck. Remove and discard the buckle-side of the seat belt.
3. If an air-adjustable seat has tether belts, use an 11/16-inch socket or a T50 Torx wrench to unscrew the capscrews that attach both tether belt brackets to the cab deck. Remove and discard the tether belts.
4. Use an 11/16-inch socket or a T50 Torx wrench to unscrew the capscrew that attaches the seat belt retractor to the lower cab wall. Then unscrew the T50 Torx capscrews that attach the adjustable D-loop mechanism to the upper cab wall. Remove and discard the retractor-side of the seat belt.
5. Attach the adjustable D-loop mechanism of the new seat belt to the upper cab wall; tighten the Torx capscrews 40 lbf·ft (54 N·m). Attach the seat belt retractor to the lower cab wall; tighten the capscrews 40 lbf·ft (54 N·m).
6. If tether belts are required for an air-adjustable seat, attach the angled brackets of the new tether belts to the cab floor; tighten the capscrews 40 lbf·ft (54 N·m).
7. If the seat belts are for an air-adjustable seat, insert the capscrews of the seat belt brackets through the straight brackets of the tether belts (if so equipped), and attach the brackets to the intermediate-connecting-point threaded rod. Tighten the capscrews 40 lbf·ft (54 N·m).

   If the seat belts are for a static passenger seat, attach both seat-belt angled brackets to the cab deck. Tighten the capscrews 40 lbf·ft (54 N·m).
8. Remove the chocks from the tires.

Seat-Belt/Tether Belt Replacement



1. Seat Belt
2. Seat
3. Buckle
4. Intermediate Connection Point
5. Tether Belt

4. Seat Belt, Buckle Side

Fig. 2, Seat Belt Assembly (static passenger seat shown)

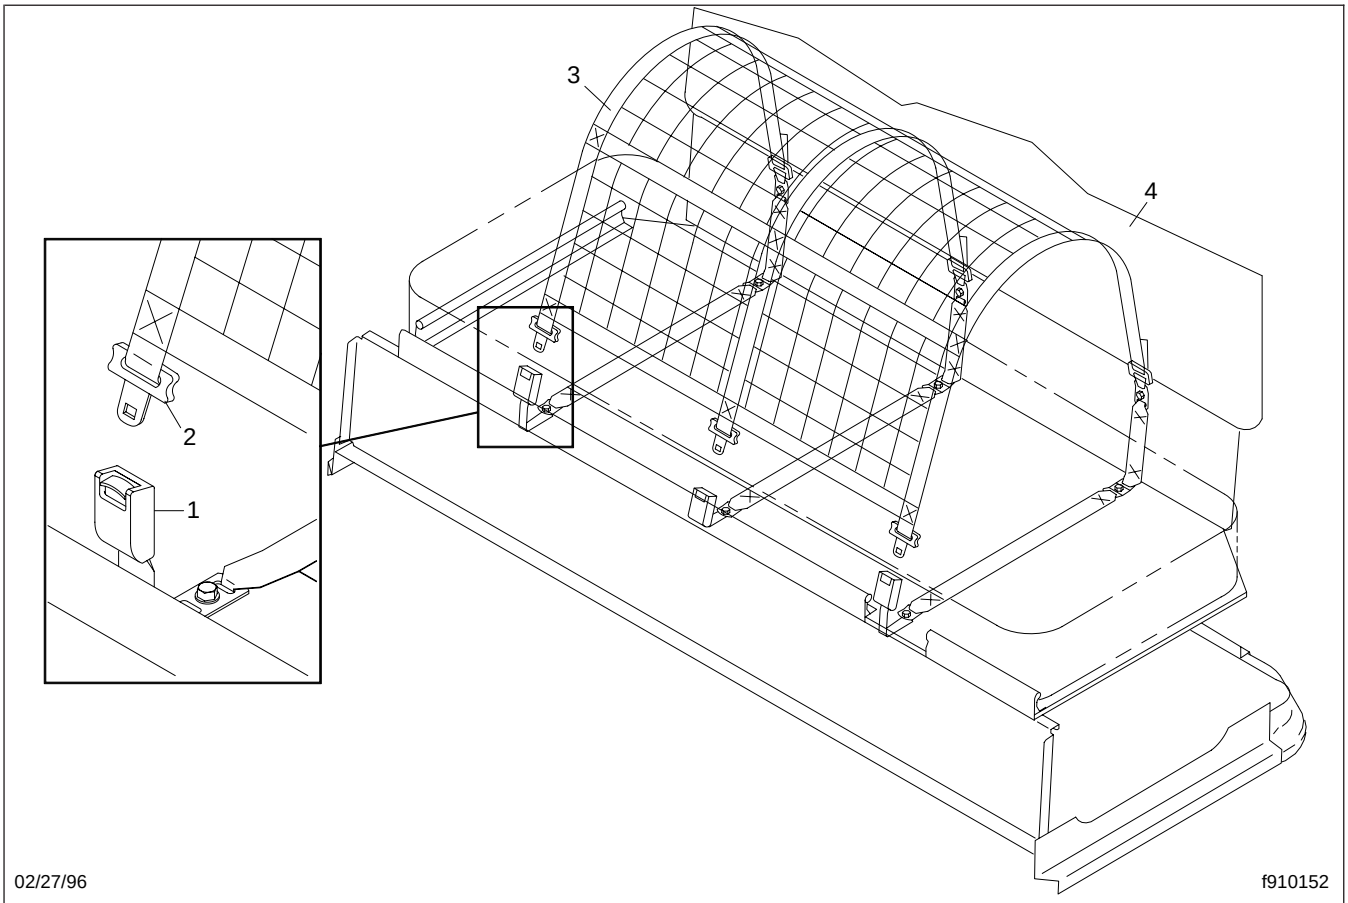
Bunk Restraint Removal and Installation

Removal

IMPORTANT: When any part of a restraint system needs replacement, the entire restraint system must be replaced. See **Fig. 1** .

Any time a vehicle is involved in an accident, the entire restraint system must be replaced before again operating the vehicle.

4. Remove the cover caps from the hexhead bolts on the bunk hatch and from the hexhead bolts that attach the bunk restraint to the rear wall of the cab.
5. Remove the six hexhead bolts on the rear wall.
6. Lift the bunk hatch to access the nuts attached to the hexhead bolts on the bunk hatch.



1. Buckle
2. Grip
3. Restraint
4. Rear Cab Wall

Fig. 1, Bunk Restraint Assembly

1. Shut down the engine and set the parking brake.
2. Chock the front tires.
3. Remove the mattress from the bunk.
7. Remove the three bolts on the bunk hatch.
8. Remove the bunk restraint.

Installation

1. Position the bunk restraint.

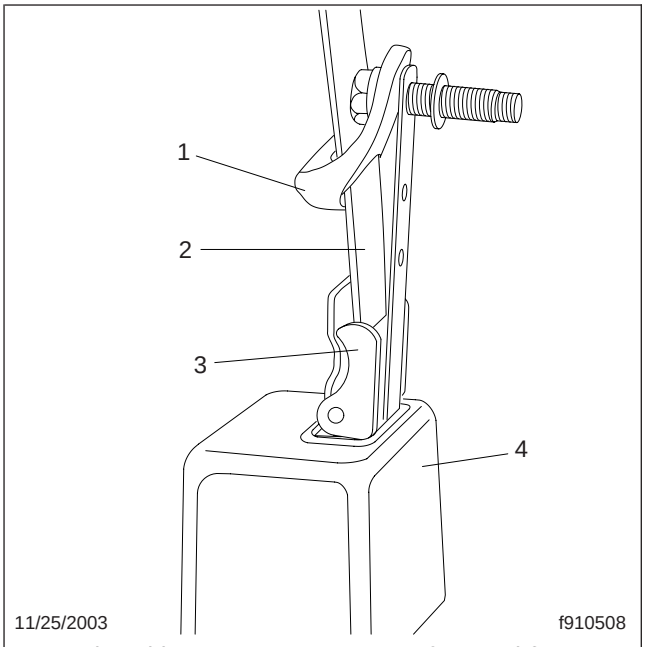
Bunk Restraint Removal and Installation

2. Lift the bunk hatch, install the three hexhead bolts onto the bunk hatch, and secure them with nuts. Tighten to 35 to 45 lbf·ft (47 to 61 N·m).
3. Lower the bunk hatch.
4. Attach the six hexhead bolts to the rear wall of the cab. Tighten to 35 to 45 lbf·ft (47 to 61 N·m).
5. Attach the cover caps to all of the hexhead bolts.
6. Return the mattress to the bunk.
7. Remove the chocks from the tires.

Unlocking an Installed Retractor

Seat belt retractors are locking up and preventing the webbing from being extracted. This condition is known as reverse lock-up and is caused by excessive webbing spooling into the retractor before installation in the vehicle.

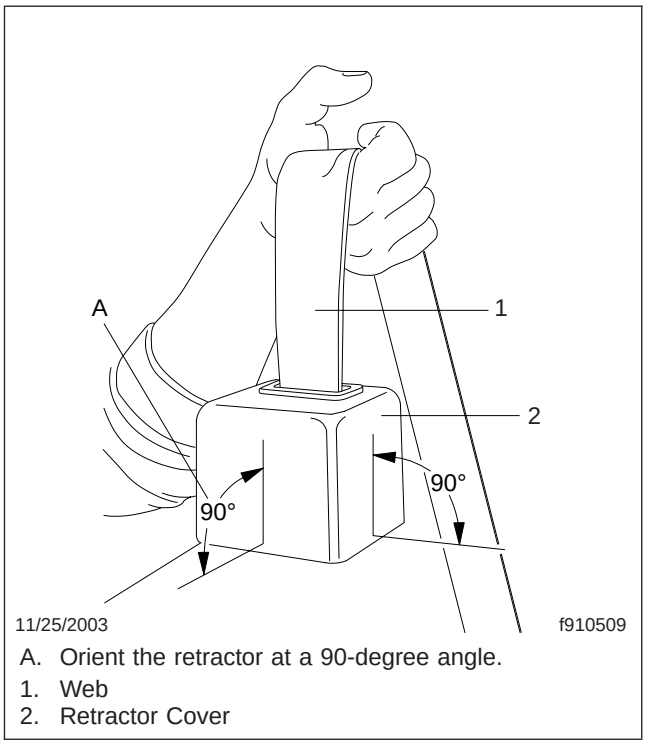
1. Park the vehicle, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Verify that the retractor is mounted in the 90-degree position. See **Fig. 1**.
3. Firmly grasp the web close to the retractor. See **Fig. 2**.



1. Web Guide Loop
2. Web
3. Komfort Latch®
4. Retractor Cover

Fig. 1, Retractor in the 90-Degree Position

4. Pull on the web with enough force to tighten the web onto the spool until the webbing locks back onto the retractor. The retractor should unlock when tension is released.
5. Remove the chocks from the tires.



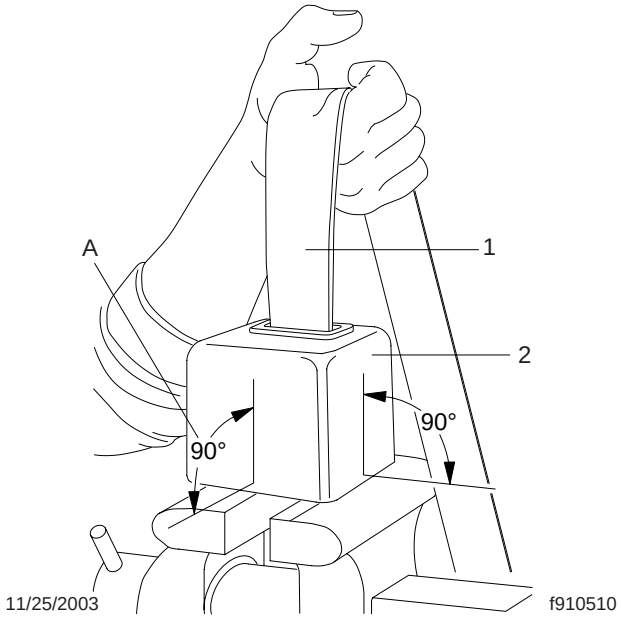
A. Orient the retractor at a 90-degree angle.
1. Web
2. Retractor Cover

Fig. 2, Firmly Grasp the Webbing

Unlocking an Uninstalled Retractor

1. Clamp the retractor in a vice at a 90-degree angle. See **Fig. 3**.
2. Pull on the web with enough force to tighten the web onto the spool.
3. Release the web. This allows 1/2-inch (12.7-mm) of the webbing to feed back into the retractor storage housing and unlock the retractor.
4. Pull all the webbing out of the retractor, and allow only 12 to 15 inches (304 to 381 mm) to retract. Lock the Komfort Latch on the web. See **Fig. 4**.

Seat Belt Retractor Unlocking



A. Retractor oriented at a 90-degree angle.

Inspection

⚠ WARNING

Inspect and maintain seat belts. When any part of a seat belt system needs replacement, the entire seat belt must be replaced, both retractor and buckle side. Any time a vehicle is involved in an accident, and the seat belt system was in use, the entire vehicle seat belt system must be replaced before operating the vehicle. Do not attempt to modify the seat belt system; doing so could change the effectiveness of the system. Failure to replace worn or damaged seat belts, or making any modifications to the system, may result in personal injury or death.

Seat belts and tether belts have a finite life which may be much shorter than the life of the vehicle. Regular inspections and replacement as needed are the only assurance of adequate seat belt security over the life of the vehicle.

1. Check the web for fraying, cuts, extreme dirt and dust, or for severe fading from exposure to sunlight, especially near the buckle latch plate and in the D-loop guide area.
2. Check operation of the buckle, latch, Komfort Latch or Sliding Komfort Latch (if equipped), web retractor, and upper seat belt mount on the door pillar. Check all visible components for wear or damage.
3. Check the seat belt and tether belt connection points, and tighten any that are loose.

General Information

One of the following three types of supplemental restraint systems systems may be installed in a Century Class vehicle:

- air bag only system, installed prior to May 12, 2000; covered in this section
- air bag only system, installed from May 12, 2000; see **Section 46.09** (except troubleshooting and wiring diagrams, covered in this section)
- air bag/SPACE system; covered in this section

The air bag only system and the air bag/SPACE system, when used with seat belts, provide additional protection to the driver and/or passenger in severe frontal collisions.

The SPACE system provides a significant increase in seat stability during a severe frontal collision. When the SPACE module in the Seat Pretensioner Activation for Crash survival Enhancement (SPACE) system senses a severe, life-threatening frontal impact, the module triggers two gas-cylinders mounted at the base of the seat. See **Fig. 1**. The gas cylinders activate the power cinches that then tighten the lap and shoulder belts against the occupant of the seat and lower the seat suspension, moving the occupant down and away from the steering wheel and ceiling. The air bag is activated simultaneously.

IMPORTANT: The SPACE system will activate during a severe frontal collision even if the seat belts are not fastened, but the SPACE system only provides protection to the occupant when the seat belts are fastened.

⚠ WARNING

Damaged seat belts or seat belts that were worn in an accident must be replaced and their anchoring points must be checked. Do not attempt to modify the SPACE system. Doing so could change the effectiveness of the system. The SPACE system must be replaced after being activated. Failure to do so may result in personal injury or death.

There are two types of systems that provide supplemental protection during a severe frontal collision:

- the air bag/SPACE system and air bag only system installed prior to May 12, 2000
- the air bag only system installed from May 12, 2000

IMPORTANT: There is no difference between an air bag/SPACE system installed from May 12, 2000 and an air bag/SPACE system installed prior to May 12, 2000. There is a difference in the air bag only system installed from May 12, 2000 and the air bag only system installed prior to May 12, 2000.

To determine which type of supplemental protection system is installed in the vehicle, look at the module under the driver's seat. The air bag/SPACE system and the air bag only system installed prior to May 12, 2000 have a SPACE module. If the vehicle has a SPACE system, gas cylinders are also located under the driver's seat. See **Fig. 2**. The air bag only system that became available on May 12, 2000 has an air bag sensor module located under the driver's seat. See **Fig. 3**.

There are troubleshooting procedures and wiring diagrams for the air bag/SPACE system and the air bag only system installed prior to May 12, 2000. There is another set of troubleshooting procedures and a wiring diagram for the air bag only system installed from May 12, 2000.

The air bag/SPACE system and the air bag only system installed prior to May 12, 2000 can have one of the following configurations:

- a driver-side air bag only system
- a driver-side air bag and SPACE system
- a driver-side air bag and driver- and passenger-side SPACE system

The air bag and SPACE system and the SPACE only system use the same SPACE module and electrical connector. The air bag only system, installed prior to May 12, 2000, uses a modified SPACE module and the same electrical connector used in the other two systems.

The air bag only system that became available on May 12, 2000 has an air bag sensor module and a different electrical connector than the connector used on the air bag/SPACE system.

The operational readiness of the air bag only system and the air bag/SPACE system is indicated by the supplemental restraint system (SRS) indicator on the dash. The SRS indicator comes on when the ignition is turned on, and then goes off. The indicator will re-

main on if there is a problem with the air bag/SPACE system. The vehicle should be serviced if the SRS indicator does not come on when the ignition is turned on or if the SRS indicator remains on.

3. Seat
4. Gas Cylinder
5. Sensor Bracket

Fig. 1, SPACE System Components

WARNING

The SPACE and the air bag systems are designed to activate only in severe or life-threatening frontal collisions. Only in these situations will they provide supplemental protection. The driver and the passenger should always wear seat belts. For maximum protection in the event of a collision or rollover, the driver's back must be against the seat back in a normal seated position and the driver's head must be upright. The seat belts must be fastened and properly positioned on the body. Because the air bag inflates with considerable speed and force, it is important that the driver maintain a proper seat position to stay a safe distance from the inflating air bag.

Objects must not be placed on the steering wheel or between you and the steering wheel, or on the SPACE system components. Doing so may cause harm during an accident because the objects could be propelled by the expanding air bag or hinder the operation of the SPACE mechanism.

Failure to follow these instructions may result in personal injury or death.

CAUTION

Before performing any electric welding on a vehicle, disconnect the battery power and ground cables and the Driver-Side SPACE (DSS) connector. See Fig. 2. At the rear of the seat base, remove the fasteners that attach the connector plate to the SPACE module. Disconnect the connector inside the SPACE module. See Subject 120 in this section for instructions. Electric currents produced during electric welding can damage various electronic components on the vehicle.

Safety Guidelines for the Air Bag/SPACE System

⚠ WARNING

Do not attempt to service the air bag/SPACE system. The components and chemicals used in the system are hazardous. The system contains components that use combustible chemicals; care must be taken when replacing or handling system components. Damaged or deployed air bag/SPACE systems should be inspected for leaking propellant chemicals before any attempt is made to remove, replace, or handle the components. If a leak is found, contact LifeGuard Technologies (1-866-765-5835) for handling instructions.

Although the air bag/SPACE system components will not likely explode, self-deploy, or produce shrapnel, care must be taken when it is necessary to replace or perform work around the air bag/SPACE system components. Before performing any work on these systems, review all service literature and comply with the following warnings and precautions. Unintentional or improper deployment of the air bag/SPACE system can result in injury or death.

- **Do not attempt to service or to disassemble the SPACE module. The SPACE module cannot be serviced.**
- **Do not cut, drill, braze, solder, weld, probe, or strike any part of the air bag/SPACE system.**
- **Store undeployed and undamaged air bag/SPACE system components in a cool, dry, enclosed area.**
- **Keep all liquids, acids, halogens, heavy metals, and heavy salts away from the air bag/SPACE system.**
- **Do not expose the air bag/SPACE system components to electricity.**
- **Do not attempt to adapt, reuse, or install an air bag/SPACE system in any vehicle other than the specific vehicle for which it is designed.**
- **On vehicles with SPACE, keep hands and tools away from the scissor points under the seats.**
- **Do not cut wires or tamper with the connectors between the vehicle wiring harness and the air bag/SPACE system unless the troubleshooting diagnostics specifically direct you to do so. Cutting or removing the electrical connectors could cause unintentional deployment.**
- **Never probe a circuit on the passenger-side SPACE connector unless the harness is disconnected between the test point and the passenger-side SPACE module. Voltage supplied by a digital multimeter or self-powered test light could cause the passenger-side SPACE unit to deploy.**
- **Store, transport, dispose of, and recycle air bag/SPACE system components in accordance with all applicable federal, state, and local regulations.**
- **Replace damaged seat belts or seat belts that were worn in an accident, and check all anchoring points.**
- **The air bag/SPACE system requires a special seat belt. Care must be taken to be sure the correct seat belt is used.**
- **When reactivating the system for the first time after repairs have been made, stand outside of the cab and away from the front of the air bag while turning on the ignition. Check that the SRS indicator comes on for a few seconds and then goes out. Make sure there are no active fault codes.**

Safety Guidelines for the Air Bag System

⚠ WARNING

The components and chemicals used in the air bag system are hazardous. The system contains components that use combustible chemicals; care must be taken when replacing or handling system components. Damaged or deployed air bag systems should be inspected for leaking propellant chemicals before any attempt is made to remove, replace, or handle the components. If a leak is found, contact LifeGuard Technologies (1-866-765-5835) for handling instructions.

Safety Guidelines

The surface of the deployed air bag may contain small amounts of sodium hydroxide (which is a by-product of the gas generant combustion) and metallic sodium. Sodium hydroxide may be irritating to the skin and eyes. Always wear rubber gloves and safety glasses when handling a deployed air bag. Immediately wash your hands and exposed skin areas with water and a mild soap. Flush your eyes immediately if exposed to sodium hydroxide.

Consider undeployed air bags to be dangerous and capable of deploying at any time. Before performing any work on these systems, review all service literature and comply with the following warnings and precautions. Unintentional or improper deployment of the air bag system can result in injury or death.

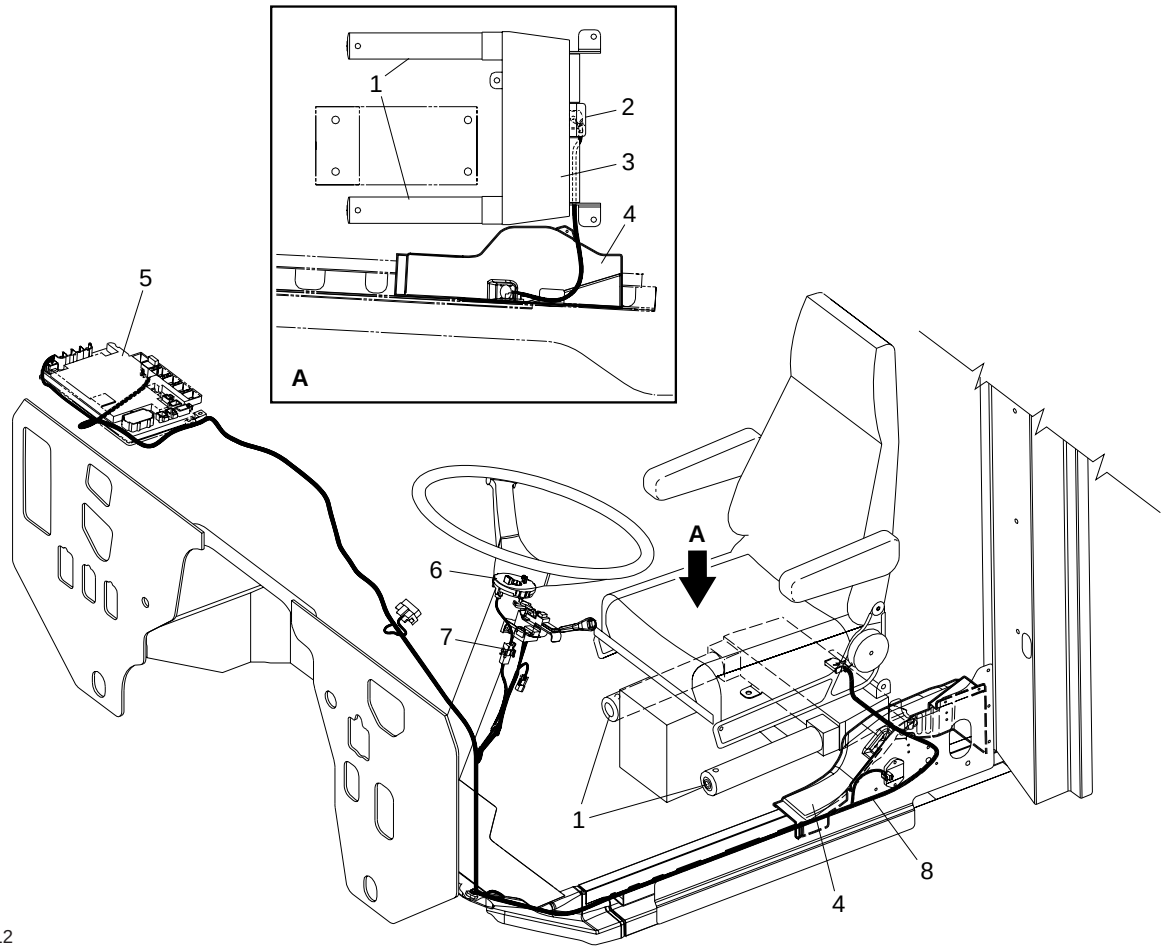
- **Carry undeployed air bags with the bag and the trim cover pointed away from your body.**
- **Place undeployed air bags face up on a surface in an enclosed area.**
- **Do not place objects near or on top of an undeployed air bag.**
- **Store undeployed and undamaged air bag modules in a cool, dry, enclosed area.**
- **Keep all liquids, acids, halogens, heavy metals, and heavy salts away from the air bag system. Do not allow system chemicals to contact other liquids, combustibles, and flammable materials. Doing so could cause chemical burns or personal injury.**
- **Do not attempt to disassemble the air bag inflator unit or breach the integrity of the sealed metallic inflator case.**
- **Do not cut, drill, braze, solder, weld, probe, or strike any part of the air bag system.**
- **Do not expose the air bag module to electricity. Never probe a circuit on the air bag side of a connector unless the harness or air bag is disconnected between the test point and the air bag.**
- **Do not attempt to adapt, reuse, or install an air bag system in any vehicle other than the specific vehicle for which it is designed.**
- **Do not cut wires or tamper with the connector between the vehicle wiring harness and the air bag module unless the troubleshooting diagnostics specifically direct you to do so. Cutting or removing the connector from the system will disable the safety shunt and could cause unintentional deployment.**
- **Allow deployed air bag systems to cool after deployment.**
- **Air bag systems should be deployed in an open area or outdoors to prevent accidental fires.**
- **Wear rubber gloves and safety glasses when handling a deployed air bag.**
- **Store, transport, dispose of, and recycle air bag system components in accordance with all applicable federal, state, and local regulations.**
- **When reactivating the system for the first time after repairs have been made, stand outside of the cab and away from the front of the air bag while turning on the ignition. Check that the SRS indicator comes on for a few seconds and then goes out. Make sure there are no active fault codes.**
- **Keep all heavy objects in the cab secured.**

Air Bag Replacement

NOTE: The following air bag replacement procedure is for the air bag only system installed prior to May 12, 2000 and the air bag/SPACE system. For information on the air bag only system installed on or after May 12, 2000, see **Section 46.09**.

A Century Class vehicle may have one of the following air bag/SPACE or air bag only systems installed:

- air bag/SPACE system (**Fig. 1**)
- air bag only system, installed prior to May 12, 2000 (**Fig. 1**)
- air bag only system, installed on or after May 12, 2000 (**Fig. 2**); see **Section 46.09**



04/09/2012 f910459

5. Power Distribution Module
6. Clockspring
7. SRS1 (Supplemental Restraint System) Connector
8. Air Bag Wiring Harness

Fig. 2, Air Bag Harness Routing on Air Bag Only Systems Installed on or After May 12, 2000

NOTE: There is no difference between an air bag/SPACE system installed on or after May 12, 2000 and one installed prior to May 12, 2000.

To determine which type of supplemental protection system is installed in the vehicle, look at the module under the driver's seat. The air bag/SPACE system and the air bag only system installed prior to May 12, 2000 have a SPACE module. If the vehicle has a SPACE system, gas cylinders are also located under the driver's seat. See **Fig. 1**. The air bag only system that became available on May 12, 2000 has an air bag sensor module located under the driver's seat. See **Fig. 2**.

⚠ WARNING

Before performing any work on the air bag system, review all service literature and comply with all warnings and precautions in this subject and in Subject 100. Unintentional or improper air bag deployment can result in injury or death.

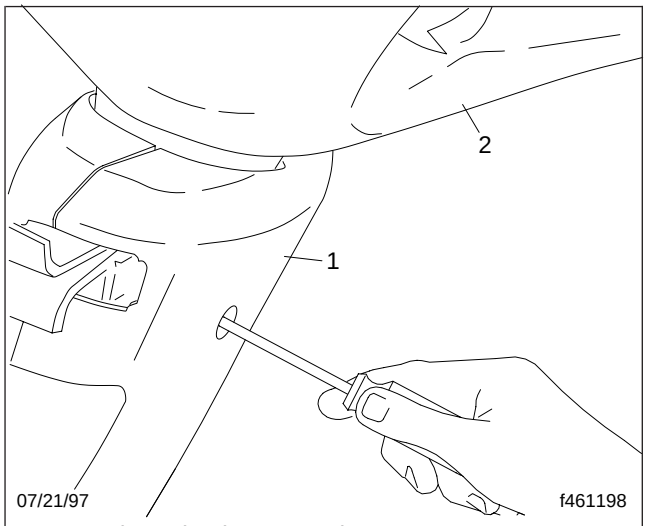
Damaged or deployed air bag systems should be inspected for leaking propellant chemicals before any attempt is made to remove, replace, or handle the components. If a leak is found, contact LifeGuard Technologies (1-866-765-5835) for handling instructions.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Disconnect the batteries and wait two minutes before proceeding.

⚠ WARNING

Wait two minutes after disconnecting the batteries to allow the internal components to discharge. Failure to allow the components to discharge could cause the air bag to deploy, resulting in severe bodily injury or death.

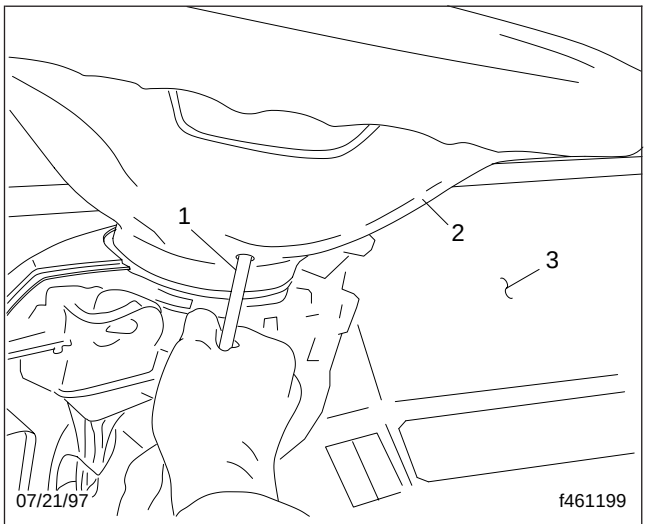
3. Disconnect the DSS connector at the back of the SPACE module. See **Fig. 1**.
4. Remove the fastener cover plugs from the steering wheel lower column cover. See **Fig. 3**.



1. Steering Wheel Lower Column Cover
2. Steering Wheel

Fig. 3, Removing the Fastener Cover Plugs

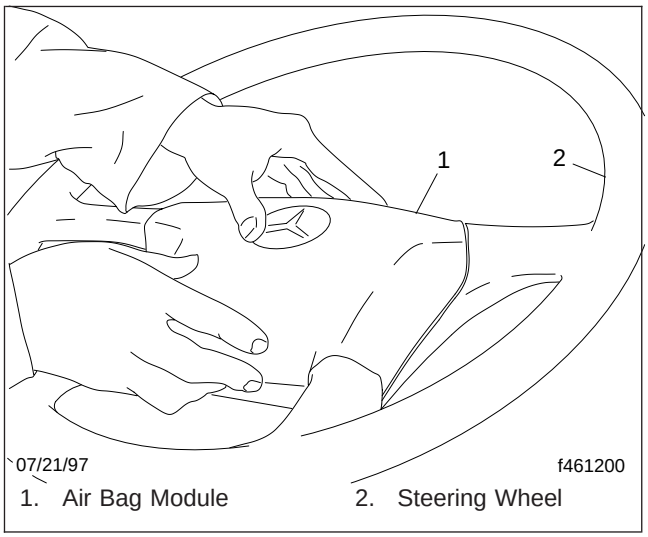
5. Remove the fasteners and the column cover.
6. Loosen the air bag retainer screws underneath the steering wheel. See **Fig. 4**.



1. Screwdriver
2. Steering Wheel
3. B Dash Panel

Fig. 4, Loosening the Air Bag Retainer Screws

7. Carefully lift the air bag from the steering wheel and disconnect the air bag connector (and the horn switch connector if equipped) from the air bag. See **Fig. 5**, **Fig. 6**, and **Fig. 7**.

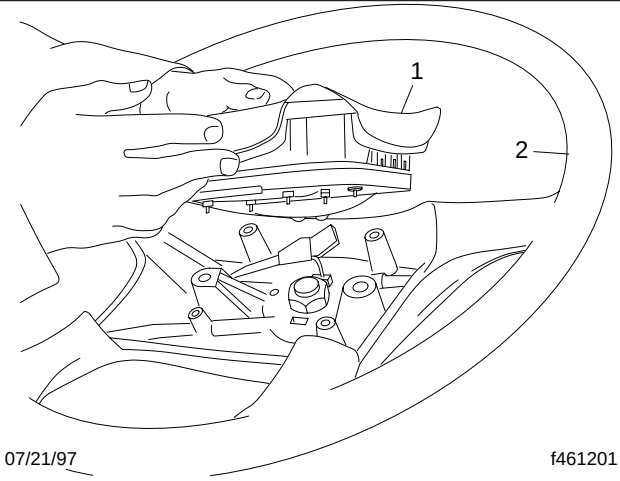


1. Air Bag Module
2. Steering Wheel

Fig. 5, Air Bag Module Installed

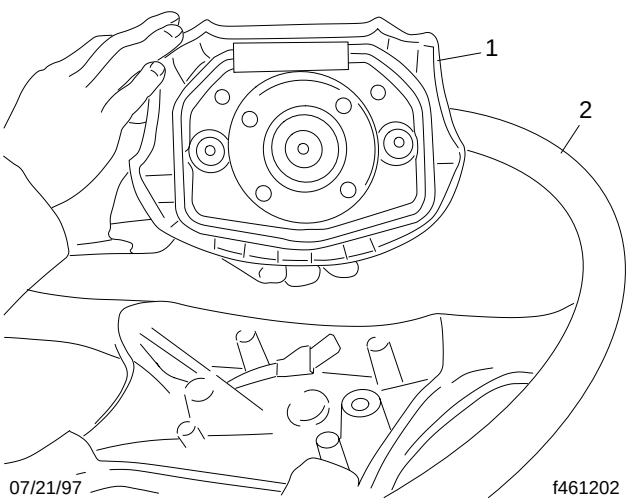
8. Remove the air bag.
9. Inspect the clockspring and clockspring connector. Replace the clockspring if there is any melting or damage.

Air Bag Replacement



1. Air Bag Module
2. Steering Wheel

Fig. 6, Lifting the Air Bag Module



1. Air Bag Module Removed
2. Steering Wheel

Fig. 7, Air Bag Removed

10. Connect the electrical wiring from the clockspring (and from the horn switch connector if equipped) to the new air bag module, then position the air bag module on the steering wheel.
11. Tighten the air bag retaining screws at the bottom of the steering wheel.
12. Using the fasteners, attach the steering wheel lower column cover to the dash.
13. Install the fastener plugs.
14. Connect the DSS connector.
15. Make sure nobody is in the cab, then connect the batteries.
16. While standing outside the cab and away from the front of the air bag, turn the ignition on. The SRS indicator should come on for several seconds and then go out. If the SRS indicator goes out and there are no active fault codes, the system is functioning properly.

    Follow the appropriate procedure in **Troubleshooting 300**, if:

    - There are active fault codes;
    - The SRS indicator remains on;
    - The SRS indicator does not come on for several seconds before going out.

Replacement

NOTE: Before replacing the SPACE module due to a lighted SRS warning lamp, make sure that all historic (inactive) fault codes are cleared. The SRS warning lamp will stay on even after the repairs indicated by the fault codes are corrected. After correcting the faults, use Service-Link to clear all historic (inactive) codes. The SRS lamp should now be off, unless an uncorrected fault exists.

⚠ WARNING

Before performing any work on the SPACE system, review all service literature and comply with all warnings and precautions in this subject and in Subject 100. Unintentional or improper initiation of a SPACE system deployment can result in injury or death.

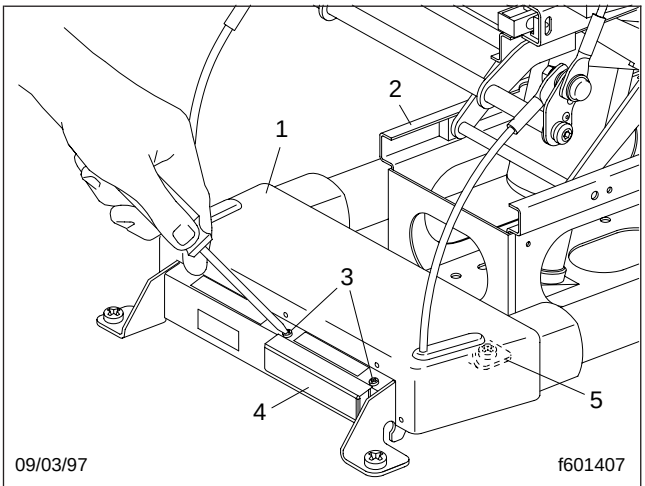
A damaged or deployed SPACE system should be inspected for leaking propellant chemicals before any attempt is made to remove, replace, or handle the components. If a leak is found, contact LifeGuard Technologies (1-866-765-5835) for handling instructions.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Disconnect the batteries and wait two minutes before proceeding.

⚠ WARNING

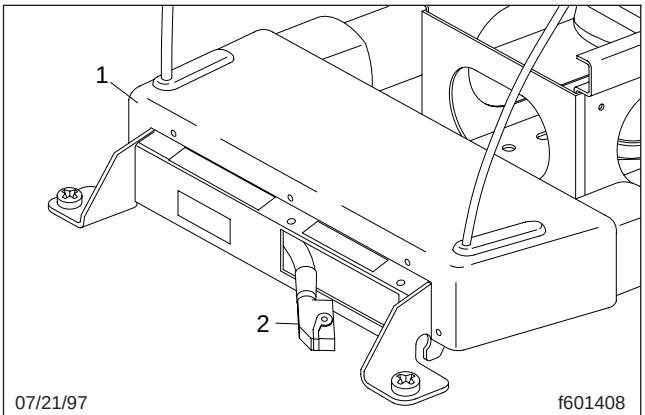
Wait two minutes after disconnecting the batteries to allow the internal components to discharge. Failure to allow the components to discharge could cause the air bag to deploy, resulting in severe bodily injury or death.

3. Remove the fasteners that attach the connector plate to the SPACE module. See Fig. 1.
4. Disconnect the connector inside the module. See Fig. 2.
5. Remove the Torx® fasteners that attach the seat belts and SPACE pretensioning cables to the interconnect point (ICP) rod at the rear of the seat. See Fig. 3.



1. SPACE Module
2. Seat Base
3. Connector Plate Fasteners
4. Connector Plate
5. Sensor Bracket

Fig. 1, Removing the Connector Plate



1. SPACE Module
2. Module Wiring Connector

Fig. 2, Disconnected Module Wiring

6. Loosen the Torx fasteners that attach the SPACE module to the cab deck and remove the module. See Fig. 4. Be careful to avoid damaging the module wiring connector and harness.

NOTE: There are five fasteners for the driver-side module and four fasteners for the passenger-side module. The bolts used to attach the SPACE module to the cab deck are

SPACE System Replacement

Loosen these Torx fasteners.
1. Gas Cylinder

Fig. 4, Attachment of SPACE Module to Cab Deck

fine-threaded and captured with washers. The bolts will remain on the module. The two bolts mounted to the forward end of the gas cylinders cannot be replaced.

7. Position the new module in place.
8. Attach the module to the cab deck with the Torx fasteners. Tighten the fasteners 35 to 45 lbf·ft (47 to 61 N·m).

IMPORTANT: The bottom flange of the sensor bracket on the bottom of the module must contact the deck metal for the system to properly function. See **Fig. 4**.

9. Attach the pretensioning cables and seat belts to the ICP rod. Tighten the fasteners 25 lbf·ft (34 N·m).
10. Connect the electrical wiring inside the module.
11. Attach the connector plate.
12. Connect the batteries.
13. Dispose of the removed SPACE system components in accordance with all applicable federal, state, and local requirements.

Clockspring Replacement

NOTE: The following clockspring replacement procedure is for the air bag only system installed prior to May 12, 2000 and the air bag/SPACE system. For information on the air bag only system installed on or after May 12, 2000, see **Section 46.09**.

To determine which type of supplemental protection system is installed in the vehicle, look at the module under the driver's seat. The air bag/SPACE system and the air bag only system installed prior to May 12, 2000 have a SPACE module. If the vehicle has a SPACE system, gas cylinders are also located under the driver's seat. See **Fig. 1**. The air bag only system that became available on May 12, 2000 has an air bag sensor module located under the driver's seat. See **Fig. 2**.

3. AS1 Connector
4. B Pillar Cover
5. Power Distribution Module
6. Clockspring
7. SRS1 (Supplemental Restraint System) Connector
8. Air Bag Wiring Harness

Fig. 2, Air Bag Harness Routing on Air Bag Only Systems Installed From May 12, 2000

⚠ CAUTION

Do not turn the steering wheel or the steering shaft at any time during this procedure. Doing so may damage the clockspring.

1. Park the vehicle on a level surface with the wheels straight ahead. Shut down the engine and set the parking brakes. Chock the rear tires.
2. Disconnect the batteries and wait two minutes before proceeding.

⚠ WARNING

Wait two minutes after disconnecting the batteries to allow the internal components to discharge. Failure to allow the components to discharge could cause the air bag to deploy, resulting in severe bodily injury or death.

3. Disconnect the DSS connector. See **Fig. 1**.
4. Remove the air bag. For instructions, see **Subject 110**.

5. Remove the steering wheel. For instructions, see **Section 46.06, Subject 100**.
6. Tape the upper and lower portions of the clockspring together to prevent it from turning.
7. Disconnect the connector located under the clockspring mounting plate on top of the steering column.
8. Loosen the screws that attach the clockspring to the clockspring bracket. It is not necessary to remove the screws in order to remove the clockspring.
9. Remove the clockspring.
10. If the steering column shaft has been allowed to rotate independently of the front wheels since the clockspring replacement procedure began, re-center the clockspring.
    - 10.1 While holding the lower portion of the clockspring stationary, rotate the upper portion counterclockwise until resistance is felt. Stop rotation as soon as some resistance is felt or the clockspring may become damaged.
    - 10.2 While holding the lower portion of the clockspring stationary, rotate the upper portion clockwise three full turns.
    - 10.3 Turn the upper portion of the clockspring clockwise until the the mounting holes in the upper portion of the clockspring are aligned with the screws in the lower portion of the clockspring. Tape the upper and lower portions together until the steering wheel is installed.
11. Using screws, attach the clockspring to the clockspring bracket.
12. Reconnect the connector from the clockspring to the air bag wiring harness. If the clockspring is taped together, remove the tape.
13. Install the steering wheel. For instructions, see **Section 46.06, Subject 100**.
14. Install the air bag. For instructions, see **Subject 110**.
15. Reconnect the DSS connector.
16. Make sure nobody is in the cab, then connect the batteries.
17. While standing outside the cab and away from the front of the air bag, turn the ignition on. The SRS indicator should come on for several seconds and then go out. If the SRS indicator goes out and there are no active fault codes, the system is functioning properly.

    Follow the appropriate procedure in **Troubleshooting 300**, if:

    - There are active fault codes;
    - The SRS indicator remains on;
    - The SRS indicator does not come on for several seconds before going out.

A Century Class vehicle may have one of the following air bag/SPACE or air bag only systems installed:

- air bag/SPACE system (**Fig. 1**)
- air bag only system, installed prior to May 12, 2000 (**Fig. 1**)
- air bag only system, installed on or after May 12, 2000 (**Fig. 2**)

NOTE: There is no difference between an air bag/SPACE system installed on or after May 12, 2000 and one installed prior to May 12, 2000.

Before doing any of the following procedures, determine which type of supplemental protection system is installed in the vehicle. Look at the module under the driver's seat. The air bag only system installed prior to May 12, 2000, and the air bag/SPACE system have a SPACE module. If the vehicle has a SPACE system, gas cylinders are also located under the driver's seat. See **Fig. 1**. The air bag only system that became available on May 12, 2000 has an air bag sensor module located under the driver's seat. See **Fig. 2**.

⚠ WARNING

Consider undeployed air bags to be dangerous and capable of deploying at any time. Before performing any work on the air bag or SPACE system components, review all service literature and comply with the warnings and precautions in this subject and in Subject 100. Unintentional or improper deployment of the air bag or SPACE system can result in injury or death.

Deactivating an Air Bag Only System Installed Prior to May 12, 2000, or an Air Bag/SPACE System

NOTE: Deactivate the air bag only when directed to do so in the troubleshooting procedure.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Disconnect the batteries and wait two minutes before proceeding.

⚠ WARNING

Wait two minutes after disconnecting the batteries to allow the internal components to discharge. Failure to allow the components to discharge could cause the air bag to deploy, resulting in severe bodily injury or death.

NOTE: Make sure the ignition is off when the Driver-Side SPACE (DSS) connector is disconnected or reconnected.

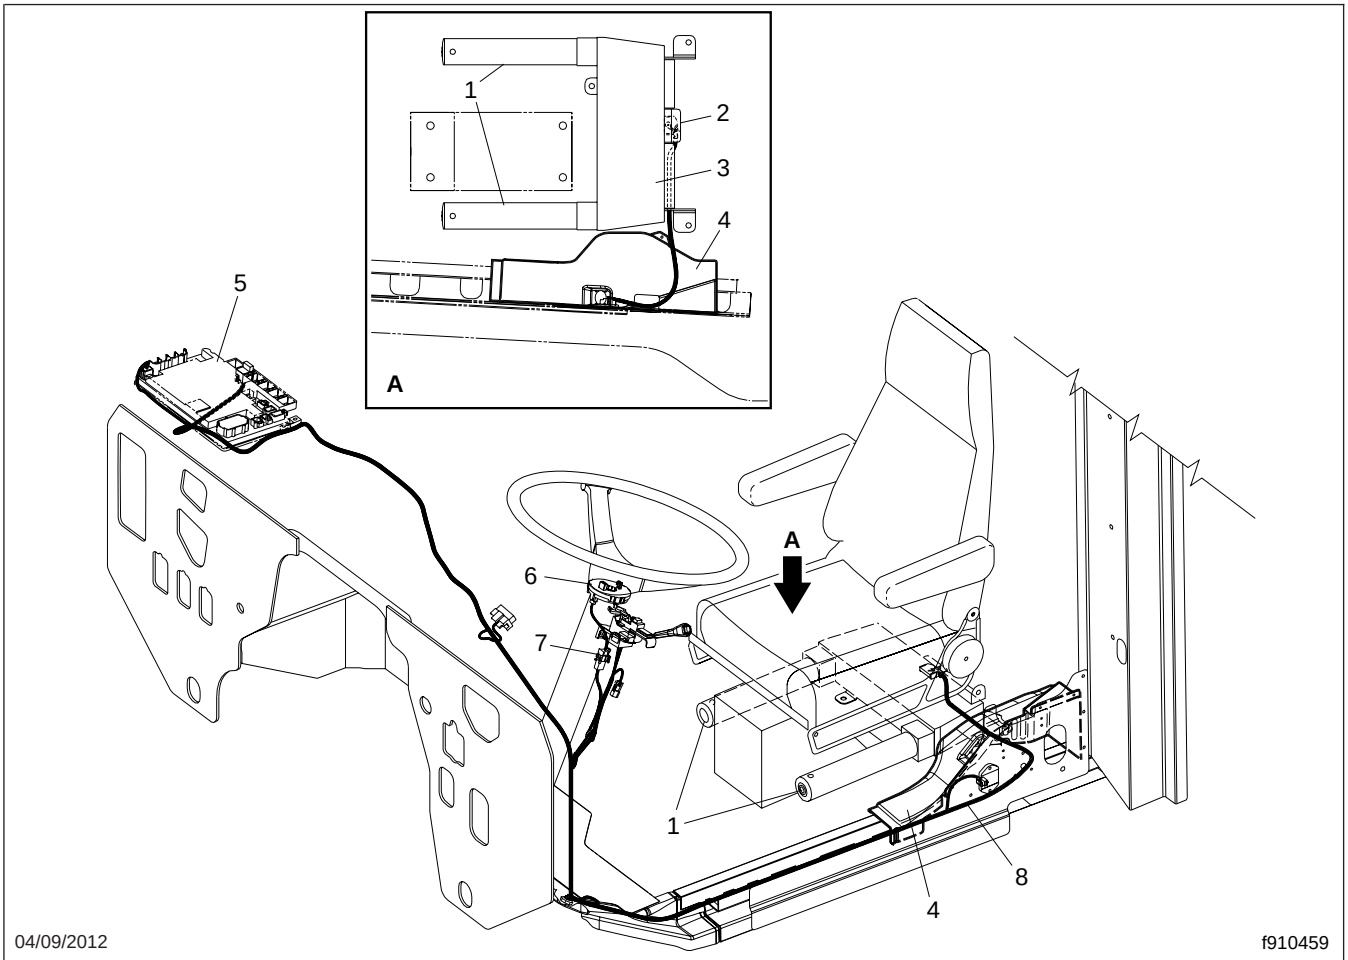
3. Disconnect the DSS connector and the Passenger-Side SPACE (PSS) connector if equipped. See **Fig. 1**.
4. Remove the fastener cover plugs from the steering wheel lower column cover. See **Fig. 3**.
5. Remove the fasteners and the column cover.
6. Loosen the air bag retainer screws underneath the steering wheel. See **Fig. 4**.
7. Carefully lift the air bag from the steering wheel and disconnect the air bag connector (and the horn switch connector if equipped) from the air bag. See **Fig. 5**, **Fig. 6**, and **Fig. 7**.
8. Remove the air bag.
9. Reconnect the DSS connector.
10. Reconnect the batteries.

Reactivating an Air Bag Only System Installed Prior to May 12, 2000, or an Air Bag/SPACE System

NOTE: Reactivate the air bag only when directed to do so in the troubleshooting procedure.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Make sure that the connectors in the air bag system are connected, except for the air bag connector, the DSS connector, and the PSS connector if equipped.
3. Disconnect the batteries and wait two minutes before proceeding.

Deactivating and Reactivating Procedures



A. Top view of Air Bag/SPACE System.

2. Driver-Side SPACE (DSS) Connector
3. Driver-Side SPACE Module
4. B-Pillar Cover
5. Power Distribution Module
6. Clockspring
7. Supplemental Restraint System (SRS) Connector
8. Air Bag Wiring Harness

Fig. 1, Air Bag Harness Routing on Air Bag Only Systems Installed Prior to May 12, 2000, and Air Bag/Space Systems

⚠ WARNING

Wait two minutes after disconnecting the batteries to allow the internal components to discharge. Failure to allow the components to discharge could cause the air bag to deploy, resulting in severe bodily injury or death.

4. Connect the electrical wiring from the clockspring (and from the horn switch connector if equipped) to the new air bag module, then position the air bag module on the steering wheel.
5. Tighten the air bag retaining screws at the bottom of the steering wheel.
6. Using the fasteners, attach the steering wheel lower column cover to the dash.
7. Install the fastener plugs.

NOTE: Make sure the ignition is off when the DSS connector is reconnected.

8. Air Bag Wiring Harness

Fig. 2, Air Bag Harness Routing on Air Bag Only Systems Installed on or After May 12, 2000

8. Reconnect the DSS connector and the PSS connector if equipped. See **Fig. 1**.
9. Make sure nobody is in the cab, then connect the batteries.
10. While standing outside the cab and away from the front of the air bag, turn the ignition on. The SRS indicator should come on for several seconds and then go out. If the SRS indicator goes out and there are no active fault codes, the system is functioning properly.

Follow the appropriate procedure in **Troubleshooting 300**, if:

- There are active fault codes;
- The SRS indicator remains on;
- The SRS indicator does not come on for several seconds before going out.

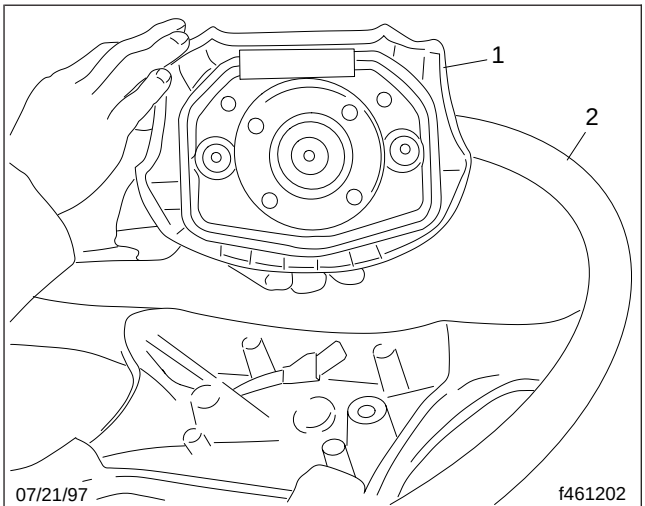
Deactivating an Air Bag Only System Installed on or After May 12, 2000

NOTE: Deactivate the air bag only when directed to do so in the troubleshooting procedure.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.



1. Air Bag Module Removed
2. Steering Wheel

Fig. 7, Air Bag Removed

2. Disconnect the batteries and wait two minutes before proceeding.

WARNING

Wait two minutes after disconnecting the batteries to allow the internal components to discharge. Failure to allow the components to discharge could cause the air bag to deploy, resulting in severe bodily injury or death.

3. Disconnect the AS2 connector. See **Fig. 2**.
4. Remove the fastener cover plugs from the steering wheel lower column cover. See **Fig. 3**.
5. Remove the fasteners and the column cover.
6. Loosen the air bag retainer screws underneath the steering wheel. See **Fig. 4**.
7. Carefully lift the air bag from the steering wheel and disconnect the air bag connector (and the horn switch connector if equipped) from the air bag. See **Fig. 5**, **Fig. 6**, and **Fig. 7**.
8. Remove the air bag.
9. Reconnect the AS2 connector.
10. Reconnect the batteries.

Reactivating an Air Bag Only System Installed on or After May 12, 2000

NOTE: Reactivate the air bag only when directed to do so in the troubleshooting procedure.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Make sure that the connectors in the air bag system are connected, except for the air bag connector and the AS2 connector.
3. Disconnect the batteries and wait two minutes before proceeding.

WARNING

Wait two minutes after disconnecting the batteries to allow the internal components to discharge. Failure to allow the components to discharge could cause the air bag to deploy, resulting in severe bodily injury or death.

4. Connect the electrical wiring from the clockspring (and from the horn switch connector if equipped) to the new air bag module, then position the air bag module on the steering wheel.
5. Tighten the air bag retaining screws at the bottom of the steering wheel.
6. Using the fasteners, attach the steering wheel lower column cover to the dash.
7. Install the fastener plugs.
8. Connect the AS2 connector. See **Fig. 2**.
9. Make sure nobody is in the cab, then connect the batteries.
10. While standing outside the cab and away from the front of the air bag, turn the ignition on. The SRS indicator should come on for several seconds and then go out. If the SRS indicator goes out and there are no active fault codes, the system is functioning properly.

    Follow the appropriate procedure in **Troubleshooting 300**, if:

    - There are active fault codes;

Deactivating and Reactivating Procedures

- The SRS indicator remains on;
- The SRS indicator does not come on for several seconds before going out.

Air Bag Disposal Procedure

⚠ WARNING

Air bags are designed to work in specific vehicle makes and models. Air bag modules and components can not be adapted, reused, or installed in any vehicle other than the vehicle they are designed and manufactured for. Any attempt to adapt, reuse, or install an air bag module or component in any other vehicle can result in death or severe injury to vehicle occupants in the event of an accident.

IMPORTANT: The storage, transportation, disposal, or recycling of air bag modules or components must be performed in accordance with all applicable federal, state, and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety, and transportation.

NOTE: If a vehicle is going to be scrapped and the air bag or SPACE system has not been deployed, contact your District Service Manager for instructions on how to proceed.

1. Remove the inflator from a deployed air bag module. Send the inflator to a recycler for reclamation of the steel and aluminum components.
2. Separate the air bag from the recyclable steel and aluminum components.
3. The plastic materials may be recycled or disposed of in common trash.

Replacement

NOTE: Before replacing the air bag sensor due to a lighted SRS warning lamp, make sure that all historic (inactive) fault codes are cleared. The SRS warning lamp will stay on even after the repairs indicated by the fault codes are corrected. After correcting the faults, use Service-Link to clear all historic (inactive) codes. The SRS lamp should now be off, unless an uncorrected fault exists.

WARNING

Before performing any work on the air bag system, review all service literature and comply with the warnings and precautions in this subject and in Subject 100. Unintentional or improper air bag deployment can result in injury or death.

Damaged or deployed air bag systems should be inspected for leaking propellant chemicals before any attempt is made to remove, replace, or handle the components. If a leak is found, contact LifeGuard Technologies (1-866-765-5835) for handling instructions.

- **Do not attempt to service or to dissassemble the air bag sensor module. The sensor module cannot be serviced.**
- **Do not cut, drill, braze, solder, weld, strike, or probe any part of the air bag sensor module.**
- **Keep all liquids, acids, halogens, heavy metals, and heavy salts away from the air bag sensor module.**
- **Do not attempt to adapt, reuse, or install an air bag sensor module in any vehicle other than the specific vehicle for which it is designed.**
- **Do not cut wires or tamper with the connectors between the vehicle wiring harness and the air bag sensor module. Cutting or removing the electrical connectors could cause unintentional deployment of the air bags.**
- **Do not expose the air bag sensor module to electricity. Never probe a circuit.**

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.

WARNING

Before removing the mounting capscrews from the sensor module, be sure to disconnect the batteries and disconnect the wiring from the sensor module. Failure to follow these precautions may result in the air bag being unintentionally deployed, which could cause severe bodily injury or death.

2. Disconnect the batteries and wait two minutes before proceeding.

WARNING

Wait two minutes after disconnecting the batteries to allow the internal components to discharge. Failure to allow the components to discharge could cause the air bag to deploy, resulting in severe bodily injury or death.

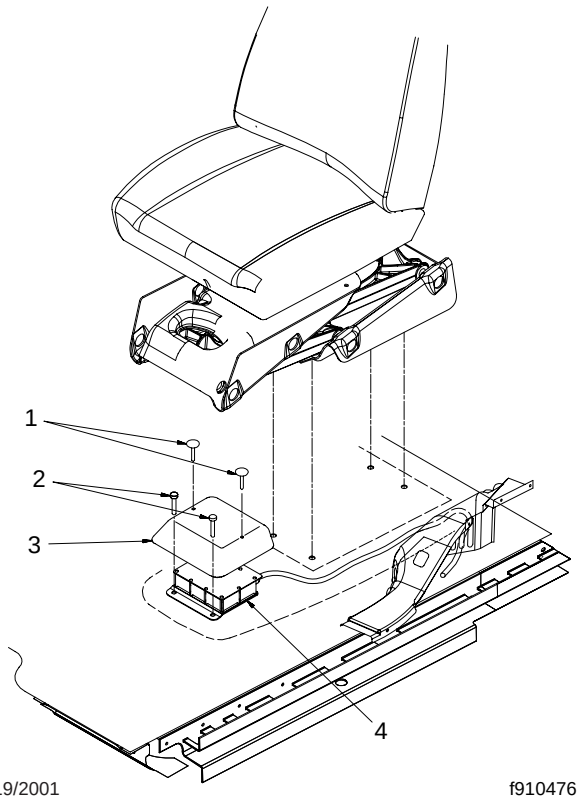
3. Raise the seat to its maximum position. If the seat is equipped with a seat shroud, lift the shroud to access the air bag sensor module.
4. Remove the plastic retainers that attach the sensor module cover to the sensor module and remove the cover. See **Fig. 1** or **Fig. 2**.
5. Disconnect the wiring from the sensor module at the AS2 connector under the B pillar cover.
6. Remove the sensor module.
   - On vehicles with an EzyRider seat, remove the capscrews that attach the sensor module to the cab floor. See **Fig. 1**.
   - On vehicles with a nonproprietary seat, remove the capscrews that attach both the sensor module and the seat to the cab floor. The front mounting capscrews for the seat may need to be loosened to remove the sensor module. See **Fig. 2**.

WARNING

Do not substitute the air bag sensor mounting fasteners. Use the fasteners provided with the sensor to ensure adequate engagement.

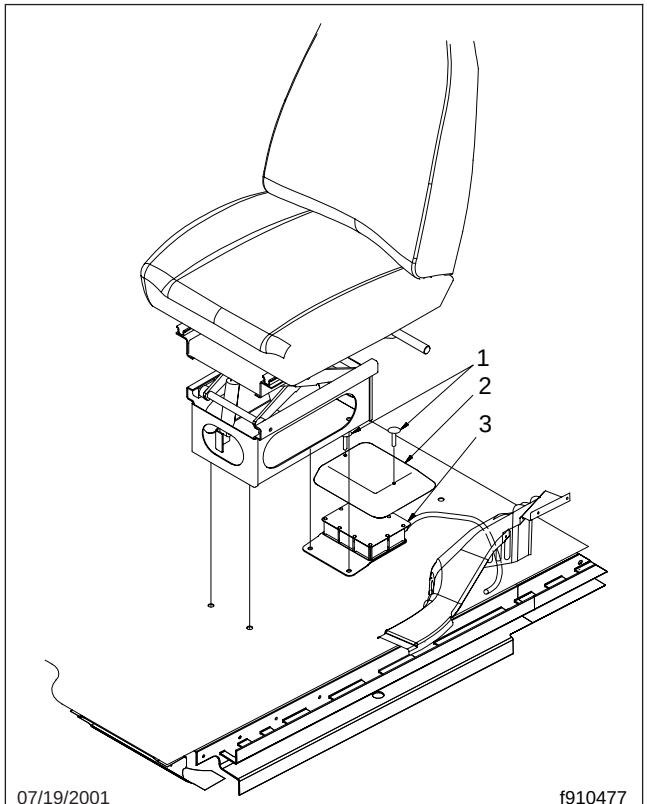
7. Install the new sensor module.

Air Bag Sensor Module Replacement



1. Sensor Module Cover Plastic Retainer
2. Sensor Module Capscrew
3. Sensor Module Cover
4. Sensor Module

Fig. 1, EzyRider Seat With Air Bag Sensor Module



1. Sensor Module Cover Plastic Retainer
2. Sensor Module Cover
3. Sensor Module

Fig. 2, Nonproprietary Seat With Air Bag Sensor Module

- On vehicles with an EzyRider seat, use two capscrews to attach the sensor module to the cab floor. Tighten the capscrews 25 to 29 lbf·ft (34 to 39 N·m).
- On vehicles with a nonproprietary seat, use two capscrews to attach both the sensor module and the seat to the cab floor. If the front mounting capscrews for the seat were loosened, tighten the capscrews. Tighten the capscrews 35 to 40 lbf·ft (47 to 54 N·m).

⚠ WARNING

Before attaching the wiring to the sensor module and before connecting the batteries, be sure to attach and tighten the mounting capscrews to the sensor module. Failure to follow these precautions may result in the air bag being unintentionally deployed, which could cause personal injury or property damage.

8. Attach the wiring to the sensor module.
9. Using two plastic retainers, attach the sensor module cover to the sensor module.
10. Lower the seat. If the seat is equipped with a seat shroud, lower the shroud around the base of the seat.
11. Connect the batteries.

Troubleshooting

IMPORTANT: There is no difference between an air bag/SPACE system installed on or after May 12, 2000 and an air bag/SPACE system installed prior to May 12, 2000. There is a difference in the air bag only system installed on or after May 12, 2000 and the air bag only system installed prior to May 12, 2000.

To determine which type of supplemental protection system is installed in the vehicle, look at the module under the driver's seat. The air bag/SPACE system and the air bag only system installed prior to May 12, 2000 have a SPACE module. If the vehicle has a SPACE system, gas cylinders are also located under the driver's seat; see **Fig. 1**. The air bag only system that became available on May 12, 2000 has an air bag sensor module located under the driver's seat; see **Fig. 2**.

Fig. 2, Air Bag Harness Routing on Air Bag Only Systems Installed on or After May 12, 2000

Troubleshooting the Air Bag/ SPACE System or the Air Bag Only System Installed Prior to May 12, 2000

⚠ WARNING

When directed to activate or deactivate, connect or disconnect, assemble or disassemble any part of the system in a troubleshooting procedure, refer to the appropriate procedures and warnings in Subject 140, and the safety guidelines in Subject 100. Consider undeployed air bags to be dangerous and capable of deploying at any time. Failure to observe the proper procedures and safety guidelines could cause the unintentional deployment of the air bag, which could result in severe injury or death.

IMPORTANT: The clockspring has one green wire and one violet wire. The green-wire circuit has a capacitor in series inside the air bag connector. The wires going into the air bag connec-

tor appear to line up directly with the pins of the connector. However, the wires are routed internally to the opposite pins. Be sure to make note of the pin numbers when troubleshooting the clockspring.

NOTE: On vehicles with driver-side SPACE, the system cannot be fully deactivated and still allow for diagnostics. Consider the driver-side SPACE to be live any time the DSS connector is connected.

See **Specifications 400** for the air bag/SPACE system wiring diagrams.

Troubleshooting the Air Bag Only System Installed on or After May 12, 2000

⚠ WARNING

When directed to activate or deactivate, connect or disconnect, assemble or disassemble any part of the system in a troubleshooting procedure, refer to the appropriate procedures and warnings in Subject 140, and the safety guidelines in Subject 100. Consider undeployed air bags to be dangerous and capable of deploying at any time. Failure to observe the proper procedures and safety guidelines could cause the unintentional deployment of the air bag, which could result in severe injury or death.

IMPORTANT: The clockspring has one green wire and one violet wire. The green-wire circuit has a capacitor in series inside the air bag connector. The wires going into the air bag connector appear to line up directly with the pins of the connector. However, the wires are routed internally to the opposite pins. Be sure to make note of the pin numbers when troubleshooting the clockspring.

See **Specifications 400** for the air bag only system wiring diagram.

Troubleshooting Charts

NOTE: If the fault codes were active previously, you must clear the historic codes, or the SRS lamp will stay on.

For the air bag/SPACE system or the air bag only system installed prior to May 12, 2000, see **Table 1** for the fault codes, fault code descriptions, and the figure numbers of the corresponding troubleshooting charts.

For the air bag only system installed on or after May 12, 2000, see **Table 2** for the fault codes, fault code descriptions, and the figure numbers of the corresponding troubleshooting charts.

Troubleshooting Charts for the Air Bag/SPACE System or the Air Bag Only System Installed Prior to May 12, 2000

Specifications

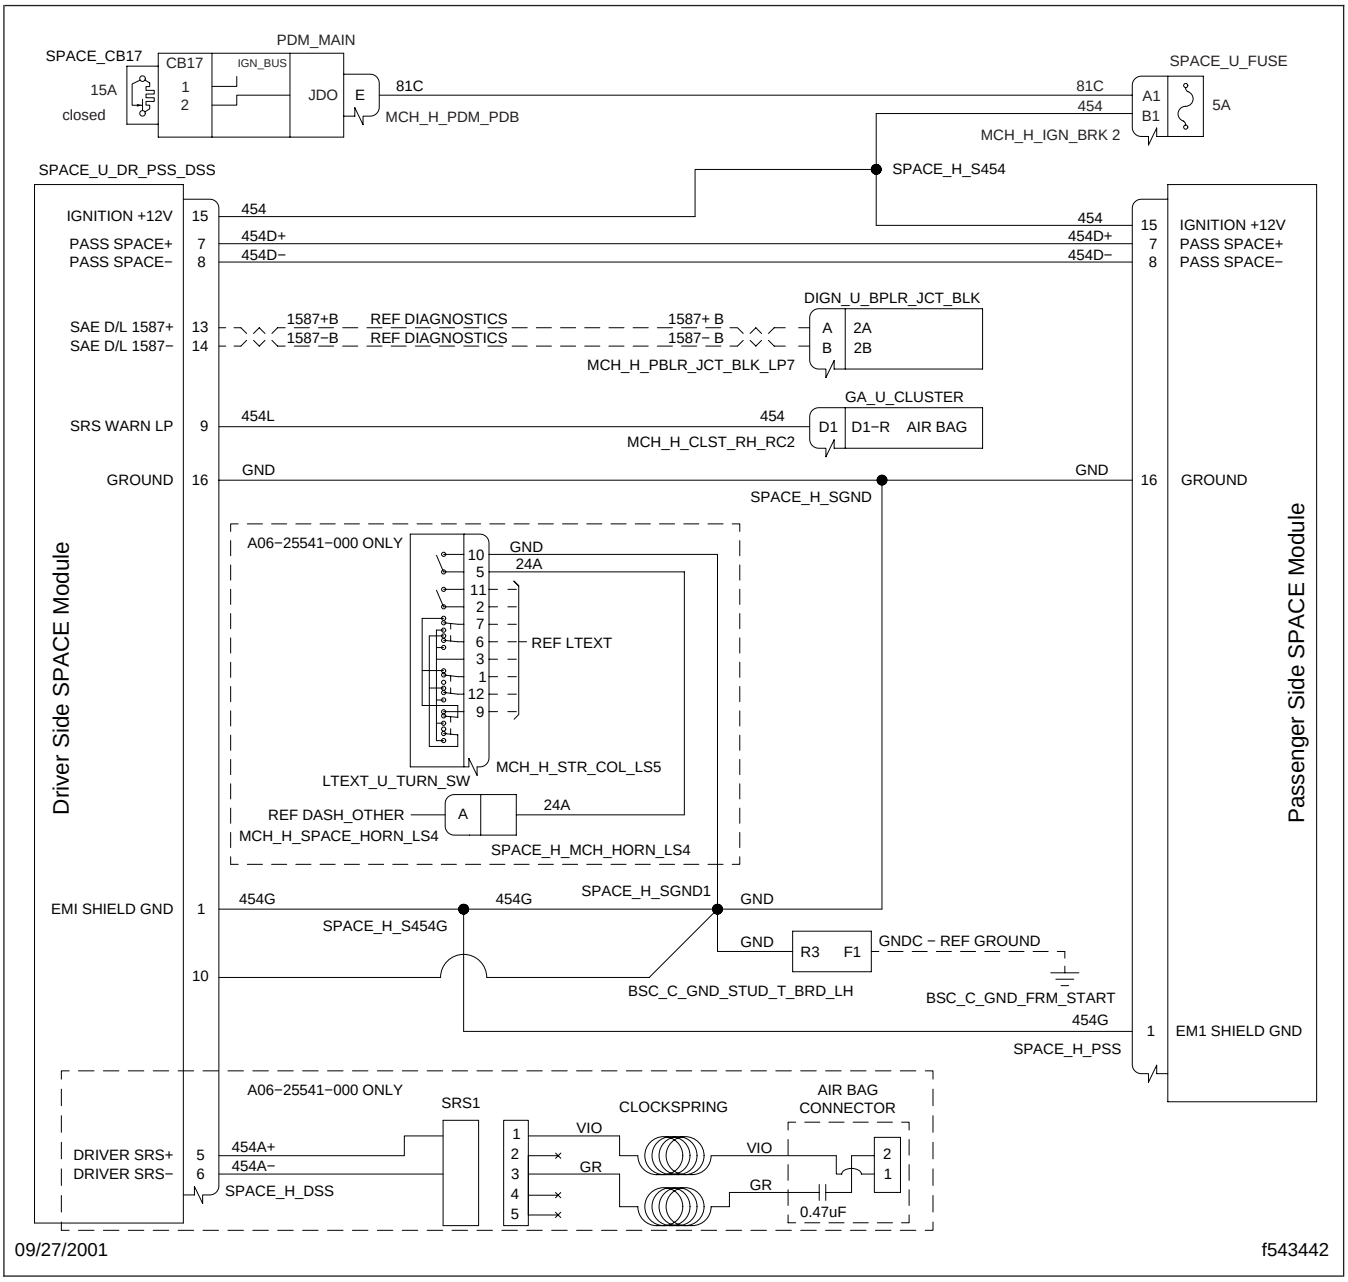

Fig. 2, Driver and Passenger Air Bag/SPACE System Wiring Diagram

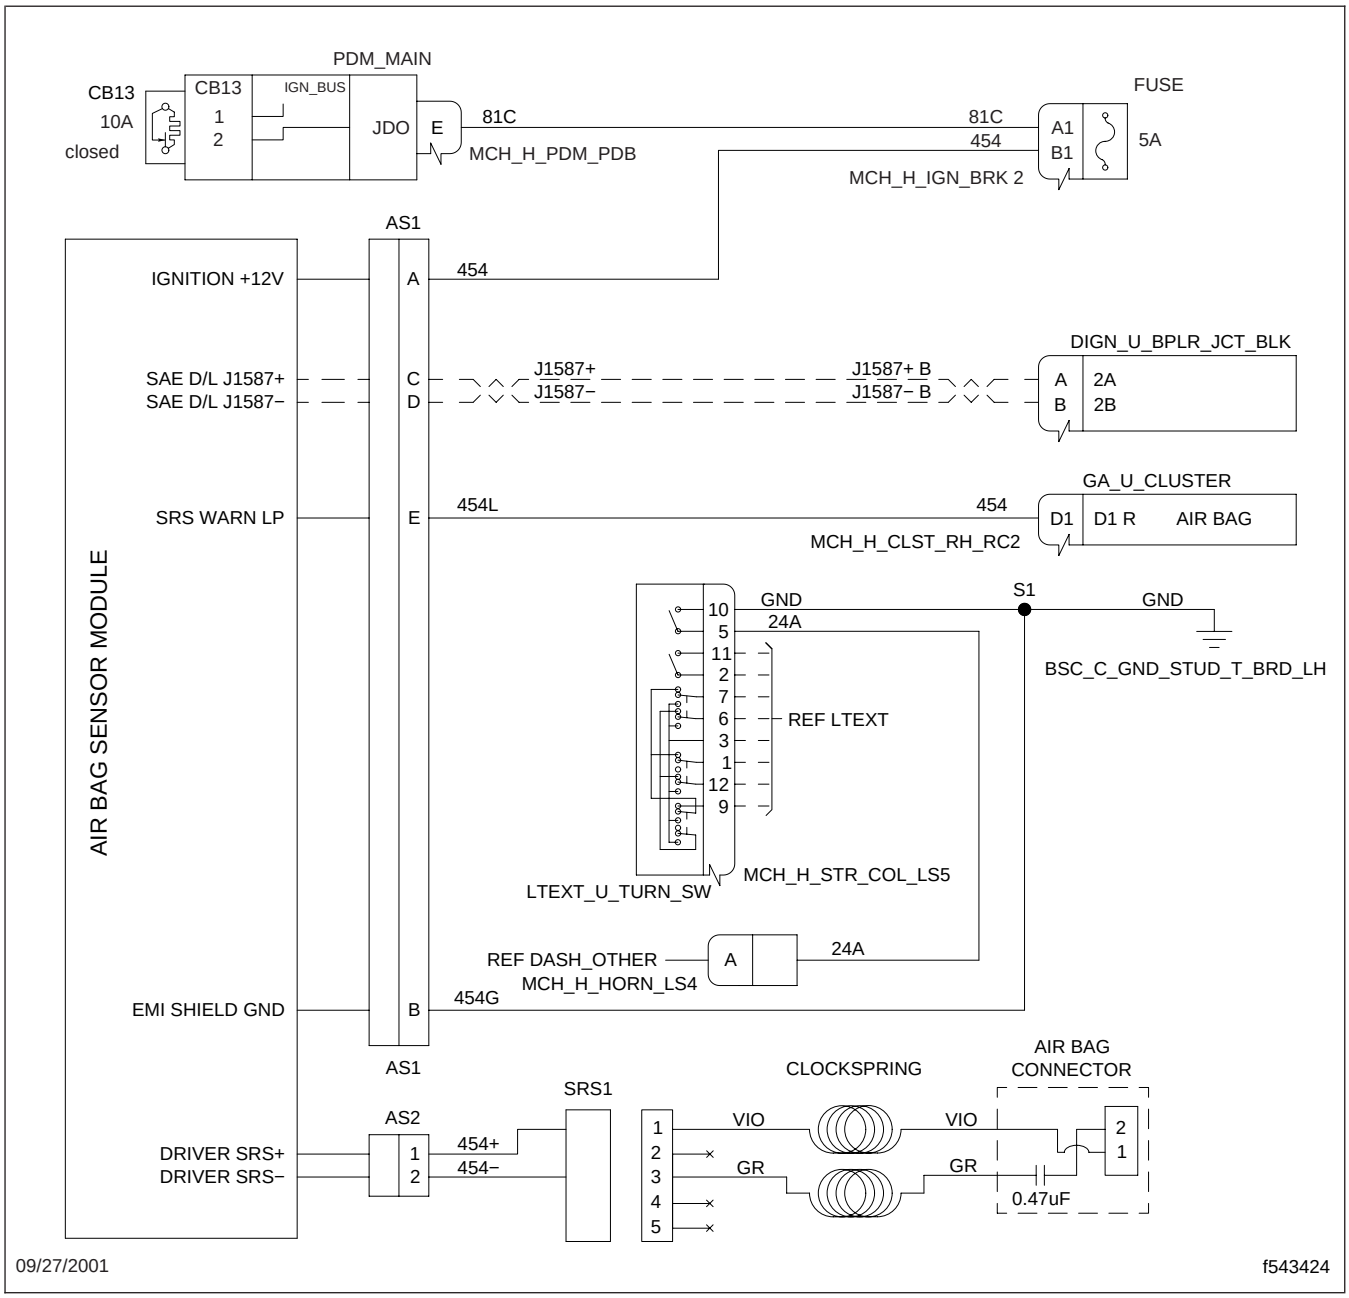

Fig. 3, Air Bag Only System Wiring Diagram for Vehicles Installed on or After May 12, 2000

General Information

EzyRider seats (**Fig. 1** and **Fig. 2**) offer adjustment features for height, fore and aft positioning, back cushion tilt, lumbar support, seat cushion tilt, and armrest adjustment. The air suspension and height-adjustment features are provided by an air spring that receives air pressure from the vehicle air system; pressure in the air spring is controlled by a switch attached to the seat frame. Each seat is equipped with a shock absorber to dampen unwanted up-and-down motion of the seat. An isolator reduces the amount of road shock by isolating the occupant from the motion of the vehicle. A lockout feature is used whenever the isolator is not desired.

5. Back Cushion Tilt Lever
6. Bottom Cushion Angle Guide
7. Armrest Adjustment

Fig. 2, EzyRider Seat (from May 2010)

The availability and configuration of the seat adjustment features may vary from those shown. For detailed operating instructions and descriptions of all seat adjustment features, see the vehicle driver's manual.

Removal

1. Apply the parking brake and chock the tires.
2. Press the seat ride-height rocker switch until the seat is adjusted to its maximum height.
3. Remove the seat suspension skirt (if equipped) from the seat base.
4. Secure the seat suspension in the extended position, using the method appropriate to the suspension type, as described below.

   For seats equipped with a scissor-type suspension, bind the two cross-rods together with a large tie strap, at either the top or bottom of the fully extended scissor arms.

   For seats equipped with a parallel arm suspension, cut a wooden block to the length required to support the seat at its maximum height, and place the block between the air suspension seat base and the rear crosstube of the lower arm.

⚠ WARNING

Do not remove the seat without first draining the seat air spring, and using an appropriate method to secure the seat suspension in the extended position. If the seat suspension is not properly secured, the seat could lower unexpectedly, pinching a hand or finger between the suspension parts, resulting in personal injury.

5. Drain the vehicle air reservoirs. Then press the seat-height adjustment switch until all the air is exhausted from the air spring.

⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

6. Remove the seat heel guard (if equipped) as follows. See **Fig. 1**.

   6.1 Remove the two capscrews that attach the heel guard to the cab deck.

   NOTE: On Argosy models, the passenger-side heel guard is cut off, and supported by a bracket on the inboard side. Remove the two screws that hold the bracket to the cab deck.

   6.2 Loosen the four capscrews that attach the seat to the cab deck.

   6.3 Slide the heel guard, first backward to unseat the locating bosses from the holes in the seat base, then forward to unseat the bottom flange from under the outer edges of the seat base. Remove the heel guard.

7. Disconnect the air valve air-supply hose at the quick-connect union behind the seat. See **Fig. 1** or **Fig. 2**.
8. Remove the capscrews that attach the seat and tether belts to the intermediate-connecting-point (ICP) rod.

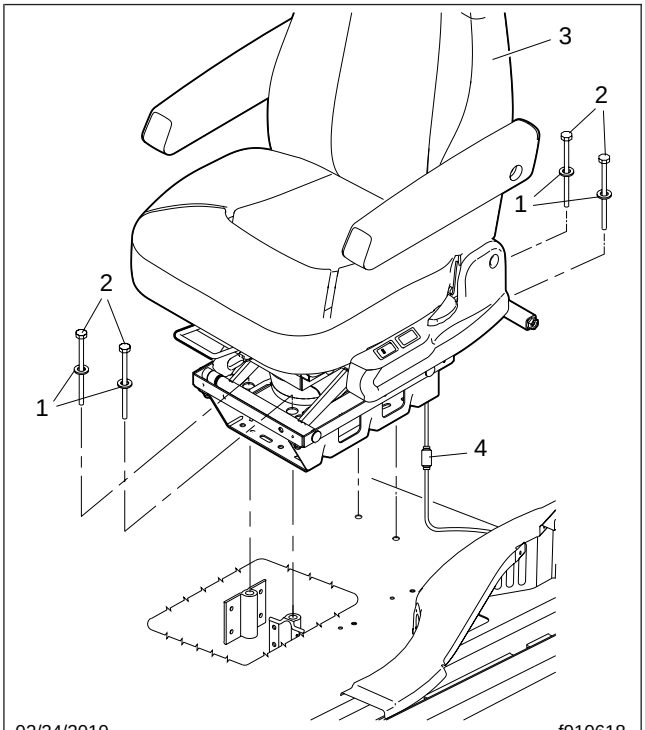
Seat Removal and Installation



1. Washers
2. Capscrews
3. Seat
4. Air Supply Quick-Connect Union

Fig. 2, EzyRider Seat Installation (from May 2010)

NOTE: On day cab models it may be necessary to detach the seat from the cab deck before removing the seat-belt strap.

9. Remove the four capscrews and the washers that attach the seat to the cab deck. Remove the seat from the cab.

Installation

1. Place the seat on the cab deck. Insert the capscrews through the washers and the seat base, as shown in **Fig. 1** or **Fig. 2**.

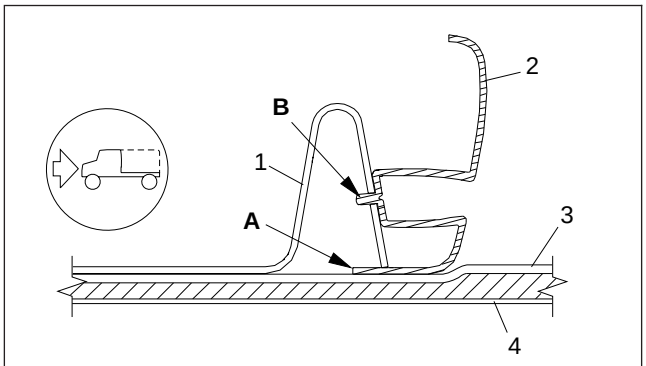
   If equipped with a heel guard, do not tighten the capscrews until the heel guard is installed.

   If not equipped with a heel guard, tighten the capscrews 25 to 29 lbf·ft (34 to 39 N·m).

NOTE: On day cab models it may be necessary to first attach the seat-belt strap.

2. Attach the seat and tether belts to the intermediate-connecting-point (ICP) rod. Tighten the capscrews 35 to 50 lbf·ft (47 to 68 N·m).
3. Connect the air valve air-supply hose by pressing the pneumatic tubing into the quick-connect union behind the seat.
4. Install the seat heel guard (if equipped) as follows.

   4.1 Place the heel guard around the seat base, first sliding it backward to seat the bottom flange under the outer edge of the seat base on both sides, then forward to seat the locating bosses in the holes in the seat base. See **Fig. 3**.



A. Slide the bottom flange of the heel guard under the outer edge of the seat base.
B. Insert the heel guard locating bosses into the holes on the seat base.

1. Seat Base
2. Heel Guard
3. Floor Covering
4. Cab Deck

Fig. 3, Installing the Heel Guard

   4.2 Tighten the four capscrews that attach the seat to the cab deck 25 to 29 lbf·ft (34 to 39 N·m).

   4.3 Attach the front of the heel guard to the cab deck with the two capscrews.

   NOTE: On Argosy models, the passenger-side heel guard is cut off, and supported by a bracket on the inboard side. Attach the bracket to the cab deck with the two screws.

5. Start the engine and allow the air reservoirs to fill. Adjust the seat to its maximum height, then

remove the tie strap or block that supports the suspension in the extended position.

6. Install the seat suspension skirt (if equipped).

NOTE: The following procedure applies to vehicles built before May 2010.

Replacement

1. Apply the parking brake and chock the tires.
2. Press the seat ride-height rocker switch until the seat is adjusted to its maximum height.
3. Pull the slide lever, and slide the seat to the forward position.
4. Lift the suspension skirt up and out of the way.
5. Cut a wooden block to the length required to support the seat at its maximum height, and place the block between the air suspension seat base and the rear crosstube of the lower arm.

⚠ WARNING

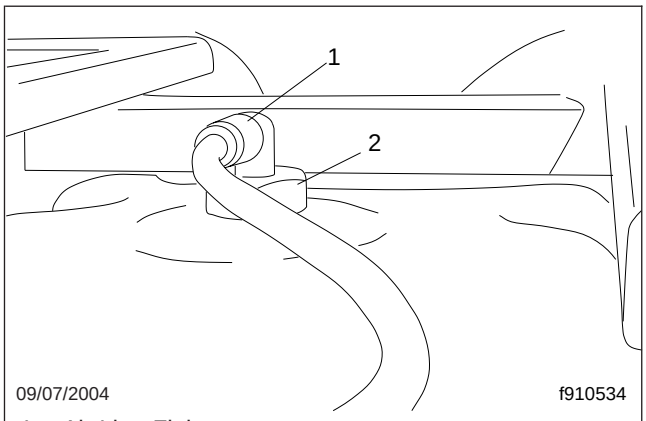
Do not remove the air spring without first draining the air from it, and securing the seat suspension with a block. If the seat suspension is not properly secured, the seat could lower unexpectedly, pinching a hand or finger between the suspension parts, resulting in personal injury.

6. Drain the vehicle air reservoirs. Then press the seat-height adjustment switch until all the air is exhausted from the air spring.

⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

7. Remove the air line from the air spring. See **Fig. 1**.
8. Remove the air fitting from the top of the air spring.
9. Remove the nut that secures the air spring to the spring plate.
10. Use a 9/16-inch socket wrench to remove the lower air spring bolt.
11. Remove the air spring.
12. Install the new air spring.



1. Air Line Fitting
2. Spring Plate Mounting Nut

Fig. 1, Air Line and Fitting

13. Install the spring plate mounting nut and torque 130 lbf·in (1470 N·cm).
14. Install the air fitting and tighten securely. Make sure that the fitting is oriented forward.
15. Cut 1/4 inch (6 mm) off of the air line using a hose cutter.
16. Insert the air line into the air fitting.
17. Apply Loctite™ 454 to the bottom six threads of the mounting bolt. See **Fig. 2**.

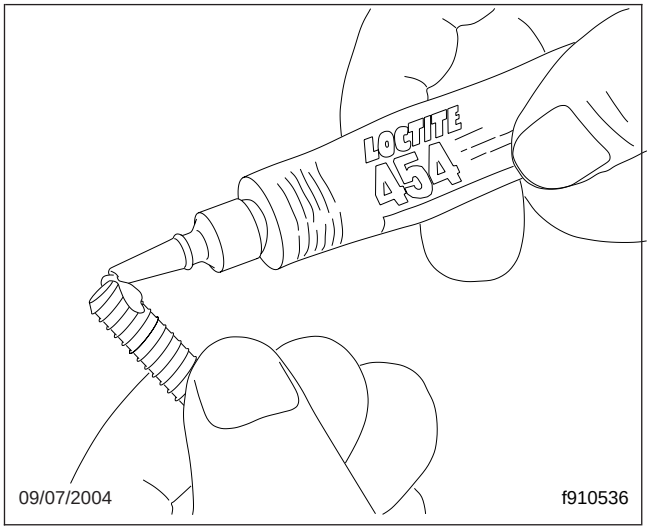


Fig. 2, Apply Loctite to the Bottom Six Threads

Air Spring Replacement

18. Install the bolt through the bottom casting of the seat to the air spring and tighten the bolt 45 lbf·in (510 N·cm).
19. Start the engine and allow the air reservoirs to fill. Adjust the seat to its maximum height.
20. Remove the block.

General Information

DANGER

Do not place objects on the seat back or block the side-roll air bag. Objects that block the side-roll air bag may prevent proper inflation and may increase the potential for serious injury or death.

The RollTek system, when used with seat belts, provides additional protection to the driver and passenger (if equipped with a passenger-side system) in rollover accidents. The RollTek system provides a significant increase in seat stability during a rollover.

Vehicles equipped with RollTek rollover protection have a sensor mounted in the seat base that activates the side-roll air bag and seat pull-down device during a rollover; see **Fig. 1**. When the RollTek module senses a rollover, the module triggers gas cylinders mounted in the base of the seat. The gas cylinders activate the power cinches that then tighten the lap and shoulder belts against the occupant of the seat and lower the seat suspension, moving the occupant down and away from the steering wheel and ceiling. The side-roll air bag deploys from the outboard side of the seat as the seat is pulled down to its lowest position.

Damaged seat belts and tethers, or seat belts and tethers that were worn in an accident, must be replaced, and their anchoring points must be checked.

The operational readiness of the RollTek system is indicated by the supplemental restraint system (SRS) indicator on the dash. The SRS indicator comes on for approximately 10 seconds when the engine is started and then goes off. The indicator will remain on if there is a problem with the air bag or RollTek system. The vehicle must be serviced if the SRS indicator does not come on when the engine is started or if the SRS indicator remains on.

Safety Precautions

⚠ WARNING

Before performing any work on the RollTek system, review all service literature and comply with the following warnings and precautions. Unintentional or improper deployment of the RollTek system can result in injury or death.

Damaged or deployed RollTek systems should be inspected for leaking propellant chemicals before any attempt is made to remove, replace, or handle the components. If a leak is found, contact LifeGuard Technologies (1-866-765-5835) for handling instructions.

- **Do not attempt to modify the RollTek system. Doing so could change the effectiveness of the system. The RollTek system must be replaced after being activated.**
- **Do not attempt to service or to disassemble the RollTek module. The RollTek module cannot be serviced.**
- **Do not attempt to deploy an undeployed pyrotechnic inflator device, such as the RollTek Rollover Protection module. For disposition of an undeployed pyrotechnic inflator device, please contact LifeGuard Technologies (1-866-765-5835) for handling and forwarding instructions.**
- **Do not cut, drill, braze, solder, weld, strike, or probe any part of the RollTek system. Air bags and seat cylinders contain explosives and pressurized gas that can be dangerous if punctured, damaged, or cut.**
- **Keep all liquids, acids, halogens, heavy metals, and heavy salts away from the RollTek system.**
- **Do not remove the RollTek sensors from the mounted locations if connected. Movement from a connected sensor can deploy the devices. The sensors should not be removed except for replacement.**
- **Do not connect electrical power to the RollTek module or sensors unless they are securely mounted in their designated locations.**
- **Do not attempt to adapt, reuse, or install a RollTek system in any vehicle other than the specific vehicle for which it is designed.**
- **Keep hands and tools away from the scissor points under the seats.**
- **Do not cut wires or tamper with the connectors between the vehicle wiring harness and the RollTek system. Cutting or removing the electrical connectors could cause unintentional deployment.**
- **Do not expose the RollTek system to electricity. Never probe a circuit.**
- **Store, transport, dispose, and recycle deployed RollTek system components in accordance with all applicable federal, state, and local regulations.**
- **Replace damaged seat belts, or seat belts that were worn in an accident, and check all anchoring points.**
- **The RollTek system requires a special seat belt. Care must be taken to ensure the correct seat belt is used.**
- **The seat must be attached to the RollTek module and seat riser with the capscrews and spacers provided with the module.**
- **Always disconnect the SRS system when welding on the vehicle.**
- **Before connecting or disconnecting the SRS sensors, always turn the battery switch to OFF and disconnect the batteries, then wait one minute before connecting or disconnecting the sensors.**

The RollTek system contains components with pyrotechnic inflator devices, which use combustible chemicals. The RollTek module and the air bags have inflators. Use care when replacing or handling these system components.

For disposition of a deployed pyrotechnic inflator device, follow and comply with any current and applicable state laws.

Replacement

IMPORTANT: Prior to performing any service work on the RollTek Rollover Protection System, perform the diagnostic check using the procedure under "Diagnostics" in **Troubleshooting 300**.

WARNING

Before attempting to service the RollTek system, read and comply with the precautions in Subject 060. Failure to do so may result in severe injury or death.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Lower the side window. In the event of an accidental deployment, an open window will prevent the pressure wave created by deploying air bags from damaging cab components.

WARNING

Before removing the mounting capscrews from the RollTek module, be sure to disconnect the batteries and disconnect the wiring from the module. Failure to follow these precautions may result in the air bag(s) being unintentionally deployed, which could cause severe bodily injury or death.

3. Turn the battery disconnect switch to the OFF position (if so equipped). Disconnect the batteries and wait two minutes before proceeding.

WARNING

Wait two minutes after disconnecting the batteries to allow the internal components to discharge. Failure to allow the components to discharge could cause the air bag and pretensioner to deploy, resulting in severe bodily injury or death.

4. Raise the seat to its maximum position. If the seat is equipped with a seat shroud, remove or lift the shroud to access the RollTek module.
5. Connect an anti-static grounding strap from your wrist to a ground surface on the vehicle. Wear the connected grounding strap while working with the RollTek module and wiring.
6. Remove the access panel from the back of the RollTek module; see **Fig. 1**.

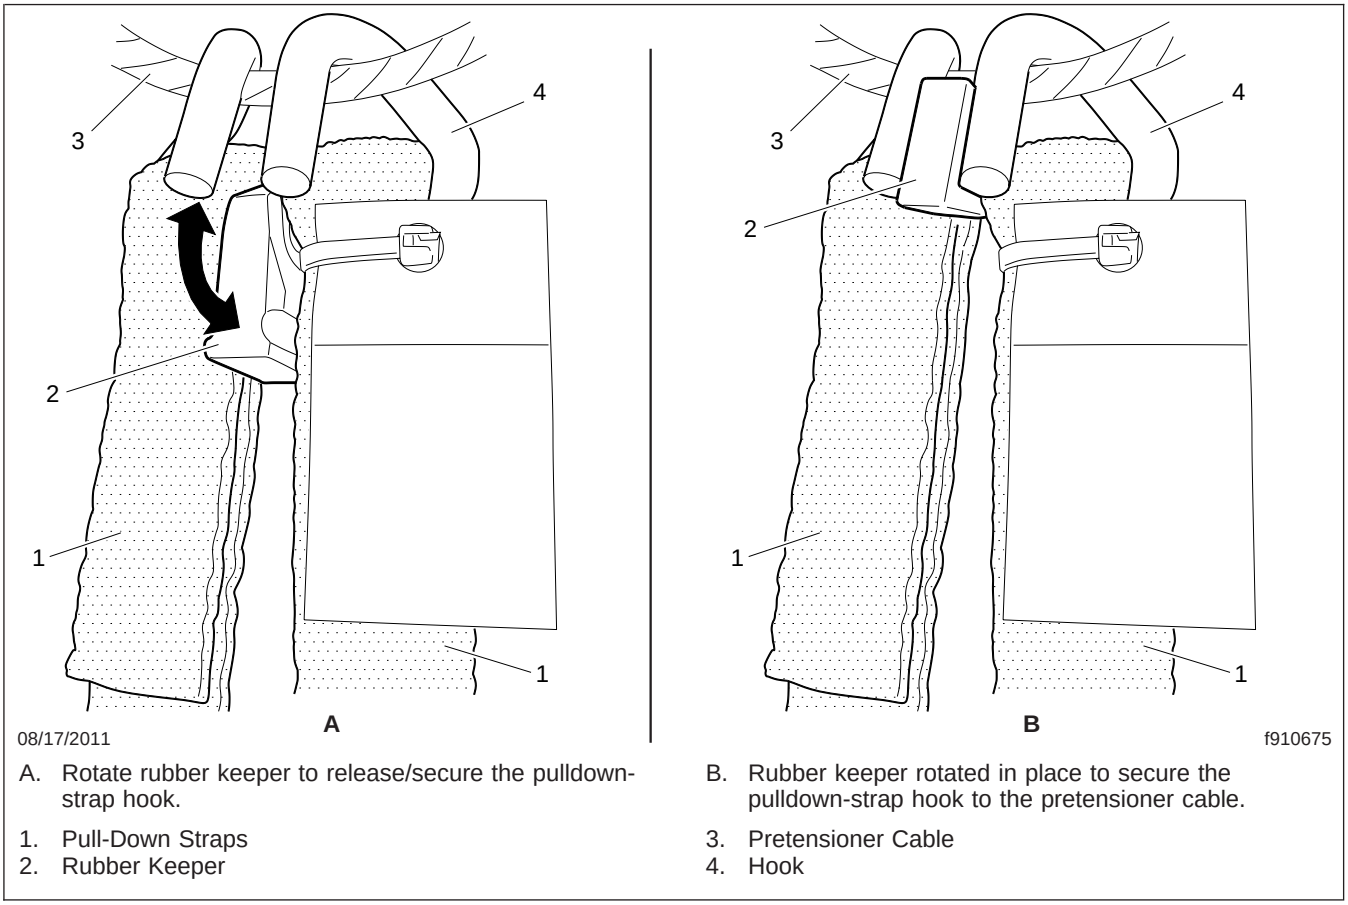
5. Intermediate-Connecting-Point (ICP) Bar
6. Pull-Down Straps
7. RollTek Module

Fig. 1, RollTek Module Wiring Access

7. Disconnect the wiring from the back of the RollTek module.
8. Rotate the rubber keeper down to release the pulldown-strap hook from the seat belt pretensioner cable; see **Fig. 2**.
9. Lower the seat to its mid-height position.
10. Unhook the pulldown straps from the seat belt pretensioner cable.
11. Raise the seat to its maximum height position.
12. Remove the four capscrews and spacers that attach the RollTek module to the seat and to the seat riser; see **Fig. 3**. Slide the RollTek module forward, out of the seat riser.

RollTek Module Replacement



A. Rotate rubber keeper to release/secure the pulldown-strap hook.

1. RollTek Module
2. Capscrew
3. Spacer
4. Seat
5. Seat Riser

Fig. 3, RollTek Module Installation

⚠ WARNING

Do not substitute the RollTek module mounting fasteners. Use the fasteners provided with the module to ensure adequate engagement.

13. Install the new RollTek module using the capscrews and spacers provided with the module. Make sure that the module is oriented correctly, with the arrow on the top pointed to the front of the vehicle, and that the mounting surface is flat, with no foreign objects inside the riser. Tighten the capscrews 16 to 18 lbf·ft (22 to 24 N·m).

⚠ WARNING

Before attaching the wiring to the RollTek module and before connecting the batteries, be sure to attach and tighten the mounting capscrews to the

RollTek module. Failure to follow these precautions may result in the air bag(s) being unintentionally deployed, which could cause personal injury or property damage.

14. Lower the seat to its mid-height position.
15. Hook the pulldown straps to the seat belt pretensioner cable; see **Fig. 2**.
16. Rotate the rubber keeper up to secure the pulldown-strap hook to the seat belt pretensioner cable; see **Fig. 2**.
17. Raise the seat to its maximum height position.
18. Connect the wiring to the RollTek module, and place the connectors inside the recess on the back of the module; see **Fig. 1**.
19. Install the access panel over the recess on the back of the RollTek module.
20. Lower the seat. If the seat is equipped with a seat shroud, install or lower the shroud.
21. Connect the batteries. Turn the battery disconnect switch (if so equipped) to the ON position.
22. Verify that no one is in the cab, and while standing outside the cab and clear of the driver's seat, turn the ignition key to the ON position for a few seconds, then turn it to the OFF position.

NOTE: Do not turn the ignition key past the ON position to START.

23. Follow the diagnostic procedure to test for proper installation; see **Troubleshooting 300**.

⚠ WARNING

Before attempting to service the RollTek system, read and comply with the precautions in Subject 060. Failure to do so may result in severe injury or death.

CGW Central Gateway

FMI Failure Mode Indicator. The part of a J1939 fault code that identifies how part of a device, or item on a device, failed.

ICU Instrumentation Control Unit

SPN Suspect Parameter Number

General Information

The J1939 RollTek system uses the AB10 sensor, with sensing elements that detect both frontal impact and side roll events. Even if battery power is lost during an event, deployment of restraint devices will still be possible through its energy reserve capacitors. Upon deployment, crash-relevant parameters are saved in the AB10 sensor.

System diagnostics continuously monitor internal AB10 functions and external circuits. Fault conditions are indicated using the SRS fault lamp and communicated over the SAE J1939 data bus.

When the ignition is turned on, the AB10 performs an initialization that takes approximately six seconds. The SRS fault lamp is on during this time.

The number of igniter circuits the AB10 controls is parameterized, based on vehicle content. There are five different configurations for the AB10 system:

- Driver Frontal Impact Protection—controls a driver frontal air bag and only uses the AB10 sensor.
- Driver Side Roll Protection—controls the driver's seat belt pretensioner and side air bag. The AB10 is internal to the RollTek Module; see **Fig. 1**.
- Driver Frontal and Side Roll Protection—controls the drivers seat belt pretensioner, frontal, and side air bag. The AB10 is internal to the RollTek module.
- Driver and Passenger Side Roll Protection—controls the driver's and passenger's seat belt pretensioners. The AB10 is internal to the RollTek module under the driver's seat. The RollTek module under the passenger's seat is used only for deploying the passenger-side seat belt pretensioner.
- Driver and Passenger Frontal and Side Roll Protection—controls the driver's and passenger's seat belt pretensioners, and the frontal and side air bags. The AB10 is internal to the RollTek module under the driver's seat. The RollTek module under the passengers seat is used only for deploying the passenger-side seat belt pretensioner and the passenger-side air bag.

Diagnostic Tool

The diagnostic procedures described in this subject require the following tool:

- ServiceLink connected to J1939

Troubleshooting

Diagnostics

The RollTek system is powered by ignition circuit 454 from the main PDM. The 5-amp fuse feeding circuit 454 receives ignition power through circuit 81C. Circuit 81C is sourced through the main PDM on the 15-amp circuit breaker CB13.

The RollTek/AB10 system communicates over the J1939 data bus and is assigned the source address 83 (0x53).

The operational readiness of the RollTek system is indicated by the supplemental restraint system (SRS) indicator on the dash. The SRS indicator comes on for approximately 10 seconds when the engine is started and then goes off. The indicator will remain on if there is a problem with the air bag or RollTek system. The vehicle must be serviced if the SRS indicator does not come on when the engine is started or if the SRS indicator remains on.

⚠ WARNING

Before performing any service, deactivate the SRS system by turning off the ignition and battery switch. Do NOT service a live system. Accidental deployment could cause serious injury and property damage.

Prior to performing any service work on the RollTek Rollover Protection System, it is necessary to determine the nature and exact cause of the problem, using the applicable diagnostic procedure in this subject.

1. Determine the appropriate service procedure based on the information provided by the active fault code(s).
2. Complete the service procedure, then clear fault codes following specific fault clearing instructions, if identified in the procedure.
3. Turn the ignition OFF. After 5 seconds, turn it back ON, and verify that no RollTek faults are active.

Fault Codes

ICU3 J1939 Fault Codes				
SPN (Dec)	**FMI (Dec)**	**Description**	**Connector/ Pin**	**Action**
624	03	Warning Lamp Circuit Out of Range High	A-E	Troubleshoot for a wiring fault on circuit 454L between the RollTek module and the ICU. This fault can also be set if the lamp in the ICU has been replaced with one that does not draw the amperage that the RollTek module expects.
	04	Warning Lamp Circuit Out of Range Low		
	05	Warning Lamp Circuit Current Low or Open		
	06	Warning Lamp Circuit Current High or Short to Battery		
	31	Warning Lamp Circuit Cross Coupling		
	14	Warning Lamp Circuit Configuration		

ICU3 J1939 Fault Codes				
SPN (Dec)	**FMI (Dec)**	**Description**	**Connector/ Pin**	**Action**
4818	03	Driver Front Air Bag Circuit Out of Range High	B-1 B-2	Follow the disconnect sequence: 1. Disconnect the batteries and wait one minute. 2. Connect an anti-static grounding strap from your wrist to a ground surface on the vehicle. 3. Disconnect all RollTek module connectors. 4. Disconnect the driver's front air bag connector at the steering column. With the air bag disconnected and placed aside, troubleshoot for a wiring fault with the clockspring and on circuits 454A+ and 454A– between the RollTek module and the driver's front air bag connector at the clockspring. If no wiring fault is found, place a 2.2Ω +/-5% 1/4-watt resistor across the 454A+ and 454A– circuits in the vehicle side of the harness. Reconnect the RollTek module but leave the driver's front air bag disconnected. Connect the batteries, then turn on the ignition without starting the engine. If the fault does not reset as active, replace the air bag. If the fault is still active, replace the RollTek module from under the driver's seat; see **Subject 100**.
	04	Driver Front Air Bag Circuit Out of Range Low		
	05	Driver Front Air Bag Circuit Current Low or Open		
	06	Driver Front Air Bag Circuit Current High		
	31	Driver Front Air Bag Circuit Cross Coupling		
	14	Driver Front Air Bag Circuit Configuration		
4822	03	Driver Buckle Pretensioner Circuit Out of Range High	Internal	Internal circuit fault with the driver-side buckle pretensioner. Replace the RollTek module; see **Subject 100**.
	04	Driver Buckle Pretensioner Circuit Out of Range Low		
	05	Driver Buckle Pretensioner Circuit Current Low or Open		
	06	Driver Buckle Pretensioner Circuit Current High		
	31	Driver Buckle Pretensioner Circuit Cross Coupling		
	14	Driver Buckle Pretensioner Circuit Configuration		

Troubleshooting

ICU3 J1939 Fault Codes				
SPN (Dec)	**FMI (Dec)**	**Description**	**Connector/ Pin**	**Action**
4823	03	Passenger Buckle Tension Interconnect Circuit Out of Range High	D-1 D-2 E-1 E-2	Follow the disconnect sequence: 1. Disconnect the batteries and wait one minute. 2. Connect an anti-static grounding strap from your wrist to a ground surface on the vehicle. 3. Disconnect all Rolltek module connectors from all Rolltek modules. Troubleshoot for a wiring fault on circuits 454C+ and 454C– between the driver-side Rolltek module connector D, pins 1 and 2, and the passenger-side Rolltek module connector E, pins 1 and 2. Repair any wiring fault that is found.
	04	Passenger Buckle Tension Interconnect Circuit Out of Range Low		
	05	Passenger Buckle Tension Interconnect Circuit Current Low or Open		
	06	Passenger Buckle Tension Interconnect Circuit Current High		
	31	Passenger Buckle Tension Interconnect Circuit Cross Coupling		
	14	Passenger Buckle Tension Interconnect Circuit Configuration		
4824	03	Driver Side Air Bag Circuit Out of Range High	C-1 C-2	1. Turn off the ignition and wait one minute. 2. Connect an anti-static grounding strap from your wrist to a ground surface on the vehicle. 3. Unzip the driver-side seat back cover and locate the connectors in the lower outboard area of the seat back. See **Fig. 2**. Disconnect the yellow connector that connects to the Rolltek module to the driver-side air bag. 4. Place a 2.2Ω +/– 5% 1/4-watt resistor in the connector on the side of the harness from the Rolltek module. This resistor will simulate the air bag that will remain disconnected. 5. Turn the ignition on without starting the engine. If the fault does not reset as active, replace the air bag. If the fault remains active, troubleshoot for and repair a fault in the wiring to the Rolltek module. If no wiring fault is found, replace the Rolltek module; see **Subject 100**.
	04	Driver Side Air Bag Circuit Out of Range Low		
	05	Driver Side Air Bag Circuit Current Low or Open		
	06	Driver Side Air Bag Circuit Current High

	14	Driver Side Air Bag Circuit Configuration		

ICU3 J1939 Fault Codes				
SPN (Dec)	**FMI (Dec)**	**Description**	**Connector/ Pin**	**Action**
4826	03	Passenger Side Air Bag Circuit Out of Range High	D-3 D-4 E-3 E-4 F-1 F-2	Follow the disconnect sequence: 1. Disconnect the batteries and wait one minute. 2. Connect an anti-static grounding strap from your wrist to a ground surface on the vehicle. 3. Disconnect all Rolltek module connectors from all Rolltek modules. Troubleshoot for and repair a wiring fault on circuits 454C+ and 454C– between the driver-side Rolltek module connector D, pins 3 and 4, and the passenger-side Rolltek module connector E, pins 3 and 4. If there is no wiring fault, unzip the passenger-side seat back cover and locate the connectors in the lower outboard area of the seat back. See **Fig. 2**. Disconnect the yellow connector for the wiring from the Rolltek module to the side air bag. 1. Place a 2.2Ω +/– 5% 1/4-watt resistor in the yellow connector on the side of the harness from the passenger-side Rolltek module. This resistor will simulate the air bag that will remain disconnected. 2. While wearing the ground strap, reconnect all the other Rolltek module connectors. 3. Turn the ignition on without starting the engine. If the fault does not reset as active, replace the air bag. If the fault remains active, troubleshoot for and repair a fault in the wiring to the Rolltek module. If no wiring fault is found, replace the Rolltek module; see **Subject 100**.
	04	Passenger Side Air Bag Circuit Out of Range Low		
	05	Passenger Side Air Bag Circuit Current Low or Open

Troubleshooting

ICU3 J1939 Fault Codes				
SPN (Dec)	**FMI (Dec)**	**Description**	**Connector/ Pin**	**Action**
4952	03	Driver Side Seat Belt Buckle Circuit Out of Range High	G-1 G-2 I-1 I-2	1. Turn off the ignition and wait one minute. 2. Connect an anti-static grounding strap from your wrist to a ground surface on the vehicle. 3. Unzip the driver-side seat back cover and locate the connectors in the lower outboard area of the seat back. See **Fig. 2**. Disconnect the smaller white connector that connects to the Rolltek module to the driver-side seat belt buckle. 4. Measure resistance across the seat belt buckle (white) connector with the seat belt latched and unlatched. The latch circuit should measure 100Ω when the seat belt is latched and 400Ω when the seat belt is unlatched. If the resistance measurement is significantly different than these values, replace the seat belt buckle assembly. 5. If the seat belt buckle side of the circuit passes all testing, troubleshoot for and repair a wiring fault in the harness between the Rolltek module and the connector. 6. If there is no wiring fault, replace the Rolltek module; see **Subject 100**.
	04	Driver Side Seat Belt Buckle Circuit Out of Range Low		
	05	Driver Side Seat Belt Buckle Circuit Current Low or Open		
	06	Driver Side Seat Belt Buckle Circuit Current High		
	31	Driver Side Seat Belt Buckle Circuit Cross Coupling		
4953	03	Passenger Side Seat Belt Buckle Circuit Out of Range High	H-1 H-2 I-1 I-2	1. Turn off the ignition and wait one minute. 2. Connect an anti-static grounding strap from your wrist to a ground surface on the vehicle. 3. Unzip the passenger-side seat back and locate the connectors in the lower outboard area of the seat back. See **Fig. 2**. Disconnect the smaller white connector that connects the Rolltek module to the passenger-side seat belt buckle. 4. Measure resistance across the seat belt buckle (white) connector with the seat belt latched and unlatched. The latch circuit should measure 100Ω when the seat belt is latched and 400Ω when the seat belt is unlatched. If the resistance measurement is significantly different than these values, replace the seat belt buckle assembly. 5. If the seat belt buckle side of the circuit passes all testing, troubleshoot for and repair a wiring fault in the harness between the Rolltek module and the connector. 6. If there is no wiring fault, replace the Rolltek module; see **Subject 100**.
	04	Passenger Side Seat Belt Buckle Circuit Out of Range Low		
	05	Passenger Side Seat Belt Buckle Circuit Current Low or Open		
	06	Passenger Side Seat Belt Buckle Circuit Current High

Specifications

NOTE: Not all components may be installed.

Fig. 1, SRS Wiring Schematic

General Information

Freightliner Trucks currently applies DuPont® single-stage Imron® 5000 or two-stage (base coat and clear coat) Imron 6000 high-solids polyurethane enamel on the vehicle cab at the factory.

Black Standard Urethane or Imron 5000 is used on the vehicle chassis. The chassis includes the frame, spoke spider, running gear, and any components attached to the frame. Aluminum fuel tanks are not painted.

To meet the federal air quality regulations imposed by the EPA and local jurisdictions, these products contain lower levels of volatile organic compounds (VOCs) than earlier types (916Y, Centari®, and Imron), and are formulated free of lead and chrome.

The procedures in this section are for use with DuPont products. Unless otherwise noted, all products are manufactured by E. I. du Pont de Nemours and Company, Inc. Obtain approval from a Freightliner Regional Office for use of topcoats produced by other manufacturers.

Color-Matching

The recommended aftermarket paints for color-matching factory-applied paint are as follows:

- Cab—use Imron 5000 or Imron 6000
- Chassis—use only Imron 5000

To ensure proper gloss, durability, and color-matching of the enamel, use only Imron 5000 on panels that were previously painted with Imron 5000, and use only Imron 6000 on panels painted with Imron 6000.

To determine the correct paint number for color-matching any original finish on a vehicle, refer to the paint specification on the vehicle specification decal. Refer to the vehicle driver's manual for the location of this decal.

NOTE: The high-solids Standard Urethane applied to the chassis at the factory is sold to original equipment manufacturers (OEMs) only, and is not available for aftermarket sale. Use Imron 5000, N0001 Black, for repainting.

General Guidelines

This section provides instructions for preparing large panels or the entire cab for topcoating with DuPont® products. For spot repairs or touch-ups, see **Subject 120**.

Before topcoating, the surface must be thoroughly cleaned and sanded. Any bare areas must also be conditioned and primed.

1. Preparation materials specified for one type of surface should not be used for any other type of surface.
2. Limit intermediate coatings, such as primers, to the brand and type specified by the finish-coat manufacturer.

⚠ CAUTION

Only experienced, qualified persons using proper equipment should attempt repainting or touch-up painting. Incorrect application of chemicals or paint could damage the surface or impair the finish.

Preparation for Prime Coat

Use the cleaners and conditioners specified in each step to prepare the surface for priming. See **Specifications, 400** for a summary of the products used in this procedure.

⚠ WARNING

Do not use solvent-based cleaners on large areas of plastic or fiberglass, such as the hood or air fairing. Wiping down these large areas may cause a buildup of static electricity. The resulting spark could cause a flash fire, which could result in personal injury or property damage.

Cab and Hood Preparation

1. Wash and dry the entire vehicle with a mild detergent.

⚠ WARNING

Solvents are flammable. Keep them away from heat, sparks, and open flame. Keep the container closed. Use only with adequate ventilation. Avoid breathing the vapor, or headache, nausea, and impaired reaction time and coordination may result.

2. Wipe all surfaces to be painted with a clean cloth soaked with solvent or cleaner. Remove all traces of wax, polish, grease, and silicones.
   - Metal—use DuPont Prep-Sol 3919 S.
   - Plastic—use DuPont Plastic Prep 2319 S.
   - Fiberglass—use DuPont Prep-N-Solv.

   2.1 Work on small areas at a time, wetting the surface liberally.

   2.2 Quickly wipe the surface with a clean cloth before the solvent or cleaner has a chance to dry. Change cloths frequently.
3. Feather the edge of all repaired areas, chipped surfaces, and scratches.

   3.1 Cut down the edges of broken spots with no. 220 sandpaper.

   3.2 Feather the edges by hand, using a sanding block with no. 400 sandpaper.
4. Sand the entire area to be painted. Using a sanding block and no. 400 sandpaper, remove the gloss to improve adhesion of the primer.
5. Using a clean cloth soaked with cleaner, remove any sanding dust.
   - Metal or plastic—use DuPont 3939 S lacquer and enamel cleaner.
   - Fiberglass—use a solution of one part water and one part isopropyl alcohol (IPA).
6. Treat bare metal and rusted areas.
   - Steel—use DuPont 5717 S metal conditioner.
   - Aluminum—use DuPont 225 S aluminum cleaner.

   6.1 Mix one part of the cleaner with two parts of water in a plastic bucket.

6.2 Apply the cleaner with a cloth or sponge. If corrosion is present, work the surface with a stiff plastic brush or 3M Scotch-Brite® pad. Do not use any pads containing iron.

6.3 While the metal is still wet, wipe thoroughly with a clean, dry cloth. Allow the surface to dry before applying a conversion coating.

7. Apply a conversion coating to all bare metal.
   - Steel—use DuPont 5718 S metal conversion coating.
   - Zinc casings or galvanized surfaces (iron or steel)—use DuPont 5718 S metal conversion coating.
   - Aluminum—use DuPont 226 S aluminum conversion coating.

   7.1 Pour the conversion coating into a plastic container (do not dilute). Using a 3M Scotch-Brite or similar non-iron abrasive pad, apply the conversion coating to the metal surface. Work only as much area as can be coated and rinsed before the solution dries.

   7.2 Leave the coating on the surface for 2 to 5 minutes. Then, rinse off the solution with cold water, or mop with a sponge or cloth rinsed frequently in clean water.

   If the metal surface dries before rinsing, reapply the conversion coating, then repeat the previous substep.

   7.3 Wipe the surface dry with a clean cloth, or air dry.

8. With paper and tape, mask all areas that are not to be painted.

Air Fairing Kit Preparation

Before installing a new air fairing, prepare the surface for topcoating.

1. Wash the air fairing with a mild detergent. Dry with a clean, absorbent, lint-free cloth or paper towels.
2. Using a clean cloth soaked with DuPont Prep-N-Solv®, wipe the entire surface to remove any trace of grease or oil.
3. Scuff-sand the air fairing with no. 320 grit sandpaper.
4. Wipe the air fairing with a clean cloth soaked in a solution of one part water and one part isopropyl alcohol. Allow 10 to 15 minutes for the air fairing to dry.
5. With tape and paper, mask all areas that are not to be painted.

Prime Coat

Prime all bare and feathered areas before topcoating. The specified primers can be used on any surface.

1. Clean all cracks and surfaces with dry compressed air.
2. Using a tack cloth, wipe all surfaces to be painted.

⚠ WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C) when mixing or spraying primer, and until the work area has been exhausted of all vapor and spray mist. Breathing paint fumes can cause serious personal injury.

3. Prime all bare metal and feathered areas with DuPont primer.
   - Steel and aluminum—use Corlar 824 S epoxy primer.
   - Fiberglass—use Corlar 825 S epoxy primer.

   3.1 Stir the primer thoroughly.

   3.2 Mix two parts Corlar epoxy primer with one part DuPont 826 S activator.

   3.3 Reduce three parts of this mixture with one part DuPont 3602 S lacquer thinner (viscosity reading is 18 to 22 seconds in a no. 2 Zahn cup). Stir thoroughly.

   3.4 Wait 1 to 2 hours from time of mixing before using. This provides time for complete chemical induction.

   3.5 Set the air pressure at the spray gun at 45 psi (310 kPa). For pressure feed systems,

set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.

3.6 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.

3.7 Spray one full wet coat to give a dry film thickness of 0.7 to 1.0 mil (18 to 25 µm).

3.8 Clean the equipment immediately after use with DuPont 3602 S lacquer thinner.

3.9 Air dry 2 hours or force dry 20 minutes.

4. Wet sand the primer with no. 400 grit or finer sandpaper. Feather the edge into the surrounding area.

5. Dry the surface. Using a clean cloth soaked with cleaner, remove any sanding dust.
   - Metal or plastic—use DuPont 3939 S lacquer and enamel cleaner.
   - Fiberglass—use solution of 1 part water and 1 part isopropyl alcohol (IPA).

NOTE: See **Subject 110** for topcoating instructions.

General Guidelines

This section provides instructions for applying a topcoat of DuPont® enamel to full panels or the entire cab. For spot repairs or touch-ups, see **Subject 120**.

⚠ CAUTION

Only experienced, qualified persons using proper equipment should attempt repainting or touch-up painting. Incorrect application of chemicals or paint could damage the surface or impair the finish.

Do not mix additives with the finish coats unless they are specified by the finish-coat manufacturer. See **Specifications, 400** for a summary of the products used in this procedure.

Before applying any topcoat:

1. Prepare the surface for topcoating. See **Subject 100** for instructions.
2. Clean all cracks and surfaces with dry compressed air.
3. Using a tack cloth, wipe all surfaces to be painted.

After topcoating, remove the masking as follows:

- After normal air drying—remove all masking when the surface is reasonably dry.
- After forced drying—remove the masking immediately after the finish has been baked.
- After two-toning—remove the masking used for the first coat as soon as it has set up, usually in about 35 to 40 minutes. Follow the same procedure for the second color.

Imron 5000 Topcoating

Imron 5000 is a single-stage, low VOC, high-solids polyurethane enamel. It provides a durable, high-gloss surface with good chemical resistance. It requires the addition of an activator.

⚠ WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator approved by NIOSH or MSHA (TC-19C), while spraying Imron 5000, and until the work area has been exhausted of all vapor and spray mist. Breathing paint vapor or spray mist can cause personal injury.

Mixing

1. Stir the Imron 5000 enamel thoroughly.
2. Mix three parts Imron 5000 enamel with one part of DuPont 193 S or 194 S activator. No further reduction is necessary for application.

NOTE: The pot life of the mixture is about 2 to 4 hours at 70°F (21°C), unless an accelerator is added.

3. If faster curing time is desired, add DuPont 389 S fast-dry accelerator. Add up to 2 ounces (60 mL) to 1 gallon (3.8 L) of mixed material.
4. Mix thoroughly and strain.

NOTE: The viscosity of the mixture is about 9 to 20 seconds in a no. 3 Zahn cup, depending on the color. Adding reducer could affect the color match on some metallics.

Application

1. Set the air pressure at the spray gun to 60 to 65 psi (410 to 450 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.
2. Apply the topcoating.
   - 2.1 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.
   - 2.2 Using a cross-coat technique, spray one medium-wet coat in a north-to-south direction
   - 2.3 Allow 5 to 10 minutes drying time between each application. Do not sand.
   - 2.4 Apply a second medium-wet coat in an east-to-west direction.
   - 2.5 A third medium-wet coat may be needed for good coverage of some colors.
3. To air dry, allow 2 to 4 hours with accelerator 389 S, and 6 to 8 hours without the accelerator.

   To force dry, wait 15 minutes following the application of the final coat, then dry for 30 minutes at 140 to 180°F (60 to 82°C).

4. To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied. Avoid contacting the freshly painted surface with masking paper.
5. Clean the equipment immediately after use with DuPont 3602 S lacquer thinner or 8685 S reducer.

Recoating or Decorating

Two-toning, striping, or lettering may be applied in 4 to 6 hours if DuPont 389 S accelerator is used. Wait 10 to 12 hours if no accelerator is used.

Decals may be applied in 12 to 16 hours if 389 S accelerator is used. Wait 24 hours if no accelerator is used.

For topcoats cured over 72 hours, scuff-sand with no. 400 grit sandpaper and wipe with a clean tack cloth before recoating, striping, lettering, or applying decals.

Imron 6000 Topcoating

Imron 6000 is a two-stage, high-solids polyurethane enamel. It provides good cover with one cross-coat of the base color followed by one coat of Imron 6000 clear coat. Both the base color and clear coat require the addition of an activator.

⚠ WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator approved by NIOSH or MSHA (TC-19C), while spraying Imron 6000, and until the work area has been exhausted of all vapor and spray mist. Breathing paint vapor or spray mist can cause personal injury.

Mixing

1. Stir the Imron 6000 base color thoroughly.
2. Mix three parts Imron 6000 base color with one part DuPont 193 S or 194 S activator. No further reduction is necessary for application.

NOTE: The pot life of the mixture is about 2 to 4 hours at 70°F (21°C), unless an accelerator is added.

3. If faster curing time is desired, add DuPont 389 S fast-dry accelerator. Add up to 2 ounces (60 mL) to 1 gallon (3.8 L) of mixed material.
4. Mix thoroughly and strain.

NOTE: For solids, the viscosity of the mixture is about 20 seconds in a DuPont M-222 (M-50) cup; for metallics, it is about 18 seconds.

Application

1. Set the air pressure at the spray gun to 60 to 65 psi (410 to 450 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.
2. Apply the topcoating.
   - 2.1 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.
   - 2.2 Apply one cross-coat of the Imron 6000 base color.
   - 2.3 Flash 10 minutes minimum. Do not sand.
   - 2.4 Mix three parts DuPont 3440 S or 3480 S clear with one part DuPont 193 S or 194 S activator.
   - 2.5 Apply one coat of the activated DuPont 3440 S or 3480 S clear.
3. To air dry, allow 2 to 4 hours if DuPont 389 S accelerator is used, and 6 to 8 hours if no accelerator is used.

   To force dry, wait 15 minutes following the application of the clear coat, then dry for 30 minutes at 140 to 180°F (60 to 82°C).
4. To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied. Avoid contacting the freshly painted surface with masking paper.
5. Clean the equipment immediately after use with DuPont 3602 S lacquer thinner or 8685 S reducer.

Recoating or Decorating

Two-toning, striping, and lettering may be applied in 4 to 6 hours if DuPont 389 S accelerator is used. Wait 10 to 12 hours if no accelerator is used.

Decals may be applied in 12 to 16 hours if 389 S accelerator is used. Wait 24 hours if no accelerator is used.

For topcoats cured over 72 hours, scuff-sand with no. 400 grit sandpaper and wipe with a clean tack cloth before recoating, striping, lettering, or applying decals.

General Guidelines

This section provides instructions for making spot repairs or touch-ups with DuPont® enamels. Buffing may correct minor imperfections; more serious repairs require surface preparation before a topcoating can be applied. For striping, lettering, or decal application after the repair is complete, see **Subject 110**.

1. Preparation materials specified for one type of surface should not be used for any other type of surface. See **Specifications, 400** for a summary of the materials used in this section.
2. Limit intermediate coatings, such as primers, to the brand and type specified by the finish-coat manufacturer.
3. Do not mix additives with the finish coats unless they are specified by the finish-coat manufacturer.

⚠ CAUTION

Only experienced, qualified persons using proper equipment should attempt repainting or touch-up painting. Incorrect application of chemicals or paint could damage the surface or impair the finish.

Buffing Minor Imperfections

1. Clean the area carefully with a mild detergent and rinse.
2. Remove imperfections using ultra-fine or micro-fine sandpaper (1500 or 2000 grit) and water. Rinse the area with clean water, then dry.
3. Buff the area.
   - 3.1 Use a clean foam pad at low speed (about 1600 rpm) with one of the following products:
     - DuPont 1500 S
     - Meguiar's No. 2
     - 3M Finesset Two 5928
   - 3.2 Using medium pressure, buff slowly in an overlapping pattern until the imperfection has been eliminated. Repeat as necessary.
   - 3.3 Rinse the area with clean water, then dry.
4. Polish the area.
   - 4.1 Apply one of the following products with a clean pad (3M Waffle Pad):
     - DuPont 3000 S
     - Meguiar's No. 9
     - 3M 5996
   - 4.2 Using medium pressure, work small areas using an even, overlapping pattern until the gloss is restored. As the polish dries and the gloss appears, ease the pressure on the polishing pad. Repeat as necessary.

Preparing for Topcoating

1. Wash the entire panel with mild detergent. Dry with a clean, lint-free cloth.

⚠ WARNING

Solvents are flammable. Keep them away from heat, sparks, and open flame. Keep the container closed. Use only with adequate ventilation. Avoid breathing the vapor, or headache, nausea, and impaired reaction time and coordination may result.

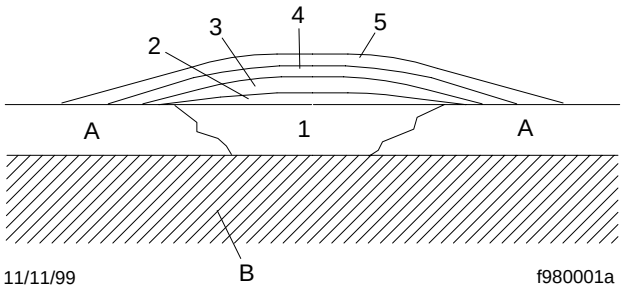
2. Clean the area to be repaired with DuPont 3939 S solvent and quickly wipe the surface with a clean, lint-free cloth before the solvent dries. Remove all traces of wax, polish, grease, and silicones.
3. Sand or grind all dents and scratches.
4. Wet sand and the area being repaired with no. 320 grit or finer sandpaper, or a 3M Scotch-Brite® or similar non-iron abrasive pad. Feather the edge.
5. Remove the sanding dust. Use the same solvent and wipe-on, wipe-off method used earlier to clean the area.
6. Mask all areas that will not be painted.
7. Clean all cracks and surfaces with dry compressed air.
8. Using a tack cloth, wipe all surfaces to be painted.

Spot Repair

WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C) when mixing or spraying primer, and until the work area has been exhausted of all vapor and spray mist. Breathing paint fumes can cause serious personal injury.

9. Prime all bare metal and feathered areas with DuPont primer. See **Fig. 1**.
   - Steel and aluminum—use Corlar 824 S epoxy primer.
   - Fiberglass—use Corlar 825 S epoxy primer.



NOTE: Scale exaggerated for clarity. The number of layers depends on the specific application.

A. Existing Paint
B. Panel Material (substrate)
1. Primer
2. First Color Topcoat
3. Second Color Topcoat
4. Third Color Topcoat
5. Clear Coat

Fig. 1, Spot Repair Cross-Section

9.1 Stir primer thoroughly.

9.2 Mix two parts Corlar epoxy primer with one part DuPont 826 S activator.

9.3 Reduce three parts of this mixture with one part DuPont 3602 S lacquer thinner (viscosity reading is 18 to 22 seconds in a no. 2 Zahn cup). Stir thoroughly.

9.4 Wait 1 to 2 hours from time of mixing before using. This provides time for complete chemical induction.

9.5 Set the air pressure at the spray gun to 45 psi (310 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.

9.6 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.

9.7 Spray one wet coat to give a dry film thickness of 0.7 to 1.0 mil (18 to 25 µm).

9.8 Clean the equipment immediately after use with DuPont 3602 S lacquer thinner.

9.9 Air dry 2 to 4 hours or force dry 20 minutes.

10. Wet sand the primer with no. 400 grit or finer sandpaper. Feather the edge into the surrounding area.

11. If the original paint was Imron 6000, hand-rub the area around the spot repair with a medium grade compound to ensure a seamless finish.

12. Remove the sanding dust. Use the same solvent and wipe-on, wipe-off method used earlier to clean the area.

13. Wipe the repair area with a tack cloth.

14. If the finish is old, apply one coat of DuPont 222 S adhesion promoter over the entire repair area.

14.1 Set the air pressure to 35 psi (240 kPa) at the spray gun.

14.2 Flash for 5 to 10 minutes at 70°F (21°C) before topcoating.

Topcoating a Spot Repair

WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator approved by NIOSH or MSHA (TC-19C), while spraying topcoating, and until the work area has been exhausted of all vapor and spray mist. Breathing topcoating vapor or spray mist can cause personal injury.

Imron 5000 Topcoating

1. Mix the Imron 5000 polyurethane enamel.

1.1 Stir the Imron 5000 enamel thoroughly.

1.2 Mix three parts Imron 5000 base color with one part DuPont 193 S or 194 S activator. No further reduction is necessary for application.

1.3 Mix thoroughly and strain.

2. Set the air pressure at the spray gun at 60 to 65 psi (410 to 450 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.

3. For metallic topcoats only, apply one coat of DuPont 500 S urethane clear.

3.1 Mix eight parts of 500 S urethane with one part 193 activator.

3.2 Reduce the activated 500 S urethane mixture 50 percent with 8685 S reducer.

3.3 Apply a medium-wet coat of the reduced 500 S urethane over the entire repair area, and well beyond where the color will be applied.

3.4 Flash 3 minutes before applying the Imron 5000 topcoat.

4. Apply the solid color or metallic topcoating.

4.1 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.

4.2 Spray one medium-wet coat over the primed area.

4.3 Flash 5 to 10 minutes.

4.4 Apply a second medium-wet coat. Extend the spray area slightly to taper the edge and avoid a visible ring.

4.5 A third medium-wet coat may be needed for good coverage of some colors. Allow each coat to flash before applying the next coat.

NOTE: A mist coat of five parts of color to three parts of 8022 S is recommended when applying metallics. Hold the gun about 18 inches (45 cm) from the surface.

5. Blend the repair area into the OEM finish.

5.1 Lower the air pressure to 15 to 20 psi (100 to 140 kPa) at the spray gun.

5.2 Empty the spray cup and refill it with DuPont 8022 S reducer or a blend of 8022 S and 8093 S.

5.3 Carefully blend the edge of the repair with even coats to melt in the overspray.

5.4 Spray one or two medium coats of the reducer over the entire area.

5.5 If a haze appears around the edge after the reducer has dried, lightly rub the edge with DuPont 1500 S one-step polish.

6. To air dry, allow 2 to 4 hours if DuPont 389 S accelerator is used, and 6 to 8 hours if no accelerator is used.

To force dry, wait 15 minutes following the application of the final coat, then dry for 30 minutes at 140 to 180°F (60 to 82°C).

7. To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied. Avoid contacting the freshly painted surface with masking paper.

8. Clean the equipment immediately after use with DuPont 3602 S lacquer thinner or 8685 S reducer.

Imron 6000 Topcoating

1. Mix the Imron 6000 polyurethane enamel.

1.1 Stir the Imron 6000 base color thoroughly.

1.2 Mix three parts Imron 6000 base color with one part DuPont 193 S or 194 S activator. No further reduction is necessary for application.

1.3 Mix thoroughly and strain.

2. Set the air pressure at the spray gun at 60 to 65 psi (410 to 450 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.

3. Apply the topcoating.

3.1 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.

3.2 Apply one cross-coat of the Imron 6000 base color over the primed area. No flash time is required before applying a clear coat.

Spot Repair

3.3 Flash 10 minutes minimum. Do not sand.

3.4 Mix three parts DuPont 3440 S or 3480 S clear with one part DuPont 193 S or 194 S activator.

NOTE: For best results, apply the clear coat over the entire panel. If a blend of the repair area is attempted, apply the clear coat only over the repair area, overspraying the edge slightly.

3.5 Apply one coat of the activated DuPont 3440 S or 3480 S clear.

4. Blend the 3440 S or 3480 S clear into the surrounding topcoat.

   4.1 Set the air pressure to 25 psi (170 kPa) at the spray gun.

   4.2 Apply one coat of 3401 S blending clear over the repair area only to the overspray edge.

   4.3 Flash 2 minutes. Repeat if necessary.

5. To air dry, allow 2 to 4 hours if DuPont 389 S accelerator is used, and 6 to 8 hours if no accelerator is used.

   To force dry, wait 15 minutes following the application of the final coat, then dry for 30 minutes at 140 to 180°F (60 to 82°C).

6. To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied. Avoid contacting the freshly painted surface with masking paper.

7. Clean the equipment immediately after use with DuPont 3602 S lacquer thinner or 8685 S reducer.

General Information

If corrosion appears around the rivets on an aluminum cab, the rivets must be replaced as part of the surface corrosion repair.

Use only the DuPont products specified in each step. See **Specifications, 400** for a summary of the products used in this procedure.

⚠ CAUTION

Only experienced, qualified persons using proper equipment should attempt repainting or touch-up painting. Incorrect application of chemicals or paint could damage the surface or impair the finish.

⚠ WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C) when mixing or spraying primer or topcoat, and until the work area has been exhausted of all vapor and spray mist. Breathing paint vapor or spray mist can cause personal injury.

Surface Preparation

1. Wash and dry the cab with a mild detergent.
2. Wipe all areas to be repaired with a clean cloth soaked with DuPont Prep-Sol 3919 S.
   - 2.1 Work on small areas at a time, wetting the surface liberally.
   - 2.2 Quickly wipe the surface with a clean cloth before the solvent has a chance to dry. Change cloths frequently.
   - 2.3 Remove all traces of wax, polish, oil, grease, and silicones.
3. Using a no. 11 tool bit (0.191-inch/4.85-mm diameter), drill out the rivet heads in the corroded area. Remove the rivets.
4. Sand the corroded areas.
   - 4.1 Using no. 220 to 320 grit sandpaper, sand the corroded or otherwise exposed areas on the aluminum skin (substrate).
   - 4.2 Feather the edges by hand or with an oscillating sander (DA).
5. Sand the entire area to be painted. Using a sanding block and no. 400 sandpaper, remove the gloss to improve adhesion of the primer and topcoat.
6. Using a clean cloth soaked with DuPont 3939 S lacquer and enamel cleaner, remove any sanding dust.
7. Install new 3/16-inch-diameter rivets in the clean, drilled holes.

IMPORTANT: Make sure both the bare metal and new rivets are treated with metal conditioner.

8. Treat all bare metal and new rivets with metal conditioner.
   - 8.1 Mix one part of DuPont 225 S aluminum cleaner with two parts of water in a plastic container. Do not use a metal container.
   - 8.2 Apply the cleaner with a cloth or sponge. Work the surface with a stiff plastic brush or 3M Scotch-Brite® pad. Do not use any pads containing iron.
   - 8.3 While the metal is still wet, wipe thoroughly with a clean, dry cloth. Allow the surface to dry before applying the conversion coating.
9. Apply a conversion coating to all bare metal.
   - 9.1 Pour DuPont 226 S aluminum conversion coating into a plastic container. *Do not dilute.* Using a 3M Scotch-Brite or similar non-iron abrasive pad, apply the conversion coating to all bare metal surfaces.

     Work only as much area as can be coated and rinsed before the solution dries.
   - 9.2 Leave the coating on the surface for 2 to 5 minutes. Then, rinse off the solution with cold water, or mop with a sponge or cloth rinsed frequently in clean water.

     If the metal surface dries before rinsing, reapply the conversion coating, leave it on for 2 to 5 minutes, then rinse thoroughly.
   - 9.3 Wipe the surface dry with a clean cloth, or air dry.

10. With paper and tape, mask all areas that are not to be painted. Prime immediately.

Prime Coat

1. Clean all cracks and surfaces with dry compressed air.
2. Using a tack cloth, wipe all surfaces to be painted.
3. Prime all bare metal and feathered areas with DuPont Corlar® 824 S epoxy primer.
   - 3.1 Stir Corlar 824 S primer thoroughly.
   - 3.2 Mix two parts Corlar 824 S primer with one part DuPont 826 S activator.
   - 3.3 Reduce three parts of this mixture with one part DuPont 3602 S lacquer thinner (viscosity reading is 18 to 22 seconds in a no. 2 Zahn cup). Stir thoroughly.
   - 3.4 Wait 1 to 2 hours from time of mixing before using, to provide time for complete chemical induction.
   - 3.5 Spray one full wet coat to give a dry film thickness of 0.7 to 1.0 mil (18 to 25 µm).
   - 3.6 Clean equipment immediately after use with DuPont 3602 S lacquer thinner.
   - 3.7 Air dry 2 to 4 hours or force dry 20 minutes.

Topcoat

Imron 5000® is a single-stage, low VOC, high-solids polyurethane enamel. It provides a durable, high-gloss surface with good chemical resistance. It requires the addition of an activator.

Mixing

1. Stir the enamel thoroughly.
2. Mix three parts Imron 5000 enamel with one part of DuPont 193 S or 194 S activator. No further reduction is necessary for application.

NOTE: The pot life is about 2 to 4 hours at 70°F (21°C), unless an accelerator is added.

3. If faster curing time is desired, add DuPont 389 S fast-dry accelerator. Add up to 2 ounces (60 mL) to 1 gallon (3.8 L) of activated material.
4. Mix thoroughly and strain.

NOTE: The viscosity of the mixture is about 9 to 15 seconds in a no. 3 Zahn cup, depending on the color. Adding reducer could affect the color match on some metallics.

Application

1. Set the air pressure at the spray gun at 50 to 60 psi (345 to 414 kPa) for solid colors, and 65 psi (448 kPa) for metallics. For pressure feed systems, set the fluid delivery at 12 to 16 ounces (355 to 473 mL) per minute. See **Specifications, 400**.
2. Apply the topcoating.
   - 2.1 Hold the spray gun about 8 inches (20 cm) from the surface.
   - 2.2 Spray one medium-wet coat over the primed area.
   - 2.3 Allow 5 to 10 minutes drying time between each application.
   - 2.4 Apply a second medium-wet coat. Extend the second coat beyond the edge of the first coat to provide the correct taper and avoid a visible ring.
   - 2.5 A third medium-wet coat may be needed for good coverage of some colors.
3. To air dry, allow 2 to 4 hours if DuPont 389 S accelerator is used, and 6 to 8 hours if no accelerator is used.

   To force dry, wait 15 minutes following the application of the final topcoat, then dry for 30 minutes at 140 to 180°F (60 to 82°C).
4. To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied. Avoid contacting the freshly painted surface with masking paper.
5. Clean the equipment immediately after use with DuPont 3602 S lacquer thinner or 8685 S reducer.

Recoating or Decorating

Two-toning, striping, or lettering may be applied in 4 to 6 hours if DuPont 389 S accelerator is used. Wait 10 to 12 hours if no accelerator is used.

Decals may be applied in 12 to 16 hours if DuPont 389 S accelerator is used. Wait 24 hours if no accelerator is used.

For topcoats cured over 72 hours, scuff-sand with no. 400 grit sandpaper and wipe with a clean tack cloth before recoating, striping, lettering, or applying decals.

Equipment Application Parameters

Equipment Application Parameters		
Parameter	**English Units**	**Metric Units**
Atomizing Air		
Primer	45 psi	310 kPa
Enamel	60–65 psi	410–450 kPa
Fluid Delivery	12–16 oz/min	350–470 mL/min
Booth Temperature	75°F	23°C
Spray Gun Distance	10–12 in	25–30 cm

Equipment cleanup	3939 S lacquer and enamel cleaner or 8685 S reducer	

General Description

PPG Delta® DUHS base-coat and DCU2070 clear-coat paint is used on the vehicle cab. To meet the federal air quality regulations imposed by the EPA and local jurisdictions, these products contain low amounts of solvent and are formulated to be free of lead and chrome.

The procedures in this section are for use with PPG products. Unless otherwise noted, all products are manufactured by PPG. Obtain approval from Daimler Trucks North America LLC for use of topcoats produced by other manufacturers.

Color Matching

PPG Delta® high solids polyurethane is the recommended aftermarket PPG paint. For repairs, use PPG Delta DFHS paint for color-matching the chassis and PPG Delta DUHS base coat with DCU2070 clear coat paint for color-matching the cab.

To determine the correct paint number for color-matching of any original finish on a vehicle, refer to the paint specification on the vehicle specification decal. See **Fig. 1**. Refer to the vehicle operator's manual for the location of this decal.

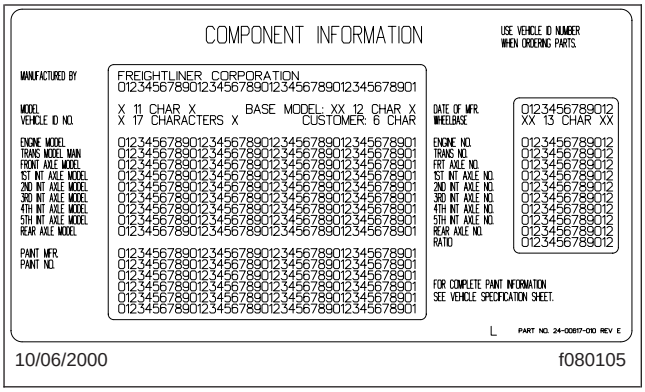

Fig. 1, Vehicle Specification Decal

General Guidelines

1. Preparation materials specified for one type of surface should not be used for any other type of surface.
2. Limit intermediate coatings, such as sealers, to the brand and type specified by the finish coat manufacturer.
3. Do not mix additives with the finish coats, unless the finish coat manufacturer specifies them.

IMPORTANT: Only experienced, qualified persons, using proper equipment, should attempt repainting and touch-up painting.

Preparation for Topcoating

1. Wash and dry the entire surface to be painted.
2. Using a clean cloth soaked with PPG DX436 Wax and Grease Remover, remove all traces of wax, polish, grease, and silicones, as follows:
   - 2.1 Work on small areas at a time, wetting the surface liberally.
   - 2.2 Change cloths frequently.
   - 2.3 Wipe off the surface with a clean cloth before the PPG DX436 wax and grease remover has a chance to dry.
3. Feather-edge all repaired areas, chipped surfaces, and scratches, as follows:
   - 3.1 Cut down the edges of broken spots with 220-grit sandpaper.
   - 3.2 Feather the edges by hand, using a sanding block with 400-grit sandpaper.
4. Sand the entire area to be repainted. Use a sanding block and 400-grit sandpaper to remove the gloss and to improve adhesion of the primer.
5. Using a clean cloth soaked with PPG DX436 wax and grease remover, remove any sanding dust from the area to be painted. Remove all traces of wax, polish, grease, dust, and silicones, as follows:
   - 5.1 Work on small areas at a time, wetting the surface liberally.
   - 5.2 Change cloths frequently.
   - 5.3 Wipe off the surface with a clean cloth before the PPG DX436 wax and grease remover has a chance to dry.
6. Treat bare metal and corroded areas. For aluminum, use PPG DX533 Aluminum Cleaner; for all other metals, use PPG DX579 Metal Cleaner.
   - 6.1 For aluminum, mix one part of PPG DX533 Aluminum Cleaner with three parts of water in a plastic bucket.

     For all other metals, mix one part of the PPG DX579 Metal Cleaner with two parts of water in a plastic bucket.
   - 6.2 All corroded areas must be abraded until the area is free of rust or corrosion. Use 80-grit followed by 220-grit sandpaper to abrade the area.
   - 6.3 Spray cleaner on the surface and allow it to react for 2 to 3 minutes.
   - 6.4 Rinse off the cleaner with fresh water and dry thoroughly with a clean, lint free, dry cloth.

Preparing for Topcoating

IMPORTANT: Carbon steel must be primed immediately after abrading and cleaning. Aluminum must be primed within 4 to 8 hours of abrading and cleaning.

7. With paper and tape, mask all areas that are not to be painted, then prime immediately.

Primers for the Cab

PPG has several compatible primers to use when repainting or repairing. The recommended primers are:

- DP-LF — A chrome- and lead-free epoxy primer with excellent corrosion resistance.
- DPU217 — A chrome-free polyurethane primer that can be applied as low as 2.1 lb./gal VOC with excellent adhesion and corrosion resistance properties.
- DEP351 — A 3.5 VOC chrome- and lead-free epoxy primer with excellent adhesion and corrosion resistance properties.
- DPHS-52 — A non-isocyanate, chrome- and lead-free, corrosion resistant, sandable primer with excellent adhesion and filling properties.

DP-LF Primer

NOTE: Refer to PPG Product Information Bulletin P-196 for additional information.

IMPORTANT: Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C), when mixing or spraying primer, and until the work area has been exhausted of all vapor and spray mist.

1. Stir the DP-LF Primer thoroughly. Then, mix two parts of DP-LP with one part of DP 401LF.
2. Stir thoroughly and allow a 30-minute induction time to obtain maximum performance.
3. Apply two light-to-medium wet coats to achieve a 1.0 mil minimum to 2.0 mil maximum dry film thickness (DFT).
4. Allow 15 minutes flash time between coats.
5. Allow a drying time of 1 hour at 70°F (21°C) before topcoating.
6. Clean all cracks and surfaces with dry compressed air.
7. Using a tack cloth, wipe all surfaces to be painted.

DPU217 Primer

NOTE: Refer to PPG Product Information Bulletin FL304 for additional information.

IMPORTANT: Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C), when mixing or spraying primer, and until the work area has been exhausted of all vapor and spray mist.

NOTE: This mixture has a VOC of 2.8 lb/gal. To spray at 2.1 lb/gal do not add the DRS reducer.

1. Stir the DPU217 primer thoroughly.
2. Mix five parts of DPU217 with one part of DPU218.
3. Add 6 fluid ounces (177 mL) of DX39/DX53 per ready-to-spray gallon (3.8 L).
4. Add one part of DRS reducers.

NOTE: When adding DRS reducers in the 2.8 VOC blend, for best results, the DRS solvents must be added last, after the addition of the DX39/DX53.

5. Apply one to two coats.
6. Allow 10 to 15 minutes flash time between coats.
7. Allow a drying time of 60 minutes at 70°F (21°C) before topcoating.

NOTE: After four days, DPU217 must be sanded before additional primer or topcoat can be applied.

8. Clean all cracks and surfaces with dry compressed air.
9. Using a tack cloth, wipe all surfaces to be painted.

DEP351 Primer

NOTE: Refer to PPG Product Information Bulletin FL305 for additional information.

IMPORTANT: Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C), when mixing or spraying primer, and until the work area has been exhausted of all vapor and spray mist.

1. Stir the DEP351 Primer thoroughly. Then, mix two parts of DEP351 with one part of DEP352.

   The addition of 10 to 20 percent Acetone or DES1570 Exempt Solvent Blend should be used for sealer application.
2. Apply one to two coats.
3. Allow 5 minutes flash time between coats.
4. Allow a drying time of 60 minutes at 70°F (21°C) before topcoating.
5. Clean all cracks and surfaces with dry compressed air.
6. Using a tack cloth, wipe all surfaces to be painted.

DPHS52 Primer

NOTE: Refer to PPG Product Information Bulletin FL301 for additional information.

IMPORTANT: Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C), when mixing or spraying primer, and until the work area has been exhausted of all vapor and spray mist.

1. Stir the DPHS52 Primer thoroughly. Then, mix two parts of DPHS52 with one part of DPHS521 and mix thoroughly.
2. Apply two to three wet coats to achieve a 2.0 mil minimum to 3.0 mil maximum DFT.
3. Allow 10 minutes flash time between coats.

NOTE: A minimum of 2.0 mil DFT after sanding must be maintained to ensure proper adhesion and corrosion protection.

4. Allow a drying time of 45 minutes at 70°F (21°C) before topcoating.

   Or, if sanding before topcoating, allow a drying time of 3 to 4 hours, then DA sand with 320- to 360-grit dry sandpaper, followed with a finish DA sanding using 1500-grit or finer paper.
5. Clean all cracks and surfaces with dry compressed air.
6. Using a tack cloth, wipe all surfaces to be painted.

Delta® DFHS High Solids Polyurethane

NOTE: Refer to PPG Product Information Bulletin P-FL504 for additional information.

IMPORTANT: Wear a positive-pressure, supplied-air, vapor and particulate respirator approved by NIOSH or MSHA (TC-19C), while mixing and spraying, and until the work area has been exhausted of all vapor and spray mist.

Mixing

1. Stir Delta DFHS Single Stage thoroughly.
2. Mix four parts Delta DFHS Single Stage with one part DFH535/DFH536.
3. Add six fluid ounces (177 ml) DX39 per ready-to-spray (RTS) gal.

NOTE: May substitute with DX53 or DX49, but pot life, dry times, and recoat ability may be affected.

4. Mix thoroughly and strain.

Spraying

1. For High Velocity, Low Pressure (HVLP) systems, the air pressure at the air cap should be set at 10 psi (69 kPa).

   For conventional spray guns, set the air pressure to 45 to 60 psi (310 to 414 kPa) at the gun.

   The fluid tip size for conventional HVLP guns should be 1.3 to 1.7 mm.

   The fluid tip size for pressure-feed HVLP guns should be 1.0 to 1.4 mm.
2. Apply two coats, or until hiding is achieved. Flash time between coats is 5 to 10 minutes at 70°F (21°C).
3. Dry times: See **Table 1** for air dry times. See **Table 2** for force dry times.

Delta® DUHS Basecoat

NOTE: Refer to PPG Product Information Bulletin P-FL507 for additional information.

IMPORTANT: Wear a positive-pressure, supplied-air, vapor and particulate respirator approved by NIOSH or MSHA (TC-19C), while mixing and spraying, and until the work area has been exhausted of all vapor and spray mist.

Air Dry Time - at 70°F (21°C) with DFH535	
Using DX39	12 hours
Using DX53	16 hours
Using DX49	5 hours

Table 1, Air Dry Times

Force Dry with DX53 only.	
Flash	10 minutes
@ 120°F (49°C)	30 minutes
@ 180°F (82°C)	15 minutes

Table 2, Force Dry Times

Mixing

NOTE: One-quarter part DHSX Converter is the minimum quantity and one part is the maximum quantity of converter to add to DUHS Basecoat. Increasing the level of DHSX will speed dry time, but will shorten pot time, especially in warm and humid conditions.

1. Stir Delta DUHS Basecoat thoroughly.
2. Mix two parts of Delta DUHS Basecoat with one-quarter to one part of DHSX Converter.
3. Add one part DDH526.
4. Mix thoroughly and strain.

Spraying

1. For High Velocity, Low Pressure (HVLP) systems, the air pressure at the air cap should be set at 10 psi (69kPa).

   For conventional spray guns, set the air pressure to 45 to 60 psi (310 to 414 kPa) at the gun.

   The fluid tip size should be 1.3 to 1.7 mm for conventional HVLP guns and 1.0 to 1.4 mm for pressure feed HVLP guns.
2. Apply two coats of the basecoat, or until hiding is achieved. Minimum film build for each coat

should be 1.5 mils wet and no more then 2.0 mil wet. Flash time between coats is 5 to 10 minutes at 70°F (21°C).

3. Dry time to clearcoat is 10 to 15 minutes minimum and up to 72 hours maximum at 70°F (21°C). After 72 hours the DUHS basecoat must be sanded and additional color applied before clearcoating.
4. Allow a drying time of 60 minutes at 70°F (21°C) before topcoating.

Delta® Urethane Clear DCU2070

NOTE: Refer to PPG Product Information Bulletin FL600 for additional information.

IMPORTANT: Wear a positive-pressure, supplied-air, vapor and particulate respirator approved by NIOSH or MSHA (TC-19C), while mixing and spraying, and until the work area has been exhausted of all vapor and spray mist.

Mixing

1. Mix four parts of DCU2070 with one part of DRS Reducer.
2. Add two parts DCX2071/DCX2072.
3. Add four fluid ounces (118mL) of DX39/DX54 per RTS gallon (3.8 L) of mixed material.
4. Mix thoroughly and strain.

Spraying

1. For HVLP systems, the air pressure at the air cap should be set at 10 psi (69 kPa).

   For conventional spray guns, set the air pressure to 55 to 60 psi (379 to 414 kPa) at the gun.

   The fluid tip size should be 1.0 to 1.4 mm for pressure feed HVLP and 1.3 to 1.5 mm for conventional feed HVLP.
2. Apply two coats allowing 10 to 15 minutes between coats.
3. For dry times at 70°F (21°C), See **Table 3**. Force dry time is 30 minutes at 140°F (60°C).

Dry Times		
DCU2070	**With DCX2071**	**With DCX2072**
With DX39	3 hours	1 to 2 hours
With DX53	4 to 5 hours	2 hours

Table 3, Dry Times

4. Buffing may begin 4 to 6 hours after the unit is air dried, or immediately after cool off, if force dried.

NOTE: If polishing is required, use DCX2071 Polish within 24 hours.

Buffing

Refer to PPG Product Information Bulletin PD768 for polishing and compounding.

General Guidelines

These are instructions for making spot repairs or touch-ups with PPG Delfleet® Evolution urethane topcoat single stage or basecoat/clearcoat.

Buffing may correct minor imperfections; more serious repairs require surface preparation before a topcoating can be applied.

1. Preparation materials specified for one type of surface should not be used for any other type of surface.
2. Limit intermediate coatings, such as primers, to the brand and type specified by the paint manufacturer.
3. Do not use any products or additives that are not specifically recommended by the paint manufacturer in published literature.
4. Substrate and ambient temperature should be above 65°F (18°C) for optimum performance.

Buffing Minor Imperfections

1. Clean the area carefully with a mild detergent, then rinse.
2. Remove imperfections using ultra-fine or micro-fine sandpaper (1500- or 2000-grit) and water.
3. Rinse the area with clean water, then dry.
4. Buff the area, using a clean foam pad at low speed (about 1600 rpm) with one of the following products:
   - Meguiar's No. 2 Fine-Cut Cleaner
   - 3M Finesse-it II 05928

   Using medium pressure, buff slowly in an overlapping pattern until the imperfection has been eliminated. Repeat as necessary.
5. Rinse the area with clean water, then dry.
6. Polish the area with a clean pad, such as a 3M Waffle Pad, using either of the following products:
   - Meguiar's No. 9 Swirl Remover
   - 3M Perfect-It 05996

   Using medium pressure, work small areas using an even, overlapping pattern until the gloss is restored. As the polish dries and the gloss appears, ease the pressure on the polishing pad. Repeat as necessary

Preparing for Topcoating

1. Wash the entire panel in mild detergent, containing no lanolin or additives. Before the solution dries, rinse with fresh water. Dry with a clean, lint-free cloth.
2. Cover areas around the repair area to prevent damage to surrounding objects from solvent overspray or drips.

⚠ WARNING

Solvents are flammable. Keep the container closed. Use only with adequate ventilation. Keep solvents away from heat, sparks, and open flame. Breathing the vapor can cause headache, nausea, impaired reaction time, and impaired coordination.

3. Clean the area to be repaired with PPG D436/DX437/DX438 Substrate Cleaner. Choose the product depending on local regulations and degree of contamination. Quickly wipe the surface with a clean, lint-free cloth before the substrate cleaner dries.

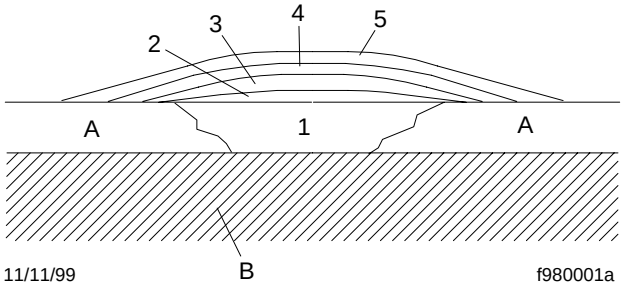
   Remove all traces of substrate contamination such as wax, polish, grease, diesel exhaust residue, and silicones. Do not allow substrate cleaners to air dry on the repair area.
4. Sand or grind all dents and scratches.
5. DA sand the area being repaired with 320- or 400-grit, or finer sandpaper, or a 3M Scotch-Brite® pad. Feather the edge.
6. Remove sanding dust using the method detailed in step 3 above.
7. Mask all areas not to be painted.
8. Clean all cracks and surfaces with dry compressed air.
9. Use a tack cloth to wipe all surfaces to be painted.

Spot Repair

WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C) when mixing or spraying paint products, and until the work area has been exhausted of all vapor and spray mist. Breathing paint fumes can cause serious personal injury.

10. Prime all bare metal and feathered areas with PPG primer. Use F3995 primer for fiberglass, steel, and aluminum. See **Fig. 1**.



NOTE: The number of paint layers depends on the specific use.

A. Existing Paint
B. Panel Material (Substrate)
1. Primer
2. First Color Topcoat
3. Second Color Topcoat
4. Third Color Topcoat
5. Clearcoat

Fig. 1, Spot Repair Cross Section, Scale Exaggerated for Clarity.

10.1 Stir or shake primer thoroughly.

10.2 Mix three parts F3995 epoxy primer with one part F3996 activator and one-half part F–series reducer.

10.3 Set the air pressure at the spray gun to 55 psi (380 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 ml) per minute.

10.4 Spray one wet coat to yield a minimum dry film thickness of 0.7 mils (18µm).

10.5 Clean equipment immediately after use with PPG Gun Cleaning Solvent.

10.6 Air dry 1 hour or force dry 20 minutes at 120 to130°F (49 to 55°C).

11. If the original paint was a basecoat/clearcoat, hand rub the area around the spot repair with a medium grade compound to ensure a seamless finish. Use Scotch–Brite® 7448 or 2000-grit wet or dry sandpaper.

12. Remove the sanding dust. Use the same cleaner and wipe on, wipe off method used earlier to clean the area.

13. Wipe the repair area with a tack cloth.

Topcoating a Spot Repair

Delfleet® Evolution Single Stage Topcoating

1. Mix the Delfleet® Evolution Single Stage (FDGH) polyurethane enamel.

1.1 Stir the Delfleet® Evolution Single Stage (FDGH) polyurethane enamel thoroughly.

1.2 Mix three parts Delfleet® Evolution color (FDGH) with one part F3260 activator to 6 ounces additive F34XX per RTS gallon (44 ml per liter), to an optional 10 percent F33XX reducer. The pot life is 2 to 3 hours at 70°F (22°C). See **Table 1**.

Speed Rating	F34XX Additives	F33XX Reducers
Fast Dry	F3400	F3320
Medium Dry	F3405	F3330
Slow Dry	F3410	F3340
Extra Slow Dry	—	F3350

Table 1, PPG Additives and Reducers

1.3 Mix thoroughly and strain.

NOTE: the viscosity of the mixture should be at 25 to 35 seconds in a No. 2 Zahn cup. Check the designated shelf life if using a product from a previously opened container.

2. Set the air pressure at 50 to 60 psi (345 to 415 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 ml) per minute. The fluid tip should be 1.3 to 1.5 mm.

3. Apply the solid or metallic color topcoat.

3.1 Spray one medium-wet coat over the primed area.

3.2 Flash 10 to 15 minutes.

3.3 Apply a second medium-wet coat. Extend the spray area slightly to taper the edge and avoid a visible ring.

4. FDGH dry film thickness must be a minimum of 1.5 mils (38µm).
5. To air dry, allow overnight cure at 65°F (19°C) minimum.
6. To force dry, flash 5 to 10 minutes, then cure 40 minutes at 140°F (60°C) metal temperature.
7. If taping, allow 3 hours at 68°F (20°C). To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied.
8. If decals are to be applied, let the paint cure at 70°F (21°C) for 3 days prior to putting them on.
9. Clean the equipment immediately after use with PPG Gun Cleaning Solvent.

Delfleet Evolution Basecoat/ Clearcoat Topcoating

1. **Option 1:** Mix the Delfleet Evolution Basecoat (FBCH) polyurethane enamel.

1.1 Stir/shake the Delfleet Evolution Basecoat (FBCH) thoroughly.

1.2 Mix three parts FBCH basecoat color with one part F3260 activator to one-half part F3440 converter. Pot life is 1 to 2 hours at 70°F (21°C) and 50 percent relative humidity.

1.3 Mix thoroughly and strain.

1.4 The viscosity of the mixture is 20 to 25 seconds in a No. 2 Zahn cup, depending on the color.

2. **Option 2:** Mix the Delfleet Evolution Basecoat-Fast (FBCS) polyurethane enamel.

2.1 Stir or shake the Delfleet Evolution Basecoat-Fast (FBCS) color thoroughly.

2.2 Mix three parts FBCS basecoat color with one part F3200. Ten percent F33XX Reducer is optional for this application. Pot life is 1 hour at 70°F (21°C) and 50 percent relative humidity.

2.3 Mix thoroughly and strain.

2.4 The viscosity of the mixture is 20 to 30 seconds in a No. 2 Zahn cup, depending on the color.

3. Set the air pressure at 50 to 60 psi (345 to 415 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 ml) per minute. The fluid tip should be 1.3 to 1.5 mm.
4. Apply the basecoat (FBCH or FBCS): Apply one or two coats of FBCH or FBCS basecoat color over the primed area until full hiding is achieved. Allow 5 to 10 minutes between coats.
5. If blending the repair area into the OEM finish, see instructions at the end of the top coat instructions.
6. Allow 30 minutes flash, prior to applying clearcoat.
7. If clearcoat is not applied within 8 hours, FBCH/ FBCS basecoat color must be sanded and recoated.
8. Mix the Delfleet Evolution High Build Clear

8.1 Mix three parts Delfleet Evolution Clearcoat F3905 with one part F3240 activator to one-half part reducer (F33XX) to 2 ounces accelerator per RTS gallon (16 ml per liter). Pot life is 1 hour to 1.5 hours at 70°F (21°C) and 50 percent relative humidity. See **Table 2**.

PPG Thinners	
Fast	F3320
Medium	F3330
Slow	F3340
Extra Slow	F3350

Table 2, F33XX Thinner Selection

8.2 Mix thoroughly and strain.

8.3 The viscosity of the mixture is 32 seconds in a No. 2 Zahn cup.

9. Set the clearcoat air pressure at the spray gun at 45 to 55 psi (310 to 380 kPa). For pressure feed

systems, set the fluid delivery at 12 to 16 ounces (350 to 470 ml) per minute. Use a 1.3 to 1.5 mm fluid tip.

10. Apply 2 coats of F3905 clearcoat with a 10 to 15 minute flash time between coats to reach 2.0 mils (50 µm) minimum dry film thickness.

NOTE: For best results, apply the clearcoat over the entire panel.

11. To blend the clearcoat:

    11.1 Apply one coat of the activated Delfleet Evolution F3905 Clearcoat.

    11.2 Mix one part DX840 to one part ready-to-spray F3905 clearcoat and apply this mixture to the blend edge. Additional DX840 may be added if a second coat to extend the blend edge is necessary or desired.

    11.3 Moving the gun from the outside in, mist a light coat onto the edge of the repair to melt in the dry overspray.

    11.4 To air dry, allow overnight cure at 65°F (18°C).

    11.5 If taping, allow 6 hours at 68°F (20°C). To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied.

    11.6 To force dry, flash off up to 5 minutes, then dry for 40 minutes at 150°F (65°C).

    11.7 If sanding or polishing are desired, allow the finish to sit 16 hours if air dried, and 4 to 8 hours after bake cool-down before polishing.

    11.8 Clean the equipment immediately after use with PPG Gun Cleaning Solvent.

Solid Color Blends in FBCH/FBCS/FDGH

1. Prepare the repair area as outlined above.
2. Spray color to full hiding in two or three coats, allowing specified flash time between coats.
3. Once hiding is achieved, pour out the remaining ready-to-spray (RTS) color from the gun.
4. Add several ounces of DX840 to the gun that still contains residual RTS color and lightly blend the outside edge.

NOTE: It is very important to add DX840 to the gun that still contains some residual RTS color. This keeps the outside edge from breaking or de-wetting.

5. For FBCH or FBCS repair jobs, apply clearcoat following a 30 minute flash time, or a similar force-dry.

Blending Metallic Colors in FDGH and Blending Metallic/Pearl Colors in FBCH/FBCS

NOTE: Spot repairs in high-solid colors often show a dark ring or halo around their edges. Spraying a wet bed helps prevent the ring or halo when repairing high-solid colors.

On very light colors, it may be necessary to spray the wet bed completely to the edge of the panel but not over the repair area, to prevent the halo effect.

1. Follow the steps outlined above to prepare the area for applying the wet bed.
2. Prior to applying the wet bed, the area that is to receive the wet bed should be scuffed with a gray scuff pad and cleaned with an appropriate substrate cleaner.
3. Mix F3905. Reduce the RTS F3905 1:1 by volume with DX840 and spray a wet bed on the outside of the spot.

    3.1 Spray one medium-wet coat to establish the wet bed. Keep the wet bed 4 to 6 inches outside the repair spot.

    3.2 Apply the color system mixed as detailed in previous headings, but do not add DX840 in this step. Spray from the repair spot into the wet bed, while the wet bed is still wet.

    NOTE: Do not apply DX840 to the edge of the color in this application. Doing so causes a halo effect.

3.3 For basecoat repairs, allow the color to become tack-free before applying the final overall color. The overall clear (F3905) is not reduced with DX840. DX840 can be used to melt in the edges of the clearcoat, once this step is complete.
