PACCAR Electrical Circuit Code Designations

Introduction

In 2004, Kenworth started to implement the PACCAR electrical circuit numbering system as new vehicle electrical systems were developed. T600, T660, T800, W900 and C500 models built with multiplexed instrumentation are excellent examples of using our original circuit designations for existing electrical components while "phasing" in the PACCAR circuit numbering system to support new systems like multiplexed instrumentation.

NOTE: As new electrical systems are designed to keep pace with changes in technology, the PACCAR electrical circuit numbering system will become the new standard. PACCAR's new electrical circuit code designations also use a color-coded and numbered wiring system, however, the circuits numbers and alpha characters used to identify each circuit are much different than in our original circuit wiring key. See the new circuit code numbering and abbreviations example on page 2.

Original Circuit Wiring Key (To be phased out starting 2004)

Wiring Code Definitions

Example: C17SR C—Function

17—Circuit Number

SR—Destination or Purpose

Example: C17SR

Destination or Purpose SR = Starter

Refer to Electrical Wiring Key—T2000, T6/T8/T4, W900B, C500B, K100E in ServiceNet for a complete listing of all original circuit wiring definitions.

New PACCAR Circuit Code Designations

Applies to the following truck models:

- T600, T660, T800, W900, C500 and Off-Highway models with multiplexed instrumentation
- · All models with 2007 engines

NOTE: Data bus, trailer/body builder harnesses and battery cables are exceptions to the color-coded and numbered wiring system. See the "Data-Bus Wire Colors" and "Trailer and Body Builder Circuit Wire Colors" sections in this manual for additional information.

PACCAR Circuit Code Numbering and Abbreviations

Example: YEL2111

YEL— Function: The first three alpha characters represent the color of the wire and define the primary electrical function of the circuit. See Table 1.

2111— Component: The four-digit circuit code is used to describe the electrical/electronic component or component subsystem that the wire supports. The components and subsystems are grouped hierarchically such that each number to the right is a subgroup of the number to the left. Table 2 lists the nine most-general groups that have been defined. For a complete list of all the circuit code descriptions, see Table 5.

For example, in the lighting category:

- A circuit (most general) that in general serves lighting only shall be labeled XXX2000. See Table 2.
- A circuit (less general) that serves headlamps only shall be labeled XXX2100. See Table 5.
- A circuit (more specific) that serves low beam headlamps only shall be labeled XXX2110. See Table 5.
- A circuit (most specific) that serves the left low beam headlamp only shall be labeled XXX2111. See Table 5.

Insulation Color	Color Code	Electrical Function
Red with white stripe	R/WXXXX	Direct battery power
Red	REDXXXX	Protected battery power
Orange	ORNXXXX	Ignition Accessory Start power
Yellow	YELXXXX	Activated power
Brown	BRNXXXX	Indicator illumination Backlit illumination
Black	BLKXXXX	Load return
Gray	GRA <i>XXXX</i>	Control
Violet	VIOXXXX	Reference voltage
Light blue	BLUXXXX	Sensor signal
Light green	GRN <i>XXXX</i>	Sensor common not connected directly to ground
White	WHTXXXX	Ground

Table 1: Color Codes

WARNING! Red with white stripe wires (direct battery power) are not protected by fuses. To avoid the possibility of an unintentional short to ground, always disconnect the batteries before performing any electrical repairs. Failure to do so could cause a short circuit, fire, or explosion and could lead to personal injury.

Number	Category
XXX0000 through XXX0999	General
XXX1000 through XXX1999	Power supply
XXX2000 through XXX2999	Lighting
XXX3000 through XXX3999	Power train
XXX4000 through XXX4999	Instrumentation, MMI
XXX5000 through XXX5999	Safety systems
XXX6000 through XXX6999	Convenience, Security
XXX7000 through XXX7999	HVAC
XXX8000 through XXX8999	(Category not Defined)
XXX9000 through XXX9999	Trailer/Customer/Bodybuilder

Table 2: Circuit Code General Categories

Data-Bus Wire Colors

All twisted-pair data-bus low-side wires shall be light green in color. All high and low side wires shall be colored according to the color assignments in Table 3.

Color – Low Side	Color – High Side	Bus
Light Green	Violet	SAE J1587, SAE
		J1708
Light Green	Orange	SAE J1922
Light Green	Yellow	SAE J1939
Light Green	Red	OEM, Private bus
Light Green	Gray	CAN
_	Light blue	Single-wire bus

Table 3: Data-Bus Wire Color

Trailer and Body Builder Circuit Wire Colors

The insulation on the wires of the circuits listed in Table 4 shall be colored according to SAE J2394, Section 6.2.11, when the circuits connect directly to trailer connectors or body builder interfaces. These circuits shall maintain the appropriate color scheme from the OEM-provided circuit protection to the load or terminating OEM connector.

Color	Electrical Function
White	Ground
Black	Clearance, ID, Marker lamps
Yellow	Left turn lamps
Red	Stop lamps
Light green	Right turn lamps
Brown	Tail lamps
Light blue	ABS power, Auxiliary
