
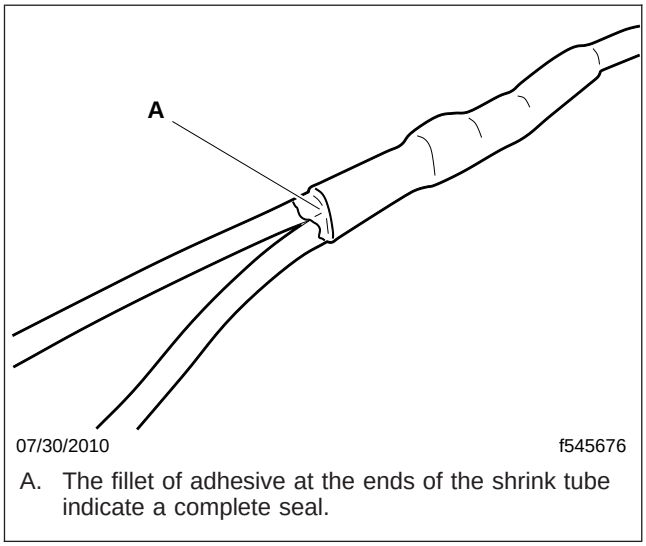
A. The solder band is completely melted.
B. Insulation rupture; gently shake off the solder bead.

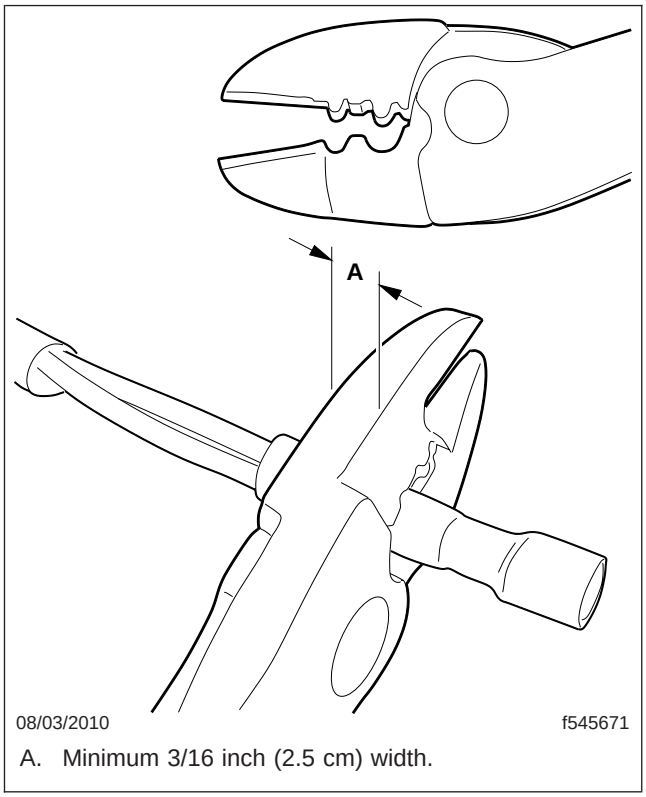
1. Adhesive Fillet

Fig. 4, Solder Bead Rupture



A. The fillet of adhesive at the ends of the shrink tube indicate a complete seal.

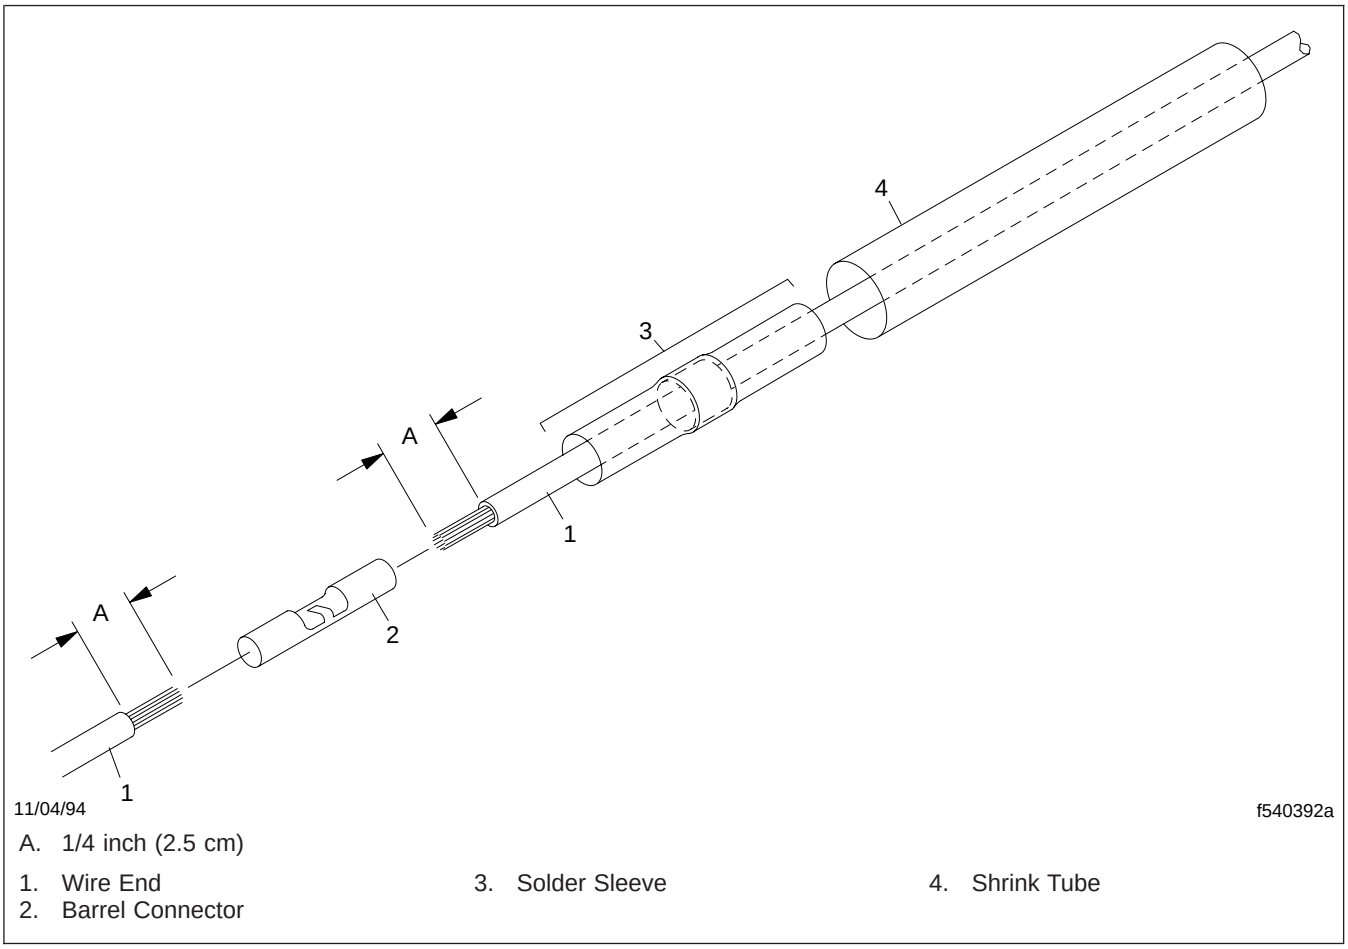
Fig. 5, Completed Three-Wire Tap Splice



A. Minimum 3/16 inch (2.5 cm) width.

Fig. 6, Dimple-Type Crimp Tool

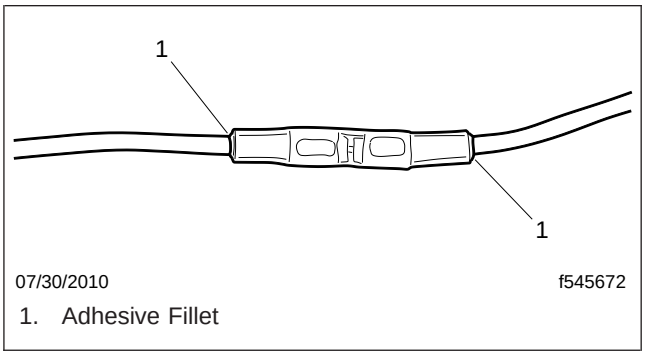
Wiring Repair and Replacement



A. 1/4 inch (2.5 cm)

1. Wire End
2. Barrel Connector
3. Solder Sleeve
4. Shrink Tube

Fig. 7, Splice Prepared with Parts in Kit ESY ES66 404



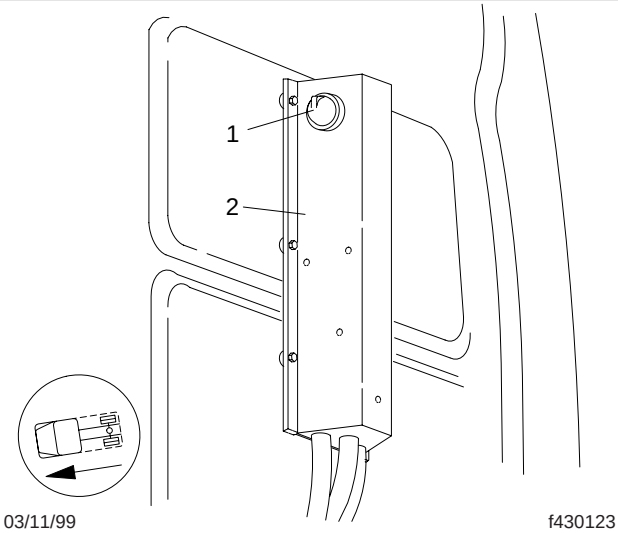
1. Adhesive Fillet

Fig. 8, Heated Solder Sleeve with Solder Band Melted into the Splice

Trailer Electrical Supply Socket Removal and Installation

Removal

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Remove the cover stud nuts retaining the cover to the cab.
4. Remove the cover. See **Fig. 1**.



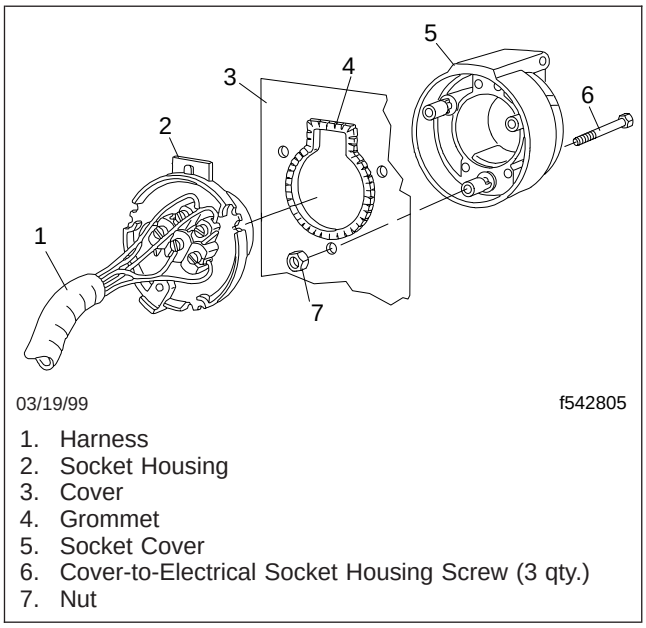
1. Electrical Socket Assembly
2. Cover

Fig. 1, Trailer Electrical Supply Socket Location

5. Remove the three screws holding the electrical socket to the cover. See **Fig. 2**.
6. Remove the housing cover from the electrical socket and remove the cap.
7. Mark and disconnect the wires from the electrical socket terminals.

Installation

1. Connect the wires to the electrical socket terminals.
2. Install the housing cover.
   - 2.1 Insert the electrical socket into the housing.



1. Harness
2. Socket Housing
3. Cover
4. Grommet
5. Socket Cover
6. Cover-to-Electrical Socket Housing Screw (3 qty.)
7. Nut

Fig. 2, Trailer Electrical Supply Socket and Components

   - 2.2 Tighten the three screws connecting the electrical socket to the housing cover. See **Fig. 2**.
3. Apply calking around the studs.
4. Slide the cover over the studs.
5. Install and tighten the nuts fastening the cover to the cab.
6. Connect the batteries.
7. Remove the chocks from the tires.

Specifications

IMPORTANT: All figures are typical for vehicles built before February 27, 2001.

See **Table 1** for fuse amperage ratings and colors for each amperage rating.

See **Table 2** for standard wiring color-coding information for vehicles built beginning February 27, 2001.

See **Table 3** for circuit numbers and descriptions for vehicles built beginning February 27, 2001.

See **Fig. 1** for a full view of the power distribution wiring.

See **Fig. 2** and **Fig. 3** for partial views of the power distribution wiring.

See **Fig. 4** for a full view of the customer access circuits wiring.

See **Fig. 5** and **Fig. 6** for partial views of the customer access circuits wiring.

See **Fig. 7** for a full view of the instrument panel wiring.

See **Fig. 8** for a full view of the cab ground summary.

See **Fig. 9** and **Fig. 10** for partial views of the cab ground summary.

See **Fig. 11** for a full view of the right-hand-drive chassis ground summary.

See **Fig. 12** for a full view of the left-hand-drive chassis ground summary.

See **Fig. 13** for bulkhead connector "A" pin and circuit number identification.

See **Fig. 14** for bulkhead connector "B" pin and circuit number identification.

See **Fig. 15** for bulkhead connector "C" pin and circuit number identification.

Blade Fuse Color-Coding Chart	
Ampere Rating	**Color**
5A ATO	Tan
10A ATO	Red
15A ATO	Light Blue
20A ATO	Yellow
25A ATO	Natural
30A ATO or Maxi	Light Green
40A Maxi	Amber

Table 1, Blade Fuse Color-Coding Chart

Standard Wiring Color-Coding for Vehicles Built Beginning February 27, 2001		
Color	**Abbr**	**Typical Usage**
Black	BK	Ground, General
Black-White	BK-W	Ground, Clean or Isolated
Blue DK	DKBL	Backup/Windshield Wiper/Trailer Auxiliary
Blue LT	LTBL	HVAC/Circulation Fans/1922+
Blue LT-White	LTBL-W	Water, Oil Gauge and Indicator (Engine and Transmission)
Brown	BR	Marker, Tail and Panel Lamps
Gray	GY	Electronic Engine (or TXL Insulation)
Green DK	DKG	Turn Signal, RH/Driver's Display/Data Record/1587+/1939–

Specifications

Standard Wiring Color-Coding for Vehicles Built Beginning February 27, 2001		
Color	**Abbr**	**Typical Usage**
Green DK-White	DKG-W	Starting Aids/Fuel Heaters/Material Control/Winch/Tailgate
Green LT	LTG	Headlamp/Roadlamp/DRL
Green LT-White	LTG-W	Axle Controls and Indicators/Suspension/Fifth Wheel
Orange	O	ABS/EBS/1587–
Pink	PK	Start Control/Ignition/Charging/Volt and Ammeter/1922–
Pink-White	PK-W	Fuel Control and Indicators/Shutdown/Speed Limiter
Purple	PRP	Engine Fan/PTO/Auto Lube and Oil
Purple-White	PRP-W	Utility/Spot/Ad/Interior/Emergency Lighting
Red	R	Power Distribution, Constant
Red-White	R-W	Brake/Pneumatic/Hydraulic/Retarder/Stop
Tan	T	MPH, RPM Signals/Horn/Flasher/Pyro/Turbo
Tan-White	T-W	Audio/Video/Security/Window/Computer/Seat/Mirror/Cab Tilt
White	W	Transmission (or SXL Insulation)
Yellow	Y	Turn Signal, LH/1939+ (or GXL Insulation)
Yellow-White	Y-W	Air Bag and SPACE

166	Starting aid, engine, ether
167	Oil fill system, leveler
168	Hour meter, engine
170	Fifth wheel slide lock indicator
171	Brakesaver, CAT
172	Clock
173	Coolant level, engine coolant
174	Engine protection, Nycal, warning
175	Engine protection, Nycal, warning
177	Engine protection, Robert Shaw, warning
178	Idle timer, delayed shutdown, cool down
179	Starting aid, glow plug heater
180	Engine protection, Corning Glass, warning
182	Fuel pressure
183	Air cleaner restriction indicator/warning
184	Starter lockout, neutral
185	Security system, Britec System 5
187	Fan ignition supply, engine
188	Antilock Brake System (ABS)
189	Antilock Brake System (ABS)

Circuit Numbers and Descriptions for Vehicles Built Beginning February 27, 2001	
Circuit Number	**Circuit Description**
190	Air dryer, heated, Graham-White
191	Starting aid, glow plug, heater
192	Axle indicator/warning, pusher
193	Cab tilt pump
196	Fuel/water separator heater
197	Transmission lockup sensor
198	Axle, two-speed shift control
200	PTO controls
202	Alternator, 24v
203	Exhaust brake
204	Seat belt indicator/warning
205	Fan controls and headlamp
206	Heater A/C with oil pressure controls
208	Axle control, tri-axle, steer lock
209	Axle, two-speed shift control
210	Power Distribution Module (PDM), outside cab
211	Security system; see 185
212	Refrigerator, power, (no outlet)
213	Power inverter/converter 110v to 12v
214	Generator, auxiliary
215	Heater, diesel-fired auxiliary, Webasto
216	Engine idler, Sterling Tech (SLG)
217	Fuel solenoid, engine, synchro start
218	Pyrometer, gauge
219	Turbo pressure gauge
220	Ignition switch, accessory
221	Suspension dump controls
222	Headlamp dimmer controls
223	Transmission controls, auto shift (axle shift, see 209)
224	Transmission controls (axle shift, see 209)
225	Air pressure gauge, primary
226	Air pressure gauge, secondary
227	Air pressure gauge, application
228	Oil pressure gauge, electronic

Specifications

Circuit Numbers and Descriptions for Vehicles Built Beginning February 27, 2001	
Circuit Number	**Circuit Description**
229	Retarder, Telma (TLM)
230	Retarder, Telma (TLM)
231	Cab tilt alarm
232	Transmission controls, power harness

Fig. 15, Bulkhead Connector "C" Pin and Circuit Number Identification (typical, for vehicles built before February 27, 2001)

General Information

A "datalink" is an electrical network that connects two or more computers to exchange data. The simplest datalink is a pair of wires between two computers. Freightliner uses datalinks to connect the Electronic Control Units (ECUs) for the electronically controlled vehicle systems with each other and with the Instrumentation Control Unit (ICU). A personal computer using Freightliner's ServiceLink diagnostic software can also be connected to the network via a datalink.

Datalink Systems

Different types of datalinks are used to connect certain ECUs. The vehicle may have any of the following datalinks:

J1587/J1708

J1587/J1708 is a low speed vehicle datalink that communicates information between the ECUs on the vehicle. The J1587 datalink is also referred to as J1708. See **Fig. 1**. J1708 refers to the SAE standard for the physical part of the datalink, such as the wiring and the electronic components. J1587 refers to the SAE standard for the messaging protocol that communicates on the J1708 network. In the context of vehicle repair, the terms J1708 and J1587 are used interchangeably.

The J1587 datalink uses a twisted pair of wires to reduce interference from digital messages being sent on the wires. Wire colors for the J1587 datalink are:

- Orange **J1587 Low**
- Green **J1587 High**

J1939

J1939 is a high-speed vehicle datalink that communicates information between ECUs on the vehicle. The J1939 datalink replaced the J1922 datalink. See **Fig. 2**.

Unlike the J1587 datalink, the J1939 datalink allows an ECU to broadcast requests as well as information. Examples of information that can be communicated on the J1939 datalink are:

- engine rotational speed;
- road speed;
- transmission tailshaft speed;
- engine retarder deactivation request;
- engine torque reduction request.

The J1939 datalink uses a twisted pair of wires to reduce interference from digital messages being sent on the wires. Wire colors for the J1939 datalink are:

- Yellow **J1939 High**
- Green **J1939 Low**

The back bone of the J1939 datalink is the section of the datalink that is between two terminating resistors. An ECU can be connected anywhere along the length of the backbone in between the terminating resistors. The wiring between the ECU and the J1939 backbone is called a circuit. The maximum distance of the terminating resistor is 3 feet from the last ECU or diagnostic connector.

The purpose of the terminating resistors is to minimize the reflection of data on the datalink which can cause J1939 messages to become partially or completely lost. Terminating resistors prevent this from occurring. Each terminating resistor is 120 Ohms, but the equivalent of two 120 Ohms resistors in parallel is 60 Ohms. With both resistors installed in the circuit, there should be 60 Ohms measured at any two points between **J1939 High** and **J1939 Low** in the circuit.

Each ECU is generally connected to the J1939 backbone using a tee connector or splice. See **Fig. 3**.

Making the Pinout Measurements Easier to See

The pins on the diagnostic connector may be difficult to see when testing. If the pins are difficult to see, use a Y-cable as an extension to the diagnostic connector to make test measurements easier. See **Fig. 4** for a drawing of the connector at the end of the Y-cable and the corresponding 9-pin diagnostic connector pins.

NOTE: Be sure to attach a meter with a proper jumper kit to prevent unintentional shorting to other pins and possible damage to ECUs.

The Roll Call

To check the readiness of the ECUs on the datalink, the ICU sends a signal to other ECUs and expects a

General Information

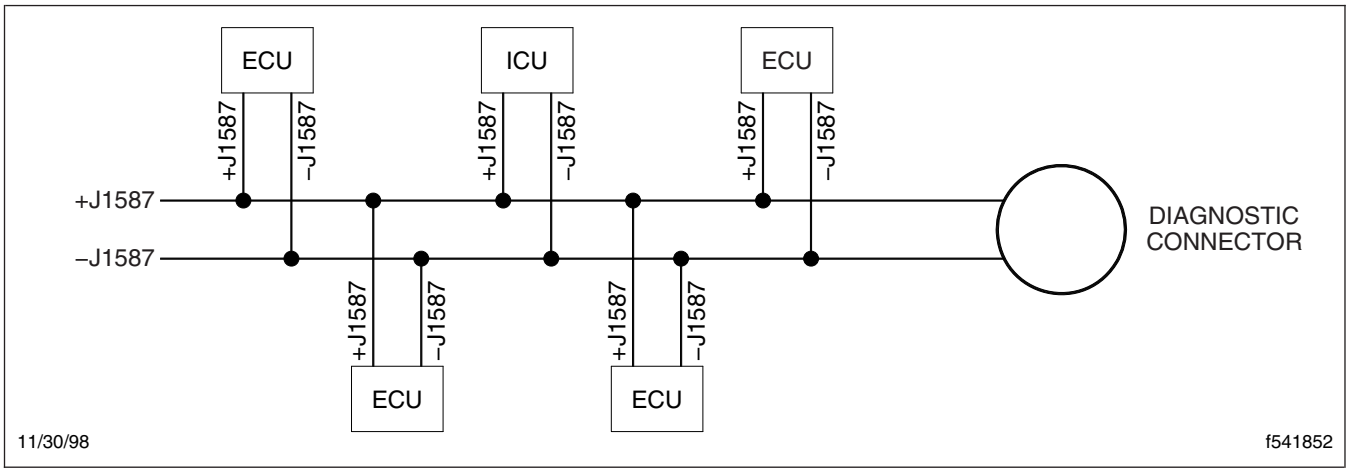

Fig. 1, J1587 Datalink

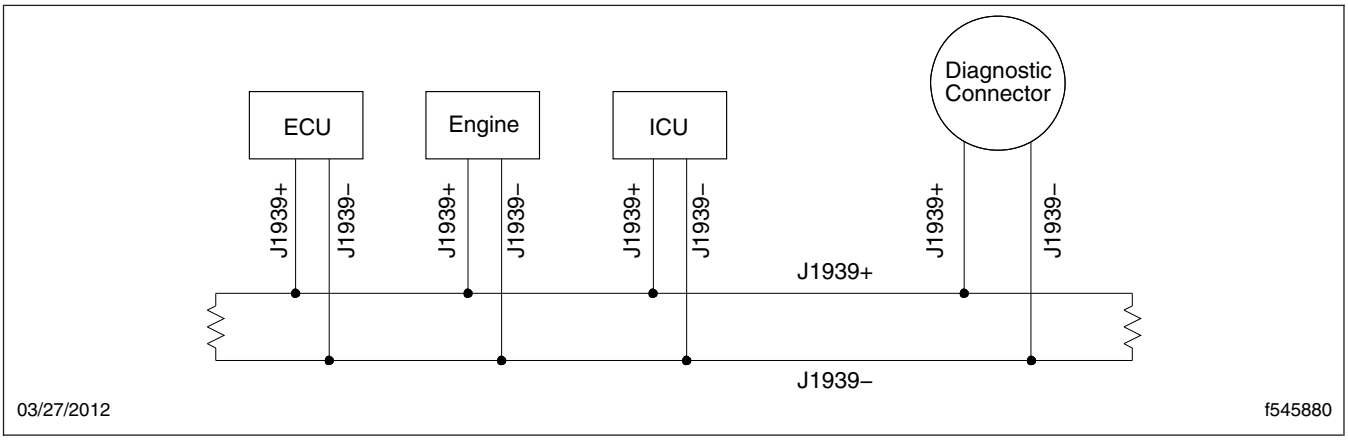

Fig. 2, J1939 Datalink

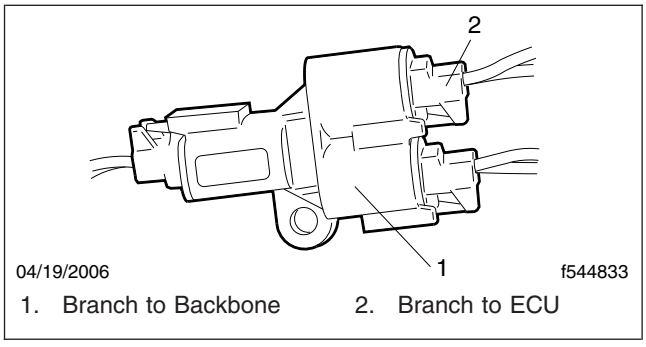

Fig. 3, J1939 Tee Connector

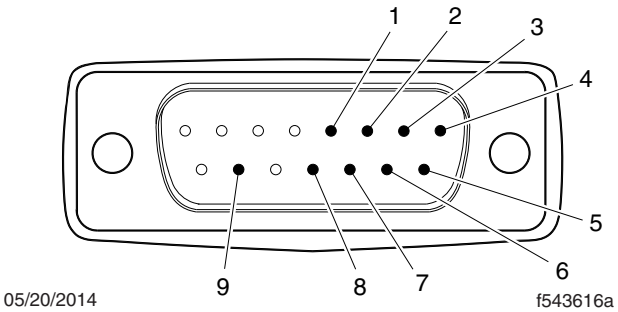
response from each. This "Roll Call" procedure tells the ICU which ECUs are functioning correctly. When the list of functioning ECUs is compared against the parameter list of factory-installed ECUs that are supposed to respond, the technician can determine which ECUs or datalinks are bad.

If the ICU does not receive a signal on the datalink from one or more of the active ECUs, it displays a roll call fault. The roll call fault is displayed *only* on the dash driver display screen. It is not broadcast on the datalink; therefore, it cannot be read by Service-Link. However, Servicelink can be used to determine if an ECU is not responding because it polls all ECUs on the datalink when it first connects to the vehicle datalink.

Datalink Junction Blocks

For the J1587 datalink, the wires routed through the vehicle cab have two datalink junction blocks and



1. Pin H (Diagnostic CAN High)
2. Pin A
3. Pin E
4. Pin B
5. Pin F
6. Pin G
7. Pin C (J1939 High)
8. Pin D (J1939 Low)
9. Pin J (Diagnostic CAN Low)

Fig. 4, Y-Cable Pinouts

two datalink connections. The ICU3 uses only one connection to the ICU.

Locating J1939 Wiring Diagrams

The J1939 wiring diagram can be found in module 160. Other modules may also contain datalink wiring information. See **Table 1**.

Use PartsPro® to obtain drawing numbers for installation drawings, harness assembly drawings, and wiring diagrams applicable to the vehicle being worked on.

Component Module Locations	
Component	**Module Number**
General J1939 harness drawings, schematics, and installation drawings	160
Engine harness and installation drawings	283 and 286
Transmission harness and installation drawings	34A and 343
ABS harness and installation drawings	330, 332, and 333

Table 1, Component Module Locations

Datalink Repairs

J1587 and J1922 Repairs

Use the same methods of repair for the twisted-pair datalink wiring as are used for the other wires on the vehicle. However, the datalink wires must be twisted at a rate of a minimum one turn per inch (25 mm) of length.

J1939 Repairs

A special cable must be used for repairs to the J1939 datalink wiring. The two types of J1939 cable ("heavy" and "lite") can be spliced together as long as the pass-through connectors are the "heavy" type. The "lite" cable (because of its lower cost) is recommended for repairs on both types of J1939 cable. Refer to Appendix C of SAE J1939-11 for the special procedures for repairing the "heavy" J1939 datalink.

Parts

Twisted-pair datalink wires may be spliced using a mating connector set. See **Table 1** for a typical set of datalink connector parts.

Procedure

1. Cut out any damaged section of datalink wire, keeping the lengths of the two wires equal. See **Fig. 1** for an example of a damaged section of datalink wire that has been removed and the datalink prepared for repair.
2. Crimp the terminals onto the wires using the proper crimp tool.
3. Pull test the terminals by hand to ensure the crimp is mechanically solid.
4. Insert the terminated wires into the connector body and install the terminal lock. The protocol for J1939 is for the yellow wire to be in cavity 1 and the green wire to be in cavity 2. Note that the lock is installed while holding the wires in position. Test the installation. If the wires slipped back during the lock installation, they will pull out of the connector.
5. Make certain the wires are twisted as close to the entry point of the connector as possible. Plug the two connector halves together. See **Fig. 2**.

Table 1, Datalink Connector Parts

General Information

This Troubleshooting subject has three main parts:

- Troubleshooting Tables

  Use the Troubleshooting Tables to get ideas on what could be causing the problem and the possible remedies to that problem.

- Troubleshooting Procedures

  Follow the Troubleshooting Procedures section to isolate the areas that have faults and to know which tests to perform.

- Testing Procedures

  The Testing Procedures section has the individual tests and specifications needed to determine whether a part must be repaired or replaced.

NOTE: Be sure to attach a meter with a proper jumper kit to prevent unintentional shorting to other pins and possible damage to ECUs.

Troubleshooting Tables

Use the following troubleshooting tables to find remedies to possible causes of datalink problems.

Problem—Power-On Roll Call Reports Fault

Problem—Power-On Roll Call Reports Fault	
Possible Cause	**Remedy**
The ECU does not support roll call function (ICU1/2M only).	Reset the ECU parameter to disable roll call.
The datalink wiring has a fault.	Repair or replace the wiring.
Wrong power supply voltage or ground to ECU.	Replace the fuse or circuit breaker, charge the battery, the check connections.
The connector has a fault - (Pass-through, Branch, Diagnostic)	Repair or replace the wiring.
The ECU has a fault.	Replace the ECU.
The ICU has a fault.	Replace the ICU.
The terminating resistor for J1939 datalink is missing or has a fault.	Replace the terminating resistor.
The branch length is too long on J1939 datalink.	Shorten "lite" branch to less than 10 feet (3 m).
The battery is discharged or is bad.	Charge or replace the battery.

Problem—ServiceLink Will Not Connect

Problem—ServiceLink Will Not Connect	
Possible Cause	**Remedy**
ICU is older series that does not support roll call.	Use ICU for display of active fault codes only.
One or more ECUs has a fault.	Remove suspected ECUs one at a time until ServiceLink can be connected.
ServiceLink computer is not configured or connected correctly.	Check the computer settings, communication adaptor and cabling between the computer, communication adaptor, and diagnostic connector.
Connector types are different.	The J1939 datalink and new J1587 datalinks have 9-pin connectors. Connect an adapter or use the ICU for the diagnostics information display.
Battery is discharged, has a bad connection, or has a fault.	Charge, clean terminals, or replace battery.

Troubleshooting

Problem—Missing Data on Datalink-Driven Gauges

Problem—Missing Data on Datalink-Driven Gauges *	
Possible Cause	**Remedy**
ICU or engine ECU is not communicating on datalink.	Test wiring and ICU or engine ECU.
Datalink wiring has a fault.	Test and repair wiring.
Connector or junction block has a fault.	Repair or replace connector.
Incorrect voltage to ECUs	Test datalink and vehicle wiring.

* Datalink-driven gauges include: engine oil pressure, coolant temperature, engine oil temperature, turbo air pressure, tachometer, speedometer

Troubleshooting Procedures

To find the part of the datalink system that is causing a problem, follow the Troubleshooting Procedures and refer to the appropriate Troubleshooting Tests for the test points and specifications. Perform the steps of the Troubleshooting Procedures in sequence until you locate the fault.

The seven steps to diagnosing a datalink problem are:

1. Determine which types of datalink are installed on the vehicle.

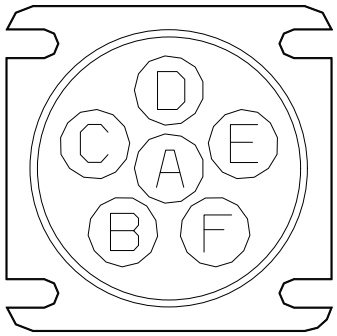
   1.1 Check the diagnostic connector. A 6-pin connector (or a 9-pin connector without pins C and D installed) is used for J1587 datalinks. See **Fig. 1** and **Fig. 2**. J1939 datalinks have pins C and D installed in the 9-pin diagnostics connector.

   1.2 Check the wires. J1939 cable has a heavy jacket. Note that some non-Freightliner ECUs have their J1587 wires inside a jacket as well. If all the wiring has a jacket, the datalink is a J1939 datalink.

   If the J1939 cable has a drain wire inside the shielding, it is a "heavy" cable. The J1939 "lite" cable (with no drain wire) can be spliced into a section of "heavy" cable.

   1.3 Determine whether a Cummins IS Series, Caterpillar CFE, or a Mercedes-Benz engine is installed with an ABS system that has traction control. These systems use a J1939 datalink.

   1.4 A J1939 datalink is used when an Eaton® Fuller® AutoShift transmission is installed. The WABCO EBS (brake-by-wire) system and certain Eaton VORAD EVT-300 systems also require J1939 datalinks. Certain other ECUs may require a J1939 datalink.



11/30/98 f542751

1. Pin A (J1587 High)
2. Pin B (J1587 Low)
3. Pin C (12V+)
4. Pin D (Reserved)
5. Pin E (Ground)
6. Pin F (Reserved)

Fig. 1, J1587 6-Pin Diagnostics Connector

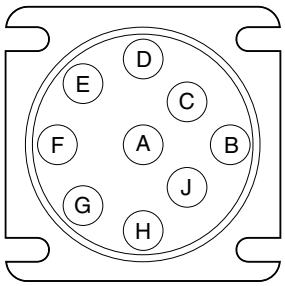
2. Determine which ECUs are not communicating with ServiceLink.

   2.1 Connect to the vehicle with ServiceLink

   2.2 Compare the ICU roll call list with ServiceLink ECU list.

   Note: Some ECUs cannot communicate with the ICU, but will appear on the ServiceLink parameter list. The ICU2L and ICU3 rollcall function is limited to the engine ECU and the ABS ECU.

   2.3 If an ECU is not communicating on the datalink, disconnect all the generic ECUs, one at a time, until no faults are displayed on the ICU screen or until ServiceLink



05/01/2006 f151036b

NOTE: Pins C and D are not installed in the J1587 diagnostics connector.

1. Pin A Battery (Low)
2. Pin B Battery (High)
3. Pin C (J1939 High)
4. Pin D (J1939 Low)
5. Pin E (Shield)
6. Pin F (J1587 High)
7. Pin G (J1587 Low)
8. Pin H (Diagnostic CAN High)
9. Pin J (Diagnostic CAN LOW)

Fig. 2, J1939/J1587 9-Pin Diagnostics Connector

connects to the system. The last ECU to be disconnected before the successful ServiceLink connection is the one causing the problem.

3. Check the suspected ECU.
   - 3.1 Check the resistance and voltage at the ECU connectors. See **Testing the ECUs** in the datalink testing procedures section of this subject.
   - 3.2 Temporarily replace the ECU with an ECU known to be good. If the ICU (or ServiceLink) now lists that ECU, install a new ECU.
4. Check the wires and connectors from the ICU at the connector for the suspected faulty ECU. See **Testing the J1587 Datalink** or **Testing the J1939 Datalink** in the datalink testing procedures section of this subject.
   - 4.1 Check the power supply voltage.
   - 4.2 Check the data signal voltage.
   - 4.3 Check the continuity and resistance to ground. If the readings are outside the acceptable range and are found at several test points, suspect that the datalink has a fault.
5. Determine which branch includes the suspected faulty ECU. Find the connectors and junction blocks that are in series with the suspected faulty ECU.
6. Check the wiring between the branch connector and the ECU and the wiring from the ICU to the branch connector. See **Testing the J1587 Datalink** or **Testing the J1939 Datalink** in the datalink testing procedures section of this subject.
   - 6.1 Check power supply voltage.
   - 6.2 Check the data signal voltage.
   - 6.3 Check the continuity and resistance to ground.
7. Check the ICU. See **Testing the ICU** in the datalink testing procedures section of this subject.
   - 7.1 Check the voltages at the junction block to the ICU.
   - 7.2 Replace the ICU with an ICU known to be good.

Datalink Testing Procedures

The following procedures give the test points and specifications for checking the various types of datalinks, connectors, ECUs and ICUs. Refer to the datalink troubleshooting tables, and the datalink troubleshooting procedures, above, for information on when to test the particular parts of the datalink system.

Testing at the ECUs

1. Make sure that the vehicle battery is charged and the fuses and circuit breakers are good before testing the ECU connectors.
2. The keyswitch must be in the OFF position. Disconnect the ECU datalink circuit at the connector closest to the ECU. Turn the keyswitch to the ON position and check the voltage at the ECU harness connector. See **Table 1** for the acceptable results.
3. Connect the ECU to the datalink connector when the keyswitch is in the OFF position. Turn the keyswitch to the ON position for this test. Touch the probes of the digital multimeter (on the DC voltmeter scale) to the metal terminals of the ECU connector as shown in **Table 1** to test the ECU. Use the AC scale for the voltage tests if

the multimeter will not display the rapidly changing DC voltage using the DC scale. If the test results are not within the range shown, replace the ECU and test again.

NOTE: Voltages in **Table 1** will be varying.

ECU Harness Voltage Tests		
J1587 aDatalink		
Meter (High) Probe	**Meter (Low) Probe**	**Acceptable Meter Reading (VDC)**
ECU Datalink High Terminal	ECU Datalink Low Terminal	1 to 4 VDC (1 to 3V on the AC Scale)
Battery Positive Post	ECU Datalink High Terminal	6 to 11 VDC *
	ECU Datalink – Terminal	9 to 13.5 VDC *
J1939 Datalink		
Diagnostics Pin C (J1939 High)	Diagnostics Pin D (J1939 Low)	.2 to 5 VDC (.1 to 4V on the AC Scale)
Diagnostics Pin B (BAT High)	Diagnostics Pin C	6 to 11 VDC*
	Diagnostics Pin D	9 to 13.5 VDC*

* If datalink wire connections are reversed, the results are reversed.

Table 1, ECU Harness Voltage Tests

Testing the J1587 Twisted-Pair Datalink

1. Make sure that all fuses and circuit breakers are in good condition.
2. Turn the keyswitch to the OFF position before disconnecting or connecting any part of the datalink system. Disconnect the J1587 connector for the datalink section you are testing.

IMPORTANT: Do NOT disconnect the datalink by disconnecting the engine, frontwall or chassis electrical connectors.

IMPORTANT: The batteries **MUST** be disconnected and the ignition must be **OFF** prior to any J1587 resistance tests. Failure to do so may result in inconclusive resistance measurements. The J1939 datalink is not completely inactive with only the ignition off. It may be active even if there appears to be no voltage on the the datalink.

3. Turn the keyswitch to the OFF position. Test the continuity of a J1587 twisted-wire pair by touching the red (positive) probe of a digital multimeter (set to the ohmmeter mode) to the **J1587 High** terminal of the connector. Connect the black (negative) probe to the J1587– wire terminal. See **Table 2** for the results.

   Check the datalink isolation to the vehicle ground by holding one ohmmeter probe on the **J1587 Low** wire and the other probe to a good ground. Perform this test again with the ohmmeter leads reversed. **Table 2** shows the acceptable resistances for these tests.

J1587 Resistance Tests		
Meter (High) Probe	**Meter (Low) Probe**	**Acceptable Meter Reading (Ohms)**
High	Low	1k to 30k Ohms
High	Vehicle Ground	More than 1k Ohms
Low	Vehicle Ground	More than 1k Ohms

Table 2, J1587 Resistance Tests

4. Test the signal voltage on the J1587 twisted pair as shown in **Table 1**. The keyswitch must be in the ON position for the voltage tests. Use the AC scale for the voltage tests if your multimeter will not display the rapidly changing DC voltage using the DC scale.

NOTE: If any voltage reading is a steady 0 VDC or a steady 12 VDC, the ECU or datalink wiring has a fault.

Testing the J1939 Datalink

Use the following five basic steps in the order given to successfully locate J1939 datalink problems. Do not skip steps or tests unless directed to do so.

J1939 Resistance Test

This test checks whether or not both terminating resistors are installed, and ensures that there is a complete circuit from the diagnostic connector through the backbone loop. It does not ensure that branch circuits to each ECU are OK.

Tests in this subject are performed using a digital multimeter set to read ohms.

IMPORTANT: The batteries **MUST** be disconnected and the ignition must be **OFF** prior to any J1939 resistance tests. Failure to do so may result in inconclusive resistance measurements. The J1939 datalink is not completely inactive with only the ignition off. It may be active even if there appears to be no voltage on the the datalink.

1. Turn the ignition OFF and disconnect the batteries.
2. Connect the meter leads of a digital multimeter set to read ohms to pins C and D of the 9-pin diagnostic connector and measure the resistance.
3. Reconnect the batteries after the test is completed.

See **Table 3** for test results and possible causes.

J1939 Resistance Test	
Result	**Possible Cause**
60Ω ± 6Ω	The J1939 datalink backbone is intact and both terminating resistors are installed. Go to step 2.
120Ω ± 12Ω	Any of the following: • One of the terminating resistors is missing. • One of the terminating resistors is open. • The circuit may be open anywhere between the terminating resistors.
40Ω ± 4Ω	Three terminating resistors have been installed; one must be removed. There must be one terminating resistor at each end of the backbone for a total of two.
0Ω to 5Ω	**J1939 High** and **J1939 Low** have shorted together somewhere in the system.
Greater than 1000Ω	The most likely cause is an open circuit between the diagnostic connector and the J1939 backbone. It may also be that both terminating resistors are missing or open.
Any other readings	Any of the following: • Incorrect terminating resistor resistance. • Poor or corroded connections. • Short circuit to ground or an open circuit somewhere on the datalink. Go to step 2 to pinpoint the problem.

Table 3, J1939 Resistance Test

ECU Communication Test

The following series of tests check for communication with each ECU connected to the J1939 datalink. If one fails to communicate, pinpoint whether the problem is wiring or an ECU. If all ECUs communicate as they should, J1939 is probably not the problem.

1. **Check whether each ECU connected to the J1939 datalink responds.**

   1.1 Connect the computer to the diagnostic connector.

   1.2 Start the J1939 Datalink Monitor template.

   NOTE: The template contains instructions on its use.

   1.3 Check whether each ECU that is supposed to be connected to the datalink responds. See **Table 4** for test results and possible causes.

Check whether each ECU connected to the J1939 datalink responds	
Result	**Possible Cause**
All ECUs respond	The J1939 datalink is probably not the problem.
One ECU fails to respond.	Go to step 2.
No ECUs respond	Possible explanations are: • The **J1939 High** and **J1939 Low** pinouts may be reversed at the diagnostic connector, or at any other connector in the system. Check their polarity. • There may be a problem with the PC to vehicle interface. • The entire datalink may be down due to a short to power or short to ground. Go to Step 3 to pinpoint the problem.

Table 4, Check Whether Each ECU Connected to the J1939 Datalink Responds

2. **Check the J1939 datalink wiring to the ECU that does not respond.**

   IMPORTANT: The batteries **MUST** be disconnected and the ignition must be **OFF** prior to any J1939 resistance tests.

   2.1 Turn the ignition OFF and disconnect the batteries.

   2.2 Locate the connector at the ECU in Step 2, Test 1 that did not respond and disconnect it.

   2.3 Locate the pins for **J1939 High** and **J1939 Low**. Refer to Freightliner or component supplier literature or wiring diagrams for the specific component.

   2.4 Check to make sure that **J1939 High** and **J1939 Low** polarity is correct at the component before proceeding. If not, this is the most likely problem.

   2.5 Using a digital multimeter set to read ohms, measure the resistance across the two J1939 datalink pins at the connector to the suspect ECU.

   2.6 Reconnect the batteries after the test is completed. See **Table 5** for test results and possible causes.

Check the J1939 datalink wiring to the ECU that does not respond	
Result	**Possible Cause**
60Ω ± 6Ω	The datalink itself is probably not the problem. Make sure that any changeable J1939 parameters for this ECU are set correctly before proceeding. Also, make sure that there is power and ground to the suspect ECU. Go to **step 3** once the following have been confirmed: • J1939 parameters for the ECU (if they can be changed) are correct. • There is power and ground to the suspect ECU.
Not 60Ω ± 6Ω	There is a problem with the J1939 wiring between the ECU connector and its connection to the J1939 backbone. Repair as necessary.

Table 5, Check the J1939 Datalink Wiring to the ECU That Does Not Respond

3. **Install a test ECU to confirm the problem.**
   - 3.1 Install a test ECU and make sure that all J1939 parameters (if changeable) are set correctly.
   - 3.2 Using the J1939 Datalink Monitor template, check to see if every ECU that is supposed to be connected to the datalink responds. See **Table 6** for test results and possible causes.

Install a test ECU to confirm the problem	
Result	**Possible Cause**
All ECUs respond	The ECU was faulty and the test ECU confirmed this. Replace the ECU.
The ECU still does not respond.	The problem has not been confirmed. Carefully repeat all the diagnostics. If the ECU still does not respond, contact your District Service Manager or the ECU supplier directly for assistance.

Table 6, Install a Test ECU to Confirm the Problem

Test J1939 Voltage for Circuit Faults (Shorts to Power and Ground)

These tests check for shorts to power and shorts to ground on the J1939 datalink.

NOTE: All tests are performed using a digital multimeter set to read voltage.

NOTE: Before proceeding, verify that battery voltage (approximately +12 VDC) is available at pin B of the diagnostic connector. With the ignition ON, use a digital multimeter to test for voltage at pin B by placing the red (+) lead on pin B and the black (-) lead on a good chassis ground.

1. **Test J1939 High for shorts to power and ground.**
   - 1.1 Turn the ignition ON.
   - 1.2 Touch the red (+) lead to pin B (+12 VDC) and the black (-) lead to pin C (**J1939 High**) of the diagnostic connector. See **Table 7** for test results and possible causes.

Shorts to Power and Ground (J1939 High)	
Result	**Possible Cause**
0 VDC	**J1939 High** is shorted to power. Continue to the next test, "Pinpointing Short Circuits on the J1939 Datalink."

Troubleshooting

Shorts to Power and Ground (J1939 High)	
Result	**Possible Cause**
12 VDC (battery voltage)	**J1939 High** is shorted to ground. Continue to the next test, "Pinpointing Short Circuits on the J1939 Datalink."
Any other reading	**J1939 High** is not shorted to power or ground. Go to step 2.

Table 7, Shorts to Power and Ground (J1939 High)

2. **Test J1939 Low for shorts to power and ground.**

   2.1 Turn the ignition ON.

   2.2 Touch the red (+) lead to pin B (+12 VDC) and the black (-) lead to pin D (**J1939 Low**) of the diagnostic connector. See **Table 8** for test results and possible causes.

Shorts to Power and Ground (J1939 Low)	
Result	**Possible Cause**
0 VDC	**J1939 Low** is shorted to power. Continue to the next test, "Pinpointing Short Circuits on the J1939 Datalink."
12 VDC (battery voltage)	**J1939 Low** is shorted to ground. Continue to the next test, "Pinpointing Short Circuits on the J1939 Datalink."
Any other reading	**J1939 Low** is not shorted to power or ground. There may be a problem with the vehicle to computer interface. The datalink itself appears to be OK.

Table 8, Shorts to Power and Ground (J1939 Low)

Databus Quick Test

NOTE: All voltages in **Table 1**, except for BAT + and BAT – will be varying.

Databus Quick Test				
No.	**Test**	**Red Lead/Black Lead**	**Specification**	**Result**
Battery Connected – Ignition ON				
1	Bat+ to Bat-	Pin B to Pin A	Source Voltage (> 12.4)	
2	J1587+ to J1587–	Pin F to Pin G	1 – 5 VDC (0 – 4 VAC)	
3	Bat+ to J1587+	Pin B to Pin F	6 – 11 VDC	
4	Bat+ to J1587–	Pin B to Pin G	9 – 13.5 VDC	
5	J1939+ to J1939–	Pin C to Pin D	.2 – 5 VDC (.1 – 4 VAC)	
6	Bat+ to J1939+	Pin B to Pin C	6 – 11 VDC	
7	Bat+ to J1939–	Pin B to Pin D	9 – 13.5 VDC	
Ignition OFF – Battery Disconnected at Batteries – NOT Cab Load Disconnect Switch				
8	J1587+ to J1587–	Pin F to Pin G	1k – 30k Ohms	
9	J1587+ to Bat–	Pin F to Pin A	> 1k Ohms	
10	J1587- to Bat–	Pin G to Pin A	> 1k Ohms	
11	J1939+ to J1939–	Pin C to Pin D	55 – 65 Ohms	
12	J1939+ to Bat–	Pin C to Pin A	> 1k Ohms	
13	J1939- to Bat–	Pin D to Pin A	> 1k Ohms	
14	Terminating Resistors	—	110 – 130 ohms	

Table 1, Databus Quick Tests

NOTE: J1939 tests can also be performed on Diagnostic CAN High – Pin H, and Diagnostic CAN Low – Pin J for similar results.

NGI Instrument Cluster

The optional AMETEK/Dixson Next Generation Instrumentation (NGI) gauge set is a full-featured individual gauge instrument cluster with a 21-telltale light bar. See **Fig. 1**. The individual gauges receive their signal over a serial data link driven by a processor, referred to as the SCU, located in the speedometer. The SCU receives and processes inputs from SAE J1587 data link, sensors, and discrete inputs for driving the various gauges and telltales. The individual gauges have stepper motor movements with Light Emitting Diode (LED) backlighting. All of the electronic gauges have LED-lit telltales. The light bar has 14 fixed positions, using LEDs to light the telltales, and seven optional telltales, six lit with replaceable incandescent bulbs for color flexibility, and one lit with an amber LED. The vehicle odometer is displayed using a Liquid Crystal Display (LCD) located in the speedometer. A collection of stand-alone mechanical and electrical gauges completes the NGI instrument package. The speedometer and tachometer are five-inch diameter data-buss driven gauges. All other gauges are approximately 2-inch diameter, data-buss driven, and have a red LED-lit telltale except the fuel gauge, which is driven by the sensor in the fuel tank, and the air pressure gauges, which are mechanically driven. A transmission fluid temperature gauge is required on vehicles with automatic transmissions.

Driver's Message Center

The driver's message center has two parts; a 21 telltale light bar located in the top center of the instrument cluster, and a one-row, seven-character liquid crystal display (LCD) located on the speedometer.

Light Bar

The light bar has three rows of seven warning lights. See **Fig. 2**. The seven telltales on the top row of the light bar will vary depending on the vehicle configuration and customer preference. The two lower rows contain the 14 standard telltales shown in **Table 1**.

NGI Light Bar Standard Telltales	
Light	**LED Color**
Left Turn Signal	Green
Check Engine	Amber
Engine Protection	Red
Fasten Seat Belt Symbol	Red
High Beam Headlamps.	Blue
Tractor ABS (Antilock Brake System)	Amber
Parking/Emergency Brake	Red
Air Intake Filter Restriction	Amber
Right Turn Signal	Green
Trailer ABS	Amber
Water in Fuel	Amber
Intake Heater	Amber
Check A/C	Amber
Low Air	Red

Table 1, NGI Light Bar Standard Telltales

Message Center

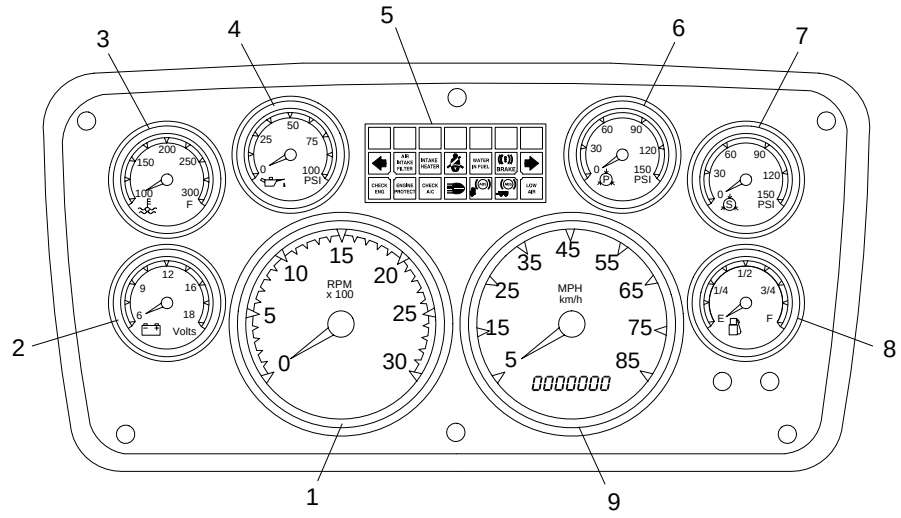
The NGI message center, **Fig. 3** is a one-row, seven-character liquid crystal display (LCD) located on the speedometer that displays the following information:

- Odometer
- Trip Odometers (two)
- Engine Hour Meter
- System Diagnostic Menu
- NGI-specific warning messages

Below the LCD there are five indicators along lower section of LCD, HR, MI, KM, TRIP, and a bell icon (not used at this time). **MI** or **KM** coincide with the primary scale of the speedometer when mileage is being displayed. The other icons display mode settings.

The odometer, hour meter, and trip odometers are primary screens. When a primary screen is displayed for 3 seconds or more it becomes the default screen. The default screen is displayed at ignition and will remain so until manually adjusted using the Mode and Set buttons.

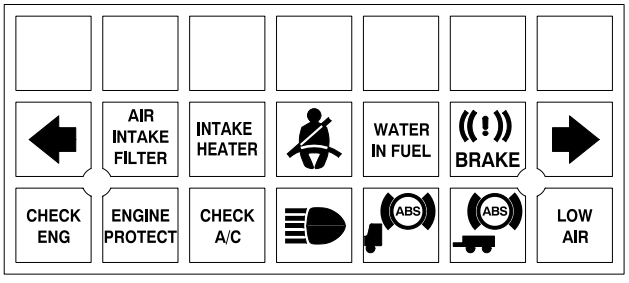
General Information



04/28/2003 f610507

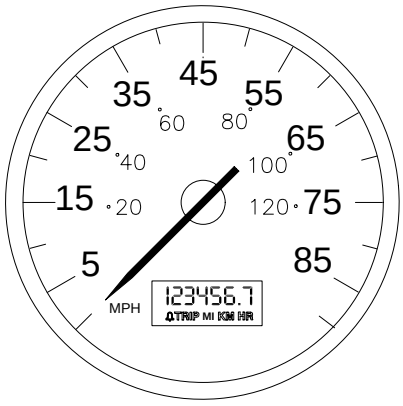
1. Tachometer
2. Voltmeter
3. Coolant Temperature
4. Engine Oil Pressure
5. Light Bar
6. Primary Air Pressure
7. Secondary Air Pressure
8. Fuel Level
9. Speedometer

Fig. 1, NGI Instrument Cluster



04/28/2003 f610506

Fig. 2, NGI Light Bar



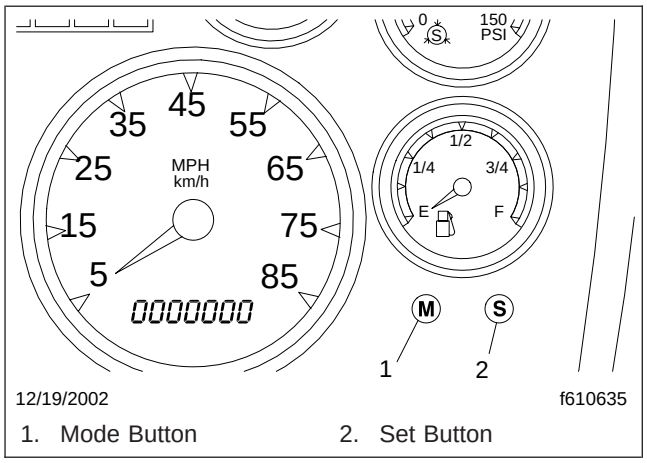
02/03/2003 f610639

Fig. 3, Message Center

Mode and Set Buttons

The Mode and Set buttons are located in the lower right corner of the instrument cluster. See **Fig. 4**. Pressing the Mode button cycles through the various functions. Pressing the Set button selects the desired function. See **Fig. 5**. In the Odometer mode, the Set button toggles to MI or KM. In the Trip 1 and 2 Odometer modes, the Set button resets the Trip meter to zero. In the Engine hours mode, total engine hours are displayed. This is not resetable. In the System mode, the Set button initiates the System Diagnostics test and will display any warning messages that are present in the system. To run the system diagnostics, the following conditions must be met:

- Ignition on
- Park brake set
- Road speed below 2 mph (3 km/h)
- Engine RPM at or below 1000



1. Mode Button 2. Set Button

Fig. 4, Mode and Set Buttons

- No low air pressure warning in effect

Buzzer

The buzzer sounds during the ignition sequence and whenever:

- The engine oil pressure falls below the preset level, which is 5 to 9 psi (35 to 60 kPa) on most engines;
- The coolant temperature rises above the preset level, which is 215°F (101°C) on Caterpillar engines, 220°F (104°C) on Cummins engines and 189°F (87°C) on MBE900 engines;
- The air pressure falls below the preset level of approximately 70 psi (483 kPa);
- The parking brake is set with the vehicle moving at a speed greater than 2 miles per hour (3 km/h).

Ignition Sequence

NOTE: If the headlights are turned on, the screen displays the odometer and waits for the ignition to be turned on.

When the ignition is turned on, the SCU performs a self-test, looking for active faults. All the electronic gauges complete a full sweep of their dials, the warning and indicator lights light up and the buzzer sounds for 3 seconds. During the first half of the self-test, all segments of the driver dash display screen illuminate as follows: "888888.8." During the second half of the self-test, the software revision level is displayed.

NOTE: The engine and ABS warning lights go on during the SCU self-test, but they are not controlled by the SCU. They are controlled by their own system electronic control unit (ECU).

If the SCU receives active fault codes from other devices, the screen displays a three-letter acronym and message identifier (MID), indicating the ECU or system that is not functioning properly. For a list of MIDs, see **Specifications, 400**. Each active fault is displayed for 3 seconds, one after the other, until the parking brake is released or the ignition is turned off. Once the parking brake is released, the screen displays the odometer. If there are no active faults, the screen displays the odometer.

NOTE: If the SCU receives a message from an ECU that has not been pre-programmed into the SCU memory, it displays "SYS ###", where ### is replaced by the MID of the broadcasting device.

General Information

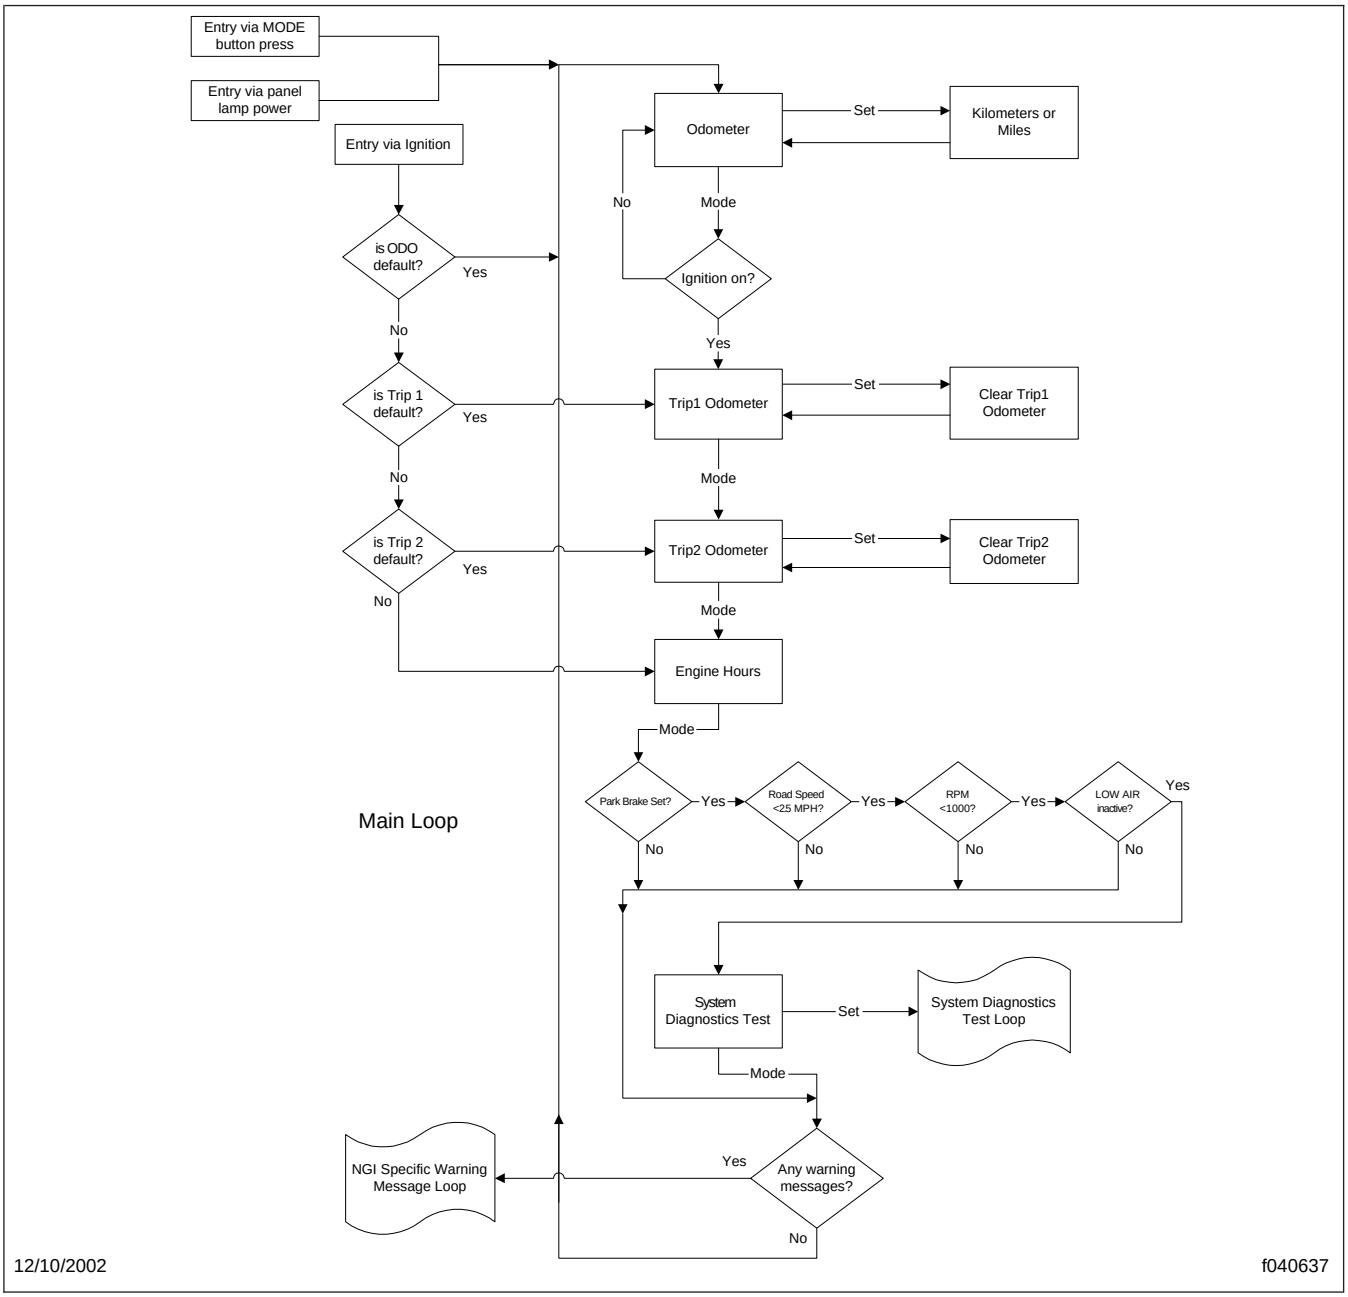


Fig. 5, State Diagram for LCD Display

Instrument Cluster Removal and Installation

NOTE: The NGI instrument cluster is designed for easy access. It is not necessary to disassemble the entire dash to service the gauges.

Removal

1. Park the vehicle on a level surface, shut down the engine, set the parking brake, and chock the tires.
2. Disconnect the batteries.

⚠ WARNING

All air pressure must be relieved from the air reservoirs before disconnecting any pneumatic lines or hoses from the air system. Failure to relieve air pressure could cause the lines to whip, resulting in personal injury.

3. Drain the air system.
4. Loosen the six quarter-turn Torx fasteners around the edge of the instrument cluster. See **Fig. 1**.

⚠ CAUTION

Do not forcibly pull the instrument cluster from the dash. This may dislodge wires from the harness electrical connectors on the back of the instrument cluster and damage the wires, the instrument cluster, or the dash.

5. Tilt the instrument cluster away from the dash.
6. Disconnect the connectors from the back of the instrument cluster.
   - 6.1 Disconnect the two electrical connectors (E3 & E6) from the back of the speedometer.
   - 6.2 Disconnect the air pressure lines from the primary and secondary air pressure gauges; see **Section 42.05**, Subject 110.
7. Remove the instrument cluster from the dash.

Installation

1. Position the instrument cluster in front of the dash opening.
2. Connect the connectors from the back of the instrument cluster.
   - 2.1 Connect the two electrical connectors (E3 & E6) to the back of the speedometer. See **Fig. 2**.
   - 2.2 Connect the air pressure lines to the primary and secondary air pressure gauges; see **Section 42.05**, Subject 110.
3. Pressurize the air system.
4. Check for air leaks.
5. Position the instrument cluster in the opening in the dash.
6. Fasten the six quarter-turn Torx fasteners.
7. Connect the batteries.
8. Remove the chocks.

Instrument Cluster Removal and Installation

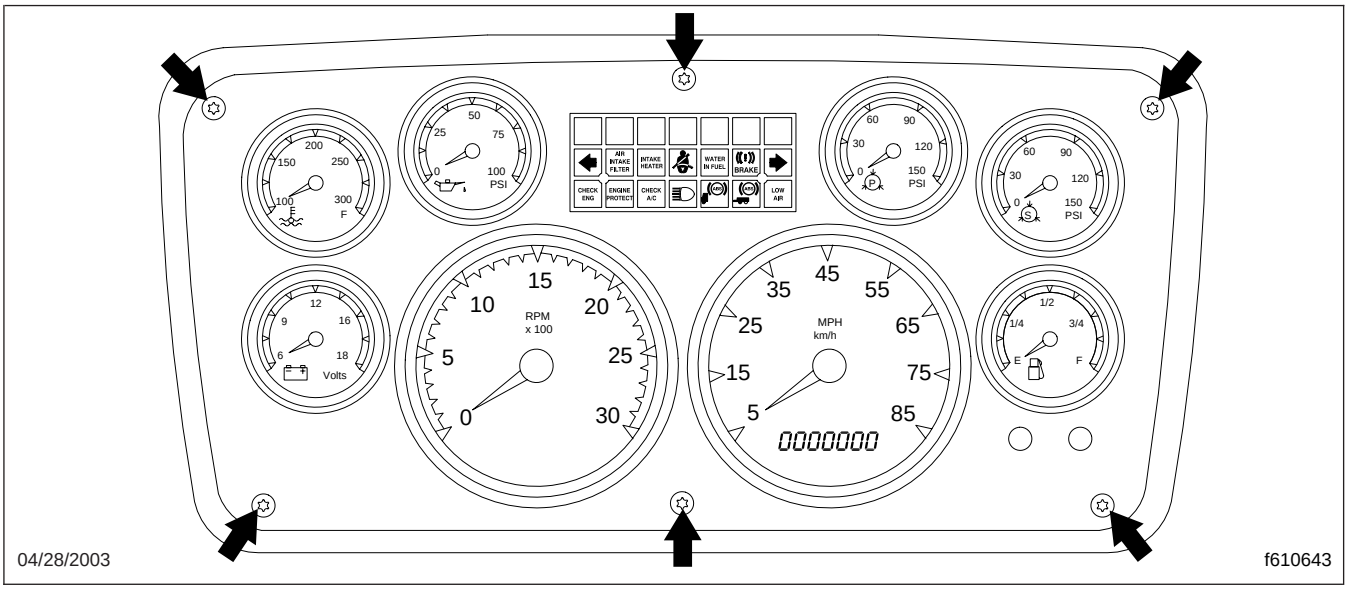

Fig. 1, Instrument Cluster Fasteners

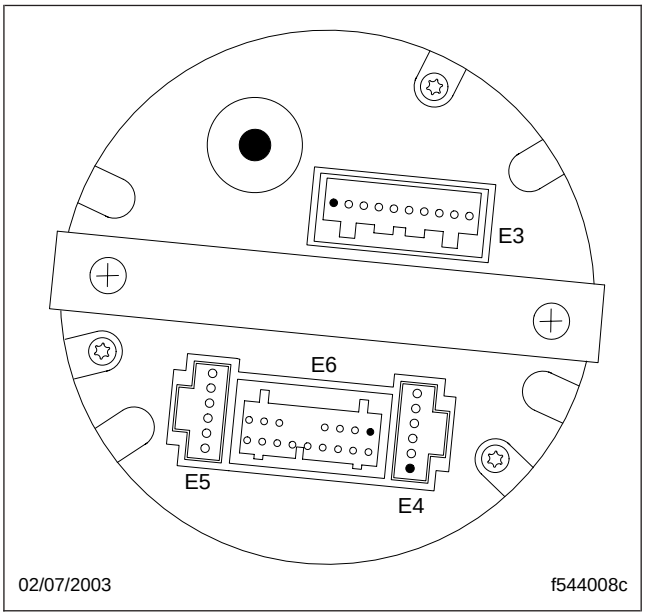

Fig. 2, Speedometer Electrical Connectors

NOTE: The instrument cluster need not be completely removed from the vehicle to remove and replace individual gauges. However, if removing the cluster is preferred, refer to **Subject 100** for the complete procedure.

Large Face Gauges

Removal

1. Park the vehicle on a level surface, shut down the engine, set the parking brake, and chock the tires.
2. Disconnect the batteries.

WARNING

All air pressure must be relieved from the air reservoirs before disconnecting any pneumatic lines or hoses from the air system. Failure to relieve air pressure could cause the lines to whip, resulting in personal injury.

3. Drain the air system if air gauges are to be disconnected.

CAUTION

Do not forcibly pull the instrument cluster from the dash. This may dislodge wires from the harness electrical connectors on the back of the instrument cluster and damage the wires, the instrument cluster, or the dash.

4. Access the back of the instrument cluster. Refer to **Subject 100** for the instrument cluster removal and installation procedure.
5. Disconnect the wire connectors from the back of the gauge to be removed. See **Fig. 1**. There are four connectors on the speedometer and two on the tachometer.
6. Remove the two screws from the U-clamp.
7. Slide the gauge out through the front of the Instrument panel.

Installation

1. Slide the gauge into position from the front of the instrument panel. Make sure the locating pin on the bottom of the gauge near the bezel fits into the notch in the gauge mounting hole.
2. Position the U-clamp and install the retaining screws.
3. Connect the wire connectors to the back of the gauge.
4. Install the instrument cluster. Refer to **Subject 100**.
5. Connect the batteries.
6. Remove the chocks.

Fig. 1, Installation, Large Face Gauges (speedometer)

Small Face Gauges

Removal

1. Park the vehicle on a level surface, shut down the engine, set the parking brake, and chock the tires.
2. Disconnect the batteries.

WARNING

All air pressure must be relieved from the air reservoirs before disconnecting any pneumatic lines or hoses from the air system. Failure to relieve

Gauge Removal and Installation

air pressure could cause the lines to whip, resulting in personal injury.

3. Drain the air system if air gauges are to be disconnected.

CAUTION

Do not forcibly pull the instrument cluster from the dash. This may dislodge wires from the harness electrical connectors on the back of the instrument cluster and damage the wires, the instrument cluster, or the dash.

4. Access the back of the instrument cluster. Refer to **Subject 100** for the instrument cluster removal and installation procedure.
5. Disconnect the wire connectors from the back of the gauge to be removed.
6. If an air pressure gauge is to be removed, disconnect the air pressure lines from the press-to-release fitting on the gauge back; see **Section 42.05**, Subject 110.
7. While holding the front of the gauge, press and turn the clamp ring counterclockwise about 1/16-inch until it releases. See **Fig. 2** for exploded view of gauge installation.
8. Remove the clamp ring, flat shim, and wave shim from the back of the gauge.
9. Slide the gauge out through the front of the cluster panel.

Installation

1. Slide the gauge into position from the front of the cluster panel. Make sure the locating pin on the bottom of the gauge near the bezel fits into the notch in the gauge mounting hole.
2. Put the wave shim, flat shim, and clamp ring on the back of the gauge.
3. While holding the front of the gauge in position, press and turn the clamp ring clockwise about 1/16-inch until it locks into place.
4. Connect the wire connectors to the back of the gauge.
5. If applicable, connect the air pressure lines to the press-to-release fitting on the back of the air pressure gauge. For the correct procedure see **Section 42.05**, Subject 110.
6. Pressurize the air system and check for leaks.
7. Install the instrument cluster. Refer to **Subject 100**.
8. Connect the batteries.
9. Remove the chocks.

Fig. 2, Installation, Small Face Gauges

Light Bar Removal and Installation

Removal

1. Park the vehicle on a level surface and apply the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Loosen the six quarter-turn Torx fasteners around the edge of the instrument cluster. See **Fig. 1**.

Installation

1. Position the light bar into the mounting panel.
2. Install the four T10 Torx retaining screws.
3. Connect the electrical connectors to the rear of the light bar.
4. Position the instrument cluster in the dash opening.

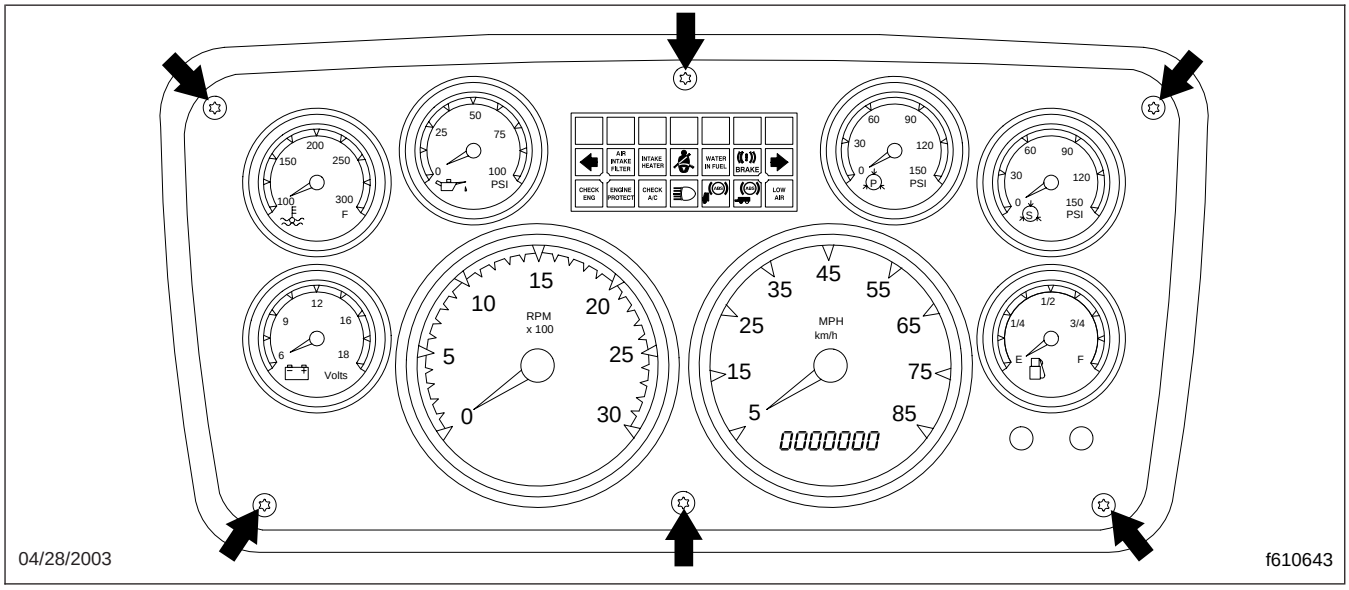

Fig. 1, Instrument Cluster Fasteners

CAUTION

Do not forcibly pull the instrument cluster from the dash. This may dislodge wires from the harness electrical connectors on the back of the instrument cluster and damage the wires, the instrument cluster, or the dash.

4. Tilt the instrument cluster out of the dash opening.
5. Depress the locking tabs and disconnect the electrical connectors from the rear of the light bar.
6. Remove the four T10 Torx screws holding the light bar to the panel. See **Fig. 2**.
7. Remove the light bar from the mounting panel.

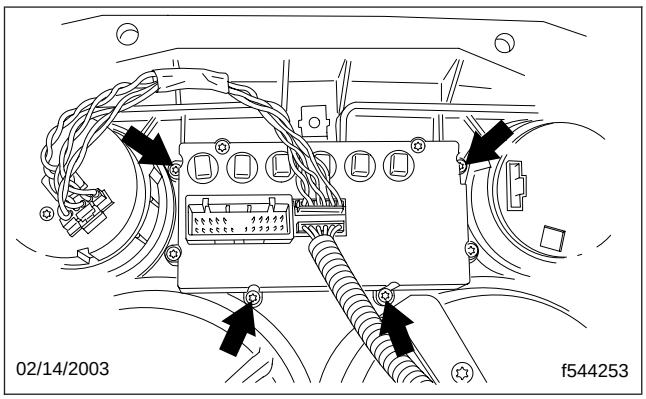

Fig. 2, Light Bar Mounting Screws

5. Fasten the six quarter-turn Torx-head fasteners.
6. Connect the batteries.
7. Remove the chocks.

Terms, Abbreviations, and Definitions

Terms, Abbreviations, and Definitions are listed below for your convenience.

- **ECU**–Electronic Control Unit
- **GC**–In the flow charts, a connector that is mounted on a gauge or other system component.
- **HC**–In the flow charts, a connector that is part of the vehicle's wiring harness.
- **LED**–Light-Emitting Diode
- **NGI**–Next Generation Instrumentation
- **SCU**–System Control Unit (Speedometer)

Mode and Set Switch Functions

Use the following flow charts to cycle through the Mode/Reset switch functions and screens when instructed to do so in the diagnostic flow charts.

See **Fig. 1** for Main Loop function flow chart.

See **Fig. 2** for Warning Message Loop function flow chart.

See **Fig. 3** for System Diagnostics Test Loop function flow chart.

See **Fig. 4** for Manual Mode Test Loop function flow chart.

See **Fig. 5** for Alpha Display Main Loop function flow chart.

Troubleshooting

For troubleshooting procedures, see Tables 1 through 7 later in this subject.

Flow Chart Information

Troubleshooting flow charts begin with Fig. 6. See Tables 1 through 7 to determine which troubleshooting flow chart to use. The black box(es) in each flow chart is the starting point for that chart. Follow the instructions in each box. The path to the next box depends upon how you answered the question in the previous box (i.e. "yes" or "no"). As you work your way through the chart you will eventually come to a box containing **bold type**. This represents the end of the flow chart. If you reach this box and your problem is still present, call the AMETEK Dixson Product Support Department for additional assistance at (800) 205-7710.

In the flow charts, "HC" refers to the connector on the wiring harness and "GC" refers to the connector on the gauge or lightbar.

Using the Automatic Mode Test Procedure

NOTE: Use this procedure when instructed to do so in the diagnostic flowcharts.

1. Using the mode switch, scroll until **DIAGTST** is displayed.
2. Press the set switch to enter the test mode.
3. Press the mode switch to scroll between **AUTO**, **MANUAL**, and **EXIT**.
4. When **AUTO** is displayed press the set switch to start the auto test.

NOTE: Light bar telltales will stay on if the condition that lights them is true.

5. The gauges, Check Engine light, and light bar will begin to cycle in the following manner with a corresponding message in the alphanumeric display. Verify that the gauges and light bar telltales function as follows:
   - **MIN** — All gauge pointers go to zero scale. All warning LEDs and all light bar telltales are off.
   - **MID**—All gauge pointers go to mid-scale. All warning LEDs are off, the Check Engine light is on, and every other telltale in the light bar is on.
   - **MAX**—All gauge pointers go to full-scale. All warning LEDs are off, the Check Engine light is off, and the light bar telltales change states.
   - **LED**—All gauge pointers go to zero-scale. All warning LEDs are on and only the Neutral, Park Brake and PTO telltales in the light bar are on.

Troubleshooting

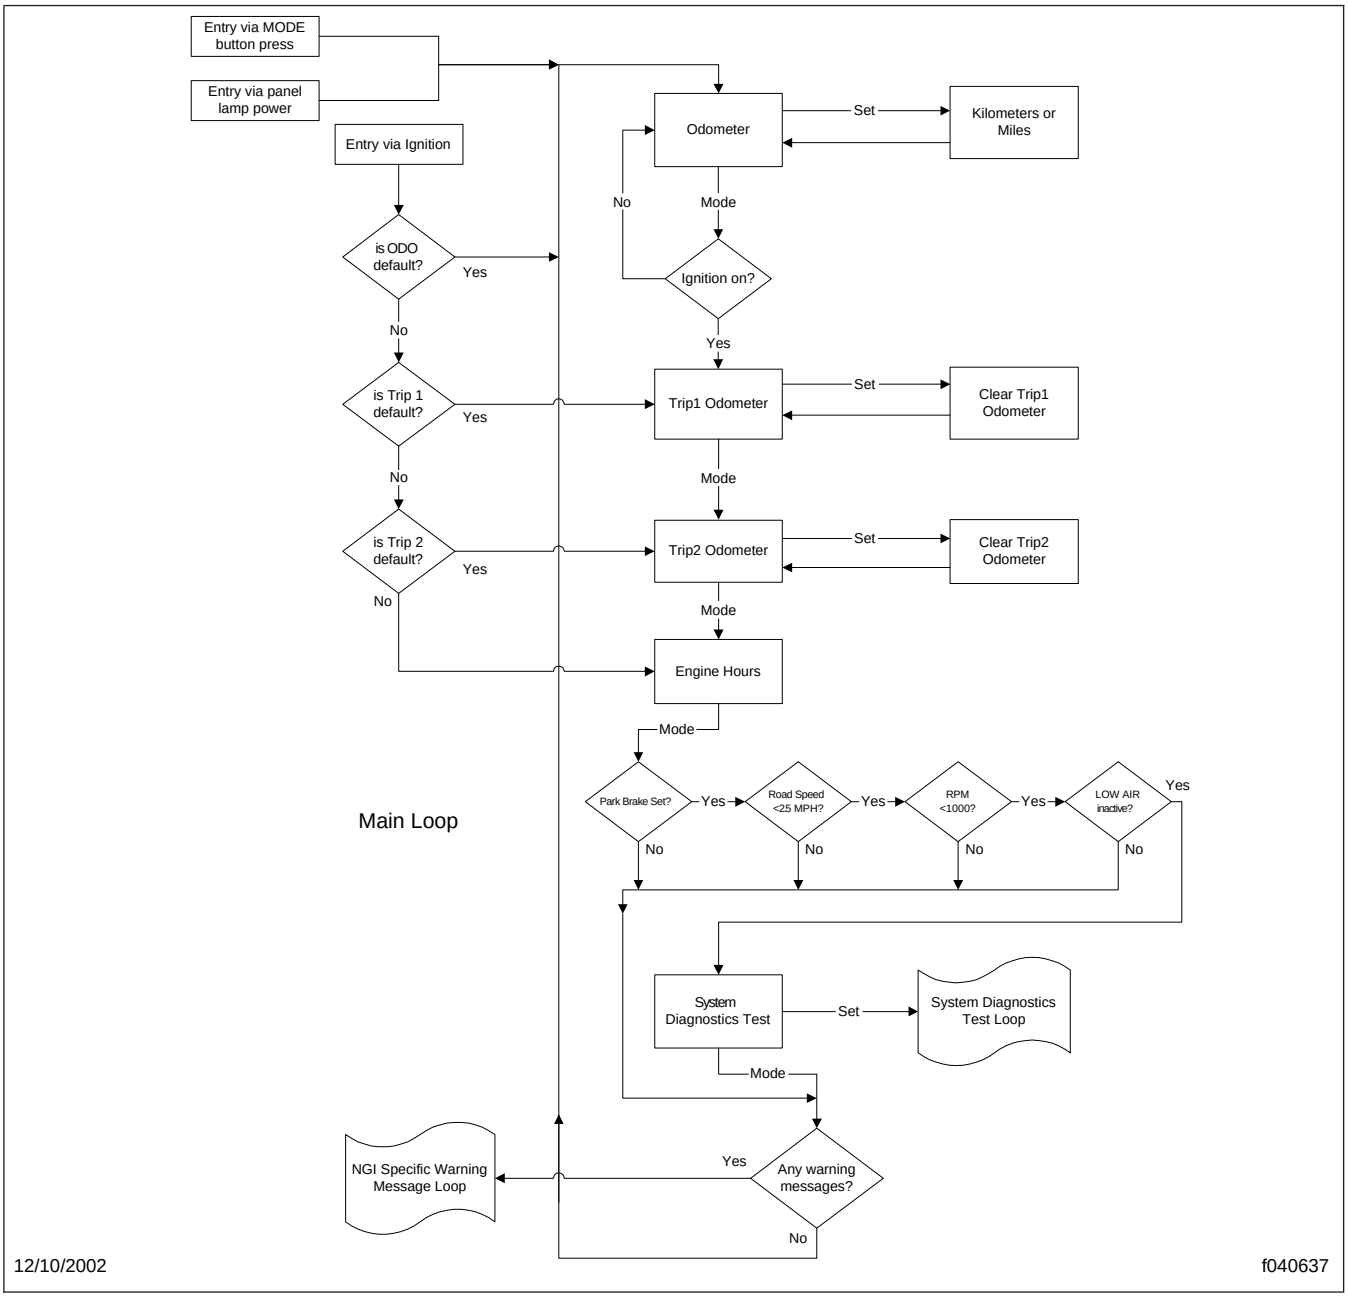

Fig. 1, Main Loop

6. All gauges, warning LEDs, and telltales must function as described.
7. When the test is complete push the set or mode switch to stop the test.
8. Use the mode switch to scroll until **EXIT** appears.

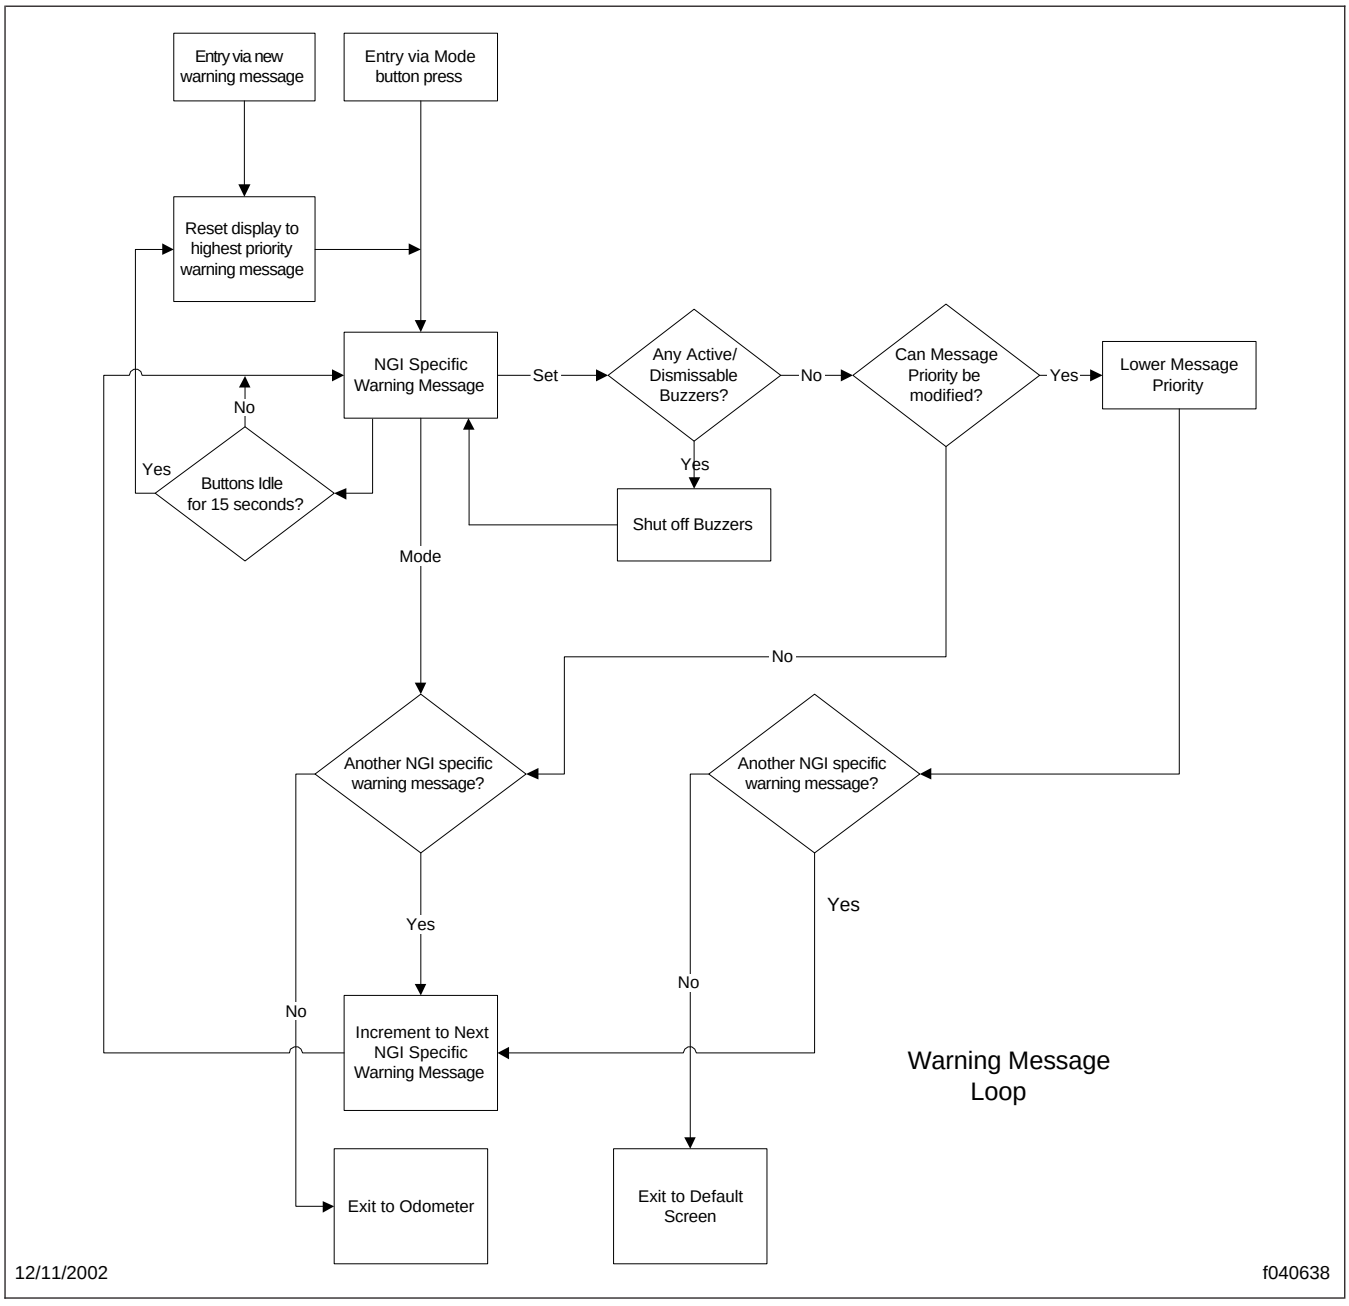

Fig. 2, Warning Message Loop

Using the Manual Mode Test Procedure

NOTE: Use this procedure when instructed to do so in the diagnostic flowcharts.

1. Using the mode switch scroll until **DIAGTST** is displayed.
2. Push the set switch to return to normal operation.
3. Press the set switch to enter the test mode.

Troubleshooting

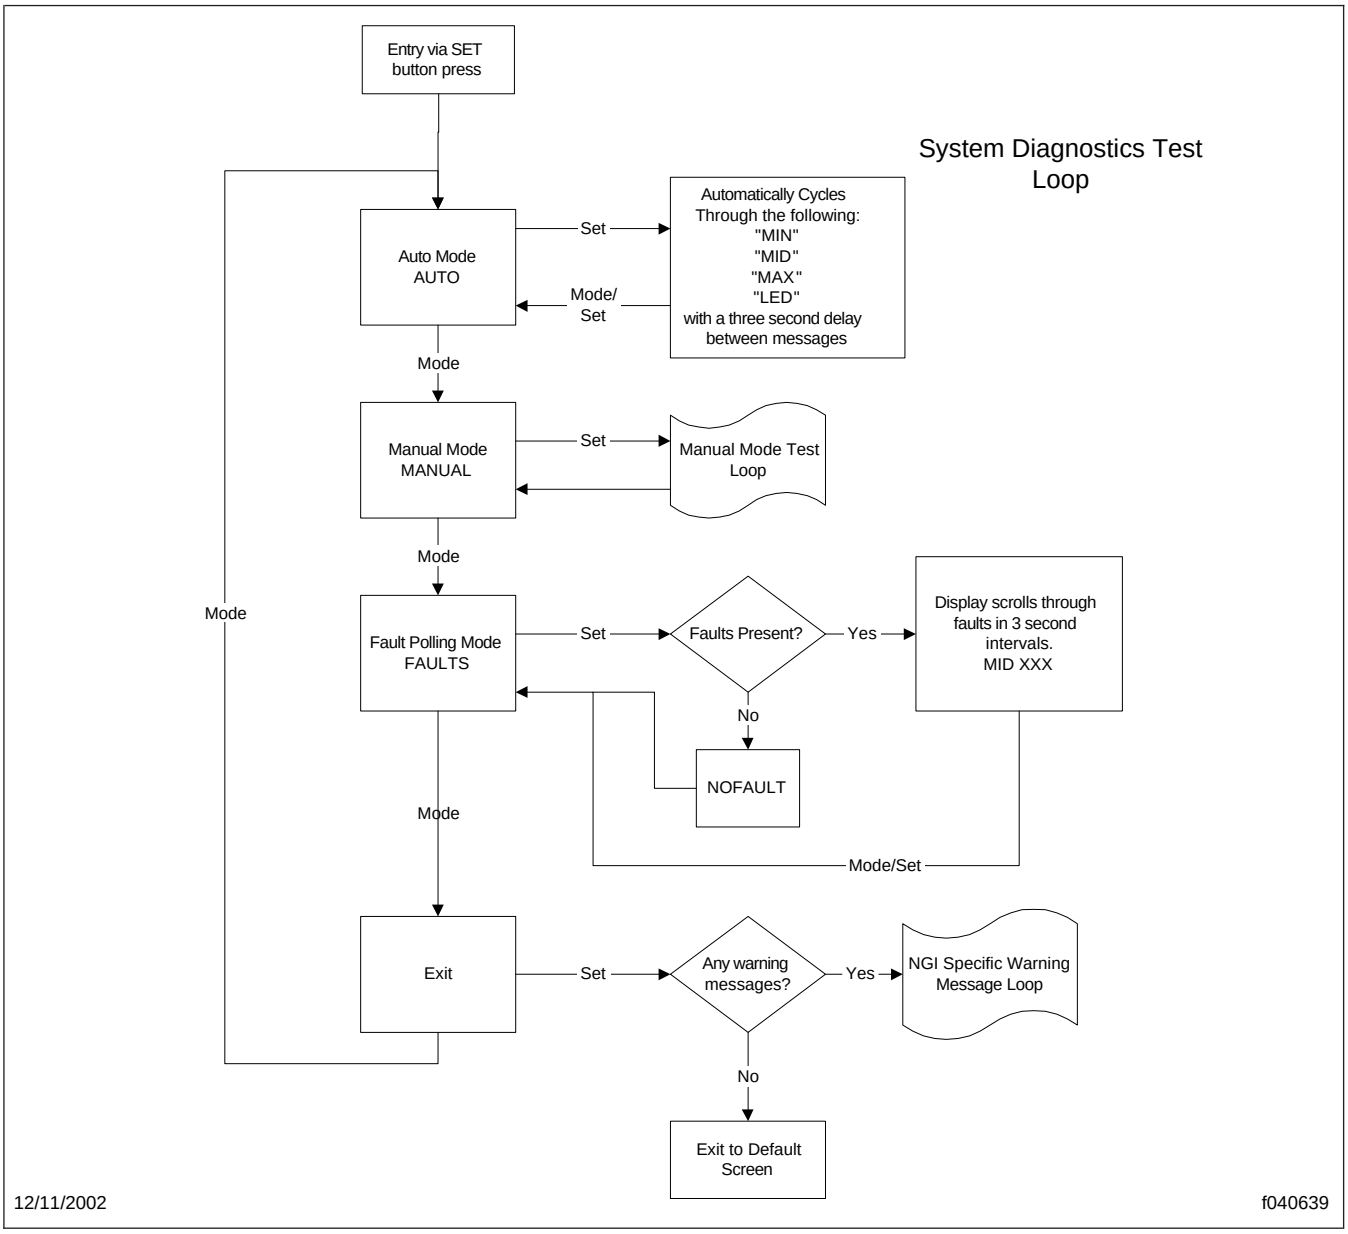

Fig. 3, System Diagnostics Test Loop

4. Press the mode switch to scroll between **AUTO**, **Manual**, and **EXIT**.
5. When **MANUAL** is displayed press the set switch.
6. To test a gauge:

6.1 Press the mode switch to scroll through the menu until the name of the gauge you wish to test is displayed.

6.2 Press the set switch to enable the test for the selected gauge.

6.3 Verify the gauge or light bar telltale behaves as follows:

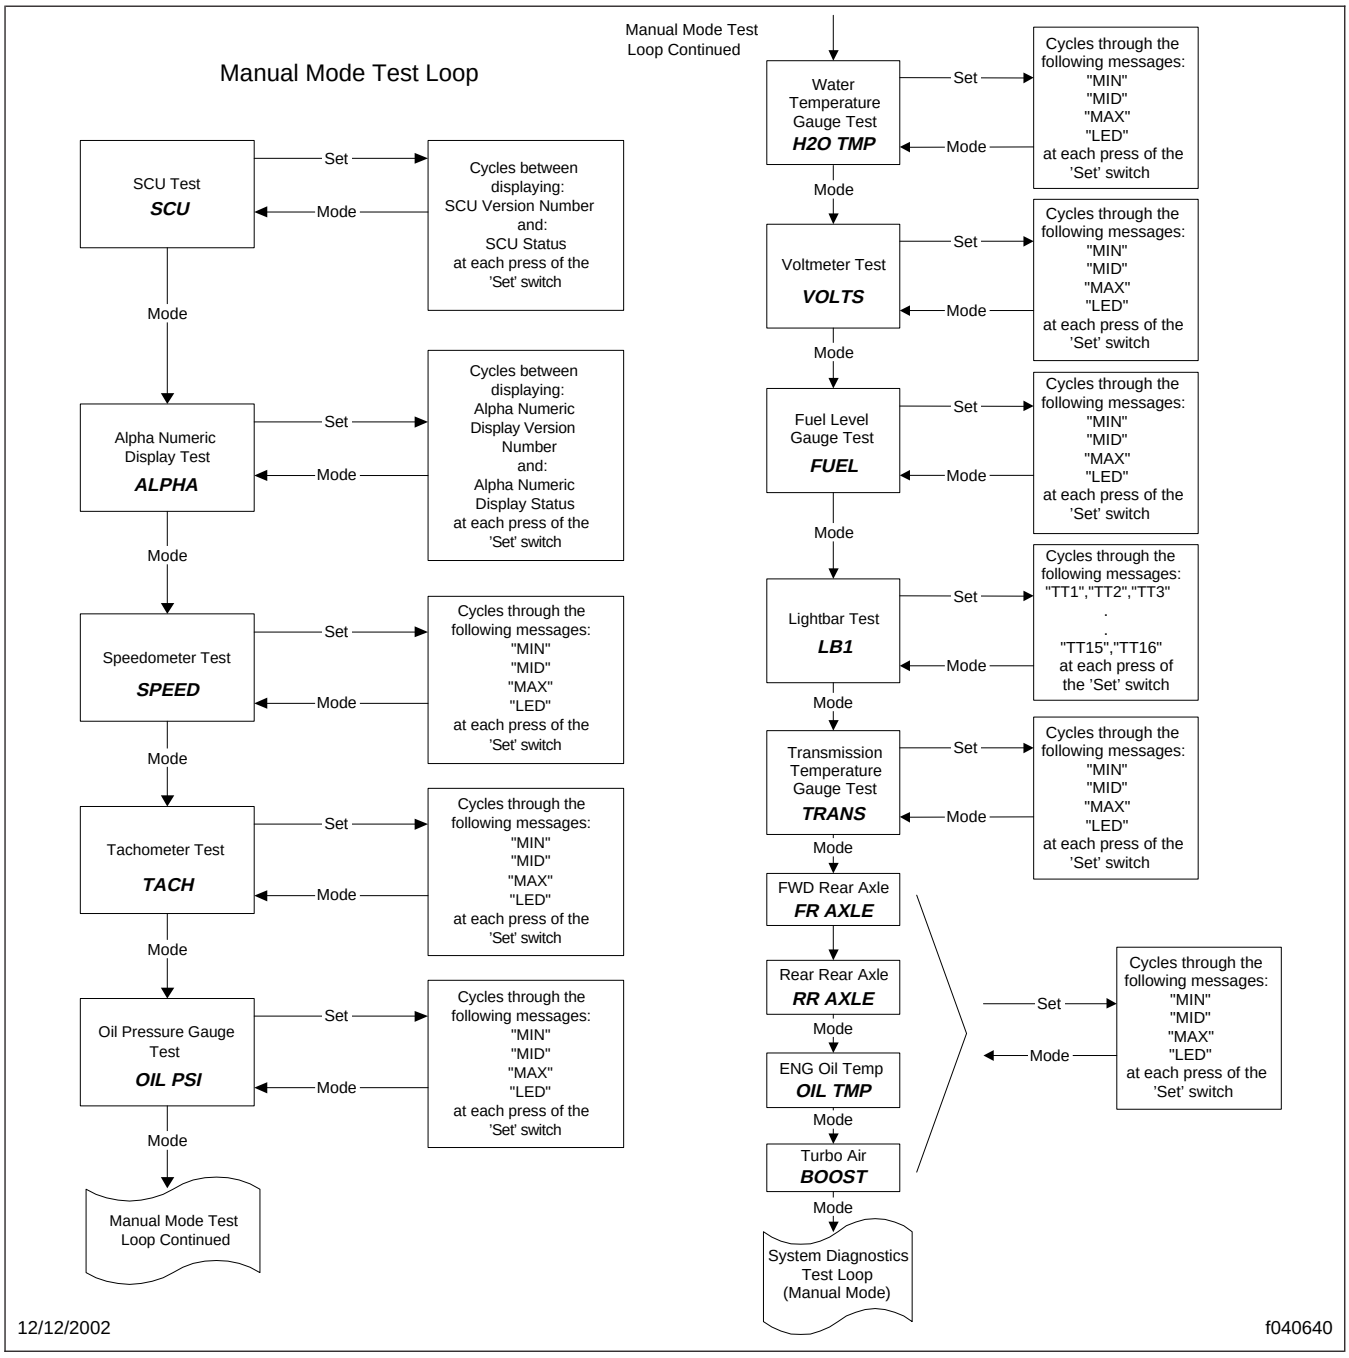

Fig. 4, Manual Mode Test Loop

- **MIN**— The gauge pointer goes to the zero scale and its warning LED is off.
- **MID**— The gauge pointer goes to mid-scale and its warning LED is off.

Troubleshooting

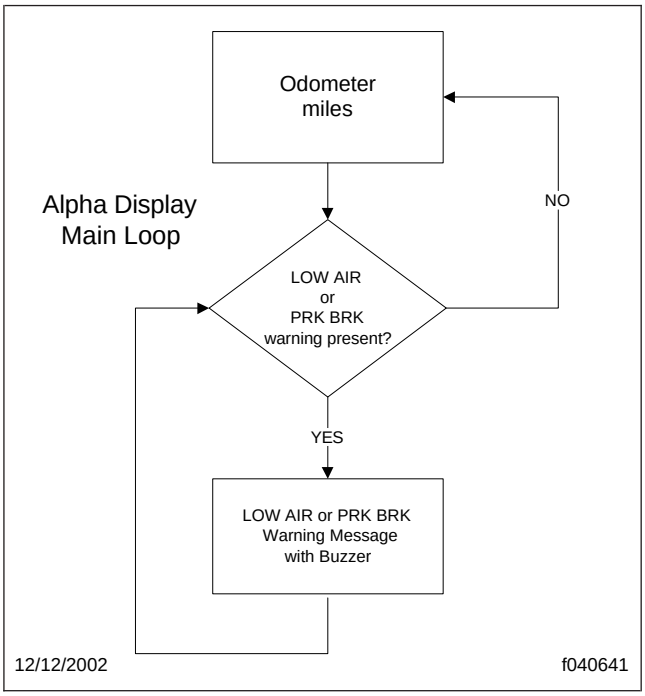

Fig. 5, Alpha Display Main Loop

- **MAX**—The gauge pointer goes to full scale and its warning LED is off.
- **LED**—The gauge pointer goes to the zero scale and its warning LED is on.

6.4 Press the set switch again to cycle through each test. You must continue pressing the set switch to cycle through the test.

6.5 Press the mode switch to exit the gauge test.

7. To test the light bar or one of its telltales:

7.1 When **MANUAL** is displayed press the set switch.

7.2 Press the mode switch until **LB1** is displayed.

7.3 Press the set switch to cycle through **TT1** to **TT16**. The location of the telltales T1 through T15 will be shown in the display. TT16 will turn the **CHECK ENGINE** light on.

7.4 Verify the correct light is on as indicated in the alphanumeric display.

7.5 Press the mode switch to exit the light bar test.

8. To exit the manual mode:

8.1 Continue pressing the mode switch to scroll through the menu until **EXIT** appears.

8.2 Press the set switch to exit the manual mode and return to normal operation.

Diagnostic Procedures

When troubleshooting the instrumentation, switch the ignition on and observe all the gauges during the initialization period. Locate the general symptom in **Table 1**, then follow the instructions.

NOTE: See **Subject 400** for instrumentation connector locations and pin identification.

General Symptoms	
Problem	**Remedy**
Problem with speedometer or alphanumeric display.	See **Table 2**.
Problem with 2-inch gauge or tachometer.	See **Table 3** or **Table 4**.
Problem with air pressure gauges.	See **Table 5**.
Problem with light bar telltales.	See **Table 6** and **Table 7**.
Problem with Check Engine light.	
Problem with left or right turn indicator.	See **Table 7**.
Problem with high beam indicator.	See **Table 7**.

General Symptoms	
Problem	**Remedy**
Warning message displayed.	See **Table 8**.
No audible warning when warning message displayed.	Replace the speedometer.

Table 1, General Symptoms

Problem With Speedometer			
Problem	**Initialization results***	**Possible Cause**	**Remedy**
LCD is dead and speedometer pointer does not move to initialization point.	Fail	No power from battery or ignition switch; defective speedometer.	See **Fig. 6**.
Speedometer pointer does not move to its initialization point.	Fail	Defective speedometer.	Replace speedometer.
Speedometer pointer goes to and stays at minimum or full scale.	Pass	Engine ECU out of range.	See **Fig. 7**.
Speedometer pointer stays at minimum scale (LCD may read **NO DATA**).	Pass	No data from Engine ECU; NGI bus problem; defective speedometer.	
Inaccurate speed indication.	Pass	Problem with Engine ECU; defective speedometer.	See **Fig. 15**
NO DATA displayed. All other components function properly.	Pass	Defective speedometer.	Replace speedometer.
Select/mode buttons not functioning.	Pass	Defective speedometer.	Replace speedometer.
LCD is dead but speedometer pointer does move to initialization point.	Fail	Defective speedometer.	Replace speedometer.
LCD is missing segments.	Fail	Defective speedometer.	Replace speedometer.
LCD backlighting not working.	Pass	Defective speedometer.	Replace speedometer.
No odometer or engine hours display.	Pass	Engine ECU not sending data; defective speedometer.	See **Fig. 8**.
Odometer or engine hour display not advancing.	Pass	Engine ECU not sending data; defective speedometer.	See **Fig. 8**.
Cannot reset trip odometer.	Pass	Defective speedometer.	Replace speedometer.
No backlighting.	Pass	Power or ground problem.	See **Fig. 9**.

* When ignition is first turned on, each gauge pointer should sweep below minimum scale and the LED should be lit, then the pointer should return to minimum scale. *This does not apply to the air pressure gauges.*

Table 2, Problem With Speedometer

Troubleshooting

Problems with J1587 Driven Gauges: Tachometer, Coolant Temperature, Oil Pressure, Voltmeter, Engine Oil Temperature, Turbo Boost			
Symptom	**Initialization Results**	**Probable Cause**	**Remedy**
Dead. Gauge pointer does not move and LED does not light.	Fail	NGI Power missing; power not getting to speedometer or gauge; defective speedometer or gauge.	See **Fig. 6**.
Gauge pointer moves correctly but LED does not light.	Fail	Defective gauge.	Replace gauge.
LED lights, but gauge pointer does not position correctly.	Fail	Defective gauge.	Replace gauge.
Gauge pointer goes to zero and LED flashes slowly.*	Pass	Open or shorted NGI bus; defective gauge or speedometer; data not on J1587 databus.	See **Fig. 10**.
Gauge inaccurate.	Pass	Engine ECU; defective sensor, speedometer.	See **Fig. 15**.
No backlighting.	Pass	Backlight power or ground problem.	See **Fig. 9**.

* Slowly means one flash per second.

Table 3, Problem With J1587 Driven Gauge

Problems with Sensor Driven Gauges: Fuel Level, Trans Oil Temperature, Axle Temperature (front and rear)			
Symptom	**Initialization Results**	**Probable Cause**	**Remedy**
Dead. Gauge pointer does not move and LED does not light.	Fail	NGI Power missing; power not getting to speedometer or gauge; defective speedometer or gauge.	See **Fig. 6**.
Gauge pointer moves correctly but LED does not light.	Fail	Defective gauge.	Replace gauge.
LED lights, but gauge pointer does not position correctly.	Fail	Defective gauge.	Replace gauge.
Gauge pointer goes to zero and LED flashes slowly.	Pass	Open or shorted NGI bus; defective gauge or speedometer.	See **Fig. 10**.
Fuel Gauge Only: Gauge pointer goes to minimum scale and LED may be lit.	Pass	Faulty sensor; open or shorted sensor wiring leading to instrumentation.	See **Fig. 16**
Transmission and Axle Temperature Gauges Only: Gauge pointer goes to minimum scale, or pointer goes to maximum scale and the LED is lit.	Pass	Faulty sensor; open or shorted sensor wiring leading to instrumentation.	See **Fig. 13**
Gauge inaccurate.	Pass	Defective sensor	Fuel level gauge: see **Fig. 16** All others: see **Fig. 13**

Problems with Sensor Driven Gauges: Fuel Level, Trans Oil Temperature, Axle Temperature (front and rear)			
Symptom	**Initialization Results**	**Probable Cause**	**Remedy**
No backlighting.	Pass	Backlight power or ground problem.	See **Fig. 9**.

Table 4, Problems with Sensor Driven Gauges

Problems with Air Pressure Gauges: Primary and Secondary Air Pressure, Service Brake Application			
Symptom	**Initialization Results**	**Probable Cause**	**Remedy**
Dead. Gauge pointer does not move.	N/A	Defective gauge; no air pressure reaching gauge.	See **Fig. 14**.
Gauge inaccurate.	N/A	Defective gauge.	See **Fig. 14**.
No backlighting.	N/A	Backlight power or ground problem.	See **Fig. 9**.

Table 5, Problems with Air Pressure Gauges

Problem With Light Bar During Initialization		
Problem	**Probable Cause**	**Remedy**
Only some telltales turn on. Fasten seatbelt telltale does not turn on. NOTE: Bulb checks for discrete input telltales (hard wired) are controlled by the ECU they are connected to.	Light bar faulty.	Replace light bar.
No telltales turn on.	No power or ground to light bar.	See **Fig. 17**

Table 6, Problem With Light Bar During Initialization

Problem With Light Bar During Operation	
Problem	**Remedy**
Optional Telltale #1 always/never on.	See **Fig. 18**.
Low Coolant telltale always/never on.	See **Fig. 18**.
Engine Protection telltale always/never on.	See **Fig. 18**.
Water in fuel telltale always/never on.	See **Fig. 18**.
Air Intake Filter telltale always/never on.	See **Fig. 18**.
Low Air telltale always/never on.	See **Fig. 22**.
Tractor ABS, telltales always/never on.	Check wiring and ABS ECUs. If OK, replace lightbar.
Trailer ABS, telltales always/never on.	
Check engine light always/never on.	See **Fig. 18**.
Optional Telltale #2 through #7 always/never on.	See **Fig. 19**.
Right/Left Turn Signal always/never on.	See **Fig. 20**.
Check A/C telltale always/never on.	See **Fig. 20**.

Troubleshooting

Problem With Light Bar During Operation	
Problem	**Remedy**
High Beam Indicator telltale always/never on.	See **Fig. 20**.
Fasten Seat Belt telltale always/never on.	See **Fig. 21**.

Table 7, Problem With Light Bar During Operation

Warning Messages

Warning messages are listed in **Table 8**. Read the message and determine what condition is causing it.

Should **NO DATA** be displayed, go to **Table 2** (Problem With Speedometer).

If you suspect the alarm condition is false and a problem does not really exist, then follow the gauge accuracy troubleshooting procedures for that gauge by going to **Table 3** (Problem With J1587 Driven Gauge).

Warning Messages	
Warning Message	**Probable Cause**
LOW AIR	Air pressure low
PRK BRK	Air tank #2 low
LOW OIL	Engine oil pressure low
H2OTMP	Coolant temperature high
No Data	See **Table 2**.

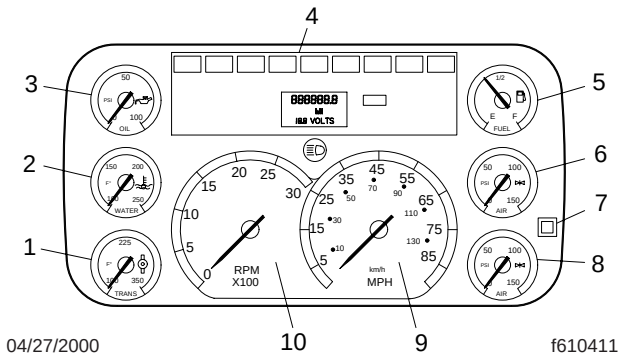
Table 12, Message Identifiers (MIDs)

General Information

Instrumentation Control Unit (ICU3)

The instrumentation control unit (ICU3) is a basic electronic dashboard that accepts input from the fuel level sensor, the transmission temperature sensor (if installed), and the J1587 datalink. The information is processed by a micro-computer and displayed on electronic gauges driven by stepper motors. Air gauges operate mechanically.

The speedometer and tachometer are large-faced electronic gauges located below the dash message center. See **Fig. 1**.



1. Transmission Fluid Temperature Gauge
2. Coolant Temperature Gauge
3. Engine Oil Pressure Gauge
4. Dash Message Center
5. Fuel Level Gauge
6. Primary Air Pressure Gauge
7. Optional Mode/Reset Push Button
8. Secondary Air Pressure Gauge
9. Speedometer
10. Tachometer

Fig. 1, ICU3 Gauge Layout (typical)

The other gauges are small-faced and located to either side of the speedometer and tachometer. The engine oil pressure, coolant temperature, transmission fluid temperature and fuel level gauges are electronic; the air pressure gauges are mechanical. The ICU3 can not drive gauges located on the auxiliary instrument panel.

A transmission fluid temperature gauge is required on vehicles with automatic transmissions.

The following items are replaceable:

- air pressure gauges
- light bulbs
- lens/mask assembly
- mode/reset button
- top row warning and indicator lenses
- back cover

Dash Message Center

The dash message center has two parts: a dash driver display screen and a set of 26 warning and indicator lights similar to those found on a conventional lightbar.

Dash Driver Display

The dash driver display screen is a 1-line by 7-character liquid crystal display (LCD) that is normally used to display the odometer reading. In addition, there is a separate voltmeter display underneath the odometer display.

The information that can be provided by the message center includes:

- Odometer readings;
- Trip miles;
- Trip engine hours;
- A listing of active faults.

With the optional Mode/Reset button, you can switch the odometer to display either miles or kilometers, invoke the trip odometer and trip engine hours, and call up diagnostic messages (active faults).

Odometer

The odometer is set to display in either miles or kilometers, depending on the primary scale of the speedometer. The legend, either "MI" or "KM," illuminates between the odometer and the volts display when the engine is running or the headlights are turned on.

The odometer is a seven-digit display with a decimal point, until the vehicle has traveled 999,999.9 miles or kilometers (km). At one million miles (km), the odometer rolls over to "1000000," without the decimal point, and can continue up to 9,999,999. The odometer only displays significant figures (no leading zeros).

General Information

IMPORTANT: The odometer uses data supplied by the engine ECU to update its count. However, it keeps its own mileage (starting at zero) from when it was first installed. The ICU3 odometer will not match the engine ECU odometer if the engine has been operated with the ICU3 disconnected, during factory break-in or engine service, or if the ICU3 has been replaced.

Warning and Indicator Lights

There are spaces on the dash message center for 26 warning and indicator lights. See **Fig. 2** for a typical installation.

There are four rows of lights. The lights in the top row are all optional and may be installed in any order, except for STOP ENGINE (Cummins engines only) and WHEEL SPIN that are typically installed at a fixed position:

NOTE: Positions 1 through 8 are ground-activated circuits. Position 2 can be activated with the ignition switch in the OFF position. Position 9 is power-activated.

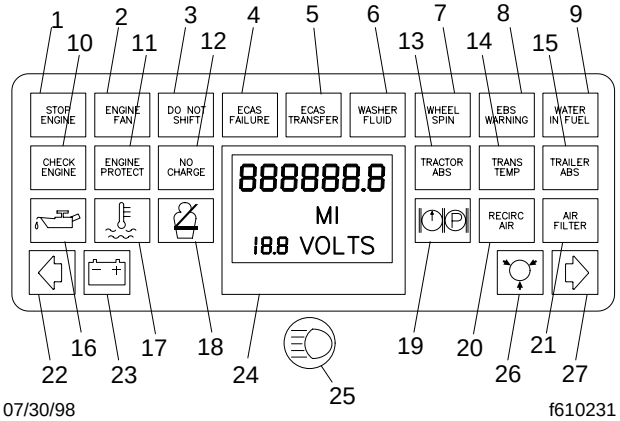
On the other three rows, the lights are installed at fixed positions. Some lights are optional; if an optional light is not requested, the position is blank (does not light up).

All light bulbs are replaceable in the field, including gauge light bulbs and warning/indicator light bulbs.

Buzzer

The buzzer sounds during the ignition sequence and whenever:

- The engine oil pressure falls below the preset level, which is 5 to 9 psi (35 to 60 kPa) on most engines;
- The coolant temperature rises above the preset level, which is 215°F (101°C) on Caterpillar™ engines, 220°F (104°C) on Cummins engines and 189°F (87°C) on MBE900 engines;
- The air pressure falls below the preset level of approximately 70 psi (483 kPa);
- The parking brake is set with the vehicle moving at a speed greater than 2 miles per hour (3 km/h).



1. Stop Engine Warning (Cummins engines only)
2. Engine Fan On Indicator (optional)
3. Do Not Shift Indicator (optional)
4. ECAS Failure Warning (optional)
5. ECAS Transfer Indicator (optional)
6. Low Washer Fluid Indicator (optional)
7. Wheel Spin Indicator (optional)
8. EBS Warning (optional)
9. Water In Fuel Indicator (optional)
10. Check Engine Indicator
11. Engine Protection Warning
12. Alternator No Charge Indicator (optional)
13. Tractor ABS Warning
14. Transmission Temperature Warning (optional)
15. Trailer ABS Warning (optional)
16. Low Engine Oil Pressure Warning
17. High Coolant Temperature Warning
18. Fasten Seat Belt Warning
19. Parking Brake On Warning
20. Recirculated Air Indicator
21. Air Restriction Indicator (optional)
22. Left Turn Signal
23. Low Battery Voltage Warning
24. Dash Driver Display Screen
25. High Beams On Indicator
26. Low Air Pressure Warning
27. Right Turn Signal

Fig. 2, ICU3 Dash Message Center

Ignition Sequence

NOTE: If the headlights are turned on, the screen displays the odometer and waits for the ignition to be turned on.

When the ignition is turned on, the ICU3 performs a self-test, looking for active faults. All the electronic gauges complete a full sweep of their dials, the warning and indicator lights light up and the buzzer

sounds for 3 seconds. During the first half of the self-test, all segments of the driver dash display screen illuminate as follows: "888888.8." During the second half of the self-test, the software revision level is displayed.

NOTE: The engine and ABS warning lights go on during the ICU3 self-test, but they are not controlled by the ICU3. They are controlled by their own system electronic control unit (ECU).

If the ICU3 receives active fault codes from other devices, the screen displays a three-letter acronym and message identifier (MID), indicating the ECU or system that is not functioning properly. For a list of MIDs, see **Mode/Reset Switch Functions 410**. Each active fault is displayed for 3 seconds, one after the other, until the parking brake is released or the ignition is turned off. Once the parking brake is released, the screen displays the odometer. If there are no active faults, the screen displays the odometer.

NOTE: If the ICU3 receives a message from an ECU that has not been pre-programmed into the ICU3's memory, it displays "SYS ###", where ### is replaced by the MID of the broadcasting device.

Replacement

CAUTION

Electronic components of the ICU3 are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU3 circuitry.

1. Park the vehicle on a level surface and apply the parking brakes. Shut down the engine. Chock the rear tires.
2. Disconnect the batteries.

WARNING

Drain all air from the compressed air tanks before trying to remove the air hoses. Failure to do so can cause the hoses to move uncontrollably when disconnected, possibly causing personal injury or equipment damage.

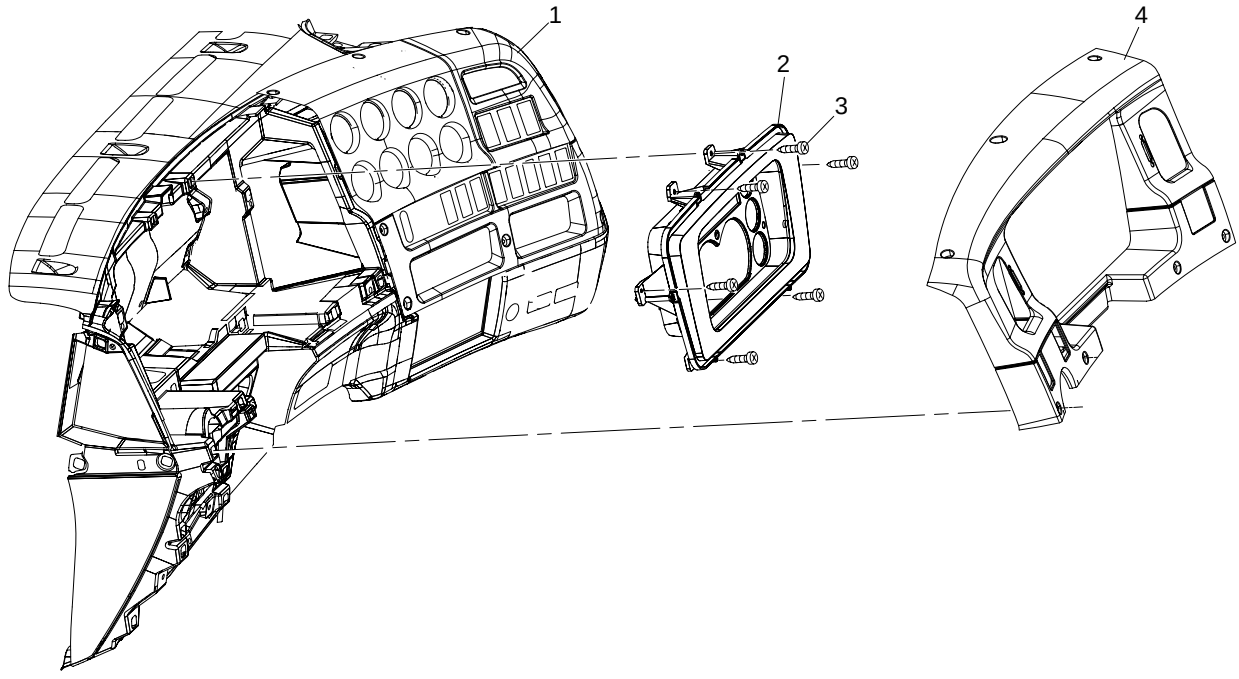
3. Drain the air system.
4. Remove the driver side finish panel. For instructions, see **Section 60.01**.
5. Remove the ICU3 mounting fasteners. See **Fig. 1**.

CAUTION

Do not forcibly pull the ICU3 from the dash. This may dislodge wires from the harness electrical connectors on the back of the ICU3 and damage the wires, the ICU3 or the dash.

6. Tilt the ICU3 away from the dash.
7. Disconnect the connectors from the back of the ICU3.
   - 7.1 Disconnect the two electrical connectors.
   - 7.2 Disconnect the air pressure lines from the brass fittings.
8. Remove the ICU3 from the vehicle.
9. Position the ICU3 on the dash.
10. Connect the connectors to the back of the ICU3.
    - 10.1 Connect the air pressure lines to the brass fittings.
    - 10.2 Connect the two electrical connectors.
11. Install the ICU3 mounting fasteners.
12. Install the driver side finish panel. For instructions, see **Section 60.01**.
13. Connect the batteries.
14. Turn on the ignition and test the operation of the ICU3.
15. Remove the chocks from the rear tires.

Instrument Control Unit (ICU3) Replacement



1. Instrument Panel
2. Instrument Cluster
3. Fasteners
4. Driver Side Finish Panel

Fig. 1, Instrument Cluster Mounting

Replacement

CAUTION

Electronic components of the instrumentation control unit (ICU3) are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU3 circuitry.

1. Park the vehicle on a level surface and apply the parking brakes. Shut down the engine. Chock the rear tires.
2. Disconnect the batteries.

WARNING

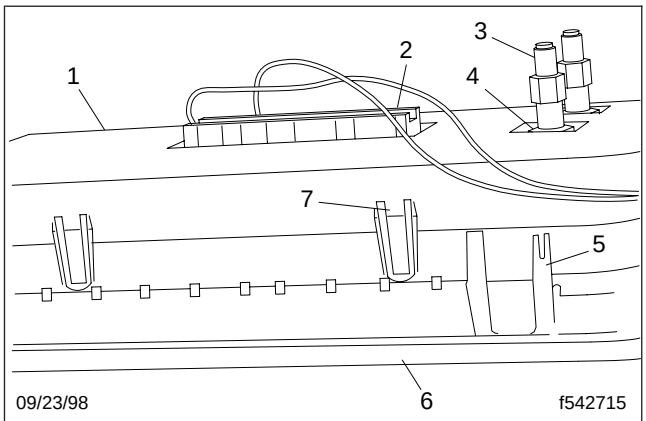
Drain all air from the compressed air tanks before trying to remove the air hoses. Failure to do so can cause the hoses to move uncontrollably when disconnected, possibly causing personal injury or equipment damage.

3. Drain the air system.
4. Remove the ICU3. For instructions, see **Subject 100**.

CAUTION

Use extreme care to avoid breaking the clips when prying them off the ICU housing. The clips are under tension and are easy to damage.

5. Using a thin-bladed screwdriver, very carefully pry the nine large white clips away from the sides of the ICU3 housing. It is helpful to use a small thin piece of metal, such as a spade terminal, to hold each clip away from the housing after it has been gently levered off its pawl. Remove the bezel from the ICU3 housing. See **Fig. 1**.
6. From the back of the ICU3 housing, remove the quick-disconnect fitting and nut from the threaded tube coming out the back of the air gauge.
7. Remove the air gauge from the ICU3.



1. ICU3 Housing
2. Electrical Connector
3. Quick-Disconnect Fitting
4. Nut
5. Bezel Clip (white)
6. Bezel
7. Back Cover Clip (black)

Fig. 1, Air Pressure Gauge Installation

8. Remove the air gauge fitting from the air gauge.
9. Install the air gauge fitting on the new air gauge.
10. Install the air gauge.
    - 10.1 Insert the gauge into the hole in the ICU3 housing.
    - 10.2 Tighten the nut on the threaded tube.
    - 10.3 Install the quick-disconnect fitting.
11. Position the bezel on the ICU3 housing. Fasten the nine white clips to the sides of the ICU3 housing.
12. Install the ICU3. For instructions, see **Subject 100**.
13. Connect the batteries.
14. Start the engine and verify the proper operation of the new gauge as the air pressure builds up.
15. Remove the chocks from the tires.

Replacement

CAUTION

Electronic components of the ICU3 are vulnerable to damage from static electricity. If available, wear a wrist grounding strap connected to a ground in the cab or workbench. If a grounding strap is not available, touch a grounded component immediately before doing any work which could bring a tool or body part in contact with ICU3 circuitry.

1. Park the vehicle on a level surface and apply the parking brakes. Shut down the engine. Chock the rear tires.
2. Disconnect the batteries.

WARNING

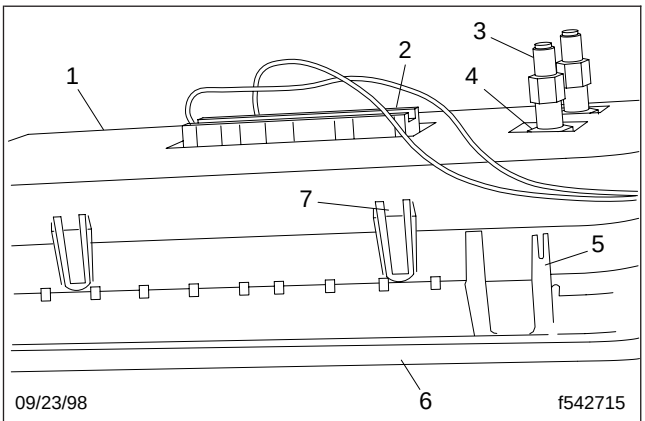
Drain all air from the compressed air tanks before trying to remove the air hoses. Failure to do so can cause the hoses to move uncontrollably when disconnected, possibly causing personal injury or equipment damage.

3. Drain the air system.
4. Remove the ICU3. For instructions, see **Subject 100**.

CAUTION

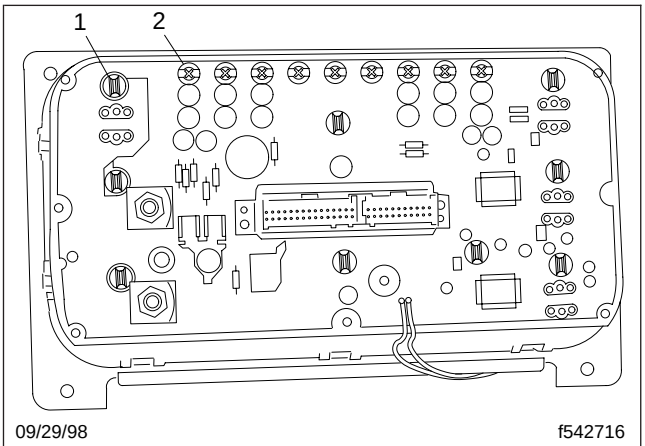
Use extreme care to avoid breaking the clips when prying them off the ICU housing. The clips are under tension and are easy to damage.

5. Pry off the four small black clips from the sides of the ICU3 housing. See **Fig. 1**.
6. Remove the two screws from the back of the housing, one on the middle of each side, and remove the back cover from the ICU3 housing.
7. Remove the burned out light bulb(s). See **Fig. 2**.
   - 7.1 To remove gauge light bulbs, twist the bulb base a quarter-turn counterclockwise and pull out.
   - 7.2 To remove warning/indicator light bulbs, use a small screwdriver to twist out the bulb base behind the affected light.



1. ICU3 Housing
2. Electrical Connector
3. Quick-Disconnect Fitting
4. Nut
5. Bezel Clip (white)
6. Bezel
7. Back Cover Clip (black)

Fig. 1, Back Cover Installation



1. Gauge Light Bulb Base
2. Warning and Indicator Light Bulb Base

Fig. 2, Light Bulb Installation

8. Install the new light bulb(s).
   - 8.1 To install gauge light bulbs, twist the bulb holder into the slot from which the old one was removed.
   - 8.2 To install warning/indicator light bulbs, insert the new bulb base into the proper slot and use a small screwdriver to tighten it.

Light Bulb Replacement

NOTE: Light emitting diodes (LEDs) must be installed with correct polarity. Insert the LED into the socket, rotating and pushing gently until it touches the contacts. If it lights, push it the rest of the way into the socket. Otherwise, pull it out, rotate it a half-turn, and check for lighting again. If it still does not light, you need to push it further into the socket, the socket is not getting power, or you may have a bad LED.

9. Position the back cover on the ICU3 housing. Fasten the four black clips to the sides of the ICU3 housing.
10. Install the two screws on the back of the housing, one on the middle of each side.
11. Install the ICU3. For instructions, see **Subject 100**.
12. Connect the batteries.
13. Turn on the ignition. Check all bulbs for correct operation.
14. Remove the chocks from the tires.

Fuel Level Gauge Diagnosis

The fuel level gauge is controlled by the ICU using a variable resistance input from the fuel level sending unit that is located in the fuel tank. The fuel level sending unit resistance varies linearly from 31±2Ω with a full tank to 247±3Ω when empty.

If the ICU3 is measuring a resistance greater than 284Ω between circuit 47 and ground, a fault will be set for fuel level circuit open. If the ICU3 is measuring less than 23.5Ω between circuit 47 and ground, a fault will be set for fuel level circuit shorted low. ServiceLink may be used to monitor for these faults. The gauge will read empty until the measurement from the sensor is between 284Ω and 23.5Ω. Refer to **Table 1** for the fuel level diagnostic procedure.

NOTE: If the fuel level sensor is below the minimum resistance (short to ground) or above the maximum (open), the fuel gauge will read empty. Shorting the fuel sensor wires will not drive the gauge to full scale.

Fuel Level Gauge Diagnosis

Step	Test Procedure	Test Result	Action
1	If a 100 ohm resistor is available, disconnect the fuel level sender connector and place the resistor across circuit 47 and ground in the wiring harness connector to simulate the fuel level sending unit. Turn the ignition to the ON position and observe the fuel gauge. If, after gauge initialization, the gauge points closely to the half tank mark, then the wiring and ICU are all operating correctly. Jump to Step 4 if there is no problem with the wiring and ICU. Does the fuel level gauge stay at empty even though there is fuel in the tank or is the complaint an inaccurate and intermittent reading? Note - turn the ignition to OFF and disconnect the batteries before continuing.	Stays at Empty	Go to Step 2.
		Inaccurate or Intermittent	Go to Step 4.
2	Disconnect the connector at the fuel level sender and measure the resistance of the sender. What is the resistance of the sender?	Greater than 284Ω or Less than 23.5Ω	Go to Step 4.
		Between 284Ω and 23.5Ω	Go to Step 3.
3	Connect the fuel level sender and disconnect the connectors on the back of the ICU. Measure the resistance in the vehicle wiring between circuit 47 in connector pin D1 and the ground circuit in connector pin D2. What is the resistance of the circuit?	Greater than 284Ω	Troubleshoot and repair an open circuit on either circuit 47 or the ground between the ICU connector and the fuel level sender.
		Between 284Ω and 23.5Ω	This is the valid resistance range. If the fuel tank is full and the resistance is close to 31Ω, replace the ICU. Otherwise no problem is indicated.
		Less than 23.5Ω	Troubleshoot and repair a short to ground on circuit 47 between the ICU connector and the fuel level sender.

Troubleshooting

Fuel Level Gauge Diagnosis			
Step	**Test Procedure**	**Test Result**	**Action**
4	Remove the fuel sending unit from the fuel tank. Connect an ohm meter to the pins at the fuel level sender connector. Slowly move the level of the float arm from full to empty. See **Fig. 1**. Does the resistance vary linearly from 31±2Ω to 247±3Ω?	Yes	Troubleshoot and repair for corrosion or an intermittent connection in the circuitry between the ICU and the fuel level sender.
		No	Replace the fuel level sending unit.

Table 1, Fuel Level Gauge Diagnosis

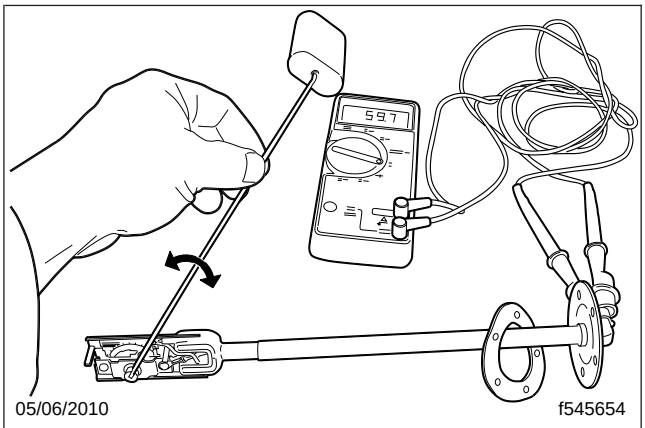


Fig. 1, Testing the Fuel Level Sending Unit

Specifications

For vehicle specific ICU3 wiring schematics, look up module 732 BOM in PartsPro to get the correct drawing number, then use EZWiring in ServicePro to access the drawing.

For fuel level wiring schematics, use module 847 BOM in PartsPro to get the correct drawing number, then use EZWiring in ServicePro to access the drawing.

For Stewart-Warner Fuel Level Sensor, Curve Values, see **Table 1**.

For Hi-Stat Temperature Sensor, Curve Value, see **Table 2** and **Table 3**.

Fuel Level Sensor (Stewart-Warner) Resistance		
Gauge Reading	**Sensor Resistance:ohms**	
	Acceptable Range	**Nominal**

Mode/Reset Switch Functions

Use the following flow charts to cycle through the Mode/Reset switch functions and screens.

See **Fig. 1**, for Mode/Reset Switch Start Sequence.

See **Fig. 2**, for Mode/Reset Switch Trip Screens.

See **Fig. 3**, for Mode/Reset Switch Engine Miles and Service Screens.

See **Fig. 4**, for Mode/Reset Switch Fault Screens.

See **Fig. 5**, for Mode/Reset Switch Service Screens.

See **Fig. 6**, for Mode/Reset Switch Oil Level Screens.

See **Fig. 7**, for Mode/Reset Switch Reset and Toggle Screens.

Service Interval Tables

NOTE: At the appropriate screen, each press of the mode/reset switch advances to the next value in the table.

For service interval miles and kilometers settings, see **Table 1**.

For service interval hours settings, see **Table 2**.

For message identifiers, see **Table 3**.

Service Interval Distance Settings

Windshield Glass Removal and Installation

Removal

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Open the hood.
3. Remove the windshield wipers. For instructions, see **Group 82**.
4. Remove the cowl-mounted antenna mast, if equipped. For instructions, see **Group 54**.
5. Close the hood.
6. Remove the exterior visor, if equipped.

⚠ WARNING

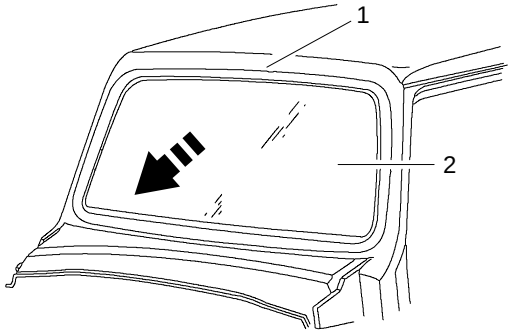
Wear protective gloves and safety glasses when replacing windshield glass. Gloves will protect your hands from sharp edges, and allow a better grip. Failure to wear gloves and safety glasses when handling glass could result in injury to hands or eyes.

NOTE: An assistant is necessary to remove the windshield glass.

7. Remove the windshield glass.
   - 7.1 Starting at the top and using a hook tool, lift the edge of the weatherstrip over the lip of the pinch weld from inside the vehicle.
   - 7.2 Push outward from inside the vehicle to remove the windshield glass.
8. Remove the weatherstrip from the glass. See **Fig. 1**.

Installation

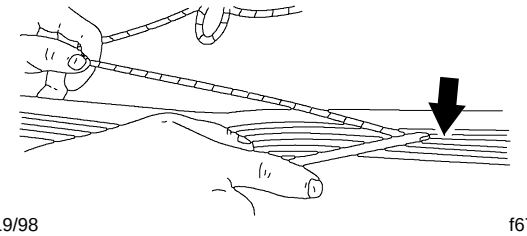
1. Using a clean cloth and water, remove any foreign material from the glass and weatherstrip. The weatherstrip must be replaced if it is cracked or weather damaged.
2. Install the weatherstrip on the glass.
3. Insert a draw cord in the pinch weld opening of the weatherstrip. Overlap the cord 18 inches (457 mm) at the lower center of the glass. See **Fig. 2**.



10/01/98 f670074

1. Weatherstrip
2. Windshield Glass

Fig. 1, Windshield Glass



01/19/98 f670075

Fig. 2, Draw Cord in Pinch Weld Opening

4. Tape the ends of the cord to the inside of the glass.
5. Lubricate the weatherstrip with water.

IMPORTANT: Any scratches through the paint in the pinch weld area must be repainted or sealed prior to reinstalling the windshield. The pinch weld can rust and possibly bleed from under the seal if it is not repaired.

NOTE: An assistant is necessary to install the windshield glass.

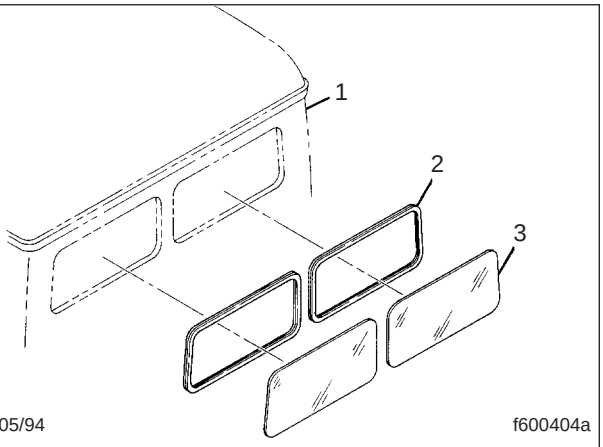
6. Place the windshield back into the pinch weld making sure the bottom of the pinch weld lip falls into the weatherstrip. See **Fig. 1**.
7. From outside the vehicle, slide a plastic stick around the outer edge of the weatherstrip until the weatherstrip is resting on the pinch weld.
8. Apply pressure to the outside of the windshield and pull the cord from the inside to pull the lip of the weatherstrip over the pinch weld.

Windshield Glass Removal and Installation

9. Water test the installation for leaks. If leaks exist, apply 3M Windshield Sealer (or an equivalent) where required.
10. Clean the glass and surrounding areas.
11. Open the hood.
12. Install the antenna mast. For instructions, see **Group 54**.
13. Install the windshield wipers. For instructions, see **Group 82**.
14. Close the hood.
15. Remove the chocks from the tires.

Rear Window Removal and Installation

Removal (See Fig. 1)



1. Cab
2. Weather Seal Retainer
3. Window Glass

Fig. 1, Rear Window Installation

CAUTION

When replacing a broken rear window, it is very important to find the cause of the glass breakage, and correct the condition before installing a new window. A small obstruction or high spot somewhere around the window opening may break the replacement glass, especially when it is exposed to high winds, pressure, temperature extremes, and vehicle motion.

1. Disconnect the batteries.
2. Use tape and paper around the window opening and outside surfaces to protect the paint finish and cab interior. Before removing the window, mark the weather-seal retainer and opening with the location of the break at the edge of the window.

WARNING

Wear protective gloves and safety glasses when replacing windshield glass. Gloves will protect your hands from sharp edges, and allow a better grip. Failure to wear gloves and safety glasses when handling glass could result in injury to hands or eyes.

3. Install vacuum cups on the window, and have an assistant secure the window before removal.
4. Loosen the lip of the weather-seal retainer from the flange along the top and at the sides by applying firm, controlled pressure to the edge of the glass. At the same time, use a putty knife to lift the retainer over the window opening flange. Remove the window glass.

Installation

CAUTION

When handling the window glass, use care not to nick or splinter the edges of the glass. Chipped edges could cause future breaks.

IMPORTANT: Two people are required to install rear window glass.

1. Remove the sealant from the window opening flange.
2. Check for the following conditions at the previously marked point of fracture on the window opening flange:
   - chipped edges on the glass
   - high spots or obstructions in the window opening flange
   - high spots or obstructions in the weather-seal retainer
3. Correct any areas on the window opening that need to be fixed.
4. With the window supported and centered in the opening, check the relationship of the glass to the opening.
5. Mark any areas on the flange to be fixed. Remove the glass, and fix the flange as necessary.
6. Install the retainer on the glass.
7. Install a 1/8-inch (3-mm) nylon cord around the edge of the retainer, leaving a loop at the top and loose ends at the bottom. See **Fig. 2**.
8. Apply a lubricant to the retainer to ease installation.
9. Place the window and retainer assembly in the opening.

Rear Window Removal and Installation

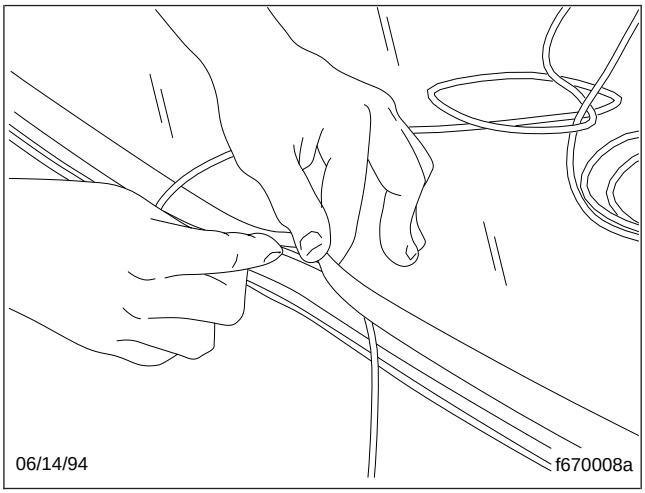


Fig. 2, Nylon Cord Installation

IMPORTANT: Use care not to tear the cab upholstery when pulling on the cord.

10. With one person lightly pushing in on the window, have another person pull on the loose ends of the cord until each is within 2 inches (51 mm) of its respective upper corner.
11. Pull on the loop until the cord is within 2 inches (51 mm) of the upper corners.
12. Finish seating the corners by pulling both ends of the cord at the same time at each corner. This will position the upper corner.
13. Be sure the window and retainer are correctly positioned in relation to each other.
14. Connect the batteries.
15. Remove the chocks from the tires.

Left-Hand Drive Instrument Panel Removal and Installation

Removal

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Drain the air system.
4. Remove the under steering panel.
5. Remove the steering column. For instructions, see **Group 46**.
6. Remove the driver side finish panel.
7. Remove the instrument cluster.
8. Remove the driver side ignition switch bezel. Hold the ignition switch, headlight switch and starter button.
9. Remove the screws and remove the driver side end panel. See **Fig. 1**.

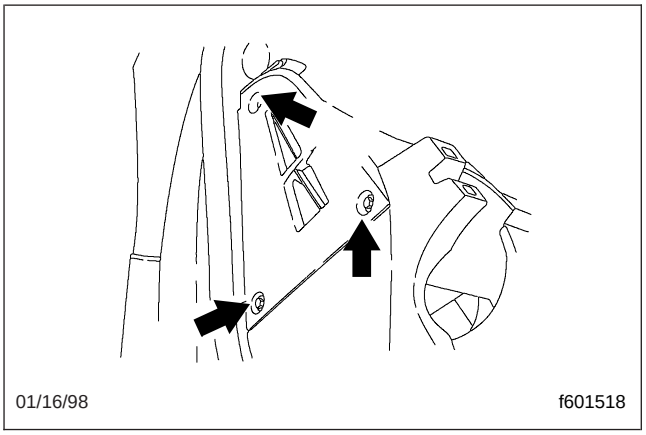

Fig. 1, Driver Side End Panel

10. Remove the auxiliary finish panel. Hold the engine brake switch and differential lock switch.
11. Remove the top of the dash cover.
12. Remove the radio. For instructions, see **Group 54**.
13. Remove the center bracket. Remove the manifold screws and remove the manifold. See **Fig. 2**. Disconnect the air lines to the tractor and trailer air valves. See **Fig. 3**.
14. Remove the mounting screws from the heater control panel. Leave the air hoses connected to the control panel.

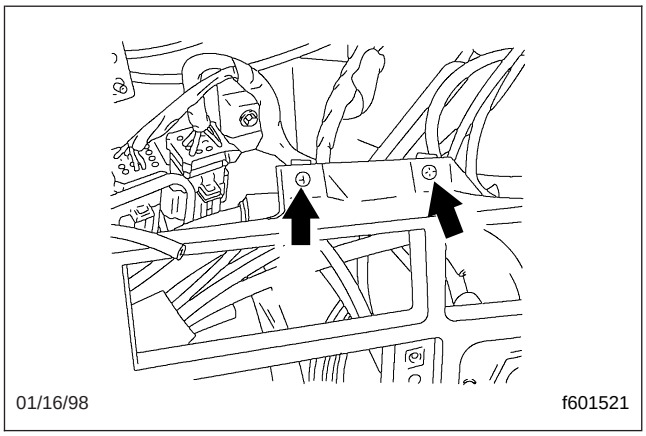

Fig. 2, Manifold Screws

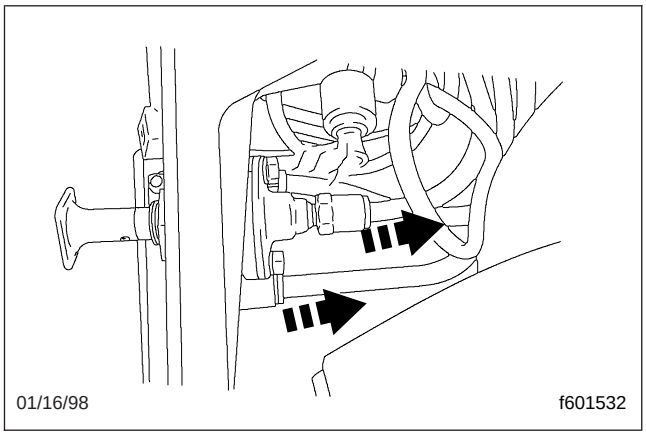

Fig. 3, Air Lines

15. Disconnect the electrical connectors located behind the hot-posts and the cigar lighter. See **Fig. 4**.
16. Remove the screws located behind the radio bracket retaining the connectors to the instrument panel and lower the harness between the instrument panel and the engine cover opening. See **Fig. 5**.
17. Release the four quarter-turn fasteners and remove the power distribution module cover. See **Fig. 6**.
18. Remove the screws and remove the power distribution module mask. See **Fig. 7**.
19. Remove the screws and lower the power distribution module to the cab floor. See **Fig. 8**.
20. Remove the screws and remove the passenger side end panel. See **Fig. 9**.

Left-Hand Drive Instrument Panel Removal and Installation

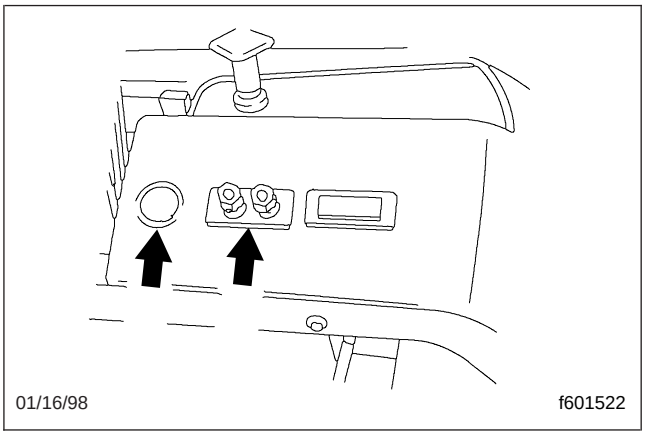

Fig. 4, Electrical Connectors

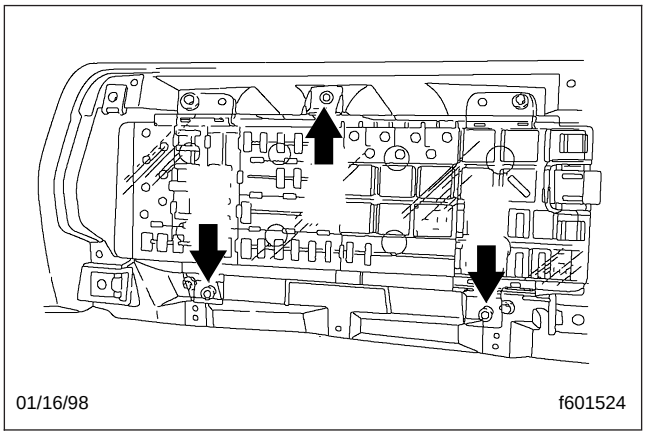

Fig. 7, Power Distribution Module Mask

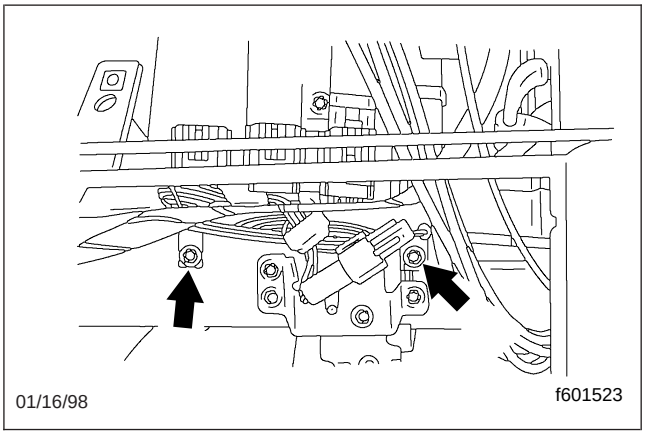

Fig. 5, Instrument Panel Connector Retaining Screws

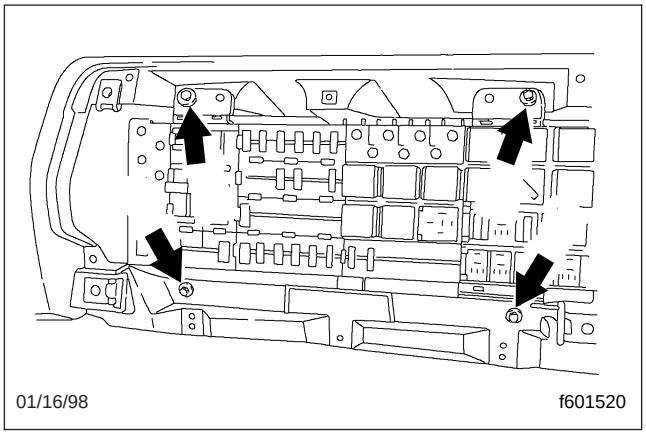

Fig. 8, Power Distribution Module Screws

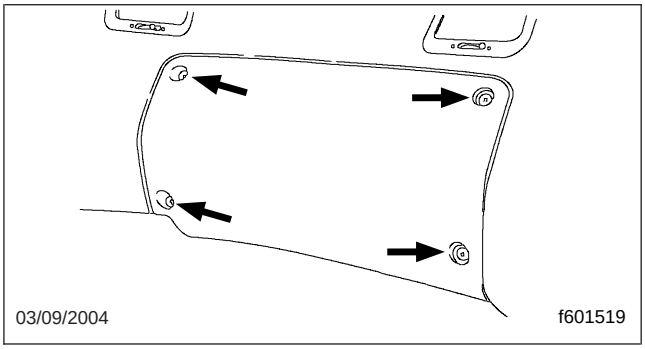

Fig. 6, Power Distribution Module Cover Fasteners

21. Remove the passenger side instrument panel mounting bolts. See **Fig. 10**.
22. Remove the five top instrument panel retaining bolts. See **Fig. 11**.

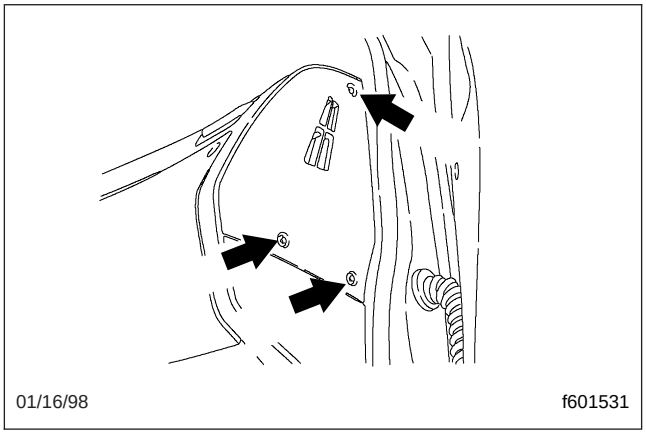

Fig. 9, Passenger Side End Panel

23. Remove the driver side instrument panel mounting bolts. See **Fig. 12**.

Left-Hand Drive Instrument Panel Removal and Installation

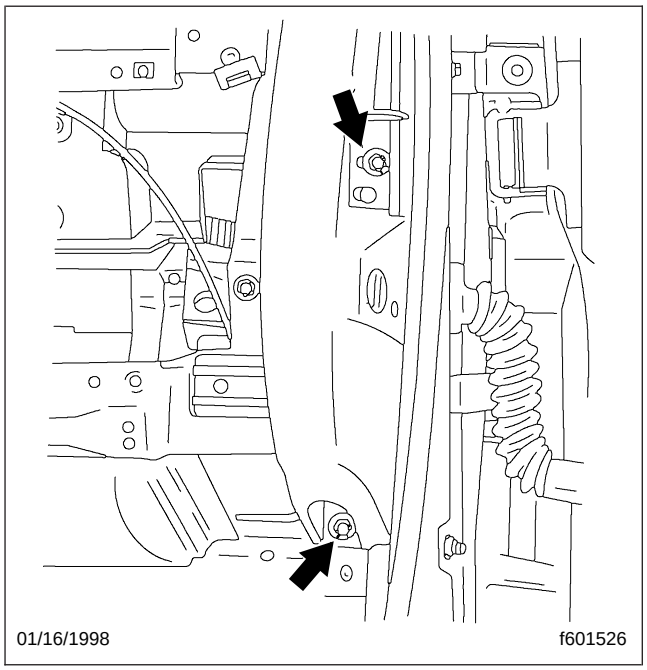

Fig. 10, Passenger Side Instrument Panel Mounting Bolts

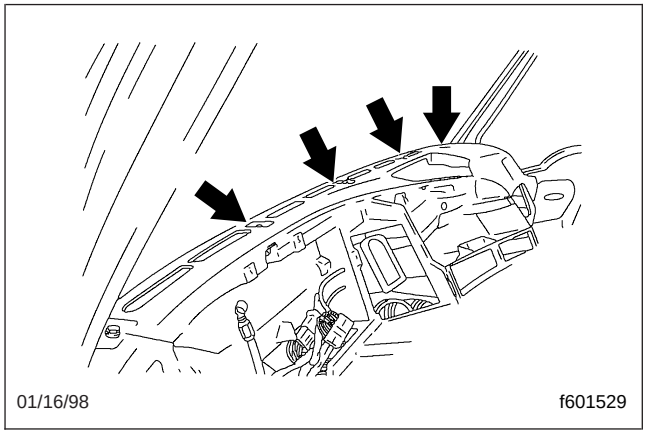

Fig. 11, Instrument Panel Retaining Bolts

24. Remove the bolt located behind the lap duct. See **Fig. 13**.
25. Remove all remaining mounting screws. This includes four behind the instrument cluster, two lower right of the steering column, three lower left of the steering column, four on the lower edge under the radio/cigar lighter, four behind the center instrument panel, and three behind the fuse block.

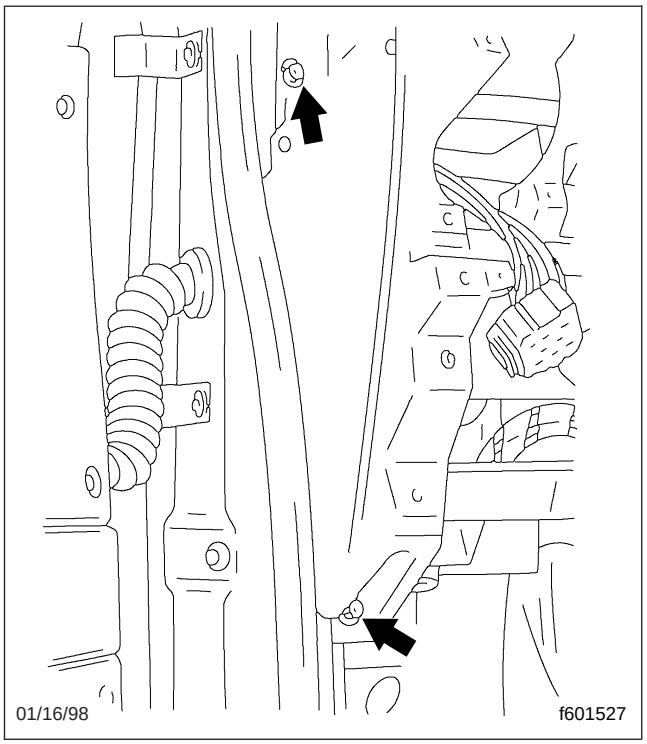

Fig. 12, Driver Side Instrument Panel Mounting Bolts

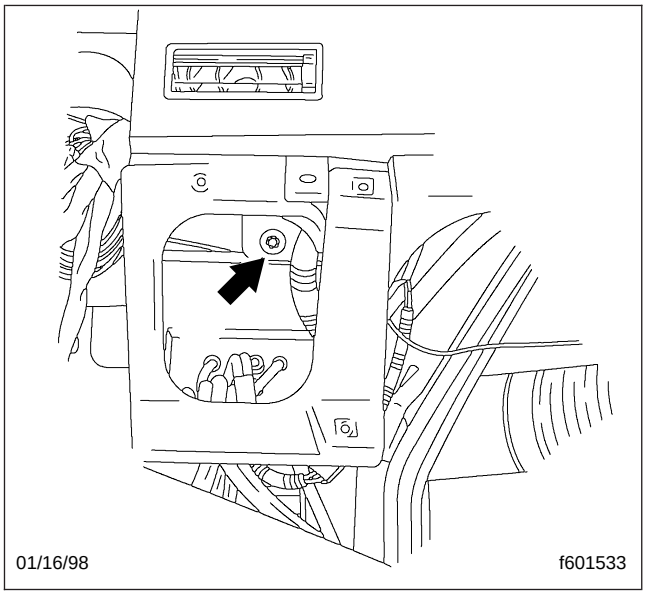

Fig. 13, Bolt Behind Lap Duct

26. Remove the diagnostic link connector, if equipped. See **Fig. 14**.

Left-Hand Drive Instrument Panel Removal and Installation

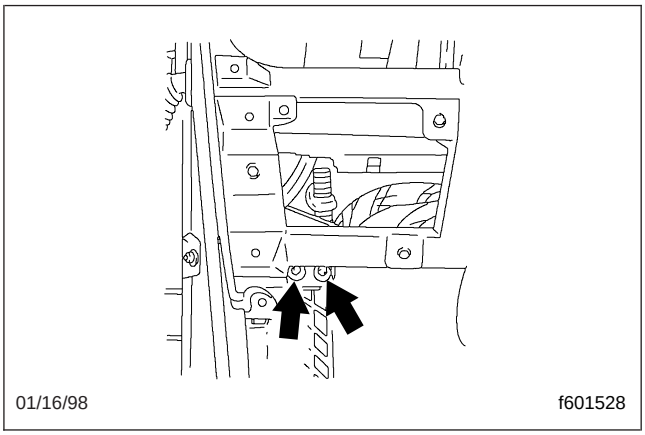

Fig. 14, Diagnostic Connector Mounting Bolts

NOTE: Carefully pull the instrument panel away from the vehicle noting not to damage any of the air pressure lines or the wiring harnesses.

27. Remove the instrument panel.

Installation

NOTE: Make sure all the air pressure lines and wiring harnesses are clear of the instrument panel mounting surfaces.

1. With the help of an assistant, position the instrument panel in the vehicle.
2. Install the five top instrument panel retaining bolts. Tighten the bolts 44 to 53 lbf·in (500 to 600 N·cm). See **Fig. 11**.
3. Install the bolts retaining the diagnostic link connector, if equipped. See **Fig. 14**.
4. Install the driver side instrument panel mounting bolts. Tighten the bolts to 27 to 35 lbf·in (300 to 400 N·cm). See **Fig. 12**.
5. Install the passenger side instrument panel mounting bolts. Tighten the bolts to 27 to 35 lbf·in (300 to 400 N·cm). See **Fig. 10**.
6. Install the four mounting screws behind the instrument cluster. Install the mounting screws in the lower left and right sides of the steering column, on the lower edge under the radio/cigar lighter, behind the center instrument panel, and behind the fuse block.
7. Install the bolt located behind the lap duct. Tighten the bolt to 44 to 53 lbf·in (500 to 600 N·cm). See **Fig. 13**.
8. Route the wiring harness between the instrument panel and the engine cover opening. Install the screws located behind the radio bracket. See **Fig. 5**.
9. Connect the electrical connectors located behind the hot-posts and the cigar lighter. See **Fig. 4**.
10. Attach the air manifold to the center bracket.
11. Connect the air lines to the brake valves and install the center mount bracket.
12. Install the power distribution module and the screws. See **Fig. 8**.
13. Install the power distribution module mask and the screws. See **Fig. 7**.
14. Install the power distribution module cover and the quarter-turn screws. See **Fig. 6**.
15. Install the passenger side end panel and the screws. See **Fig. 9**.
16. Install the top of the dash cover.
17. Install the auxiliary finish panel. Position the engine brake switch and differential lock switch.
18. Install the driver side end panel and the screws. See **Fig. 1**.
19. Install the driver side ignition switch bezel. Position the ignition switch, headlight switch and starter button.
20. Install the instrument cluster. For instructions, see **Group 54**.
21. Install the driver side finish panel.
22. Install the radio. For instructions, see **Group 54**.
23. Install the steering column. For instructions, see **Group 46**.
24. Install the under steering panel.
25. Connect the batteries.
26. Charge the brake air systems and check for leaks.
27. Remove the chocks from the tires.

Right-Hand Drive Instrument Panel Removal and Installation

Removal

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the battery ground cable.
3. Prepare the vehicle for instrument panel removal.
   - 3.1 Drain the air system.
   - 3.2 Remove the radio. For instructions, see **Group 54**.
   - 3.3 Remove the under steering panel assembly. See **Fig. 1**.
   - 3.4 Disconnect the steering column and rest it on the cab floor. For instructions, see **Group 46**.
4. Remove the power distribution module cover.
5. Remove the instrument panel bracket retaining bolts. See **Fig. 2**.
6. Remove the passenger side finish panel assembly. See **Fig. 1**.
7. Remove the trailer air supply valve and parking brake control valve knobs.
8. Remove the auxiliary finish panel retaining screws. See **Fig. 1**.

9. Tag and remove the electrical, air, and HVAC vacuum lines.
10. Remove the auxiliary finish panel.
11. Remove the HVAC control module retaining screws. Disconnect the colored air lines and remove the module. See **Fig. 3**.
12. Working from the engine compartment, remove the left-side instrument panel bracket retaining bolts. See **Fig. 2**.
13. Remove the driver side finish panel. See **Fig. 1**.
14. Turn the six quarter-turn fasteners to release the instrument cluster assembly. See **Fig. 4**.
15. Remove the instrument cluster outer frame screws. See **Fig. 5**.
16. Pull the cluster forward. Label each electrical connector and disconnect them. See **Fig. 6**.
17. Disconnect the oil pressure hose from the oil pressure gauge. See **Fig. 7**.
18. Remove the instrument cluster assembly.
19. Remove the trailer brake hand control valve.
    - 19.1 Remove the lever with a firm pull.

22. Working from the engine compartment, drill out the rivet that retains the left-side instrument panel bracket. See **Fig. 9**.
23. Remove the five instrument panel retaining bolts. See **Fig. 10**.
24. With the help of an assistant, position the defrost duct out the way and remove the instrument panel from the vehicle. Be careful not to damage any of the air lines or wiring. See **Fig. 11**.

Installation

NOTE: Make sure all the air lines and wiring harnesses are clear of the instrument panel mounting surfaces.

1. With the help of an assistant, position the instrument panel in the vehicle while aligning the defrost duct in place. See **Fig. 11**.
2. Install the five top instrument panel retaining bolts. Tighten the bolts 44 to 53 lbf·in (500 to 600 N·cm). See **Fig. 10**.

3. Feed the electrical, air lines and vacuum lines into the proper positions in the instrument panel.
4. Install the left-side instrument panel mounting bolts. Tighten the bolts to 27 to 35 lbf·in (300 to 400 N·cm). See **Fig. 10**.
5. Install the right-side instrument panel mounting bolts. Tighten the bolts to 27 to 35 lbf·in (300 to 400 N·cm). See **Fig. 10**.
6. Install the auxiliary instrument panel support bracket and fasteners. See **Fig. 2**.
7. Connect the colored air lines.
8. Install the electrical, air, and HVAC vacuum lines.
9. Install the HVAC control module and the retaining screws. See **Fig. 3**.
10. Connect the air lines to the trailer air supply valve and the parking brake control valve and install the knobs.
11. Install the auxiliary finish panel.
12. Position the instrument cluster. Connect the electrical harness and the air lines.

3. Defrost Duct-to-Cab Retaining Screw (3 qty.)

Fig. 11, Defrost Ducting

13. Connect the oil pressure hose to the oil pressure gauge. See **Fig. 7**.
14. Install the instrument cluster assembly into the instrument panel.
15. Tighten the instrument cluster outer frame screws. See **Fig. 5**.
16. Tighten the six quarter-turn fasteners to secure the instrument cluster assembly to the frame. See **Fig. 4**.
17. Install the driver side finish panel. See **Fig. 1**.
18. Install the trailer brake hand control valve.
    - 18.1 Connect the air lines and position the valve.
    - 18.2 Install the four trailer brake hand control valve retaining screws.
    - 18.3 Install the trailer brake hand control valve lever with a firm push.
19. Install the steering column. For instructions, see **Group 46**.
20. Install the under steering finish panel.
21. Install the radio. For instructions, see **Group 54**.
22. Install the ashtray bracket and the ashtray. See **Fig. 8**.
23. Install the passenger side finish panel assembly. See **Fig. 1**.
24. Install the power distribution module cover. See **Fig. 1**.
25. Connect the battery ground cable.
26. Remove the chocks from the tires.

Under Steering Panel Removal and Installation

Removal

NOTE: This procedure is typical and covers left-hand-drive and right-hand-drive vehicles.

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Remove the five screws from the under steering panel. See **Fig. 1**.

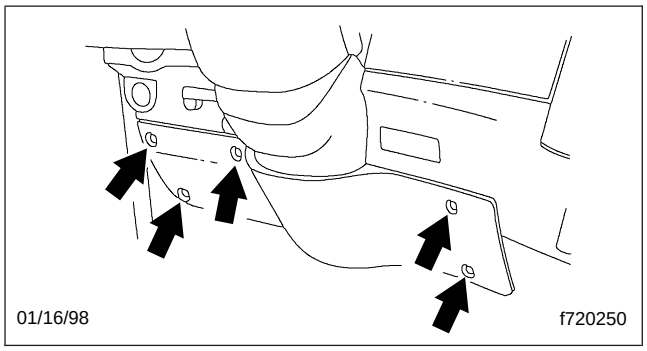

Fig. 1, Under Steering Panel Screw Location

3. Remove the spacer.
4. Remove the panel.

Installation

1. Position the under steering panel.
2. Install the spacer.
3. Tighten the five screws. See **Fig. 1**.
4. Remove the chocks from the tires.

Instrument Cluster Finish Panels Removal and Installation

Driver Side Finish Panel

NOTE: This procedure is typical and covers left-hand-drive and right-hand-drive vehicles.

REMOVAL

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Remove the screws from the driver side finish panel. See **Fig. 1**.

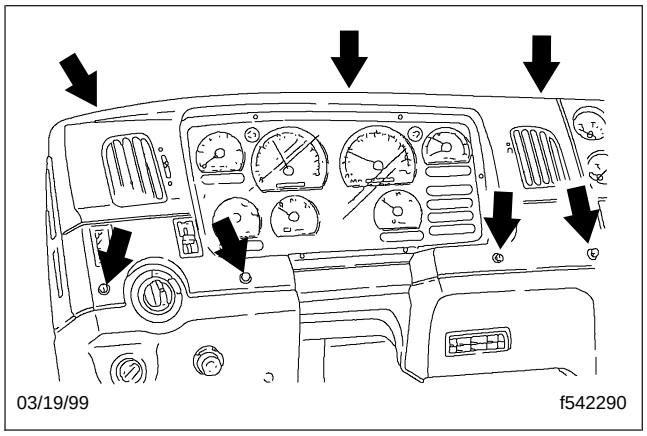

Fig. 1, Driver Side Finish Panel Screws

3. Remove only the auxiliary finish panel screws from the side closest to the driver side finish panel. See **Fig. 2**.
4. Remove the driver side finish panel.

INSTALLATION

1. Install the driver side finish panel.
2. Install and tighten the auxiliary finish panel. See **Fig. 2**.
3. Tighten the driver side finish panel screws. See **Fig. 1**.
4. Remove the chocks from the tires.

Auxiliary Finish Panel

NOTE: This procedure is typical and covers left-hand-drive and right-hand-drive vehicles.

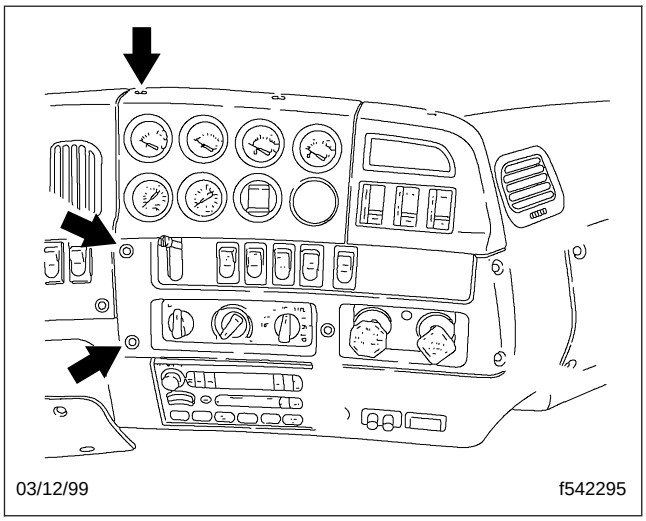

Fig. 2, Auxiliary Finish Panel Screws

REMOVAL

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Remove the trailer brake hand control valve knob. See **Fig. 3**.

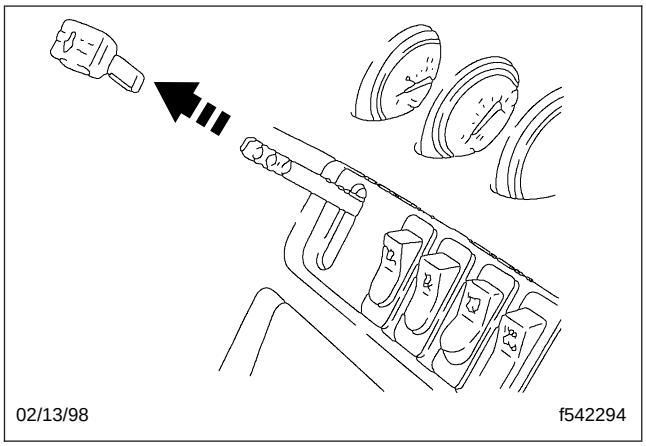

Fig. 3, Trailer Brake Hand Control Valve Knob

3. Remove the auxiliary finish panel screws and remove the panel. See **Fig. 4**.
4. Bleed the air from both the primary and secondary brake air systems, if so equipped.
5. Disconnect the electrical connectors and remove the auxiliary finish panel.

Instrument Cluster Finish Panels Removal and Installation

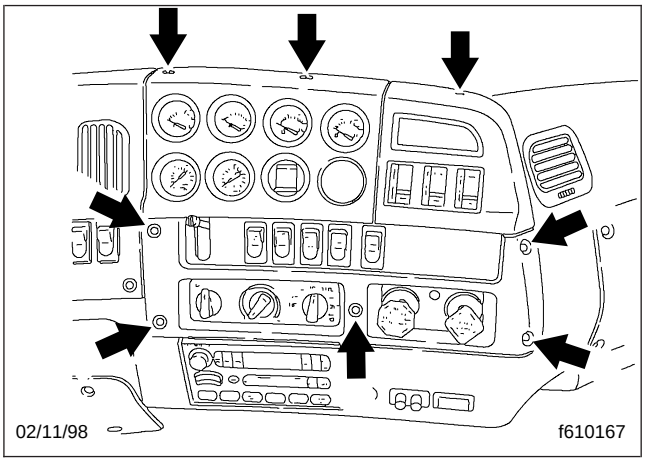

Fig. 4, Auxiliary Finish Panel Screws

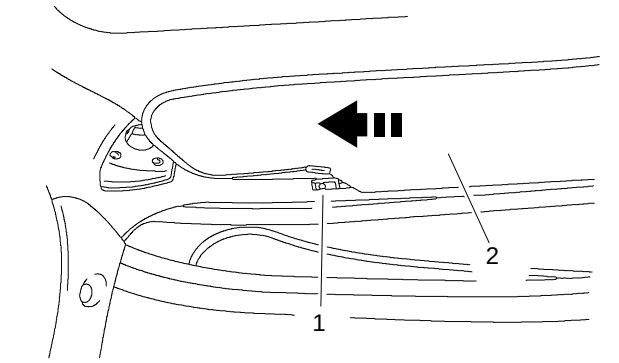
6. Disconnect the air lines.

INSTALLATION

1. Connect the electrical connectors and the air lines.
2. Install the auxiliary finish panel.
3. Install the trailer brake hand control valve knob. See **Fig. 3**.
4. Install and tighten the auxiliary finish panel screws. See **Fig. 4**.
5. Remove the chocks from the tires.

Replacement

1. If equipped with dual visors, remove the visor assembly.
   1.1 Remove the screws.
   1.2 Remove the visor assembly.
2. If equipped with dual visors, remove the secondary visor assembly (left-side shown, right-side symmetrically opposite). See **Fig. 1**.



1. Secondary Visor Assembly Screw Location
2. Secondary Visor Assembly

Fig. 1, Secondary Visor Assembly Removal

   2.1 Remove the screw.
   2.2 Slide the visor outward and remove the secondary visor assembly.

NOTE: Support the roof console before all the fasteners are removed.

3. Remove the fasteners retaining the roof console. See **Fig. 2**.
4. Disconnect the microphone connector, if so equipped. See **Fig. 3**.
5. Disconnect the hot-post connector, if so equipped. See **Fig. 4**.
6. Remove the roof console.
7. Install the roof console.
8. Connect the hot-post connector, if so equipped. See **Fig. 4**.
9. Connect the microphone connector, if so equipped. See **Fig. 3**.

NOTE: Support the roof console before reattaching all the fasteners.

10. Reattach the fasteners retaining the roof console. See **Fig. 2**.
11. If equipped with dual visors, attach the secondary visor assembly (left-side shown, right-side symmetrically opposite). See **Fig. 1**.
    11.1 Slide the visor inward and install the secondary visor assembly.
    11.2 Attach the screw.
12. If equipped with dual visors, remove the visor assembly.
    12.1 Install the visor assembly.
    12.2 Attach the screws.

Roof Console Replacement

3. Interior Lamp Switches
4. Heater-A/C Control
5. Rear Radio Control
6. Dome Lamp Assembly
7. Door Trim (left-side)

Fig. 2, Location Of SilverStar Door Trim, Accessories and Controls

Replacement (See Fig. 1)

1. Remove the upper trim panel over the door and the trim panel below the window. Refer to **Subject 110**.

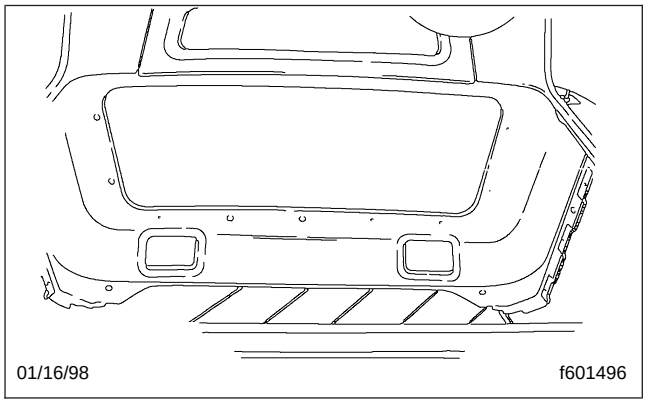

Fig. 1, Headliner

2. Remove the 27 pushpins, and remove the headliner.
3. Position the headliner, and attach the 27 pushpins.
4. Install the upper trim panel over the door and the trim panel below the window. Refer to **Subject 110**.

Side Window Panel Trim Replacement

Replacement

NOTE: Left-hand shown, right-hand symmetrically opposite.

1. Remove the shade, if so equipped. See **Fig. 1**.

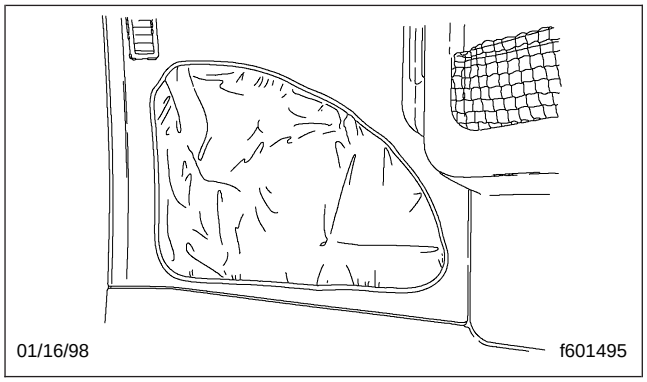

Fig. 1, Side Window Shade

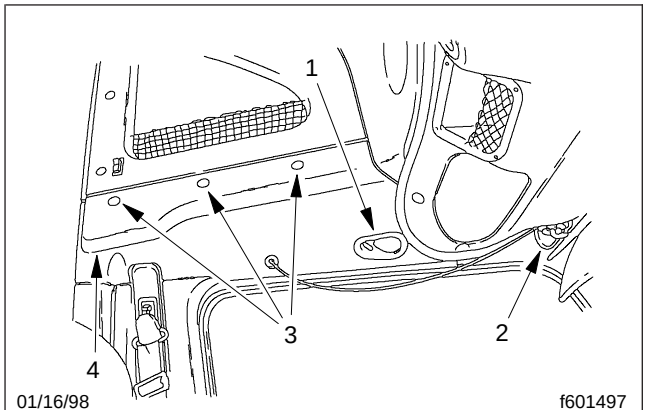
2. Remove the trim panel over the left-hand door. See **Fig. 2**.



1. Reading Lamp
2. Screw
3. Pushpins
4. Trim Panel

Fig. 2, Trim Panel Removal

2.1 Remove the reading lamp.

2.2 Remove the screw.

2.3 Remove the pushpins.

2.4 Remove the trim panel.

3. Remove the pushpins. See **Fig. 3**.

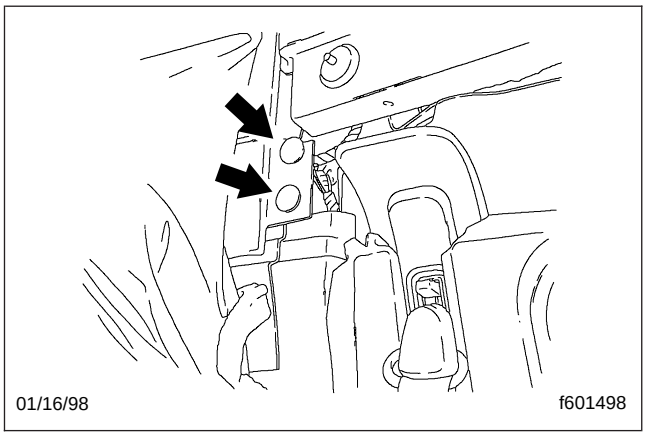


Fig. 3, Pushpins

4. Raise the bunk. Remove the pushpins, and remove the upper bunk support trim. See **Fig. 4**.

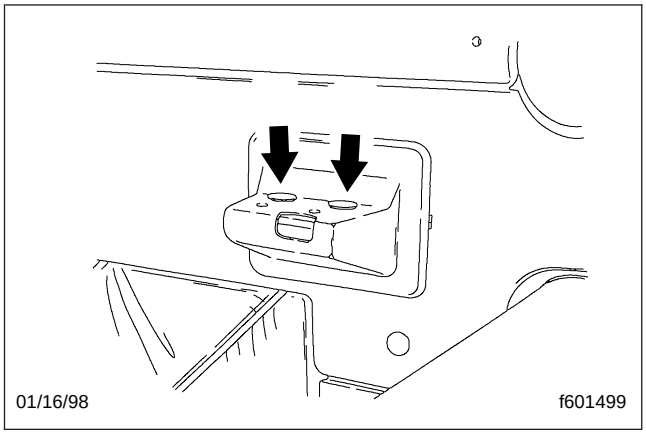

Fig. 4, Bunk Support Trim and Pushpins

5. Remove the pushpins. See **Fig. 5**.
6. Lower the bunk. Pull the trim back, and remove the pushpins. See **Fig. 6**.
7. Remove the 11 pushpins. See **Fig. 7**.
8. Pull the trim panel back, and disconnect the reading lamp connector, if so equipped. See **Fig. 8**.
9. Remove the side window trim panel.
10. Connect the reading lamp connector, if so equipped. See **Fig. 8**.
11. Replace the side window trim panel.
12. Install the 11 trim panel pushpins. See **Fig. 7**.

Side Window Panel Trim Replacement

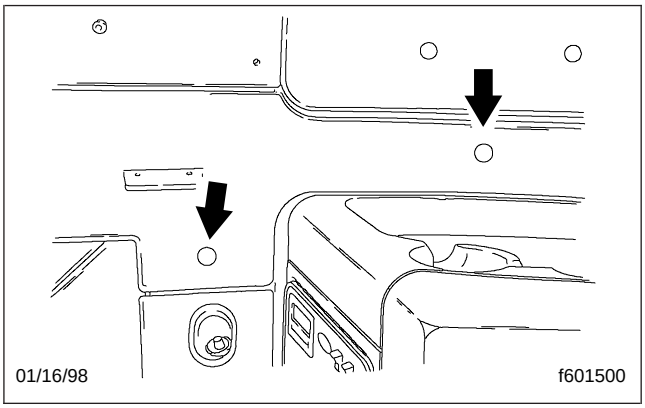

Fig. 5, Pushpins

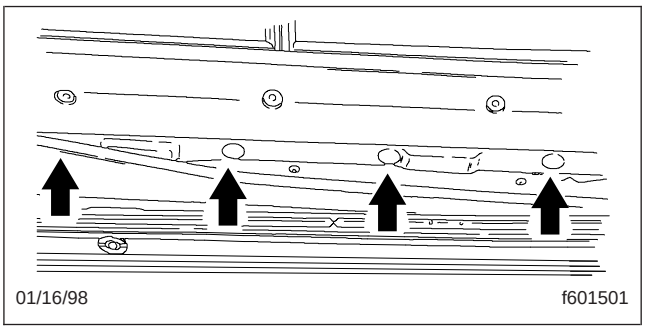

Fig. 6, Pushpins Under Bunk Trim

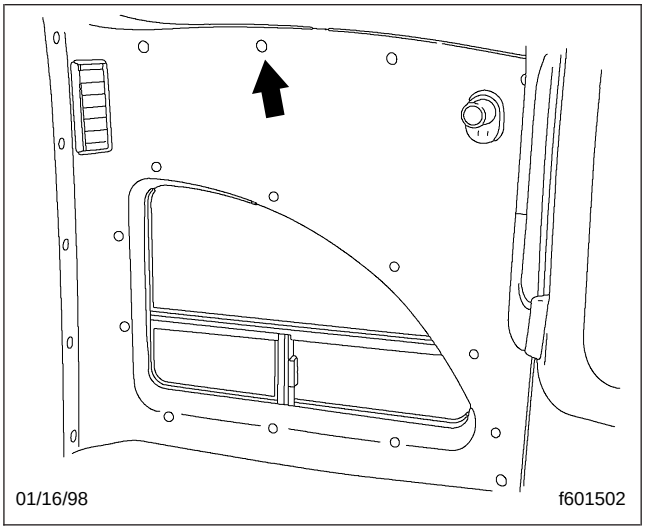

Fig. 7, Window Trim Panel Pushpins

13. Pull the trim back, and install the pushpins. See **Fig. 6**.
14. Install the pushpins. See **Fig. 5**.

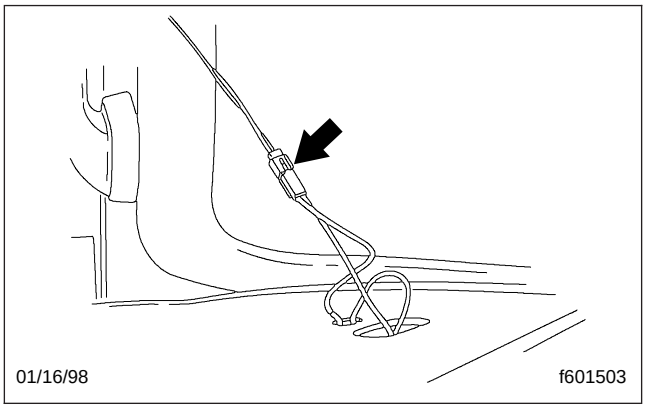

Fig. 8, Reading Lamp Connector

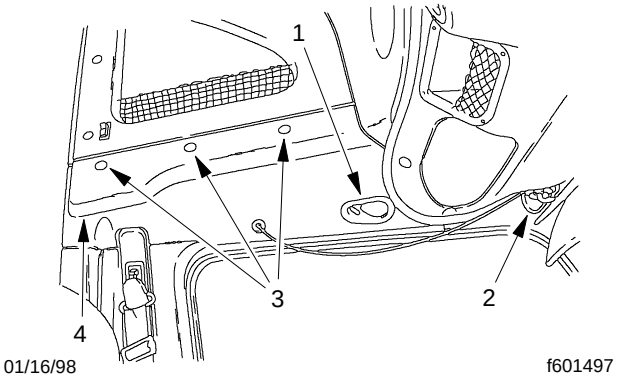
15. Raise the bunk. Install the pushpins, and install the upper bunk support trim. See **Fig. 4**.
16. Attach the pushpins. See **Fig. 3**.
17. Attach the trim panel over the left-hand door. See **Fig. 2**.
    - 17.1 Install the reading lamp.
    - 17.2 Install the screw.
    - 17.3 Install the pushpins.
    - 17.4 Install the trim panel.
18. Install the left-hand and right-hand shade, if so equipped. See **Fig. 1**.

Overhead Storage Compartment Trim Replacement

Replacement

1. Remove the trim panel over the left-hand door. See **Fig. 1**.



1. Reading Lamp
2. Screw
3. Pushpins
4. Trim Panel

Fig. 1, Left-Hand Trim Panel

1.1 Remove the reading lamp.

1.2 Remove the screw.

1.3 Remove the pushpins.

1.4 Remove the trim panel.

2. Remove the pushpins, and remove the trim panel over the right-hand door. See **Fig. 2**.

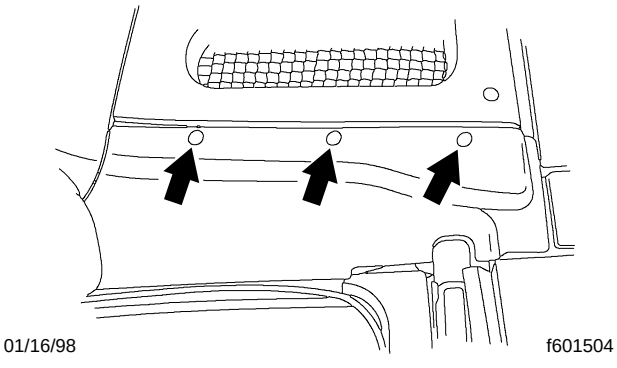


Fig. 2, Right-Hand Trim Panel

3. Disconnect the curtain from the curtain track. See **Fig. 3**.

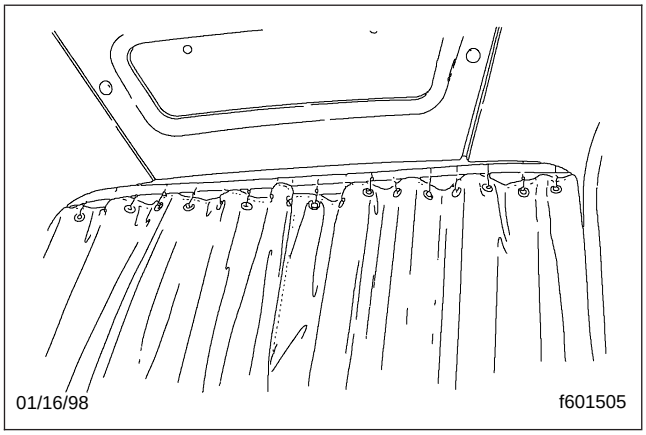

Fig. 3, Curtain

4. Remove the screws, and remove the curtain track. See **Fig. 4**.

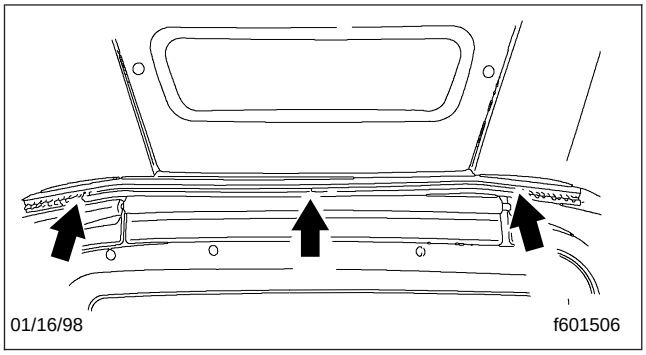

Fig. 4, Curtain Track

5. Remove the roof console.

NOTE: Left-hand shown, right-hand symmetrically opposite.

6. Remove the speaker bolts. See **Fig. 5**.
7. Disconnect the speaker electrical connectors.
8. Disconnect the interior lamp switch electrical connector. See **Fig. 6**.
9. Remove the 29 pushpins securing the overhead storage compartment. See **Fig. 7** and **Fig. 8**.

NOTE: To fully remove the overhead storage compartment, it may be necessary to remove the seats.

10. Remove the overhead storage compartment. See **Fig. 9**.

Overhead Storage Compartment Trim Replacement

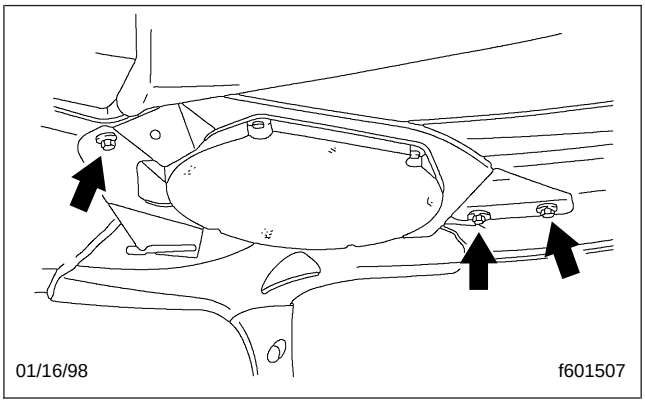

Fig. 5, Speaker Bolts

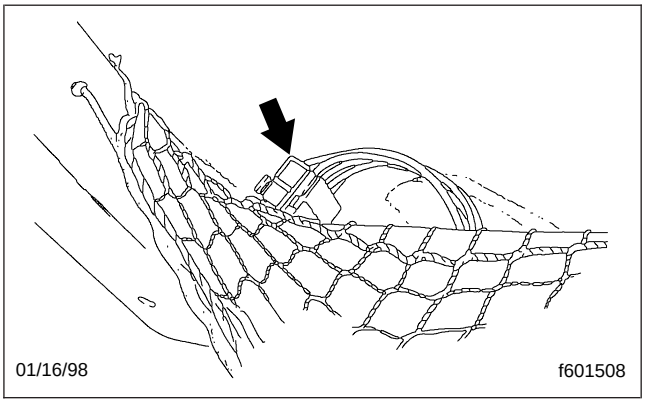

Fig. 6, Interior Lamp Electrical Switch

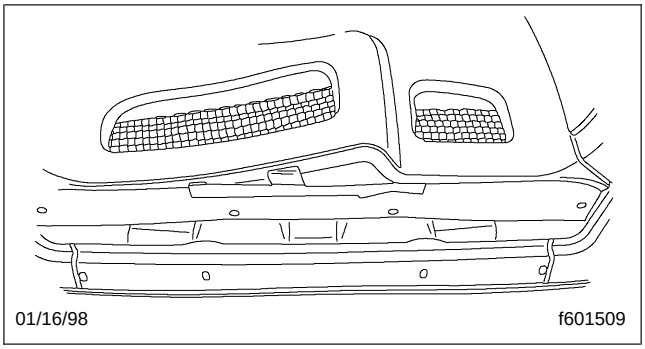

Fig. 7, Lower Storage Compartment Pushpins

NOTE: To prevent damage to the overhead storage compartment during installation, it may be necessary to drill out and remove the rivets attaching the left and right compartments to the center compartment. Install the rivets once the complete assembly is in place.

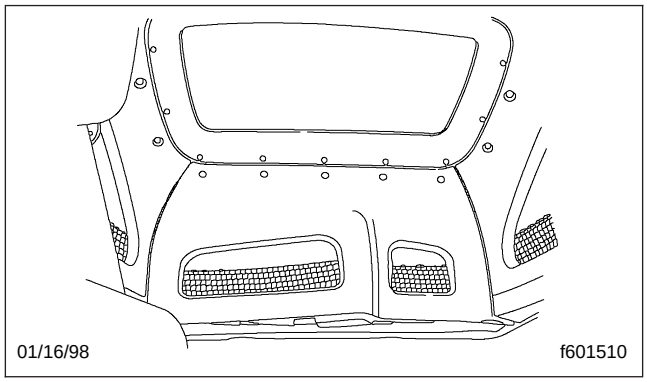

Fig. 8, Upper Storage Compartment Pushpins

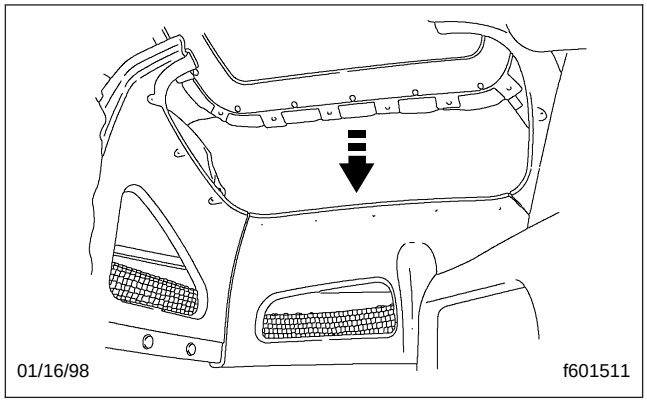

Fig. 9, Overhead Storage Compartment Removal

11. Replace the overhead storage compartment. See **Fig. 9**.
12. Install the 29 pushpins securing the overhead storage compartment. See **Fig. 7** and **Fig. 8**.
13. Connect the interior lamp switch electrical connector. See **Fig. 6**.
14. Install the speaker bolts. See **Fig. 5**.
15. Install the roof console.
16. Position the curtain track and attach the screws. See **Fig. 4**.
17. Attach the curtain to the curtain track. See **Fig. 3**.
18. Position the trim panel over the right-hand door and install the pushpins. See **Fig. 2**.
19. Install the trim panel over the left-hand door. See **Fig. 1**.

    19.1 Position the trim panel.

19.2 Install the pushpins.

19.3 Install the screw.

19.4 Install the reading lamp.

Replacement

1. Remove the screws. See **Fig. 1**.

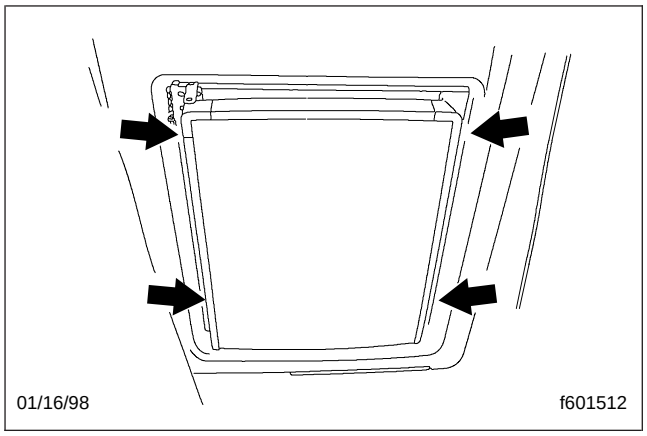

Fig. 1, Refrigerator Screw Location

2. Slide the refrigerator out of the storage compartment. See **Fig. 2**.

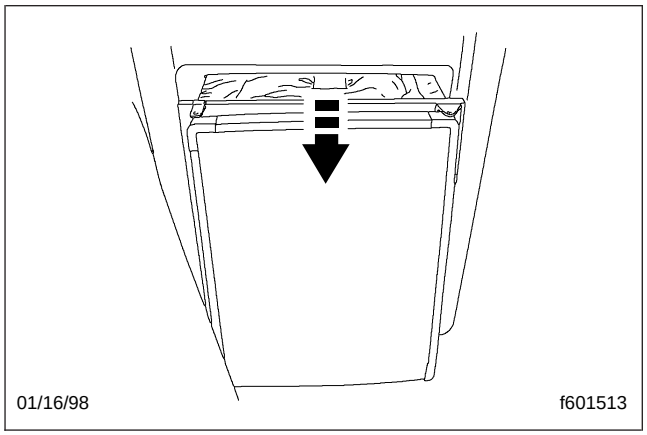

Fig. 2, Refrigerator Storage Compartment Removal

3. Disconnect the electrical connector.
4. Connect the electrical connector.
5. Slide the refrigerator into the storage compartment. See **Fig. 2**.
6. Install the screws. See **Fig. 1**.

General Information

The cab is of all-welded construction, and consists of the underbody assembly (includes the front wall and cab deck), side-wall (door-opening frame) assemblies, back-wall assembly, cowl top assembly, cowl side panels, windshield header, and roof assembly. See **Fig. 1**.

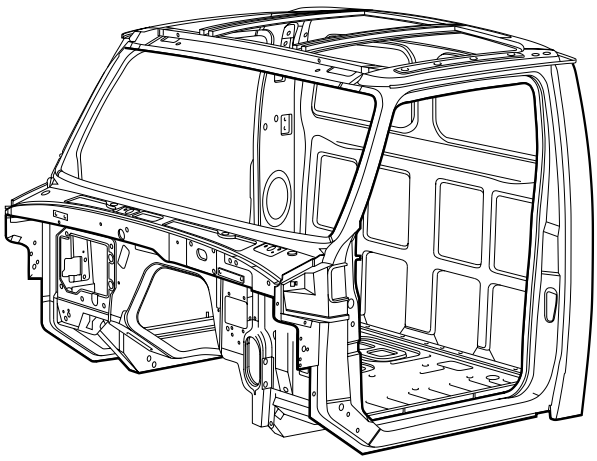

Fig. 1, Cab Structure (day cab shown)

The underbody assembly is of 3/64 inch (1.4 mm) minimum thickness for steel, and 5/64 inch (2.0 mm) minimum thickness for aluminum. Reinforcements provide added support for the engine access cover and seats. The engine cover is attached to the underbody with two bolts and two latches for rapid removal and installation. Cross sills provide reinforcement under the cab deck. Two "sled runner" shaped cab reinforcing members extend for the length of the underbody, from high on the frontwall to the rear cross sill. The rear cross sill is reinforced in the cab mount area.

Each side-wall assembly has reinforcements at all four corners. The door pillar hinge-attachment areas are strengthened by reinforcement plates.

The windshield header for sleepers and the roof side rails are of box-section construction for strength. The roof panel is contoured for stiffness.

The exterior back-wall panel has stamped ribs for stiffness. Reinforcements are located at attaching points for handles and vertical exhaust pipes. The interior upper back-wall panel has a box-section reinforcement across the width of the panel, below the window.

The cab is sealed with an epoxy structural adhesive for added structural integrity.

Rust and corrosion resistance is provided by the use of coated metals and composite materials. The roof panel, cowl sides, cowl top panel, door opening frames, rocker panels, A-pillars, floor pan, back wall panel, rear corner panels, and selected structural underbody members are made of galvanized steel. Steel-to-aluminum contact areas are protected with galvanized steel and E-coated steel components.

Insulation is located above the headliner, facing the front wall, underneath the floor mat, and at the back wall. A temperature-resistant molded engine panel is located in the engine cover area.

When any repairs are done to the cab, it is necessary to check the frame rails for correct alignment and squaring. Then the cab must be leveled and squared. If the cab is repaired without straightening the frame rails, undue stress could be put on the cab, which could weaken it. Also, it may be impossible to square the cab.

Cab Water-Leak Detection

Use the following procedure to locate areas where water may intrude into the cab.

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Prepare a wash solution of at least one-quarter cup of soap to one gallon of water in a spray bottle.
3. Place tape over the cab exhausters.
4. Close all doors, windows, and vents.
5. With the HVAC system in "Fresh Air" mode, turn the fan blower motor on high.

NOTE: Perform the leak detection test with the HVAC system in the "Fresh Air" mode only. Do not set the system in the "Recirculation" mode.

6. Spray the cab and sleeper, if so equipped, with the wash solution and look for bubbles. See **Fig. 1**. Inspect all applicable areas listed below:
    - windshield perimeter
    - visor brackets (if so equipped)
    - cab and sleeper roof seams (if present)
    - air horns and marker lights (if so equipped)
    - roof deflector mounts (if so equipped)
    - sleeper boot (if so equipped)
    - sleeper roof side windows (if present)

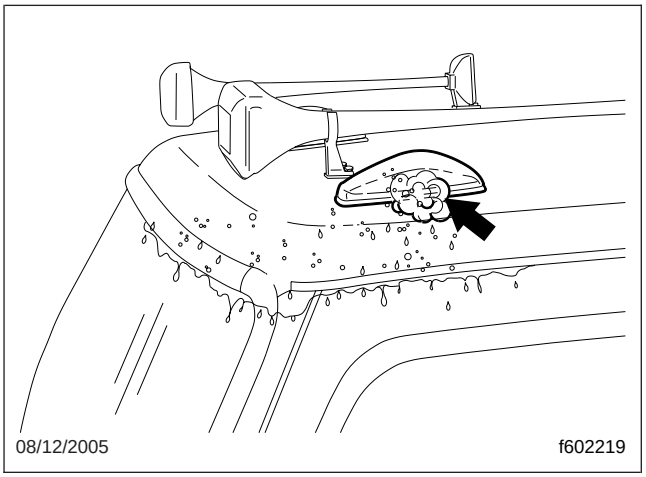

Fig. 1, Cab Water Leak Detection with Wash Solution

7. Mark areas of suspected leaks.

NOTE: This method of leak detection may also identify areas that will not leak water, even though those areas produce bubbles. Bubbles around door seals, baggage doors, and along the vehicle side walls will likely not cause water intrusion issues.

If small bubbles are found in an area that is not suspected to leak, a repair may not be necessary.

8. Rinse the wash solution off the vehicle with water.
9. Turn off the fan blower motor.
10. Remove the tape from the cab exhausters.
11. Remove the chocks.

Cab Water-Leak Repair

If a leak is found, the repair method will depend on the area and type of leak. It may be necessary to remove some components, though most leaks should be repairable by sealing the area of the leak with silicone sealant.

Repair leaks in the windshield using the approved method. See **Section 60.00, Subject 100**.

Removal

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.
2. Disconnect the battery.
3. Remove the fenders; see **Section 88.00, Subject 140**.
4. Remove the cowl side panels; see **Section 88.00, Subject 130**.
5. On each side of the vehicle, remove the fender braces from the cab.
   - 5.1 Remove the fasteners that attach the fender brace to the rocker panel; see **Fig. 1**.
   - 5.2 Remove the fasteners that attach the fender brace to the cab; see **Fig. 2**. Remove the brace.

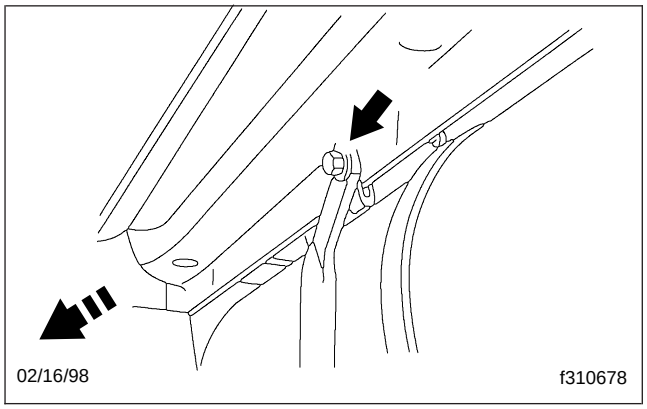

Fig. 1, Fender Brace-to-Rocker Panel Bolt

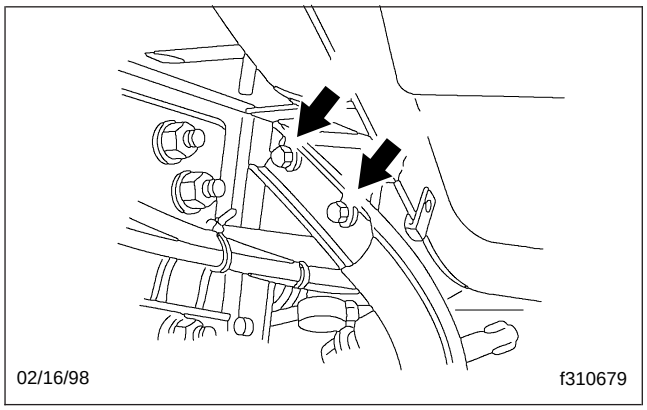

Fig. 2, Fender Brace-to-Cab Bolts

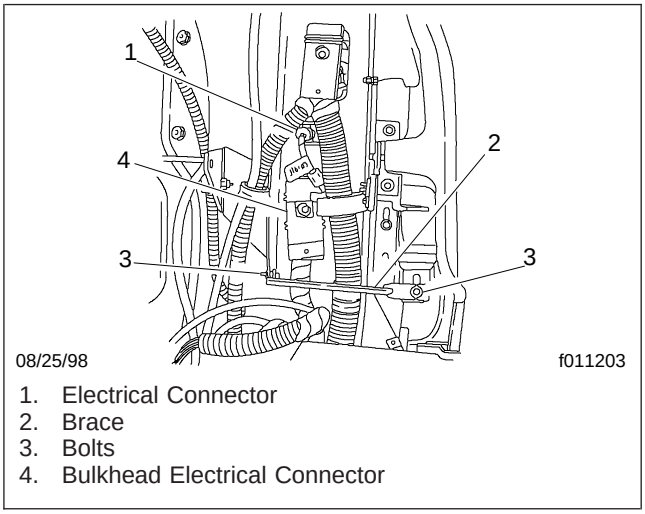
6. Remove the air cleaner assembly; see **Section 09.02**.
7. Disconnect the clutch linkage; see **Section 25.01**.
8. Disconnect the accelerator linkage; see **Group 30**.
9. Disconnect the steering linkage; see **Section 46.01**.
10. Disconnect the oil pressure gauge line fitting.
11. Disconnect the windshield washer hose.
12. Disconnect the windshield washer electrical connectors.
13. For vehicles with cab rear air suspension, place blocks between the frame and the bottom of the cab, or use jack stands to keep the cab in position when the air spring is deflated.
14. Drain the air system.

⚠ WARNING

Make sure the air system has been completely drained before attempting to remove an air line. Do not disconnect pressurized air lines as they may whip as air escapes. Before working on or around air lines and components, see the safety precautions in Section 42.06, Subject 100. Failure to take all necessary precautions could result in personal injury.

15. Disconnect the air lines from the in-cab air manifold.
16. Remove the air line retainer.
17. Disconnect the air lines from the in-dash air manifold.
18. Disconnect the bulkhead electrical connector. See **Fig. 3**.
19. Disconnect the air lines at the foot control valve; see **Group 42**.
20. Disconnect the heater hoses; see **Group 83**.
21. Disconnect the air conditioning hoses, if so equipped; see **Section 83.01, Subject 190**.
22. Disconnect the heater and air conditioning electrical connectors.
23. Remove the wire harness retainers.

Cab Removal and Installation



1. Electrical Connector
2. Brace
3. Bolts
4. Bulkhead Electrical Connector

Fig. 3, Bulkhead Electrical Connector

24. Disconnect the wire harness electrical connectors.
25. If the vehicle is equipped with a cab-mounted exhaust system, disconnect the exhaust system at the muffler. Remove the exhaust mounting bolts and the exhaust.
26. Disconnect any transmission electrical wiring, air lines, or linkages from the cab; see **Group 26**.
27. Attach the straps of a suitable lift at four points to the cab (two forward, and two rear). Support the cab with the lift while disconnecting the cab mounts.
28. On both sides of the vehicle, remove the front cab support-to-isolator mounting bolt; see **Fig. 4**.

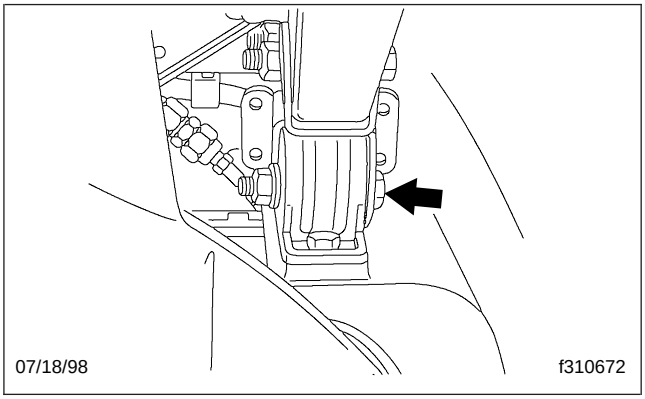


Fig. 4, Front Cab Support-to-Isolator Mounting Bolt

29. For vehicles with fixed cab rear mounts equipped with lateral bolts, remove the bolts; see **Fig. 5**.

    For vehicles with other fixed cab rear mounts, and vehicles with rear hydromounts, remove the cab upper rear-mount nuts from inside the cab; see **Section 60.07, Subject 110**.

    For vehicles with cab rear air suspension, do the following:

    29.1 Detach the tops of the air springs from the cab; see **Section 60.06, Subject 140**.

    29.2 Disconnect the height-adjustment valve vertical linkage from the cab; see **Section 60.06, Subject 170**.

    29.3 Detach the lateral control rod from the cab; see **Section 60.06, Subject 160**.

    29.4 Detach the shock absorbers from the cab; see **Section 60.06, Subject 150**.

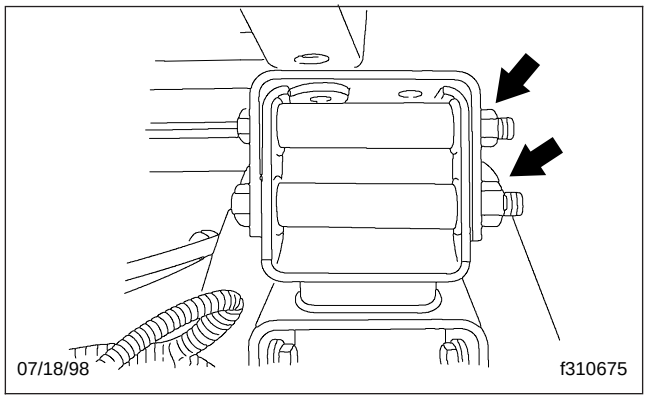

Fig. 5, Rear Cab Support Lateral Bolts

⚠ WARNING

Before lifting the cab from the chassis, make sure the cab is correctly balanced, that it is supported in at least four places, and that the hoist is strong enough to support the cab. Failure to do so could result in the cab falling.

Do not get underneath or near a cab that is supported only by a hoist. Should the cab fall, serious injury or death could result.

30. With the hood open, remove the cab with a suitable lift.

Installation

WARNING

Do not get underneath or near a cab that is supported only by a hoist. Should the cab fall, serious injury or death could result.

NOTE: For a vehicle with cab rear air suspension, make sure the blocks or jack stands are placed to hold the rear of the cab in an elevated position when the cab is lowered. This will make it easier to connect the cab rear air suspension components to the cab.

1. With the vehicle tires chocked and the hood open, lower the cab in place, using a suitable lift.
2. On both sides of the vehicle, install the front cab support-to-isolator mounting bolt; see **Fig. 4**.

   Tighten 150 to 175 lbf·ft (203 to 237 N·m) for 3/4–10 bolt.

   Tighten 120 to 152 lbf·ft (163 to 206 N·m) for 5/8–11 bolt.
3. For vehicles with fixed cab rear mounts equipped with lateral bolts, install the bolts; see **Fig. 5**.

   For vehicles with other fixed cab rear mounts, and vehicles with rear hydromounts, install the cab upper rear-mount nuts inside the cab; see **Section 60.07, Subject 110**.

   For vehicles with cab rear air suspension, do the following:

   3.1 Attach the tops of the air springs to the cab; see **Section 60.06, Subject 140**.

   3.2 Attach the shock absorbers to the cab; see **Section 60.06, Subject 150**.

   3.3 Attach the lateral control rod to the cab; see **Section 60.06, Subject 160**.

   3.4 Connect the height-adjustment valve vertical linkage to the cab; see **Section 60.06, Subject 170**.

NOTE: Unless specified in the applicable subject, tighten all rear cab mount fasteners using the torque specifications listed in **Section 00.06**.

4. Detach the lift straps from the cab.
5. Connect any transmission electrical wiring, air lines, or linkages to the cab; see **Group 26**.
6. If the vehicle is equipped with a cab-mounted exhaust system, install the exhaust and mounting bolts. Connect the exhaust system to the muffler.
7. Connect the wire harness electrical connectors.
8. Install the wire harness retainers.
9. Connect the heater and air conditioning electrical connectors.
10. Connect the air conditioning hoses, and charge the air conditioning system; see **Group 83**.
11. Connect the heater hoses; see **Group 83**.
12. Connect the air lines at the brake foot control valve; see **Group 42**.
13. Connect the bulkhead electrical connector. See **Fig. 3**.
14. Connect the air lines to the in-dash air manifold.
15. Install the air line retainer.
16. Connect the air lines to the in-cab air manifold.
17. Connect the windshield washer electrical connectors.
18. Connect the windshield washer hose.
19. Connect the oil pressure gauge line fitting.
20. Connect the steering linkage; see **Section 46.01**.
21. Connect the accelerator linkage; see **Group 30**.
22. Connect the clutch linkage; see **Section 25.01**.
23. Install the air cleaner assembly; see **Section 09.02**.
24. On each side of the vehicle, install the fender braces on the cab, as follows.

    24.1 Position the fender brace in place. Install the fasteners that attach the fender brace to the cab; see **Fig. 2**.

    24.2 Install the fasteners that attach the fender brace to the rocker panel; see **Fig. 1**.
25. Install the cowl side panels; see **Section 88.00, Subject 130**.
26. Install the fenders; see **Section 88.00, Subject 140**.
27. Connect the battery.
28. Pressurize the air system, and check it for leaks.

Cab Removal and Installation

29. For vehicles with cab rear air suspension, remove the blocks or jack stands used to keep the rear of the cab elevated.
30. Remove the chocks.

Troubleshooting

CAUTION

If welding is required for cab repair procedures, all electronic control modules on the vehicle must be isolated from ground during welding to prevent damage to the electronic components.

On vehicles using aluminum cab construction, use only original equipment manufacturer replacement parts including fasteners. This must be strictly adhered to in order to reduce the possibility of galvanic corrosion.

Problem—Dust and Water Leaks

Problem—Dust and Water Leaks	
Possible Cause	**Remedy**
Cab sealer missing	Remove trim. Check for leaks and seal with appropriate sealer. Road test or water hose test for leaks. See **Subject 100** for water hose test instructions. Recheck trim for leaks. Or use a light under the vehicle with trim removed. Check the cab interior at joints and weld lines.
Openings in welds or cab joints	
Components not fully installed	
Components missing	
Components damaged	
Missing or damaged plugs or grommets	Check plugs for proper installation. Replace if necessary.

Problem—Door Drain Holes Collecting Water

Problem—Door Drain Holes Collecting Water	
Possible Cause	**Remedy**
Holes clogged with mud or road tar	Check drain holes regularly. Clean drain holes of dirt and foreign material with a punch or screwdriver.

Problem—Wind Noise, Air Entering Vehicle Through Small Holes in Cab

Problem—Wind Noise, Air Entering Vehicle Through Small Holes in Cab	
Possible Cause	**Remedy**
Leaks at door and window seals or sheet metal joints in doors or door openings	Seal leaks with appropriate sealer. Check door adjustment; see **Section 72.00, Subject 110**. Road test.

Problem—Rattles

Problem—Rattles	
Possible Cause	**Remedy**
Loose screws, nuts, bolts, small pieces of deadener in door wells, pillars, and quarter panels	Check the doors by carefully striking underside of door with a rubber mallet and listen for loose objects in the door. Tighten the cab bolts and screws. If tightening the bolts does not eliminate the rattle, the cause could be misalignment; refer to **Group 72**.
Weather-stripping or anti-squeak material has slipped out of position	Apply additional sealer. Install in proper location to eliminate rattle.

Cab Sealers, Adhesives, and Lubricants

See **Table 1** for sealer, adhesive, and lubricant specifications and applications.

Cab Sealers, Adhesives, and Lubricants		
Item	**Specification**	**Application**
Sealers		
Liquid Butyl Sealer C9AZ–19554–B	ESB–M4G162–A	Butyl-Installed Windows and Backlights
Caulking Cord D6AZ–19560–A	ESB–M4G32–A	Surfaces Not Sealed by Gaskets
Adhesives		
Weatherstrip Adhesive E8AZ–19552–A	ESB–M2G14–A	Door Weatherstripping
Lubricants		
Silicone Lubricant COAZ–19553–AA or F7AZ–19553–AA	ESR–M13P4–A	Rubber Parts Exposed to Weather

Table 1, Cab Sealers, Adhesives, and Lubricants

Liquid Butyl Sealer

Liquid Butyl Sealer C9AZ–19554–B or equivalent meeting specification ESB–M4G162–A:

- can be used to maintain leak-free sealing around windows and backlights;
- is recommended for water leak repairs and as an after-sealer for glass replacement on butyl-installed windows and backlights;
- has excellent flow characteristics and will not run when exposed to heat.

Caulking Cord

Caulking Cord D6AZ–19560–A or equivalent meeting specification ESB–M4G32–A:

- has a plastic base with a filler;
- is heavy-bodied;
- is commonly known as perma-gum;
- can be used for seam sealing in such areas as the floorpan, wheelhouse, running board, dash panel, door openings, and drip rails;
- is used on spot-weld holes, around mounting clips, and between surfaces not sealed by a gasket.

Weatherstrip Adhesive

Weatherstrip Adhesive E8AZ–19552–A or equivalent meeting specification ESB–M2G14–A is a quick-drying, strong adhesive designed to hold or repair weatherstripping on doors, bodies, and the surrounding metal.

Silicone Lubricant

Silicone Lubricant COAZ–19553–AA or F7AZ–19553–AA or equivalent meeting specification ESR–M13P4–A:

- is used to lubricate rubber parts exposed to the weather;
- is used on the door and window weatherstrips;
- must be applied to the weatherstrips at every lubrication period;
- makes the doors easier to close;
- avoids weatherstrip squeaks;
- retards weatherstrip wear;
- helps maintain door window alignment by reducing the friction between the glass frame and the rubber weatherstrips.

Replacement

NOTE: Left-hand shown, right-hand symmetrically opposite.

1. Remove the fasteners and remove the grab handle. See **Fig. 1**.

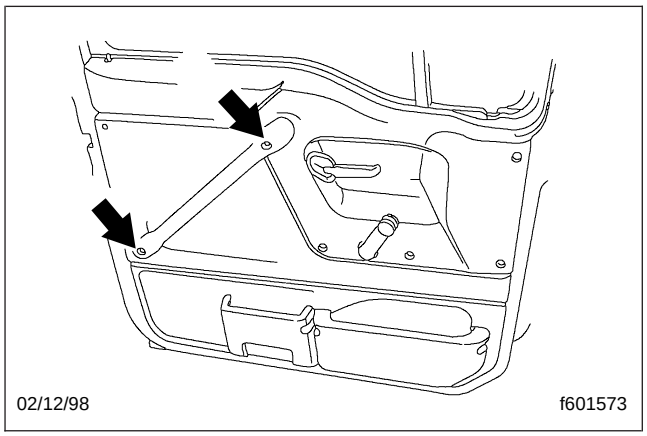

Fig. 1, Grab Handle Fasteners

2. Pry the cover up from the door window handle, if so equipped. See **Fig. 2**.

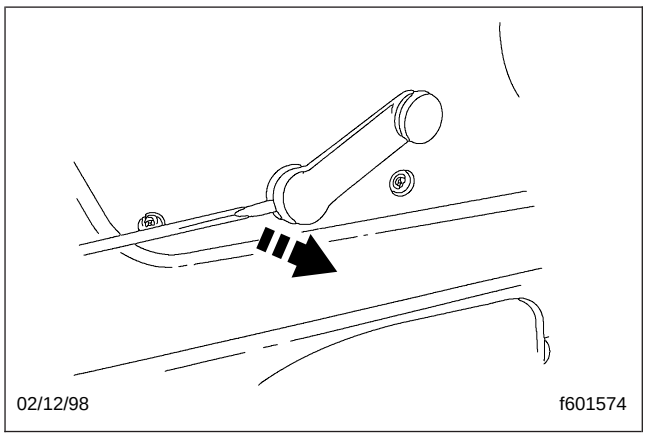

Fig. 2, Door Window Handle Cover

3. Remove the screw and remove the door window handle, if so equipped. See **Fig. 3**.
4. Remove the screws. See **Fig. 4**.
5. Tilt the door trim finish panel outward and disconnect the electrical connectors, if so equipped. See **Fig. 5**.
6. Remove the screws. See **Fig. 6**.

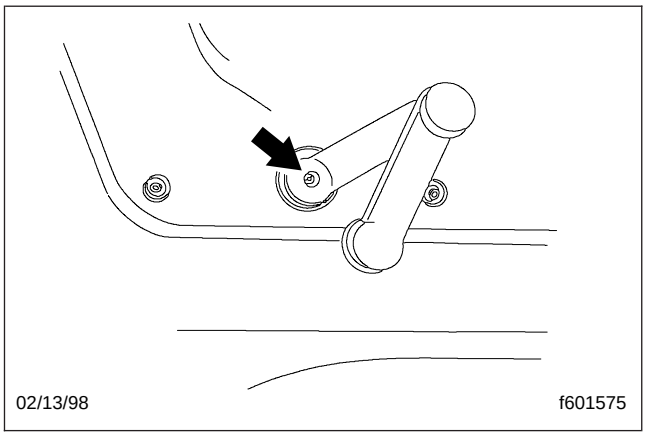

Fig. 3, Door Window Handle Screw

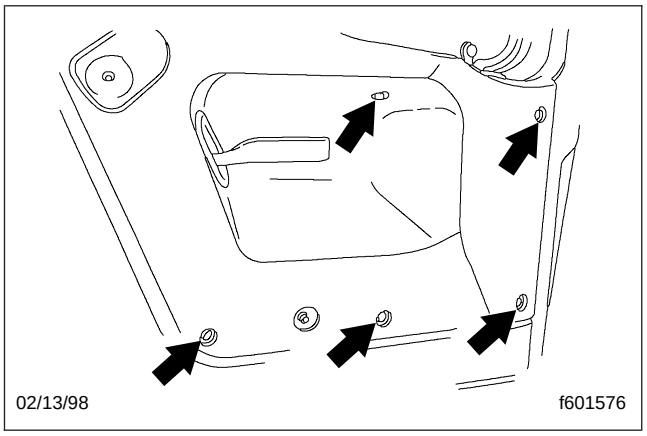

Fig. 4, Panel Screws

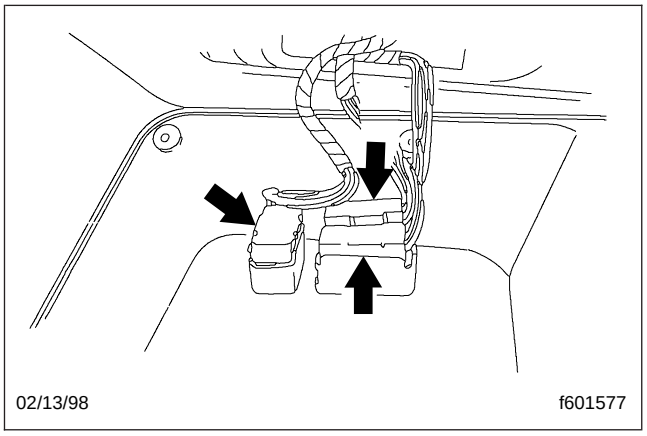

Fig. 5, Door Trim Panel Electrical Connectors

7. Disconnect the courtesy lamp electrical connector. See **Fig. 7**.

Door Trim Panel Replacement

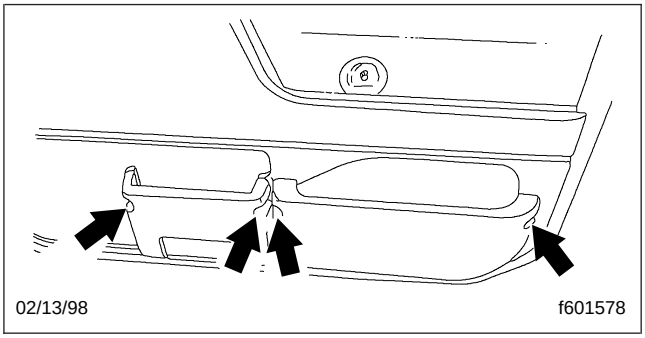

Fig. 6, Door Storage Compartment Screws

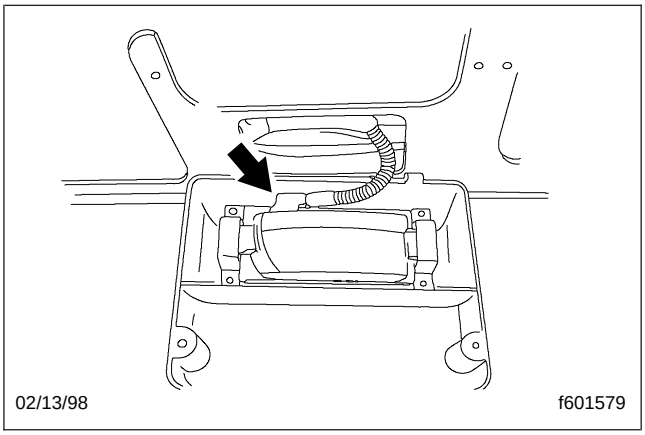

Fig. 7, Courtesy Lamp Electrical Connector

8. Remove the door trim panel retainers and remove the door trim panel. See **Fig. 8**.

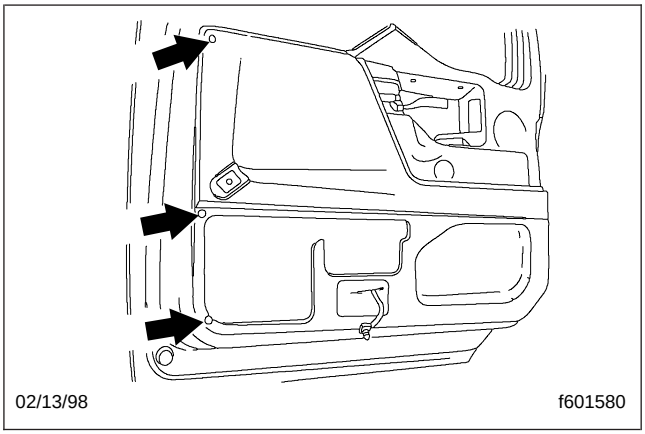

Fig. 8, Door Trim Panel Retainers

9. Position the door trim panel and install the door trim panel retainers. See **Fig. 8**.
10. Connect the courtesy lamp electrical connector. See **Fig. 7**.
11. Install the screws. See **Fig. 6**.
12. Tilt the door trim finish panel inward and connect the electrical connectors, if so equipped. See **Fig. 5**.
13. Install the screws. See **Fig. 4**.
14. Position the door window handle and install the screw, if so equipped. See **Fig. 3**.
15. Push the cover down onto the door window handle, if so equipped. See **Fig. 2**.

NOTE: Left-hand shown, right-hand symmetrically opposite.

16. Position the grab handle and attach the fasteners. See **Fig. 1**.

Replacement

1. Remove the roof console, if so equipped.
2. Remove the speaker cover bolts, if so equipped (left-hand shown, right-hand symmetrically opposite). See **Fig. 1**.

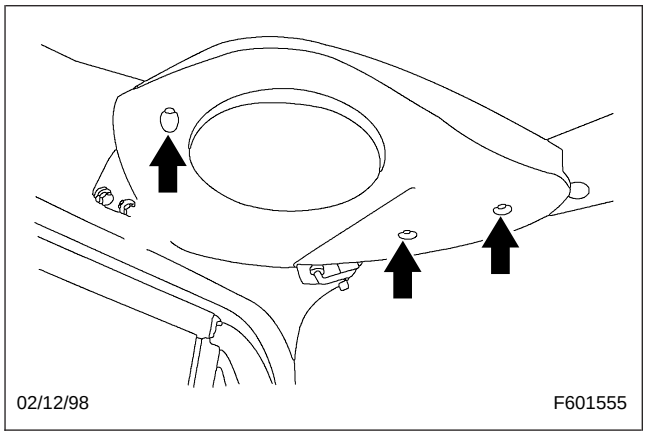

Fig. 1, Speaker Cover Bolts

3. Remove the radio speakers. Refer to **Group 54**.
4. Remove the dome lamp. Refer to **Group 54**.
5. Remove the headliner retainers and remove the headliner. See **Fig. 2**.

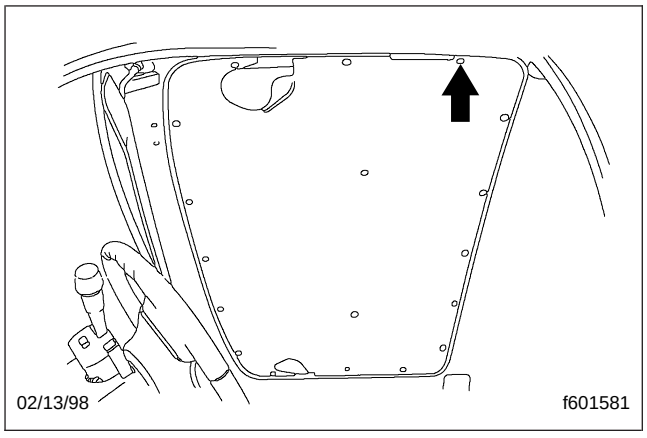

Fig. 2, Headliner Retainers

6. Replace the headliner and install the headliner retainers. See **Fig. 2**.
7. Install the dome lamp. Refer to **Group 54**.
8. Install the radio speakers. Refer to **Group 54**.
9. Install the speaker cover bolts, if so equipped (left-hand shown, right-hand symmetrically opposite). See **Fig. 1**.
10. Install the roof console, if so equipped.

Replacement

NOTE: Part of the carpet or mat assembly may need to be removed to access the engine cover.

1. Remove the bolts and remove the engine cover. See **Fig. 1**.

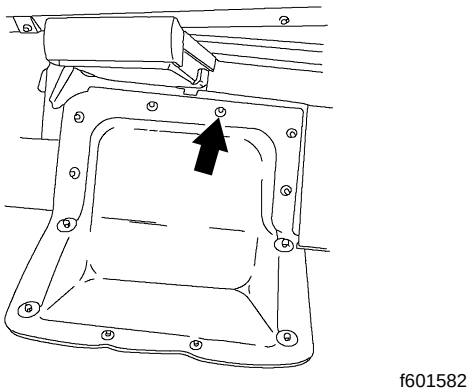

Fig. 1, Base Engine Cover

2. Position the engine cover in the cab and install the bolts.

Replacement

NOTE: Partial removal of the passenger seat assembly or removal of the manual shift lever may be necessary in order to remove some types of engine covers.

1. Release the six engine cover latches and remove the engine cover. See **Fig. 1**.

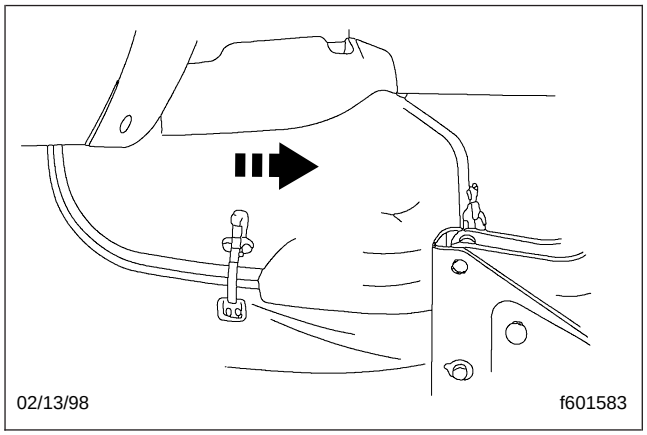

Fig. 1, Raised Engine Cover

2. Position the engine cover in the cab and latch the six engine cover latches.

Lighted Marker and Heated Western-Type Mirror Replacement

Replacement

1. Remove the left-side door trim panel.
2. Remove the inner watershield.
3. Disconnect the electrical connector. See **Fig. 1**.

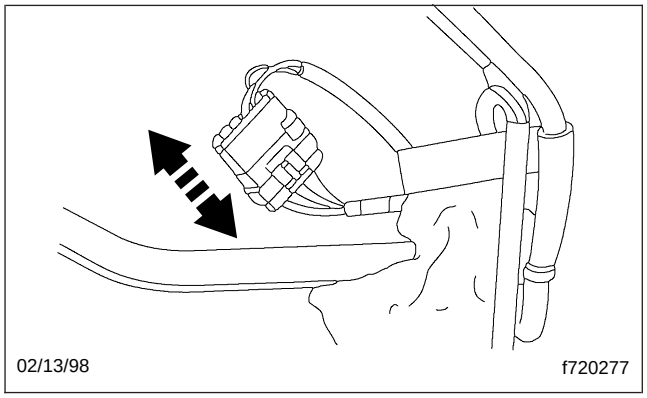

Fig. 1, Mirror Electrical Connector

4. Remove the wire grommet from the mirror bracket. See **Fig. 2**.

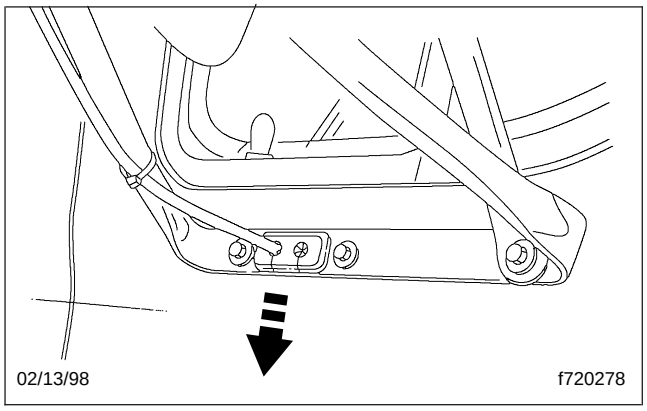

Fig. 2, Mirror Bracket Wire Grommet

5. Remove the wire from the left-side door. See **Fig. 3**.
6. Cut the cable wraps on the mirror bracket. See **Fig. 4**.
7. Remove the upper and lower retaining nuts and remove the mirror. See **Fig. 5**.
8. Replace the mirror and install the upper and lower retaining nuts. Tighten the nuts 9 to 12 lbf·ft (12 to 16 N·m). See **Fig. 5**.

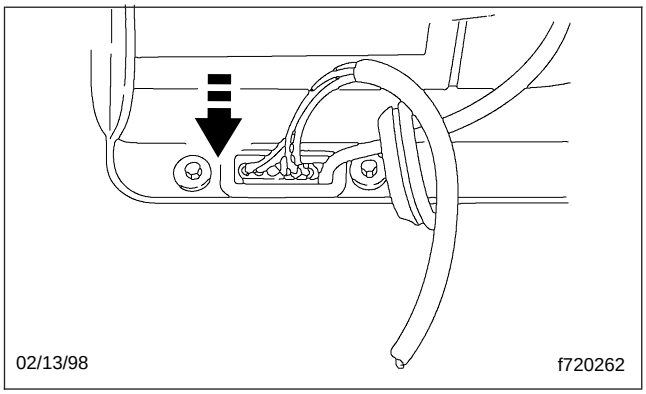

Fig. 3, Left-Side Door Wire

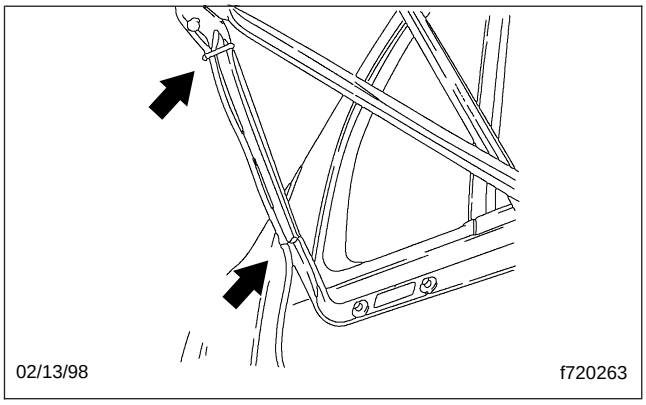

Fig. 4, Mirror Bracket Cable Wraps

9. Attach the cable wraps on the mirror bracket. See **Fig. 4**.
10. Install the mirror wire on the left-side door. See **Fig. 3**.
11. Install the wire grommet on the mirror bracket. See **Fig. 2**.
12. Connect the mirror electrical connector. See **Fig. 1**.
13. Install the inner watershield.
14. Install the left-side door trim panel.

Lighted Marker and Heated Western-Type Mirror Replacement

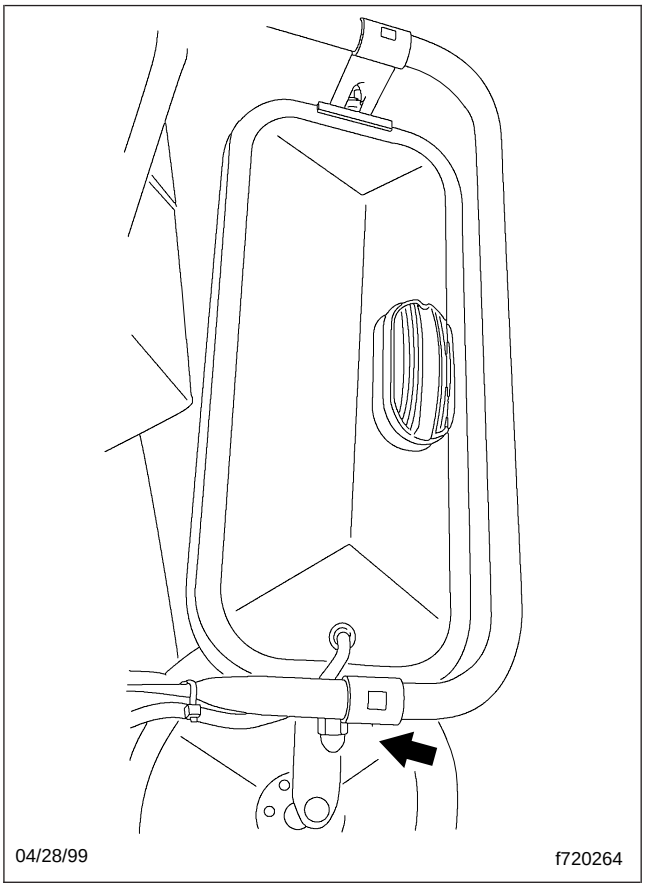

Fig. 5, Mirror Retaining Nuts

Western-Type Power Mirror Replacement

Replacement

1. Carefully pry the power mirror switch from the left-side door trim panel. See **Fig. 1**.

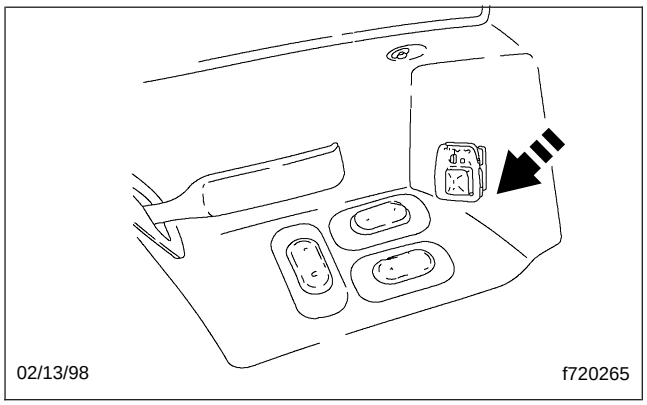

Fig. 1, Power Mirror Switch

2. Depress the electrical connector locking tab and separate the power mirror switch from the electrical harness. See **Fig. 2**.

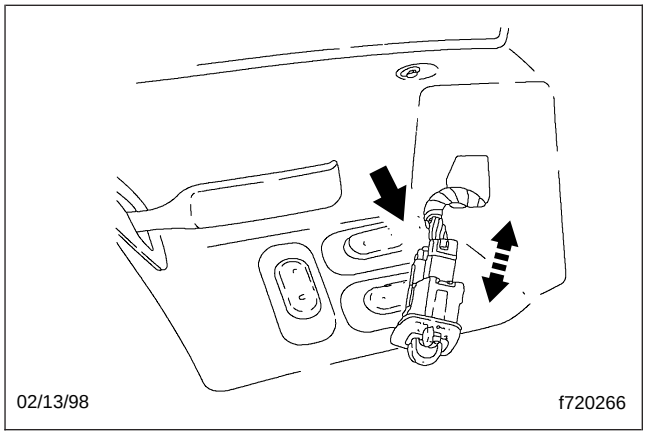

Fig. 2, Power Mirror Electrical Connector

3. Remove the left-side door trim panel.
4. Remove the wire grommet from the power mirror bracket. See **Fig. 3**.
5. Remove the power mirror wire from the left-side door. See **Fig. 4**.
6. Cut the cable wraps on the mirror bracket. See **Fig. 5**.
7. Remove the upper and lower retaining nuts, and remove the mirror. See **Fig. 6**.

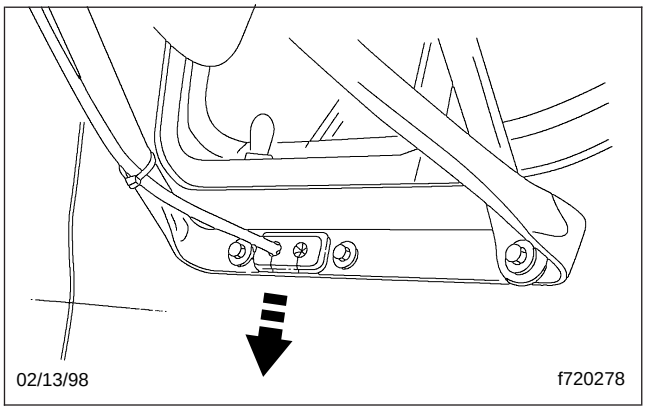

Fig. 3, Power Mirror Bracket Wire Grommet

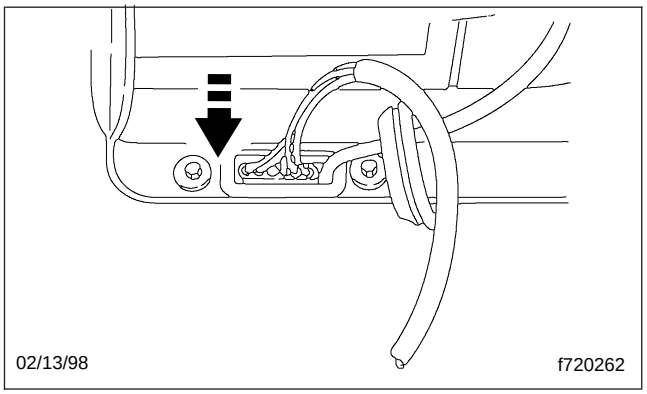

Fig. 4, Left-Side Door Mirror Wire

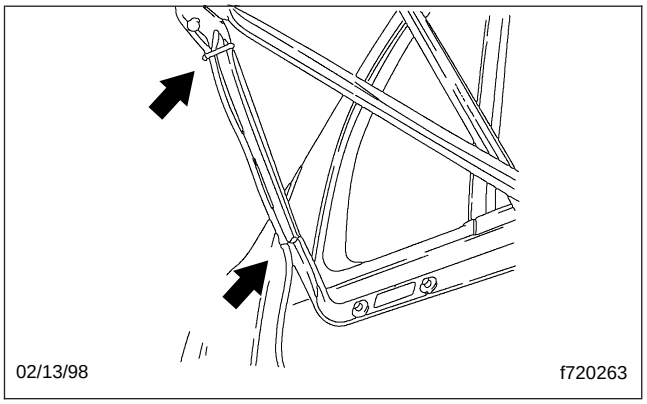

Fig. 5, Mirror Bracket Cable Wraps

8. Replace the mirror and install the upper and lower retaining nuts. Tighten the nuts 9 to 12 lbf·ft (12 to 16 N·m). See **Fig. 6**.
9. Install the cable wraps on the mirror bracket. See **Fig. 5**.

Western-Type Power Mirror Replacement

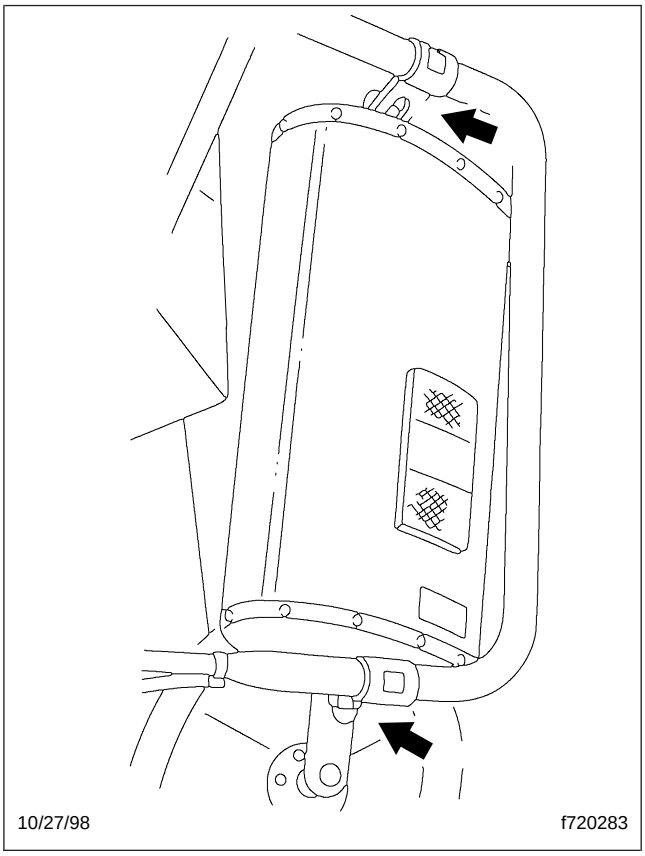

Fig. 6, Mirror Retaining Nuts

10. Install the power mirror wire on the left-side door. See **Fig. 4**.
11. Install the wire grommet on the power mirror bracket. See **Fig. 3**.
12. Remove the left-side door trim panel.
13. Connect the power mirror switch to the electrical harness. See **Fig. 2**.
14. Install the power mirror switch into the left-side door trim panel. See **Fig. 1**.

Western-Type Mirror Mounting Bracket Replacement

Replacement

1. Remove the rearview mirror. If equipped with a power or heated/lighted mirror, refer to **Subject 100** or **Subject 110**.
2. If equipped with a CB antenna, refer to **Group 54** to remove the antenna and cable.
3. Remove the seven screws, and remove the bracket. See **Fig. 1**.

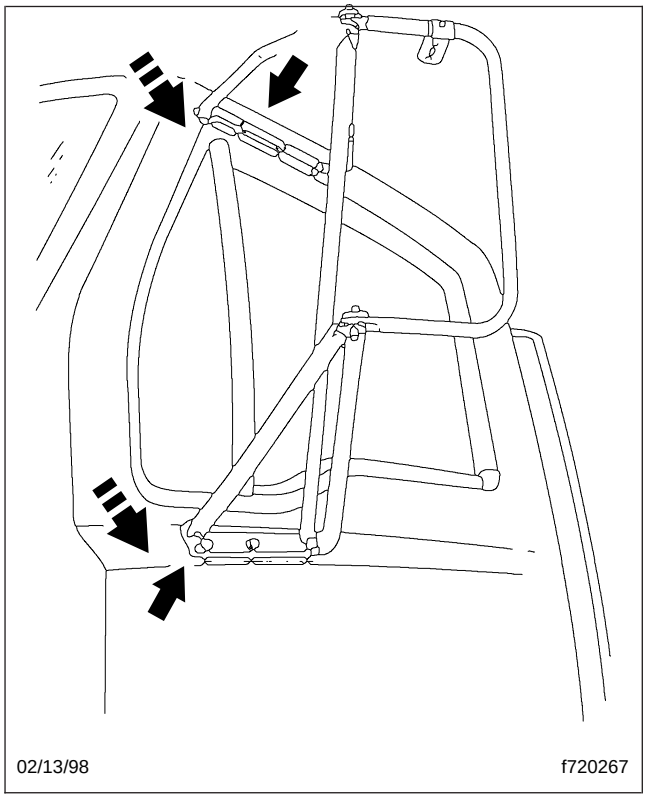

Fig. 1, Bracket Screw Removal

4. Replace the mirror bracket and install the seven screws. Tighten the screws 72 to 108 lbf·in (99 to 120 N·cm). See **Fig. 2**.
5. If equipped with a CB antenna, refer to **Group 54** to install the antenna and cable.
6. Install the rearview mirror. If equipped with a power or heated/lighted mirror, refer to **Subject 100** or **Subject 110**.

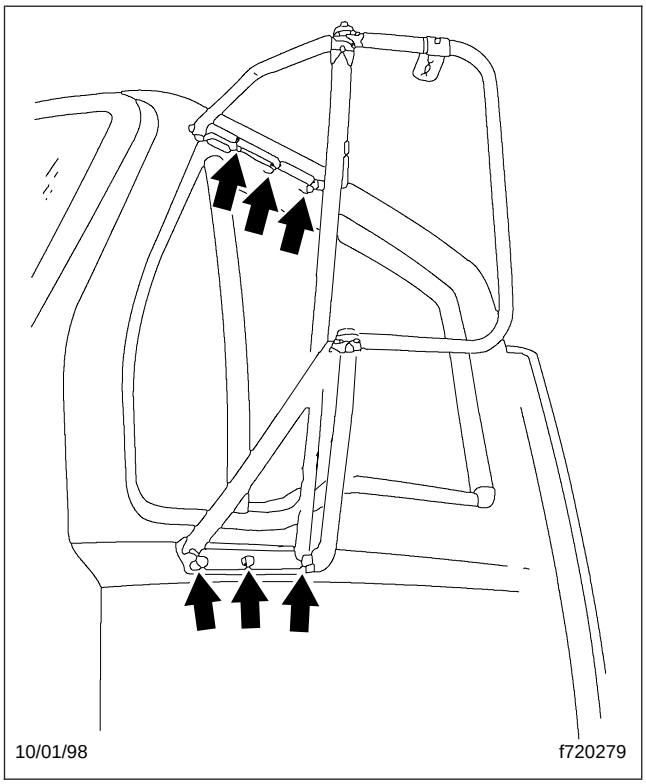

Fig. 2, Bracket Screw Installation

Aerodynamic Mirror Replacement

Replacement

1. Remove the CB antenna.
2. Remove the door trim panel. See **Fig. 1**.

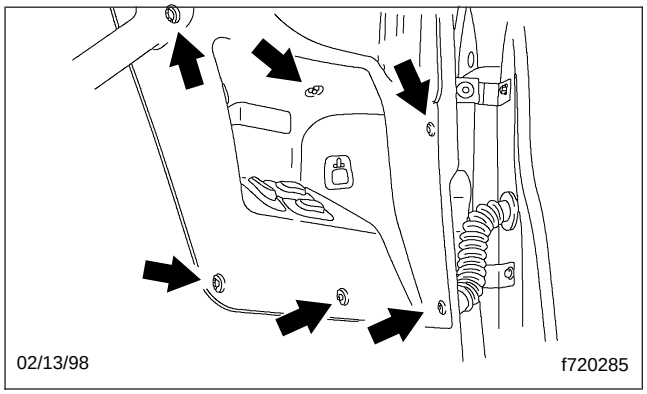

Fig. 1, Door Trim Panel

3. Disconnect the power mirror switch(es). See **Fig. 2**.

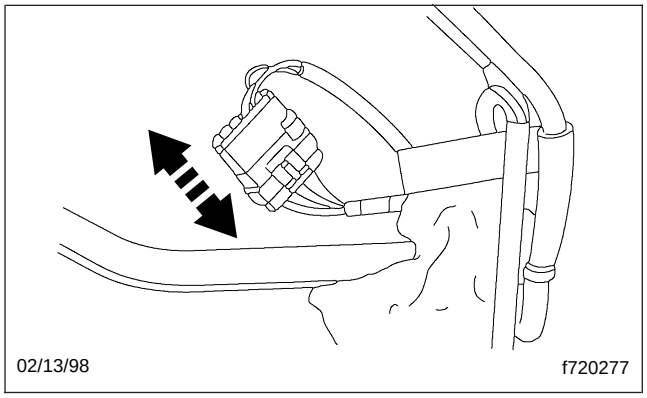

Fig. 2, Power Mirror Switch

4. Disconnect the CB antenna cable.
5. Remove the lower mirror bracket trim cover. See **Fig. 3**.
6. Remove the lower mirror bracket bolts. See **Fig. 4**.
7. Remove the upper mirror bracket bolts. See **Fig. 5**.
8. Remove the mirror assembly.

NOTE: Make sure the wiring harness does not interfere with window travel.

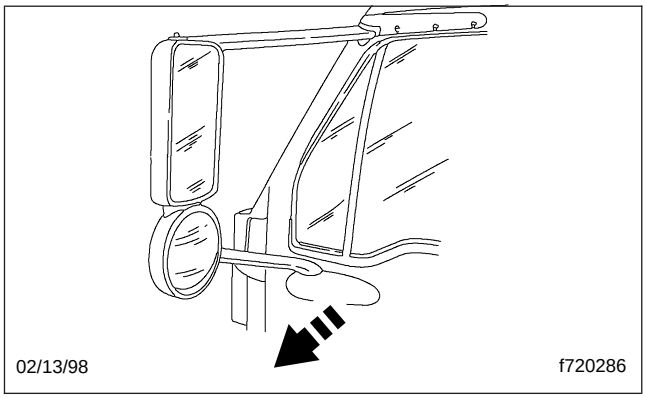

Fig. 3, Lower Mirror Bracket Trim Cover

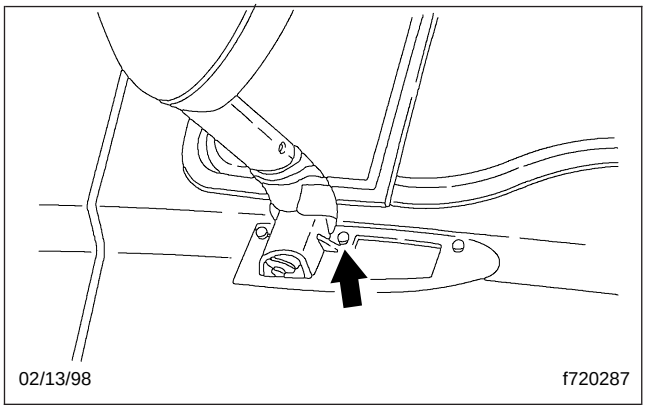

Fig. 4, Lower Mirror Bracket Bolts

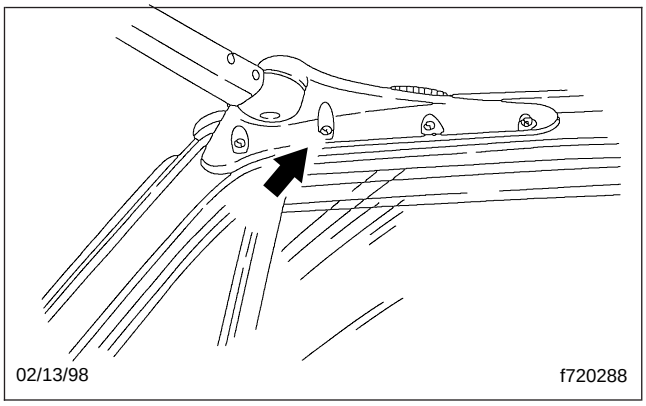

Fig. 5, Upper Mirror Bracket Bolts

9. Install the mirror assembly.
10. Install the upper mirror bracket bolts. See **Fig. 5**. Tighten the bolts 30 lbf·ft (40 N·m).

Aerodynamic Mirror Replacement

11. Install the lower mirror bracket bolts. See **Fig. 4**. Tighten the bolts 84 to 108 lbf·in (99 to 120 N·cm).
12. Install the lower mirror bracket trim cover. See **Fig. 3**.
13. Connect the CB antenna cable.
14. Connect the power mirror switch(es). See **Fig. 2**.
15. Install the door trim panel. See **Fig. 1**.
16. Install the CB antenna.

Aerodynamic Mirror Glass Removal and Installation

Removal

NOTE: The upper and lower glass are removed in the same manner.

1. Position the mirror glass in the full up-facing position, and slide the mirror glass upward until maximum travel is attained. See **Fig. 1**.

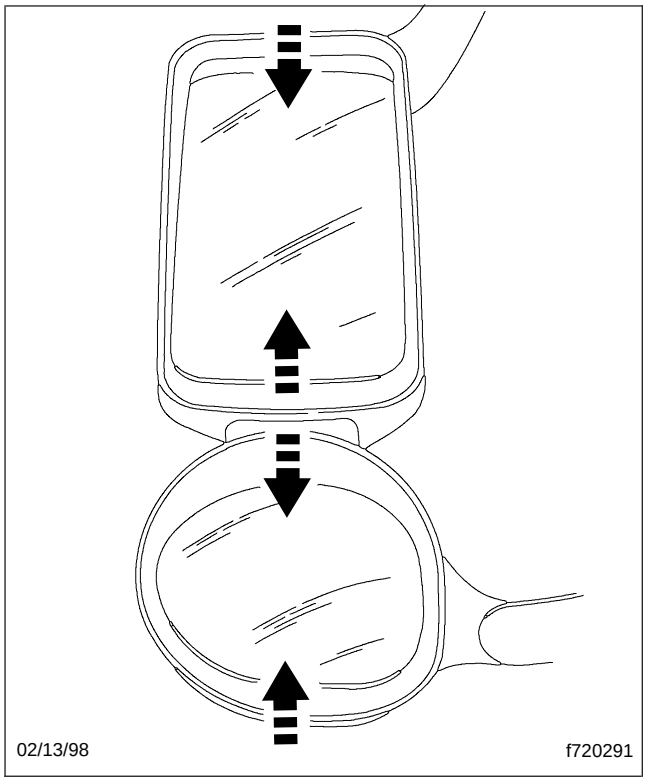

Fig. 1, Mirror Glass

2. Position the mirror glass in the full down-facing position. Place a hand on the bottom of the mirror glass, and lift upward until the glass is released. See **Fig. 2**.
3. Disconnect the electrical connectors, and remove the mirror glass. See **Fig. 3**.

Installation

1. Connect the electrical connectors to the mirror glass.

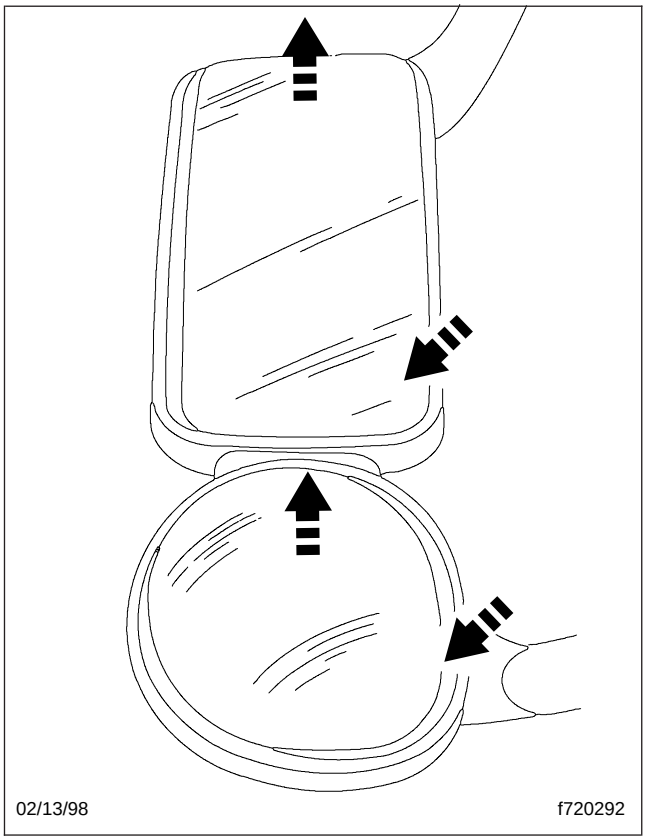

Fig. 2, Glass Removal

2. Align the mirror glass retainer tabs on the mirror actuator, and slide downward until the mirror and actuator are fully engaged.

Aerodynamic Mirror Glass Removal and Installation

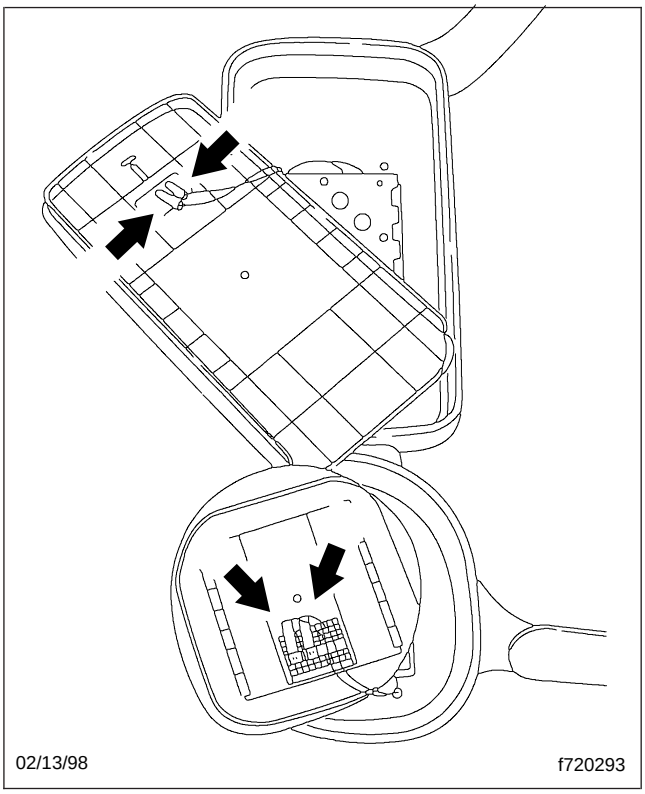

Fig. 3, Mirror Electrical Connector

Aerodynamic Mirror Actuator Replacement

Replacement

NOTE: Removal of the upper and lower actuator follows the same procedure.

1. Remove the mirror glass. Refer to **Subject 140**.
2. Remove the Allen-head screws. See **Fig. 1**.

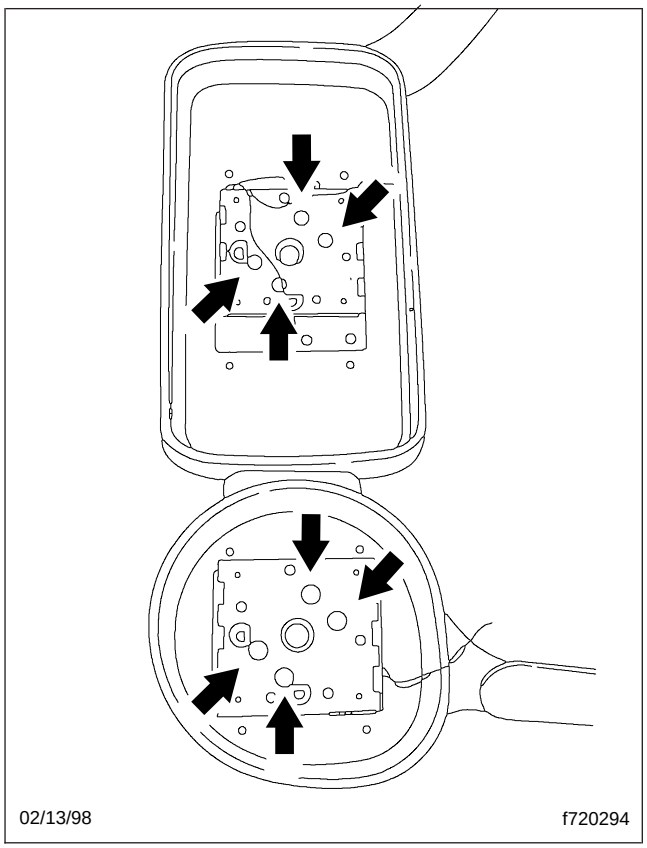

Fig. 1, Location of Allen Head Screws

3. Disconnect the actuator electrical connectors. Pay particular attention to the wiring order to aid in installation. See **Fig. 2**.
4. Remove the actuator.
5. Replace the actuator.
6. Connect the actuator electrical connectors. See **Fig. 2**.
7. Install the Allen-head screws. See **Fig. 1**.
8. Install the mirror glass. Refer to **Subject 140**.

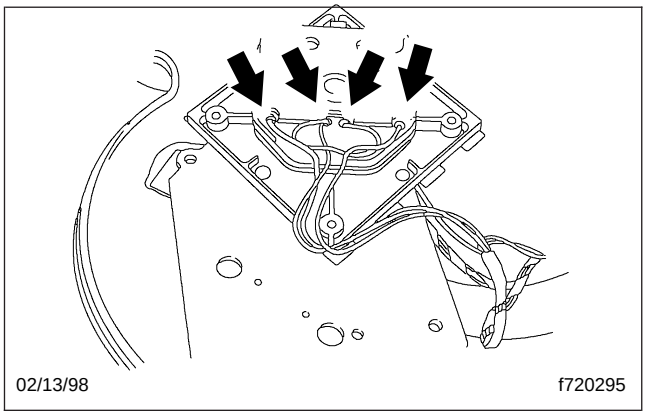

Fig. 2, Actuator Electrical Connectors

Aerodynamic Mirror Harness Replacement

Replacement

1. Remove the mirror glass. Refer to **Subject 140**.
2. Remove the actuator. Refer to **Subject 150**.
3. Remove the mirror bezel screws and the mirror bezel. See **Fig. 1**.

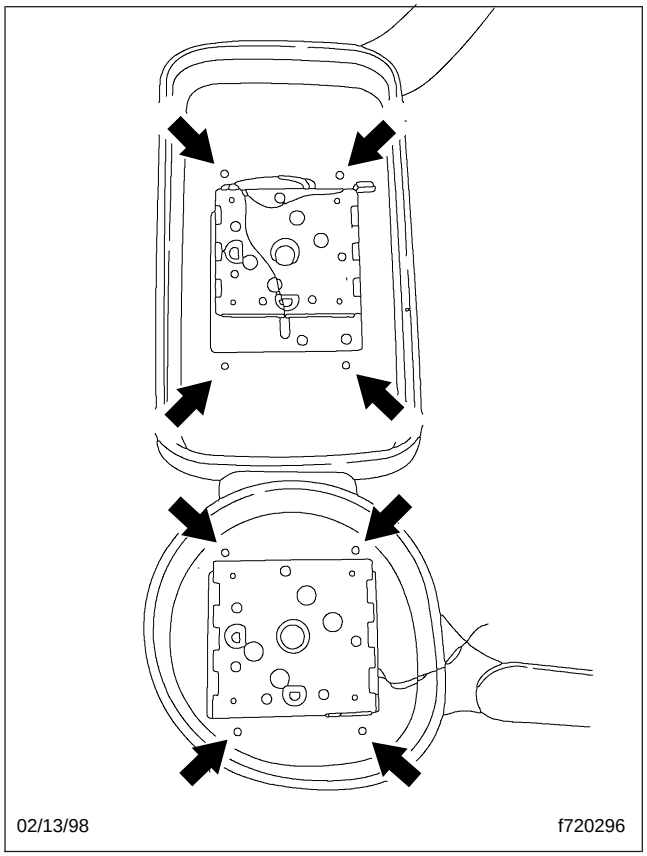

Fig. 1, Mirror Bezel and Screws

4. Remove the power mirror switch(es). Refer to **Subject 170**.
5. Remove the door trim panel. See **Fig. 2**.
6. Remove the lower mirror bracket trim cover. See **Fig. 3**.
7. Support the mirror assembly and remove the lower mirror bracket pivot bolt, shim and spring. See **Fig. 4**.
8. Remove the lower mirror mounting bracket.
9. Remove the harness through the door.

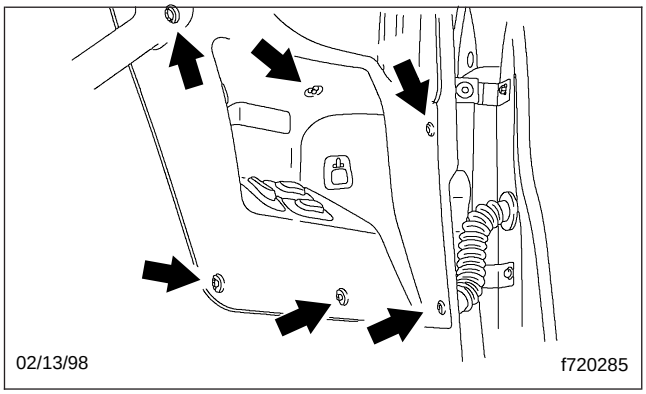

Fig. 2, Door Trim Panel

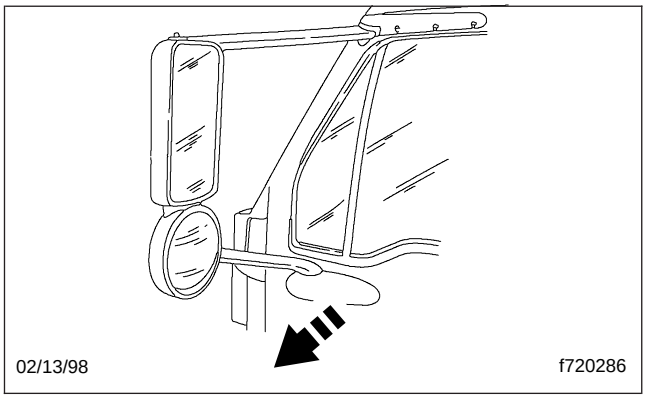

Fig. 3, Lower Mirror Bracket Trim Cover

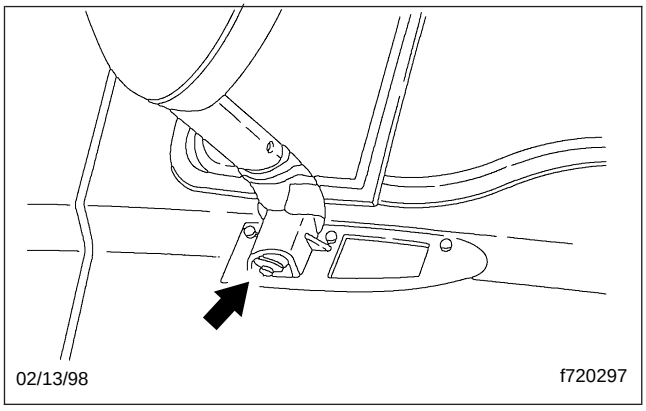

Fig. 4, Pivot Bolt

10. Install the harness through the door.
11. Install the lower mirror mounting bracket. Tighten the screws 84 to 108 lbf·in (99 to 120 N·cm).

Aerodynamic Mirror Harness Replacement

12. Support the mirror assembly and Install the lower mirror bracket pivot bolt, shim and spring. See **Fig. 4**. Tighten the bolt 30 lbf·ft (40 N·m).
13. Install the lower mirror bracket trim cover. See **Fig. 3**.
14. Install the door trim panel. See **Fig. 2**.
15. Install the power mirror switch(es). Refer to **Subject 170**.
16. Install the mirror bezel screws and the mirror bezel. See **Fig. 1**.
17. Install the actuator. Refer to **Subject 150**.
18. Install the mirror glass. Refer to **Subject 140**.

Replacement

1. Carefully pry the power mirror switch from the driver side door trim panel. See **Fig. 1**.

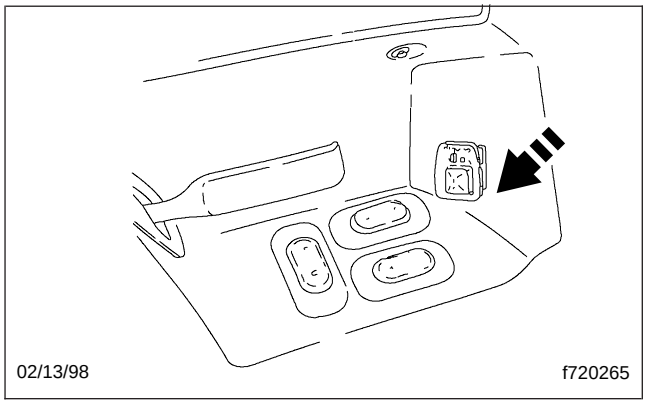

Fig. 1, Power Mirror Switch

2. Depress the electrical connector locking tab and separate the power mirror switch from the electrical harness. See **Fig. 2**.

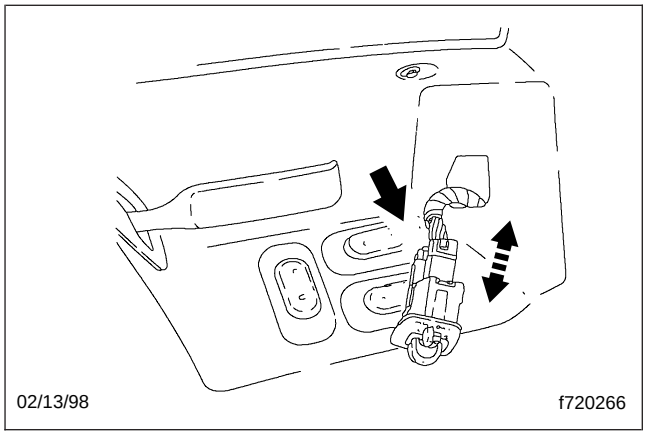

Fig. 2, Power Mirror Switch Electrical Connector

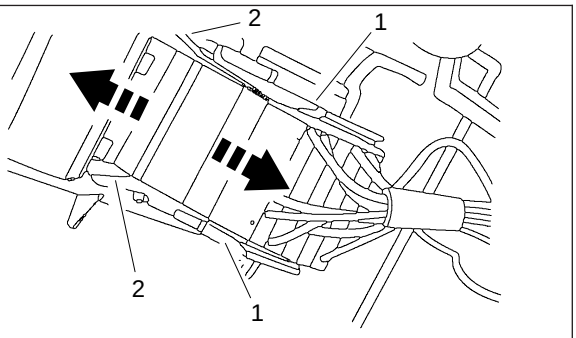
3. Connect the power mirror switch to the electrical harness. See **Fig. 2**.
4. Install power mirror switch into the driver side door trim panel. See **Fig. 1**.

Heated Mirror Switch Replacement

Replacement

1. Remove the right-hand instrument panel trim panel. Refer to **Group 54**.
2. Remove the heated mirror switch. See **Fig. 1**.



02/13/98 f720268

1. Electrical Connector Locking Tabs
2. Heated Mirror Retaining Tabs

Fig. 1, Heated Mirror Switch Removal

   2.1 Release the locking tabs, and disconnect the electrical connector.

   2.2 Depress the heated mirror retaining tabs, and push the switch through the front of the trim panel.

3. Install the heated mirror switch. See **Fig. 1**.

   3.1 Depress the heated mirror retaining tabs, and push the switch into the front of the trim panel.

   3.2 Insert the locking tabs, and connect the electrical connector.

4. Install the right-hand instrument panel trim panel. Refer to **Group 54**.

Troubleshooting

Inspection and Verification

1. Verify the customer complaint by operating the rearview mirrors.
2. Visually inspect for obvious signs of mechanical and electrical damage. Refer to **Table 1**.

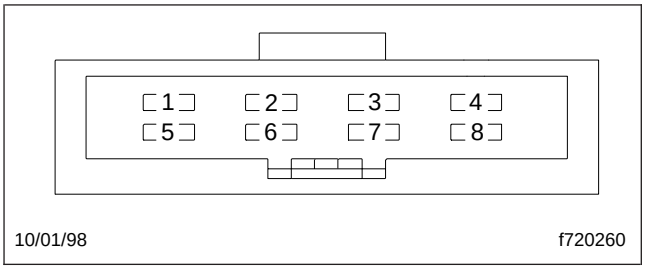


Fig. 1, Rearview Mirror Control Pin Identification

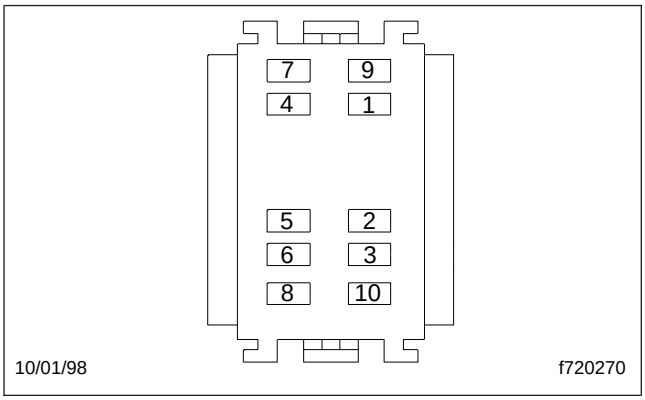

Fig. 2, Heated Mirror Connector Pin Identification

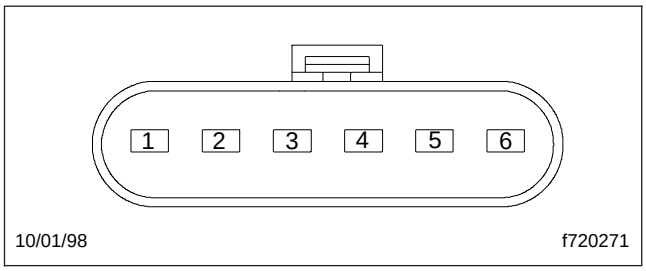

Fig. 3, Left Heated Mirror Connector Pin Identification

Visual Inspection Chart	
Mechanical	**Electrical**
Damaged mirror(s) Damaged outside rearview mirror control	Blown fuse Damaged wiring Loose, corroded, or dirty connections Damaged outside rearview mirror control Damaged rearview mirror heating element

Table 1, Visual Inspection Chart

Problem—Both Right-Hand and Left-Hand Mirrors Inoperative

Problem—Both Right-Hand and Left-Hand Mirrors Inoperative (See Fig. 1)	
Possible Cause	**Remedy**
Fuse	Check the fuse input voltage. Disconnect the IP fuse junction panel, Fuse 14, (10 A) harness connector. Measure the voltage on the input side of fuse Cavity 14. If the voltage is less than 10 volts, repair the IP fuse junction panel feed circuit. Test the system for normal operation. If the voltage is 10 volts or greater, reinstall Fuse 14 (10 A) and check the rearview mirror control.

Troubleshooting

Problem—Both Right-Hand and Left-Hand Mirrors Inoperative (See Fig. 1)	
Possible Cause	**Remedy**
Mirror control	Check the rearview mirror control. Disconnect the rearview mirror control harness connector. Recheck the rearview mirror control. If the rearview mirror control does not work, replace the rearview mirror control. Test the system for normal operation. If the rearview mirror control is OK, check the system ground circuit. Measure the resistance between the rearview mirror connector C509, Pin 4, Circuit 57 (BK) and a known good ground. If the resistance is 5 ohms or less, repair Circuit 101 (GY). Test the system for normal operation. If the resistance is more than 5 ohms, repair Circuit 57 (BK). Test the system for normal operation.
Ground Circuit	
Circuit	
Motor	

Problem—Single Mirror Inoperative

Problem—Single Mirror Inoperative	
Possible Cause	**Remedy**
Mirror control	Check the rearview mirror control. Disconnect the rearview mirror control harness connector. Test the rearview mirror control. If the rearview mirror control does not test OK, replace the rearview mirror control. Test the system for normal operation. If the rearview mirror control does test OK, check the inoperative rearview mirror motor. Disconnect the inoperative rearview mirror harness connector. Check the operation of the inoperative rearview mirror motor. Refer to "Outside Mirror Motor" under "Component Tests" in this subject. If the inoperative rearview mirror motor tests OK, repair Circuit 24 (BL/Y) or Circuit 104 (GN) (left-hand), Circuit 102 (P) or Circuit 104 (GN) (right-hand). Test the system for normal operation. If the inoperative rearview mirror motor does not test OK, replace the inoperative rearview mirror motor. Test the system for normal operation.
Motor	
Circuit	

Problem—Heated Outside Mirror Does Not Defrost

Problem—Heated Outside Mirror Does Not Defrost (See Fig. 1 and Fig. 2)	
Possible Cause	**Remedy**
Relay	Check the windshield wiper operation. Turn the ignition switch to the ACC position. Check the operation of the windshield wipers. If the windshield wipers do not operate, check the run/accessory power relay. Disconnect the IP fuse junction panel run/accessory power replay harness connector. Check the run/accessory power relay. Refer to "Relay" under "Component Tests" in this subject. If the relay tests OK, reinstall the relay. Repair Circuit 37 (BK/Y). Test the system for normal operation. If the relay does not test OK, replace the relay. Test the system for normal operation. If the windshield wipers do operate, check the heated mirror switch.
Fuse	
Switch	Check the heated mirror switch. Disconnect the heated mirror switch harness connector. Disconnect and remove the heated mirror switch. Refer to "Replacement" in **Subject 100**. Place the heated mirror switch in the "On" position. Measure the resistance of the heated mirror switch between Pin 2B and Pin 3. If the resistance is not 5 ohms or less, replace the heated mirror switch. Test the system for normal operation. If the resistance is 5 ohms or less between Pin 2B and Pin 3, check Circuit 960 (R).

Problem—Heated Outside Mirror Does Not Defrost (See Fig. 1 and Fig. 2)	
Possible Cause	**Remedy**
Circuit	Check Circuit 960 (R). Turn the ignition switch to the ACC position. Measure the voltage on the heated mirror connector C2021, Pin 3, Circuit 960 (R). If the voltage is less than 10 volts, repair Circuit 960 (R). Test the system for normal operation. If the voltage is greater than 10 volts, check Circuit 59 (GN/P). Measure the resistance between the heated mirror switch connector C2021, Pin 3, Circuit 59 (GN/P) and the left heated mirror connector C506, Pin 3, Circuit 59 (GN/P). Repeat the step for the right heated mirror connector C601, Pin 3, Circuit 59 (GN/P). If the resistance is more than 5 ohms, repair Circuit 59 (GN/P). Test the system for normal operation. If the resistance is less than 5 ohms, check ground Circuit 57 (BK).
Heating element	Measure the resistance between the left heated mirror connector C506, Pin 1, Circuit 57 (BK) and a known good ground. Repeat the step for the right heated mirror connector C601, Pin 1, Circuit 57 (BK). If the resistance is 5 ohms or less, replace the outside mirror. Test the system for normal operation. If the resistance is more than 5 ohms, repair Circuit 57 (BK). Test the system for normal operation.

Component Tests

Outside Mirror Motor

1. Disconnect the suspect outside rearview mirror. Refer to "Western-Type Power Mirror Replacement" in **Subject 110**.
2. Connect jumper wires to the rearview mirror motor. See **Fig. 4**
   - 2.1 Connect a 10 gauge (or larger) jumper wire to Terminal 5 of the rearview mirror motor.
   - 2.2 Connect a second 10 gauge (or larger) jumper wire to Terminal 6 of the rearview mirror motor.
   - 2.3 Observe the operation of the rearview mirror.
3. Reverse the jumper wires. See **Fig. 5**.
   - 3.1 Reverse the jumper wires on the rearview mirror motor.
   - 3.2 Observe the operation of the rearview mirror (the mirror should operate in reverse).
4. If the rearview mirror motor does not operate, the rearview mirror must be replaced. Refer to "Western-Type Power Mirror Replacement" in **Subject 110**.

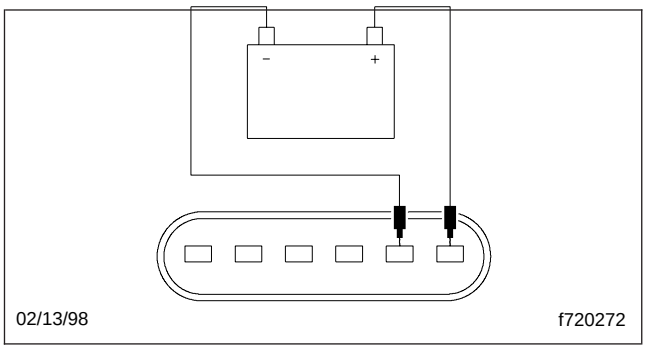

Fig. 4, Connect Jumper Wires

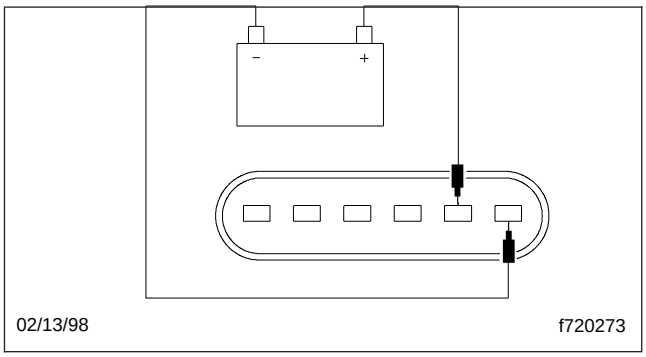

Fig. 5, Reverse the Jumper Wires

Relay

Use the following procedure to test the run/accessory power relay:

Troubleshooting

1. Locate and remove the run/accessory power relay in the instrument panel fuse junction panel. See **Fig. 6**.

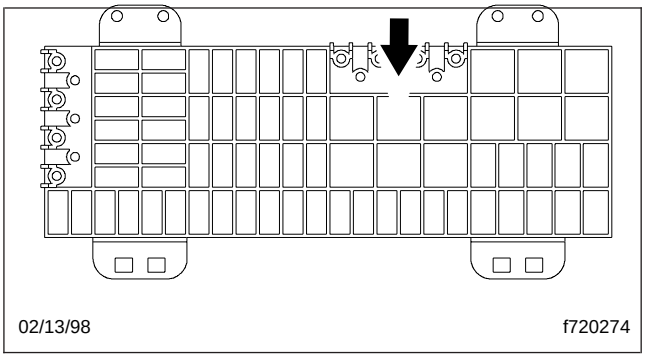

Fig. 6, Instrument Panel Fuse Junction Panel

2. Using two No. 10 (or larger gauge) jumper wires, connect relay Terminals 86 and 30 directly to the positive battery terminal. See **Fig. 7**.

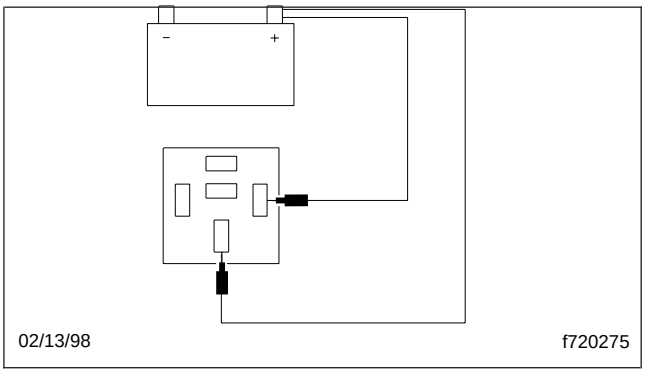

Fig. 7, Connect a Jumper From Terminals 86 and 30 to Battery

3. Connect a voltmeter to Terminal 87A. Ten volts or greater should be present. If 10 volts or greater is not present, replace the relay. If 10 volts or greater is present, continue with the test. See **Fig. 8**.
4. Connect a third jumper wire to Terminal 85 and chassis ground. See **Fig. 9**.
5. Check for voltage at Terminal 87. Ten volts or greater should be present. If 10 volts or greater is not present, replace the relay. See **Fig. 10**.

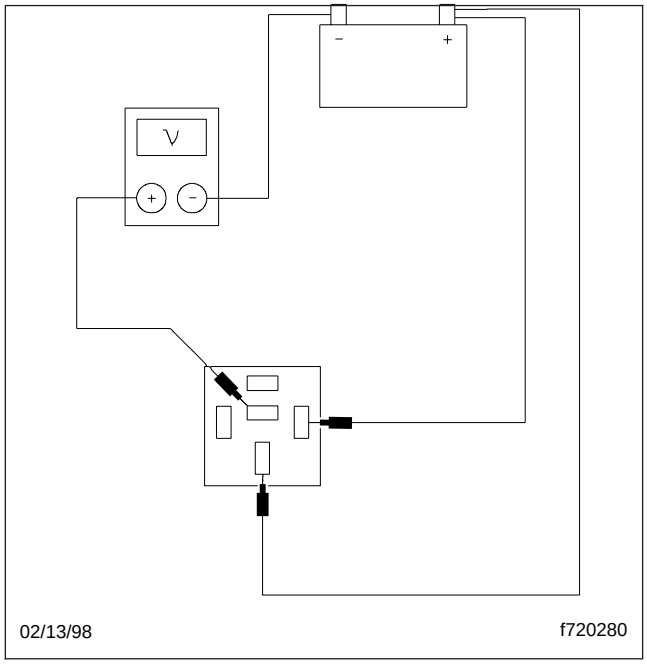

Fig. 8, Connect a Voltmeter to Terminal 87A

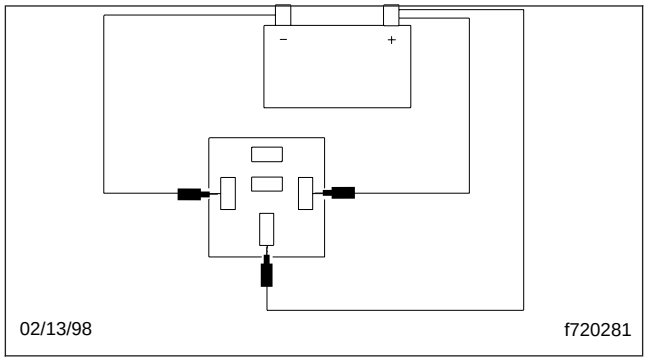

Fig. 9, Connect a Jumper From Terminal 85 to Ground

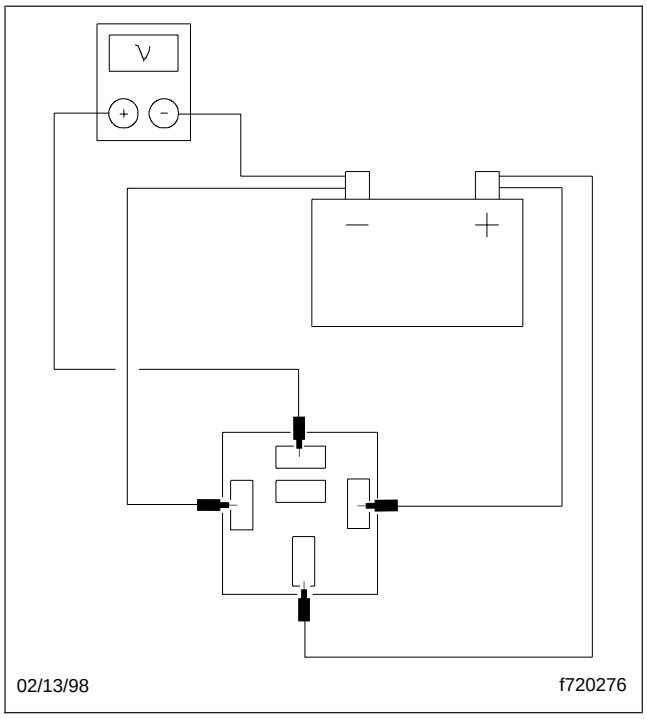

Fig. 10, Connect a Jumper From Terminal 87 to Ground

Table 1, Torque Specifications

General Information

Cab rear air-suspension systems absorb road shocks better than solid-mount systems, and thus provide a smoother ride for cab occupants and cab-mounted equipment.

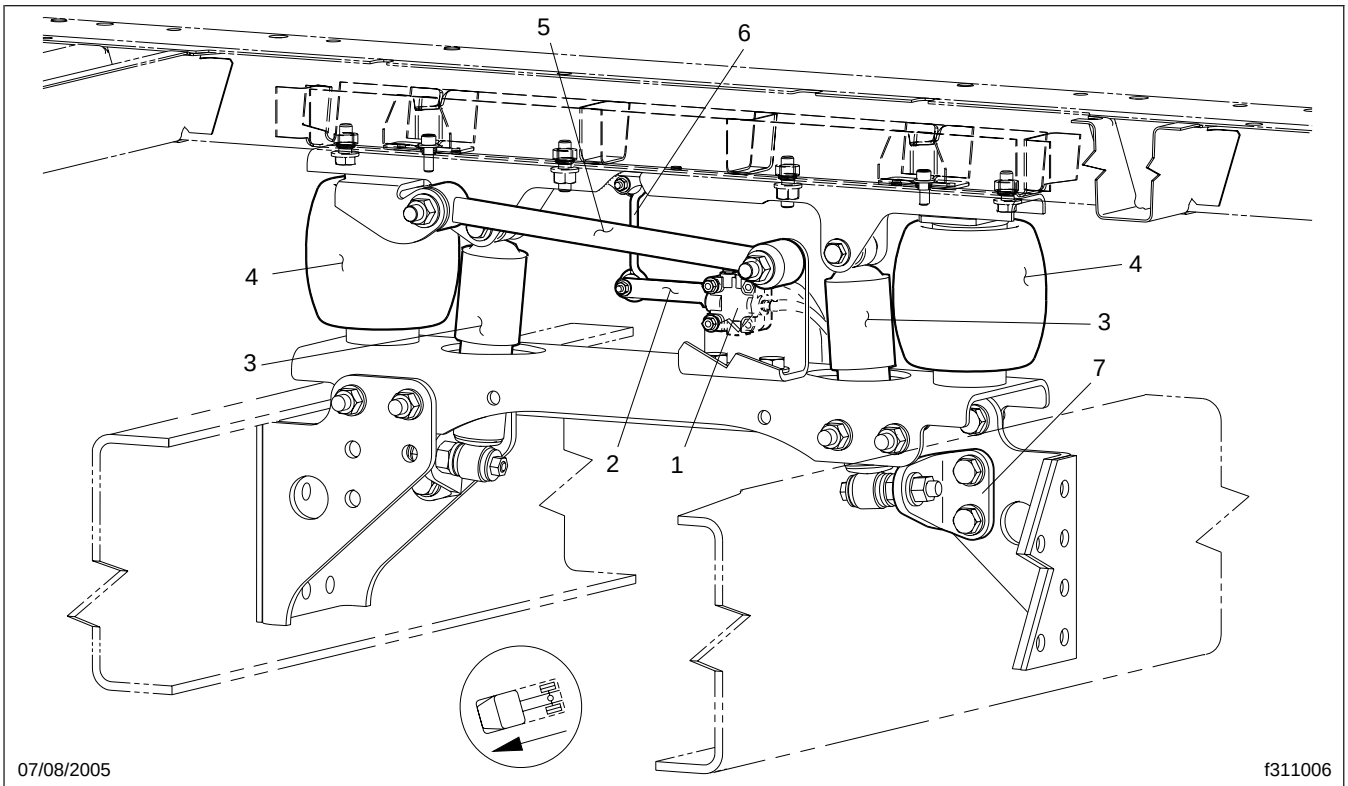
The cab air-suspension system consists of one or two air springs, a height-control valve, a lateral control rod, two shock absorbers, and a vertical linkage. See **Fig. 1**. Several types of cab air-suspension are used in the L-Line and A-Line models, depending on the size of the cab; see **Fig. 2**.

changes in cab load by maintaining the correct cab height at the rear of the cab.

Height-Control Valve

NOTE: If a leak occurs in the cab air-suspension system, a pressure protection valve (located at the secondary air tank, which supplies the air to the height-control valve) will maintain a minimum pressure of about 65 psi (450 kPa) in the vehicle secondary air system.

All of the air in the cab air-suspension system is admitted through or exhausted from the height-control valve. The height-control valve has a horizontal control lever, the outboard end of which is connected to a vertical linkage. The upper end of the vertical linkage is attached to the cab underbody.



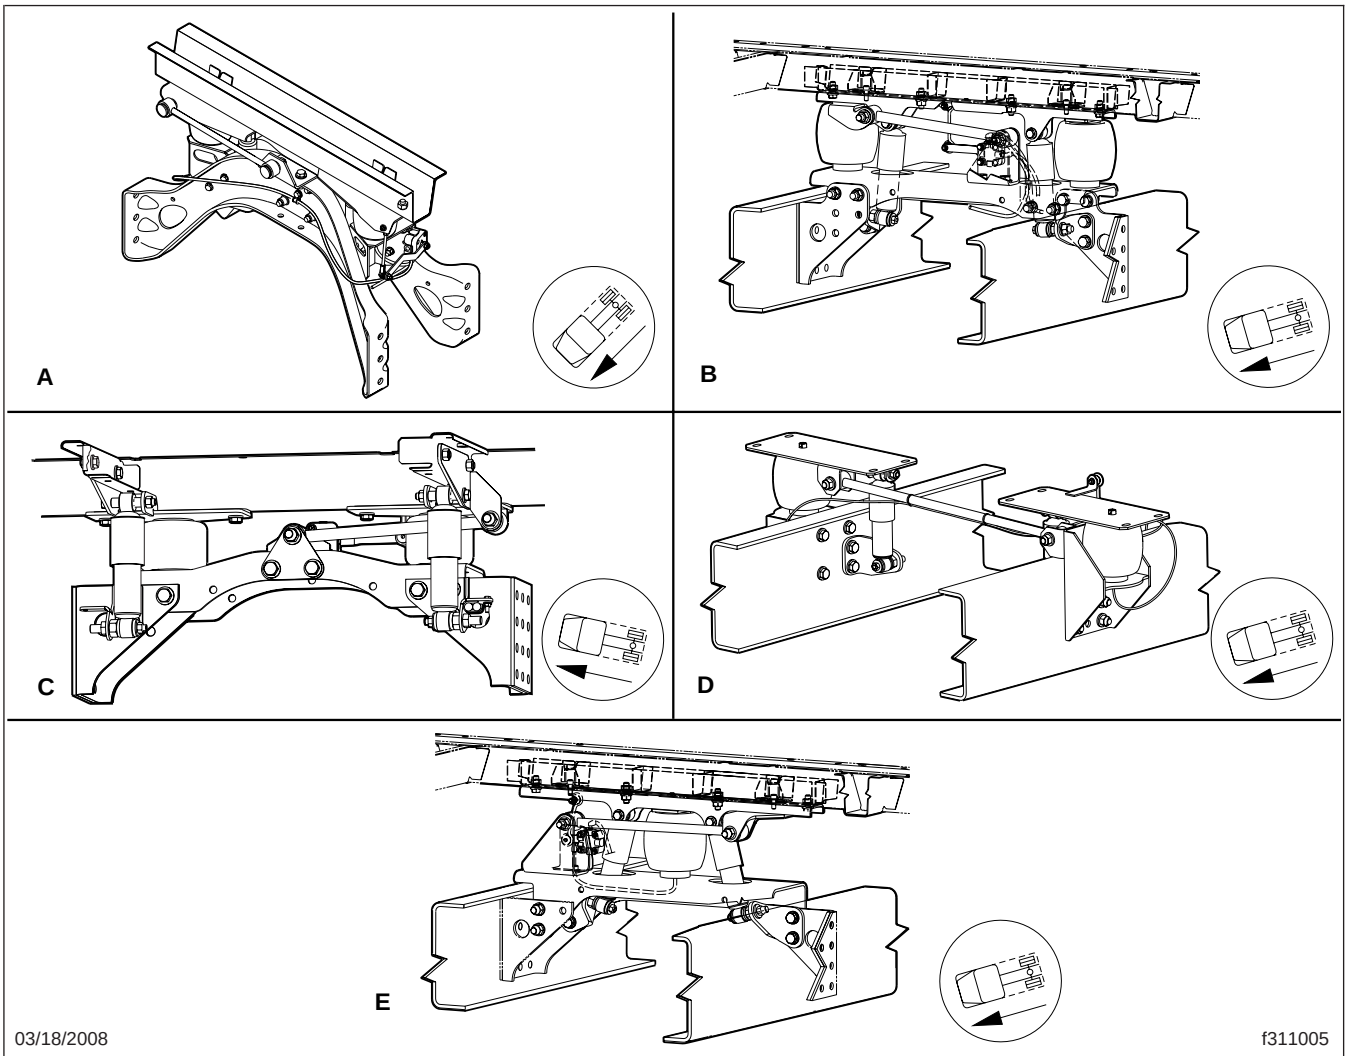
1. Cab Height-Control Valve
2. Horizontal Control Lever
3. Shock Absorber
4. Air Spring
5. Lateral Control Rod
6. Vertical Linkage
7. Lower Shock Mount Bracket

Fig. 1, Cab Air Suspension Installation

Air Springs

The top of each air spring is mounted to a bracket on the cab underbody, and the bottom is mounted to the frame rail crossmember or bracket. Together with the height-control valve, the air springs compensate for

General Information



A. A-Line (including SilverStar) and L-Line
B. A-Line (including SilverStar) and L-Line
C. A-Line and L-Line with 101-inch Cab
D. A-Line (including SilverStar) and L-Line with Sleeper
E. L-Line with 111- or 113-inch Day Cab

Fig. 2, Cab Air Suspension Systems

When the load on the cab increases, the dimension between the cab and the crossmember decreases, causing the vertical linkage to push downward on the end of the horizontal control lever. This turns the height-control valve shaft, which activates the height-control valve. Air flows through the valve and into the air springs until the pressure in the springs raises the cab to the correct height. At this height, the control lever and the control shaft are returned to their neutral positions, closing the intake air supply.

When the load on the cab decreases, the rear of the cab rises, causing the vertical linkage to pull up on the end of the horizontal control lever. Turning the height-control valve shaft in this direction activates an exhaust port in the valve. This allows air pressure in the air springs to decrease until the cab is lowered to the correct height. Again, the control lever and control shaft are returned to their neutral positions, and air flow is stopped.

When the vehicle is in motion, small and abrupt movements of the cab will occur, resulting in small or abrupt movements of the control lever. These movements of the control lever do not activate the height-control valve to correct the cab ride height.

Changes in load that occur when occupants or heavy items are added to or removed from the cab will activate the height-control valve to correct the cab ride height. Also, when the vehicle is moving forward at high speed or in a high headwind, a major change in load occurs from the downforce applied to an optional air shield or air fairing. When these changes in load occur, the cab air-suspension system will correct the cab ride height at the rear of the cab.

Lateral Control Rod

The lateral control rod limits the side-to-side motion of the rear of the cab.

Shock Absorbers

The shock absorbers control the air spring and cab suspension movement, and reduce the amount of oscillation in the cab suspension system.

Fitting Leakage Repair

1. Apply the parking brakes and chock the tires.

⚠ WARNING

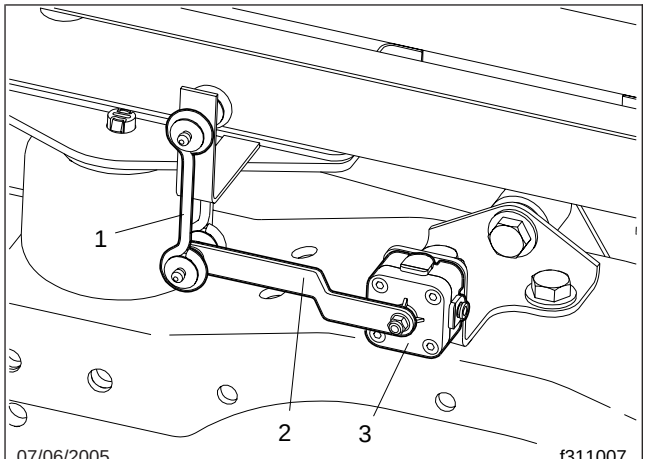
Do not disconnect any air lines in the cab suspension system without first blocking the cab securely. If the cab isn't securely blocked, disconnecting an air line could cause the cab to fall abruptly, possibly resulting in serious injury.

2. Place blocks between the frame and the bottom of the cab to keep the cab in position when the air springs are deflated.
3. Drain all air from the air tanks.

⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

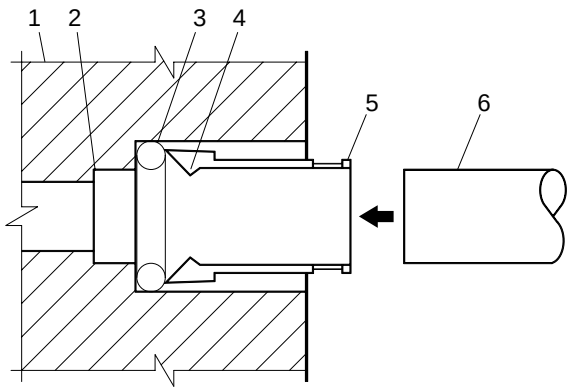
4. Remove the nut and washer that attach the vertical linkage to the horizontal control lever. Disconnect the vertical linkage from the control lever; see **Fig. 1**.



1. Vertical Linkage
2. Horizontal Control Lever
3. Cab Height-Control Valve

Fig. 1, Cab Height-Control Valve Linkage

5. Rotate and hold the control lever up until all air is exhausted from the air spring.
6. Push the collar of the quick-connect fitting into the fitting body with a 1/4-inch (7-mm) open-end wrench; see **Fig. 2**. With the collar pushed into the fitting, pull the tubing from the fitting. The fitting should easily release the tubing.



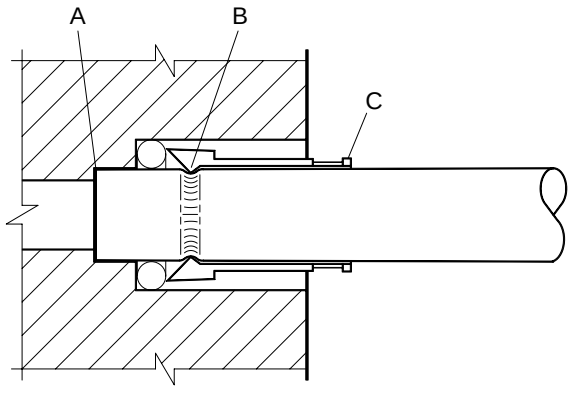
1. Fitting Body
2. Shoulder
3. Release Ring
4. Clamping Ring
5. Collar
6. Nylon Tube

Fig. 2, Parts of the Quick-Connect Fitting

NOTE: Find the mark on the tubing, about 1/4 inch (7 mm) from the end, where the collar clamped the tubing; see **Fig. 3**. If this mark is less than 1/4 inch (7 mm) from the end of the tubing, the fitting was not assembled correctly and could have caused an air leak.

7. Inspect the end of the tubing for paint or debris that could prevent full insertion of the tubing into the fitting. Remove any dirt from the tubing and fitting.
8. Check that the end of the tubing is cut square. If the tubing is cut at an angle, the fitting will not seal correctly; cut the end of the tubing at an angle of 90 degrees.
9. Insert the squared end of the tubing into the fitting. An initial resistance is felt when the tubing touches the clamping ring section of the collar. Push the tubing past this resistance another 1/4 inch (7 mm) or so until the tubing is fully seated against the shoulder.

Quick-Connect Fittings



A. Square end of the tube against the shoulder.
B. The collar clamps the tube here.
C. Push the collar to release the tube.

Fig. 3, Correctly Installed Quick-Connect Fitting

10. Tug on the air tubing to ensure the tubing is clamped in the collar.
11. Align the vertical linkage with the control lever, and install the washer and nut.
12. Run the engine to build vehicle air pressure to at least 100 psi (690 kPa). Check for air leaks.
13. Remove the blocks that were installed to support the cab.
14. Remove the chocks.

Fitting Leakage Repair

1. Apply the parking brakes and chock the tires.

⚠ WARNING

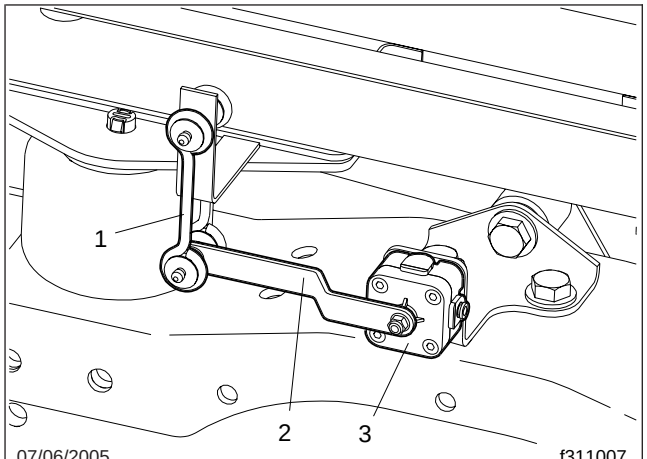
Do not disconnect any air lines in the cab suspension system without first blocking the cab securely. If the cab isn't securely blocked, disconnecting an air line could cause the cab to fall abruptly, possibly resulting in serious injury.

2. Place blocks between the frame and the bottom of the cab to keep the cab in position when the air springs are deflated.
3. Drain all air from the air tanks.

⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

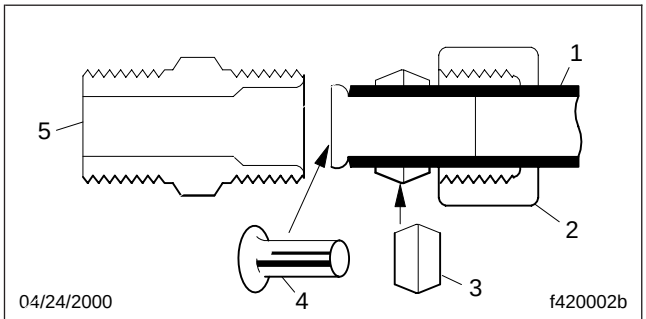
4. Remove the nut and washer that attach the vertical linkage to the horizontal control lever. Disconnect the vertical linkage from the control lever; see **Fig. 1**.



1. Vertical Linkage
2. Horizontal Control Lever
3. Cab Height-Control Valve

Fig. 1, Cab Height-Control Valve Linkage

5. Rotate and hold the control lever up until all air is exhausted from the air spring.
6. Loosen the fitting nut and remove the air tube; see **Fig. 2**.



1. Air Tube
2. Nut
3. Sleeve
4. Stainless Steel Insert
5. Body

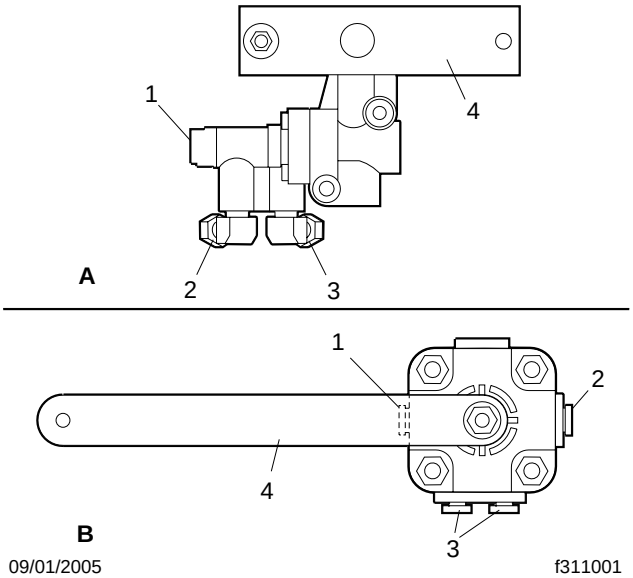
Fig. 2, Air Tube and Compression Fitting

7. Clean all of the fitting components.
8. Check that the end of the tubing is cut square. If the tubing is cut at an angle other than 90 degrees, the fitting will not seal correctly; cut the end of the tubing at a 90-degree angle.
9. Install the nut and sleeve on the air tube.
10. Insert the squared end of the air tube onto the stainless steel insert. Push it into the body of the fitting until it is fully seated against the shoulder.
11. Tighten the nut finger-tight, then an additional three turns.
12. Tug on the air tube to ensure that it is clamped in the nut.
13. Align the vertical linkage with the control lever, and install the washer and nut.
14. Run the engine to build vehicle air pressure to at least 100 psi (690 kPa). Check for air leaks.
15. Remove the blocks that were installed to support the cab.
16. Remove the chocks.

Height-Control Valve Checking

It is normal to hear air leaking from the height-control valve for as much as five minutes after getting out of the vehicle. This air leakage is just the height-control valve exhausting air from the cab suspension air spring to reach the neutral position.

Two types of height-control valves are used on L-Line and A-Line vehicles: a Sterling height-control valve or a Barksdale height-control valve; see **Fig. 1**. Two methods are available to check the operation of the Barksdale height-control valves. A leak in the valve may be discovered without using a test kit, but a test kit is necessary to determine if the valve has an unacceptable rate of leakage. The Sterling valve can only be checked without a test kit.



A. Sterling Height-Control Valve
B. Barksdale Height-Control Valve

1. Exhaust Port
2. Supply Port
3. Air Spring Port
4. Horizontal Control Lever

Fig. 1, Height-Control Valves

Some Barksdale height-control valves have been returned for warranty because the four bolts in the valve housing were overtightened, often, enough to crack the valve housing. These bolts should not be loose, and should not normally require tightening, as there are no serviceable parts in the valve.

IMPORTANT: To prevent voiding the warranty on Barksdale height-control valves, note the following:

- Do not overtighten the bolts in the Barksdale height-control valve housing if you detect leaks in the housing. The bolts should not be loose, and should not require tightening. Only if necessary, tighten the valve housing bolts 45 lbf·in (500 N·cm). Any damage to the valve housing will void the warranty.
- If it is necessary to remove a Barksdale height-control valve from a mounting bracket, always hold the valve-side mounting studs in place with an Allen wrench while loosening or tightening the nuts that attach the valve to the bracket. Because the mounting studs are threaded into the valve body, loosening the nuts without holding the studs can tighten the studs, crushing the valve body and damaging the valve. Conversely, tightening the nuts without holding the studs can back the studs out, causing a separation of the two halves of the valve body, and possibly a leak.
- Do not attempt to disassemble the Barksdale valve body or the control lever. There are no serviceable parts in the valve, and any disassembly will void the warranty.

Checking a Sterling or Barksdale Height-Control Valve Without Using a Test Kit

WARNING

Keep your hands and all objects away from the area under and around the cab when removing the pressure from the air system. Parts will move as the air is released and can cause personal injury or damage to any objects that are between the moving parts.

1. If not already done, apply the parking brakes and chock the tires.

Height-Control Valve Checking

2. Run the engine to build vehicle air pressure to at least 100 psi (690 kPa).
3. Shut off the engine and wait 5 to 10 minutes for the air suspension system to equalize.

NOTE: Normal operation of the height-control valve requires a maximum of 10 minutes to settle. Any air leakage during this time is considered normal, and does not indicate a defective valve.

4. Check all of the fittings and the valve body using a soap-and-water solution. Seal any leaks as necessary.
5. Check the valve exhaust port, and the rubber exhaust flapper, if so equipped, for leaks using a soap-and-water solution. The exhaust port is on the side opposite the supply port of the valve.

NOTE: If a leak is detected on a Barksdale height-control valve, go to "Checking a Barksdale Height-Control Valve Using a Test Kit". Barksdale valves have an acceptable leak rate of 3 cubic inches (50 cc) per minute. You can determine if a leak is acceptable only by using the Barksdale test kit.

If a leak is detected at the exhaust port on a Sterling height-control valve, the valve is defective. Replace it, following the procedure in **Subject 130**.

⚠ WARNING

Do not disconnect the vertical linkage in the cab suspension system without first blocking the cab securely. If the cab is not securely blocked, moving the control lever could cause the cab to drop abruptly, possibly resulting in serious injury.

6. Disconnect the vertical linkage from the control lever.
7. Pull the control lever up about 45 degrees for 6 to 8 seconds. If air passes through the valve, that section of the valve is okay.
8. Return the control lever to the neutral position.
9. Push the control lever down about 45 degrees for 6 to 8 seconds. If the air spring inflates, that section of the valve is okay.
10. Return the control lever to the neutral position. If the air stops again in the neutral position, the valve is working correctly.
11. If the valve works as stated in all of the above steps, no further checking is needed. Connect the vertical linkage to the control lever, then tighten the linkage nut.

    If needed, adjust the cab ride height or replace the height-control valve. For adjustment of the cab ride height, see **Subject 180**. For replacement of the height-control valve, see **Subject 130**.

NOTE: For some vehicle applications, the cab ride height is preset in the factory, and is not adjustable.

12. Remove the chocks.

Checking a Barksdale Height-Control Valve Using a Test Kit

IMPORTANT: The procedure described below is for use on Barksdale height-control valves only.

⚠ WARNING

Keep your hands and all objects away from the area under and around the cab when removing the pressure from the air system. Parts will move as the air is released and can cause personal injury or damage to any objects that are between the moving parts.

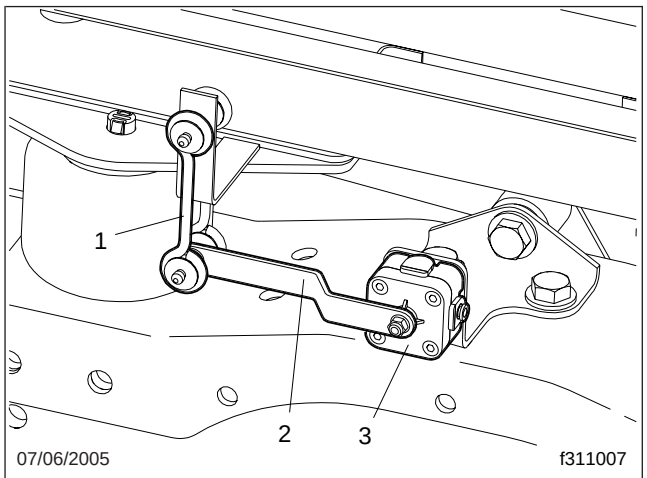
NOTE: The Barksdale field test kit is designed to be used with the height-control valve installed on the vehicle. Refer to **Specifications 400** for information on ordering the Barksdale height-control valve test kit KD2264.

1. If not already done, park the vehicle on a level surface, apply the parking brakes, and chock the tires.
2. Run the engine to build vehicle air pressure to at least 100 psi (690 kPa).
3. Shut off the engine and wait 5 to 10 minutes for the air suspension system to equalize.

NOTE: Normal operation of the height-control valve requires a maximum of 10 minutes to

settle. Any air leakage during this time is considered normal, and does not indicate a defective valve.

4. Check the rubber exhaust flapper at the back of the valve housing for leaks. Use a soapy solution.
5. Disconnect the vertical linkage from the control lever; see **Fig. 2**.



1. Vertical Linkage
2. Horizontal Control Lever
3. Cab Height-Control Valve

Fig. 2, Height-Control Valve Linkage (Barksdale shown)

6. Rotate and hold the control lever up at about 45 degrees to exhaust air from the air springs.
7. Disconnect the air lines from the air spring ports on the height-control valve. Leave the elbow fittings (if equipped) in place. Install a Parker plug into each air spring port (or elbow fitting); see **Fig. 3**.
8. If a flapper is present on the exhaust port of the height-control valve, remove it using needlenose pliers.
9. Clean the surface around the exhaust port, then install the test fitting into the exhaust port. The centering pin on the fitting must align with the slot on the exhaust port. Rotate the test fitting 45 degrees clockwise to lock it in place; see **Fig. 3**.
10. Connect one end of the air hose from the kit to the test connector on the exhaust port, and the other end to the test gauge.
11. Check the height-control valve in the fill mode, as follows.
    - 11.1 Rotate the valve control lever down 45 degrees from the horizontal to the fill position.
    - 11.2 Press the reset button on the test gauge.
    - 11.3 Observe the test gauge for 30 seconds. Refer to **Fig. 4** for the maximum allowable exhaust pressure change versus inlet pressure.

      The valve is not working correctly if the gauge pressure reading exceeds the maximum allowable within 30 seconds.

      If the gauge reads less than the maximum allowable pressure change in 30 seconds, the valve is okay.

NOTE: The test gauge will register the exhausting air. *This does not indicate a defective valve.*

12. Check the height-control valve in the exhaust mode, as follows.
    - 12.1 Rotate the valve control lever up 45 degrees from the horizontal to the exhaust position.
    - 12.2 Press the reset button on the test gauge.
    - 12.3 Observe the test gauge for 30 seconds. Refer to **Fig. 4** for the maximum allowable exhaust pressure change versus inlet pressure.

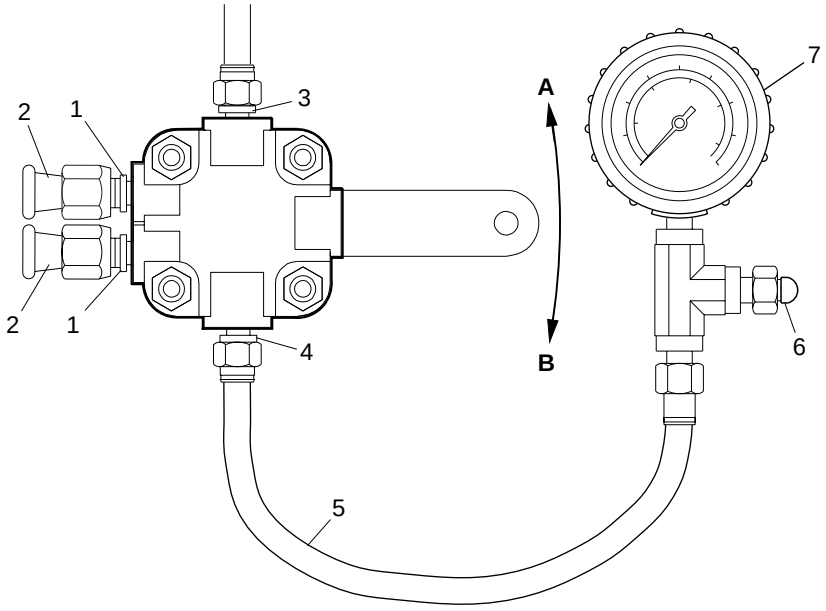
      The valve is not working correctly if the gauge pressure reading exceeds the maximum allowable within 30 seconds.

      If the gauge reads less than the maximum allowable pressure change in 30 seconds, the valve is okay.

NOTE: The test gauge will register the exhausting air. *This does not indicate a defective valve.*

13. Disconnect the test gauge and connector from the valve exhaust port.
14. If the height-control valve is defective, replace it; see **Subject 130**.
15. Install the flapper on the exhaust port by pressing it into place.

Height-Control Valve Checking



A. Exhaust
B. Fill

1. Air Spring Port

3. Air Intake Port
4. Exhaust Port Test Fitting
5. Air Line
6. Reset Button
7. Test Gauge Assembly

Fig. 3, Test Connections

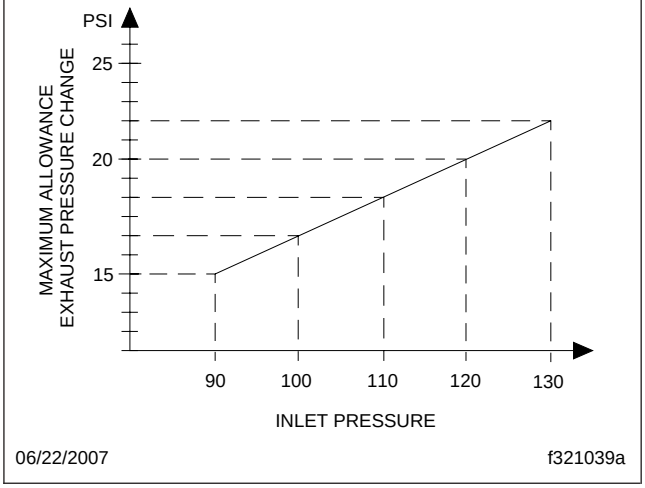

Fig. 4, Inlet Pressure vs. Exhaust Pressure Change in 30 Seconds

16. Remove the two Parker plugs from the air spring ports, and connect the air lines to the air spring ports (or elbow fittings). Connect the vertical linkage to the height-control valve control lever. The ride height will automatically return to the correct position.
17. Remove the chocks.

Height-Control Valve Replacement

IMPORTANT: Before replacing the height-control valve, perform the steps in **Subject 120** to see if the height-control valve is actually damaged or just out of adjustment.

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.

⚠ WARNING

Do not disconnect any air lines in the cab suspension system without first blocking the cab securely. If the cab isn't securely blocked, disconnecting an air line could cause the cab to fall abruptly, possibly resulting in serious injury.

2. Place blocks between the frame and the bottom of the cab, or use jack stands to keep the cab in position when the air spring is deflated.
3. Drain all air from the air tanks.

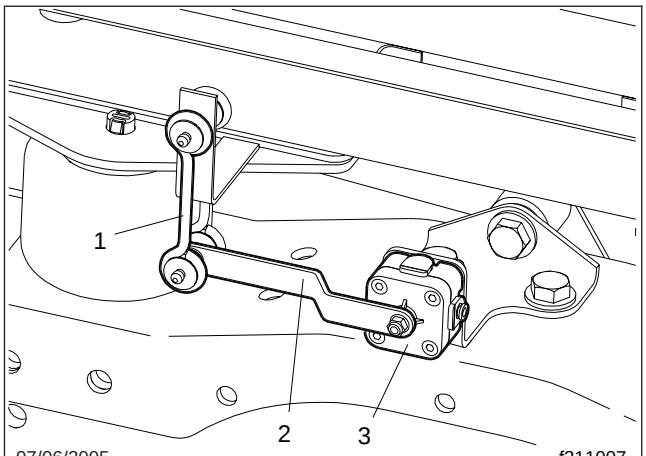
⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

4. Remove the nut and washer that attach the vertical linkage to the horizontal control lever. Disconnect the vertical linkage from the control lever; see **Fig. 1**.
5. Rotate and hold the horizontal control lever up until all air is exhausted from the air spring.
6. Mark the air tubing to the height-control valve for later reference, then disconnect the tubing; see **Subject 100** and **Subject 110**.

⚠ CAUTION

When removing or loosening a Barksdale height-control valve from a mounting bracket, always hold the valve-side mounting studs in place with an Allen wrench while loosening or tightening the nuts that attach the valve to the bracket. Because the mounting studs are threaded into the valve body, loosening the nuts without holding the studs can tighten the studs, which can crush the valve body and damage the valve. Conversely, tightening the nuts without holding the studs can back the studs out, causing a separation of the two halves of the valve body, and possibly a leak.



NOTE: Barksdale height-control valve shown.

1. Vertical Linkage
2. Horizontal Control Lever
3. Cab Height-Control Valve

Fig. 1, Cab Height-Control Valve Linkage

7. While holding the height-control valve mounting studs in place with an Allen wrench, remove the nuts and washers that attach the valve to the mounting bracket. Remove the height-control valve.
8. Position the new height-control valve on the height-control bracket. While holding the height-control valve mounting studs in place with an Allen wrench, install the nuts and washers, and tighten 45 lbf·in (500 N·cm). Do not overtighten.
9. Connect the air tubing to the height-control valve; see **Subject 100** and **Subject 110** for instructions.
10. Align the vertical linkage with the horizontal control lever and install the washer and nut.
11. Start the engine and run it until air pressure builds to at least 100 psi (690 kPa).
12. Check all air tubing and fittings for leaks.
13. Remove the cab supports.
14. Remove the chocks.

Air Spring Replacement

Two types of air spring are installed on L-Line and A-Line vehicles. To hold the air spring in place, one type uses a nut at the bottom and a bolt at the top, the other uses tangs at the top and bottom.

To determine the type of air spring used, look at the bottom of the air spring and see if a nylon nut is holding the air spring in place.

Cab Air Spring with Nut

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.

⚠ WARNING

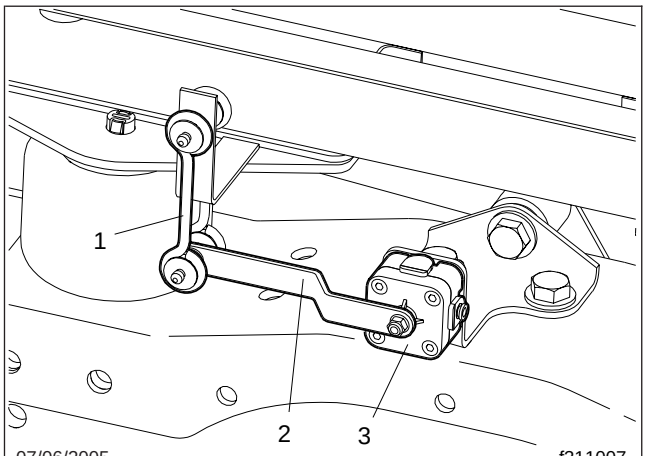
Do not disconnect any air lines in the cab suspension system without first blocking the cab securely. If the cab isn't securely blocked, disconnecting an air line could cause the cab to fall abruptly, possibly resulting in serious injury.

2. Place blocks between the frame and the bottom of the cab, or use jack stands to keep the cab in position when the air spring is deflated.
3. Drain all air from the air tanks.

⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

4. Remove the nut and washer that attach the vertical linkage to the horizontal control lever. Disconnect the vertical linkage from the control lever; see **Fig. 1**.
5. Rotate and hold the horizontal control lever up until all air is exhausted from the air spring.
6. From inside the cab, remove the four screws that hold the air-valve distribution-box cover to the air valve. Remove the cover; see **Fig. 2**.
7. Roll up the carpeting or floor matting and place it out of the way.
8. Remove the screws that hold the metal floor cover to the cab deck. Remove the cover; see **Fig. 3**.



1. Vertical Linkage
2. Horizontal Control Lever
3. Cab Height-Control Valve

Fig. 1, Cab Height-Control Valve Linkage

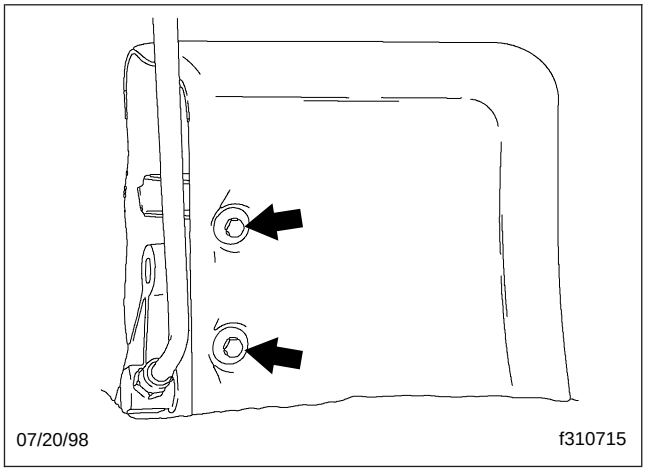


Fig. 2, Air-Valve Distribution-Box Cover Screws

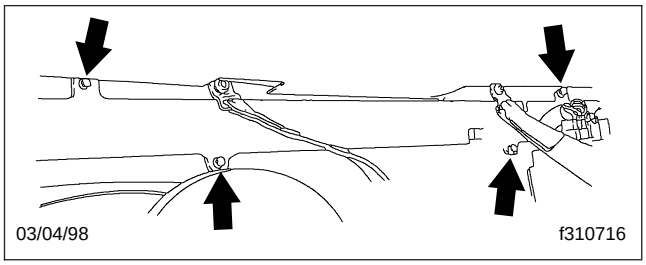

Fig. 3, Metal Floor-Cover Screws

9. Remove the rubber cover; see **Fig. 4**.

Air Spring Replacement

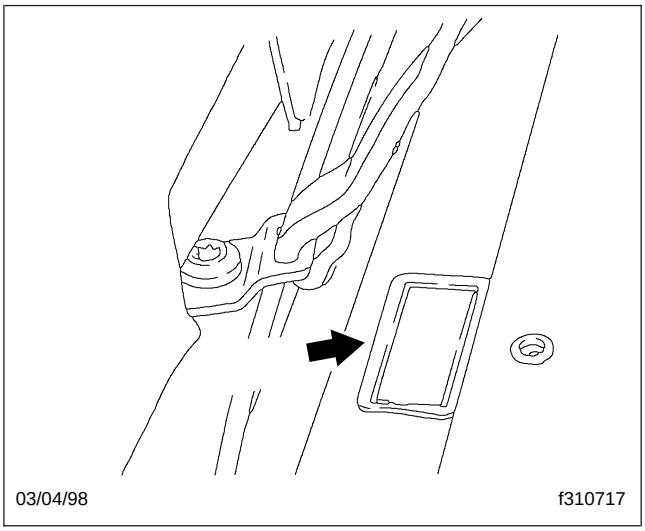

Fig. 4, Rubber Cover

10. Remove the top air-spring mounting bolt.
11. From outside the cab, disconnect the supply air tubing from the bottom of the air spring; see **Subject 100** and **Subject 110**. If the new air spring will not be installed immediately, cover the open end of the air tubing to prevent dirt or other foreign material from entering.
12. Remove the jam nut from the bottom of the air spring. Remove the air spring.
13. Place the bottom of the new air spring on the lower mounting bracket and install the jam nut on the bottom. Tighten the nut 35 lbf·in (400 N·cm).
14. Remove the cover from the air tubing, then connect it to the bottom of the new air spring; see **Subject 100** and **Subject 110**.
15. From inside the cab, install the top air-spring mounting bolt. Tighten the bolt 42 lbf·in (475 N·cm).
16. Install the rubber cover.
17. Install the metal floor cover and attach it with the screws to the cab deck.
18. Roll the carpet or matting in position.
19. Install the air-valve distribution-box cover and attach it with the four screws.
20. Align the vertical linkage with the control lever and install the washer and nut.
21. Start the engine, and run it until air pressure builds to at least 100 psi (690 kPa). Check for air leaks at the air spring.
22. Remove the cab supports.
23. Remove the chocks.

Cab Air Spring without Nut

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.

⚠ WARNING

Do not disconnect any air lines in the cab suspension system without first blocking the cab securely. If the cab isn't securely blocked, disconnecting an air line could cause the cab to fall abruptly, possibly resulting in serious injury.

2. Place blocks between the frame and the bottom of the cab, or use jack stands to keep the cab in position when the air spring is deflated.
3. Drain all air from the air tanks.

⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

4. Remove the nut and washer that attach the vertical linkage to the horizontal control lever. Disconnect the vertical linkage from the control lever; see **Fig. 1**.
5. Rotate and hold the horizontal control lever up until all air is exhausted from the air spring.
6. Insert a screwdriver between the upper cab mount and air spring, and pry the air spring away from the mount to pop the air spring tangs out of the bracket. Repeat the procedure for the bottom of the air spring, then pull the air spring out enough to access the supply air tubing.
7. Disconnect the supply air tubing from the bottom of the air spring; see **Subject 100** and **Subject 110**. If the new air spring will not be installed immediately, cover the open end of the air tubing to prevent dirt or other foreign material from entering.

8. Remove the air spring.
9. Remove the cover from the air tubing, then connect it to the bottom of the new air spring; see **Subject 100** and **Subject 110**.
10. Install the new air spring by snapping it, first into the bottom bracket, then into the top bracket.
11. Align the vertical linkage with the control lever and install the washer and nut.
12. Start the engine, and run it until air pressure builds to at least 100 psi (690 kPa). Check for air leaks at the air spring.
13. Remove the cab supports.
14. Remove the chocks.

Sleeper Air Spring with Nut

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.

⚠ WARNING

Do not disconnect any air lines in the cab suspension system without first blocking the cab securely. If the cab isn't securely blocked, disconnecting an air line could cause the cab to fall abruptly, possibly resulting in serious injury.

2. Place blocks between the frame and the bottom of the sleeper, or use jack stands to keep the sleeper and cab in position when the air spring is deflated.
3. Remove the four bolts, washers, and nuts that attach the top air-spring mount assembly to the sleeper crossmembers.
4. Drain all air from the air tanks.

⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

5. Remove the nut and washer that attach the vertical linkage to the horizontal control lever. Disconnect the vertical linkage from the control lever; see **Fig. 1**.
6. Rotate and hold the horizontal control lever up until all air is exhausted from the air spring.
7. Remove the top air-spring-mounting bolt.
8. Disconnect the supply air tubing from the bottom of the air spring; see **Subject 100** and **Subject 110**. If the new air spring will not be installed immediately, cover the open end of the air tubing to prevent dirt or other foreign material from entering.
9. Remove the jam nut from the bottom of the air spring. Remove the air spring.
10. Place the bottom of the new air spring on the lower mounting bracket and install the jam nut on the bottom. Tighten the nut 35 lbf·in (400 N·cm).
11. Remove the cover from the air tubing, then connect it to the bottom of the new air spring; see **Subject 100** and **Subject 110**.
12. Install the top air-spring mounting bolt. Tighten the bolt 42 lbf·in (475 N·cm).
13. Position the top of the air spring mount assembly against the sleeper crossmember, and attach it with four bolts, washers, and nuts.
14. Align the vertical linkage with the control lever and install the washer and nut.
15. Start the engine, and run it until air pressure builds to at least 100 psi (690 kPa). Check for air leaks at the air spring.
16. Remove the cab supports.
17. Remove the chocks.

Sleeper Air Spring without Nut

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.

⚠ WARNING

Do not disconnect any air lines in the cab suspension system without first blocking the cab securely. If the cab isn't securely blocked, disconnecting an air line could cause the cab to fall abruptly, possibly resulting in serious injury.

2. Place blocks between the frame and the bottom of the sleeper, or use jack stands to keep the sleeper and cab in position when the air spring is deflated.

Air Spring Replacement

3. Drain all air from the air tanks.

⚠ WARNING

Air lines under pressure can whip dangerously if disconnected under pressure. Drain all air from the air tanks before disconnecting air lines. Disconnecting pressurized air lines can cause personal injury and/or property damage.

4. Remove the nut and washer that attach the vertical linkage to the horizontal control lever. Disconnect the vertical linkage from the control lever; see **Fig. 1**.
5. Rotate and hold the horizontal control lever up until all air is exhausted from the air spring.
6. Insert a screwdriver between the upper cab mount and air spring, and pry the air spring away from the mount to pop the air spring tangs out of the bracket. Repeat the procedure for the bottom of the air spring, then pull the air spring out enough to access the supply air tubing.
7. Disconnect the supply air tubing from the bottom of the air spring; see **Subject 100** and **Subject 110**. If the new air spring will not be installed immediately, cover the open end of the air tubing to prevent dirt or other foreign material from entering.
8. Remove the cover from the air tubing, then connect it to the bottom of the new air spring; see **Subject 100** and **Subject 110**.
9. Install the new air spring by snapping it, first into the bottom bracket, then into the top bracket.
10. Align the vertical linkage with the control lever and install the washer and nut.
11. Start the engine, and run it until air pressure builds to at least 100 psi (690 kPa). Check for air leaks at the air spring.
12. Remove the cab supports.
13. Remove the chocks.

Shock Absorber Replacement

1. Park the vehicle, apply the parking brakes, shut down the engine, and chock the front and rear tires.
2. Place blocks between the frame and the bottom of the cab, or use jack stands to keep the cab in position when the shock is removed.
3. Remove the nut, washers, and bolt that attach the shock absorber to the cab mount bracket.
4. Remove the nut, washers, and bolt that attach the shock to the chassis mount bracket, and remove the shock.
5. Install the new shock in the chassis mount bracket and install the bolt, washers, and nut.
6. Position the upper end of the shock in the cab mount bracket and install the bolt, washers, and nut.
7. Torque the upper and lower nuts to 45 lbf·ft (61 N·m).
8. Remove the cab supports.
9. Remove the chocks from the tires.

Lateral Control Rod Replacement

1. Park the vehicle, apply the parking brakes, shut down the engine, and chock the front and rear tires.
2. Place blocks between the frame and the bottom of the cab, or use jack stands to keep the cab in position when the lateral control rod is removed.
3. Remove the nut, washers, and bolt that attach the lateral control rod to the cab mount bracket.
4. Remove the nut, washers, and bolt that attach the lateral control rod to the chassis mount bracket, and remove the lateral control rod.
5. Install the new lateral control rod in the chassis mount bracket and install the bolt, washers, and nut.
6. Position the upper end of the lateral control rod in the cab mount bracket and install the bolt, washers, and nut.
7. Torque the upper and lower nuts to 45 lbf·ft (61 N·m).
8. Remove the cab supports.
9. Remove the chocks from the tires.

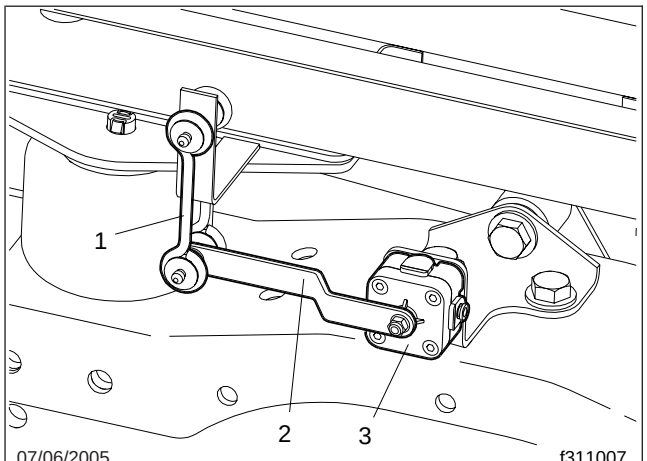
Vertical Linkage Replacement

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.
2. Run the engine to build up vehicle air pressure to at least 100 psi (690 kPa), then shut off the engine.

⚠ WARNING

Do not disconnect the vertical linkage in the cab suspension system without first blocking the cab securely and inserting a pin in the neutral-position hole of the height-control valve and the horizontal control lever. If the cab is not securely blocked, dislodging the pin and moving the control lever could cause the cab to fall or rise abruptly, possibly resulting in serious injury.

3. Place blocks between the frame and the bottom of the cab or use jack stands to keep the cab in position.
4. Insert a 5/32-inch (4-mm) pin or drill bit into the neutral-position hole of the height-control valve and horizontal control lever.
5. Remove the nut and washer that attach the vertical linkage to the horizontal control lever. Disconnect the vertical linkage from the control lever; see **Fig. 1**.



1. Vertical Linkage
2. Horizontal Control Lever
3. Cab Height-Control Valve

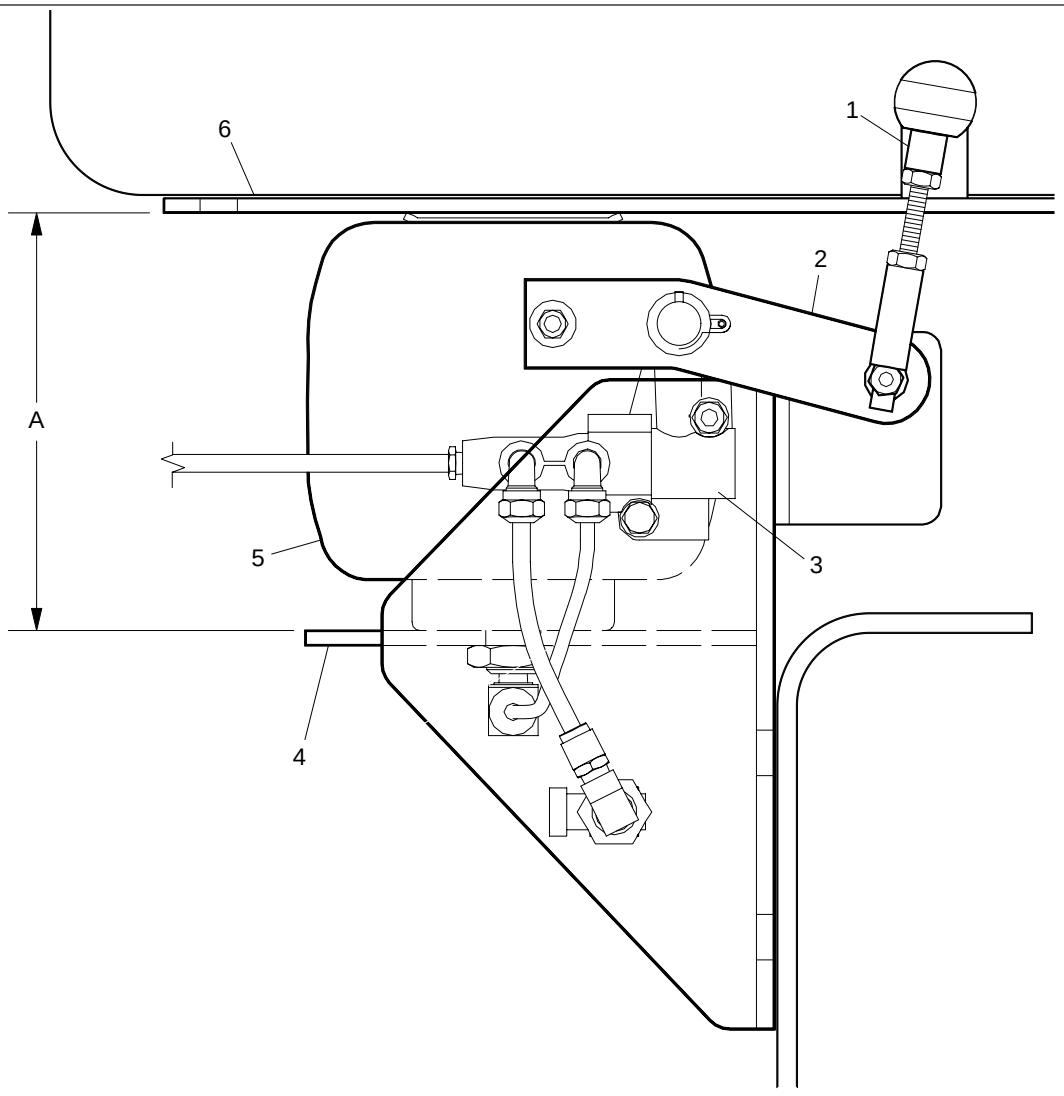
Fig. 1, Cab Height-Control Valve Linkage

6. Remove the nut and washer that attach the vertical linkage to the vertical linkage bracket.
7. Attach the new vertical linkage to the vertical linkage bracket with the washer and nut.
8. Align the vertical linkage with the horizontal control lever, and install the washer and nut.
9. Remove the drill bit or pin from the height-control valve.
10. Remove the cab supports.
11. Remove the chocks.

Cab Ride-Height Adjustment

NOTE: Cab ride height is adjustable only on vehicles built before March 2002 (**Fig. 1**), which have an adjustable vertical linkage. Vehicles built from March 2002 have a fixed vertical linkage, with cab ride height preset at the factory.

1. With the vehicle parked on a level surface, apply the parking brakes and chock the tires.
2. Run the engine to build vehicle air pressure to 105 to 135 psi (724 to 930 kPa).
3. Shut down the engine.



A. Cab Ride-Height Measurement

1. Vertical Linkage Assembly
2. Horizontal Control Lever
3. Height-Control Valve
4. Lower Bracket
5. Air Spring
6. Upper Bracket

Fig. 1, Cab Air Suspension Components (vehicles built before March 2002)

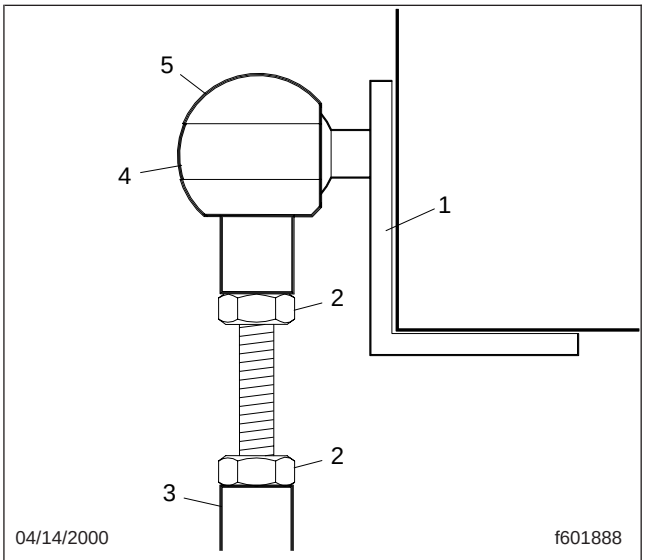
Cab Ride-Height Adjustment

4. Find the cab air spring and measure the distance between the bottom surface of the top bracket and the top surface of the bottom bracket. See **Fig. 1**. If the measured dimension is within the tolerance given in **Table 1**, then no adjustment is necessary.

Cab Ride-Height Measurement	
Application	**Dimension A (see Fig. 1)**
Day Cab	4-1/2 ± 1/8 in (116 ± 3 mm)
SilverStar	6-1/2 ± 1/8 in (165 ± 3 mm)

Table 1, Cab Ride-Height Measurement

5. Disconnect the vertical linkage of the height-control valve from the cab mounting bracket. See **Fig. 2**.



1. Cab Mounting Bracket
2. Jam Nut
3. Vertical Linkage Assembly
4. Linkage Ball Safety Clip
5. Vertical Linkage Cap

Fig. 2, Vertical Linkage and Cab Bracket

6. Adjust the cab ride height by either lifting the control lever to lower the cab, or depressing the control lever to raise the cab. Set the height to the measument given in **Table 1**.
7. Loosen the jam nuts on the linkage arm. Turn the linkage to the correct length so that the ball cap at the top of the vertical linkage lines up with the cab mounting bracket.

NOTE: The ends of the threaded rod must be threaded a minimum of five complete threads into the linkage barrel and the ball cap.

8. Snap the top of the vertical linkage into place over the ball on the cab mounting bracket.
9. Tighten the two jam nuts on the vertical linkage assembly.
10. Remove the chocks from the tires.

Checking the Cab Height-Control System for Air Leaks

⚠ WARNING

Keep your hands and all objects away from the area under and around the cab when removing the pressure from the air system. Parts will move as the air is released and can cause personal injury or damage to any objects that are between the moving parts.

IMPORTANT: To prevent voiding the warranty on Barksdale height-control valves, note the following:

- Do not overtighten the bolts in the Barksdale height-control valve housing if you detect leaks in the housing. The bolts should not be loose, and should not require tightening. Only if necessary, tighten the valve housing bolts 45 lbf·in (500 N·cm). Any damage to the valve housing will void the warranty.
- If it is necessary to remove a Barksdale height-control valve from a mounting bracket, always hold the valve-side mounting studs in place with an Allen wrench while loosening or tightening the nuts that attach the valve to the bracket. Because the mounting studs are threaded into the valve body, loosening the nuts without holding the studs can tighten the studs, crushing the valve body and damaging the valve. Conversely, tightening the nuts without holding the studs can back the studs out, causing a separation of the two halves of the valve body, and possibly a leak.
- Do not attempt to disassemble the Barksdale valve body or the control lever. There are no serviceable parts in the valve, and any disassembly will void the warranty.

1. Park the vehicle on a level surface, apply the parking brakes, and chock the tires.
2. Run the engine to build vehicle air pressure to at least 100 psi (690 kPa). Turn off the engine and wait 5 to 10 minutes for the system to equalize.

   NOTE: Normal operation of the height-control valve requires a maximum of 10 minutes to settle. Any air leakage during this time is considered normal and does not indicate a damaged valve.
3. Apply a soap-and-water solution to the outside of the air fittings on the height-control valve and on the suspension air springs. Look for bubbles indicating an air leak.
4. If bubbles are seen, check that the air tubing is installed correctly into the fitting; see **Subject 100** or **Subject 110**.

   If no bubbles are seen, check the height-control valve for air leaks; see **Subject 120**.

Diagnostics and Testing

Air Spring

Inspect the exterior surfaces of the air spring, looking for wear. With the air spring fully inflated, check to see if there is sufficient clearance around the air spring to prevent lines or objects from rubbing against the air spring. Air tubing or cab components that rub against the air spring will cause damage to the air spring. If the air spring is not capable of lifting the cab to its proper ride height, check to see if the shock absorber is damaged. A binding shock absorber will limit the air spring's ability to extend. To clean the air spring, use soap and water.

NOTE: Do not use organic solvents, abrasives, or pressurized steam cleaners to clean the air spring.

Shock Absorber

Inspect the shock body for damage such as bends or dents in the piston. Bends or dents in the shock body will negatively affect the operation of the shock. Inspect the shock body for signs of leaking fluid. Normal operation of the shock will result in some misting of the hydraulic fluid onto the exterior shock body. Large streams of fluid indicate a leak, and the shock should be replaced; see **Fig. 1**.

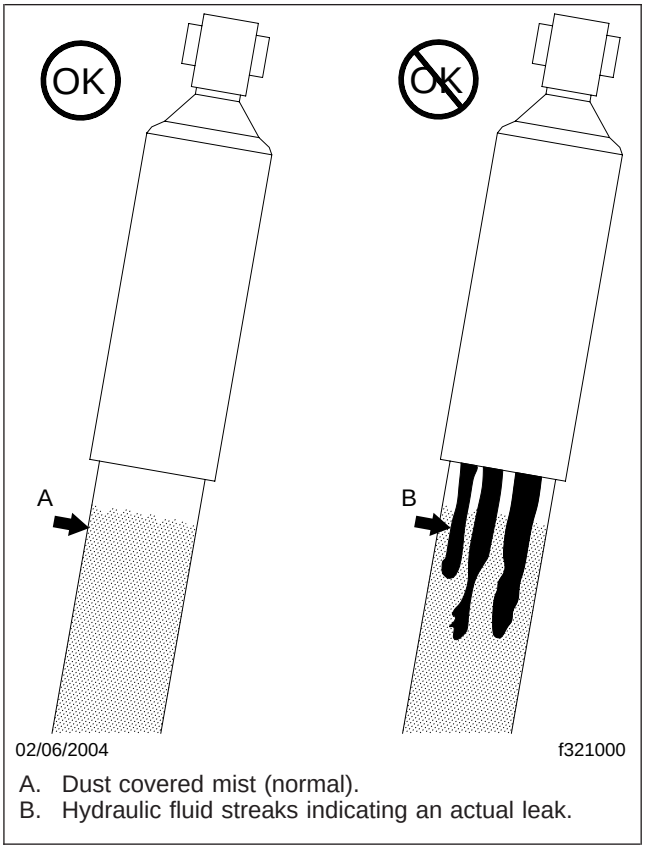
To test the operation of a shock absorber, hold the shock in an upright position and cycle the piston at least five times by pushing the piston up and down. The piston should move evenly throughout each section of the cycle. If the shock does not move evenly

Troubleshooting

when pushed down or pulled up, the shock should be replaced.

Noises such as squeaks, which may be intermittent, may be caused by the valves used to regulate the internal hydraulic fluid. This problem is not repairable and the shock will need to be replaced. Noises from the shock, such as knocking or rattling, may be due to movement between the bushings and mounting brackets. Inspect the bushings or mounting brackets for wear. Repair worn components as necessary. Check the torque of the shock absorber mounting nuts, and tighten if necessary.

NOTE: The shock absorber bushings do not require any type of lubrication. Do not attempt to stop bushing noise by lubricating them; grease and mineral-oil-base lubricants will deteriorate the bushing rubber.



A. Dust covered mist (normal).
B. Hydraulic fluid streaks indicating an actual leak.

Fig. 1, Differences Between Misting and Leaking

Cab Ride Height

Cab ride height is set by the vertical linkage, which is adjustable only on vehicles built before March 2002. Vehicles built from March 2002 have a fixed vertical linkage, with cab ride height preset at the factory.

The ride-height setting depends on the type of cab air suspension system installed in the vehicle; see **Fig. 1** and **Table 1**. All cab ride-height measurements are measured between the lower and upper air spring mounting brackets.

Torque Specifications

Unless listed in **Table 2**, tighten all fasteners using the torque specifications found in **Section 00.06**.

Special Tools

Use the kit shown in **Fig. 2** to test a Barksdale height-control valve. Test kit BKS KD2264 is available via the Direct Ship program in paragon, or directly from Barksdale, at **www.barksdale.com**, or:

Barksdale, Inc.
3211 Fruitland Avenue
Los Angeles, California 90058
Telephone: 866-832-6278

Cab Ride Height Setting				
Cab Air Suspension System (see Fig. 1)	Vehicle Application	Height Measurement		Adjustable
		inch	mm	
A	A-Line (including SilverStar) and L-Line	4-1/2 ± 1/8	116 ± 3	No
B	A-Line (including SilverStar) and L-Line	6-1/2 ± 1/8	165 ± 3	No
C	A-Line and L-Line with 101-inch Cab	4-1/2 ± 1/8	116 ± 3	No
D	A-Line (including SilverStar) and L-Line with Sleeper	6-1/2 ± 1/8	165 ± 3	No
E	L-Line with 111- or 113-inch Day Cab	6-1/2 ± 1/8	165 ± 3	No
not shown	L-Line with Day Cab Built Before March 2002	4-1/2 ± 1/8	116 ± 3	Yes
not shown	A-Line SilverStar Built Before March 2002	6-1/2 ± 1/8	165 ± 3	Yes

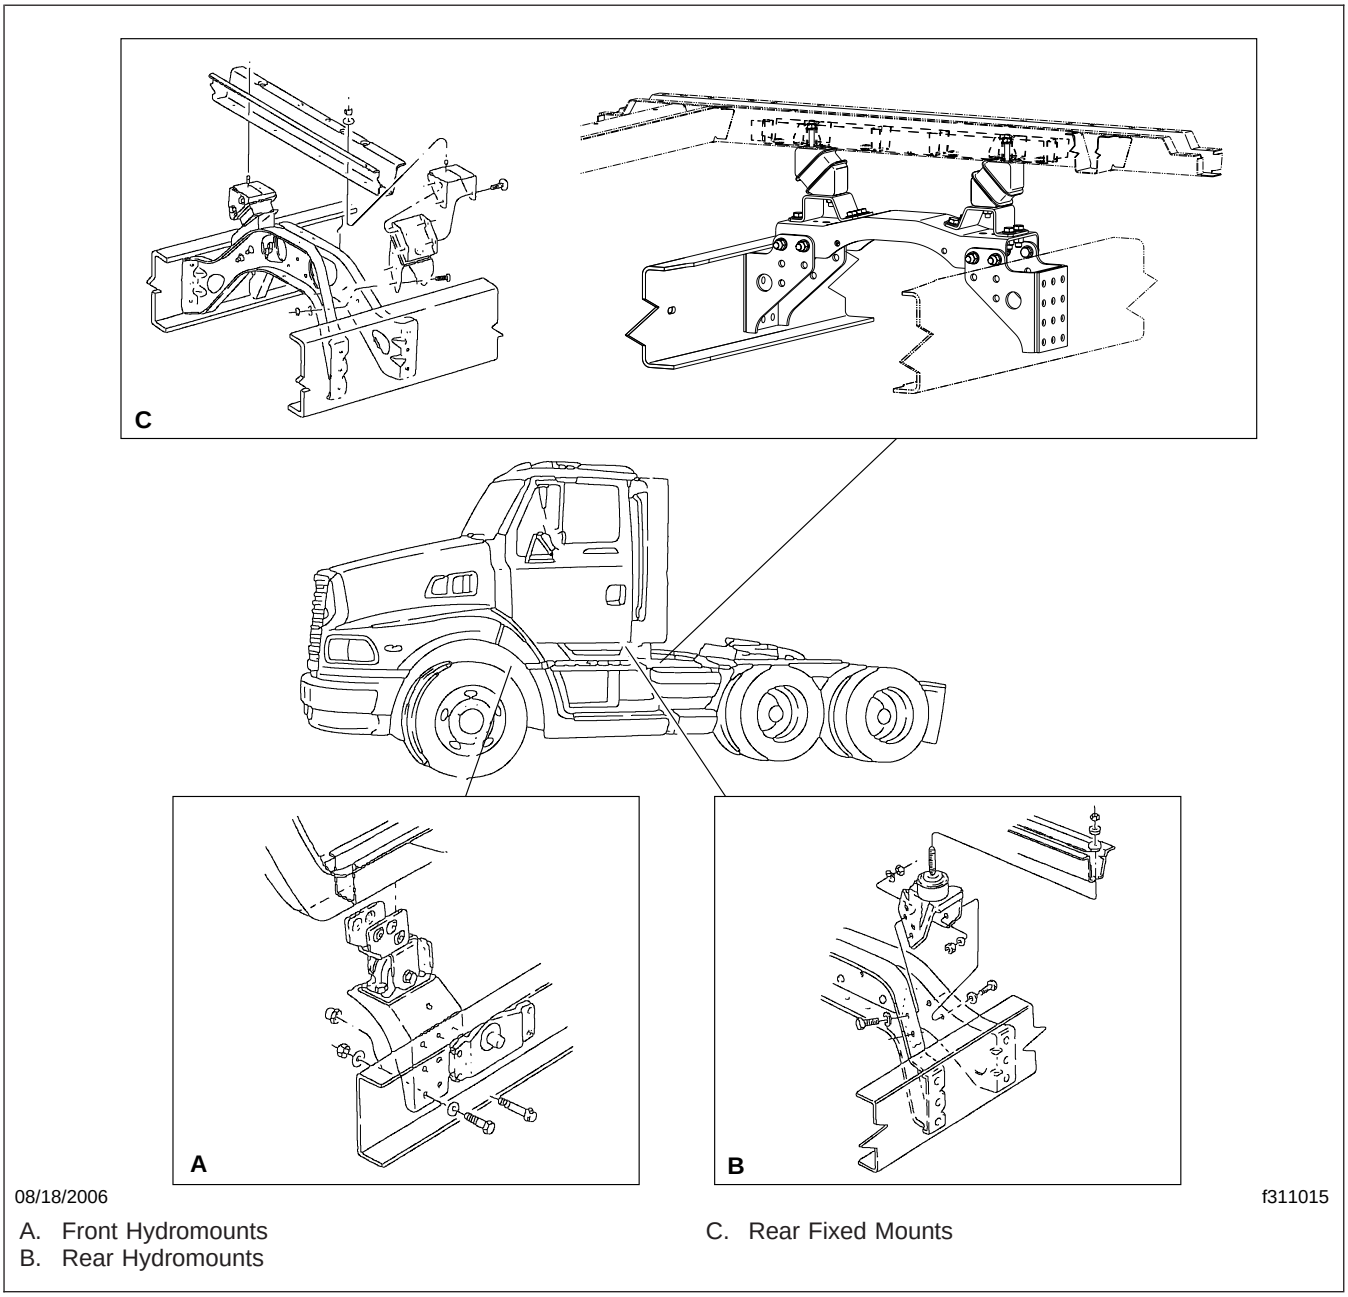
General Information

See **Fig. 1** for cab front and rear hydromounts, and rear fixed mounts.



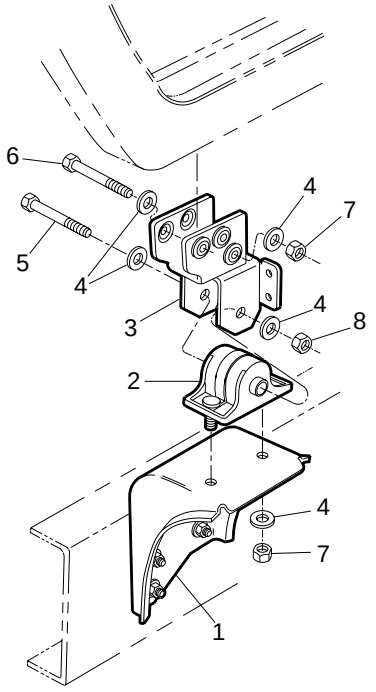
A. Front Hydromounts
B. Rear Hydromounts
C. Rear Fixed Mounts

Fig. 1, Cab Mount Locations

Front Cab Support Removal and Installation

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Remove the front cab support-to-isolator mounting bolt. See **Fig. 1**.



09/07/2006 f311024

1. Chassis-Mounted Bracket
2. Isolator
3. Cab-Mounted Bracket
4. Washer
5. Cab Support-to-Isolator Mounting Bolt
6. Cab Support-to-Cab Mounting Bolt
7. Nut, 5/8–11
8. Nut, 3/4–10

Fig. 1, Front Cab Support Installation

3. Raise and support the front of the cab.
4. Remove the nuts and washers that attach the isolator to the chassis-mounted bracket. Remove the isolator.
5. If it is necessary to remove the cab-mounted bracket, remove the 5/8–11 mounting bolts that attach the bracket to the cab. Remove the bracket.

Installation

1. With the tires chocked, attach the front cab-mounted bracket (if removed) to the cab with the 5/8–11 mounting bolts. Tighten the nuts 85 to 95 lbf·ft (115 to 129 N·m). See **Fig. 1**.
2. Attach the isolator to the chassis-mounted bracket with the nuts and washers. Tighten the nuts 136 lbf·ft (184 N·m).
3. Lower the front of the cab.
4. Install the front cab support-to-isolator mounting bolt. For 3/4–10 nut, tighten 150 to 175 lbf·ft (203 to 237 N·m). For 5/8–11 nut, tighten 120 to 152 lbf·ft (163 to 206 N·m).
5. Remove the chocks.

Rear Cab Support Removal and Installation

Removal

NOTE: Left-side is shown in the Figures, right-side is symmetrically opposite.

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Roll up the carpeting or floor matting, and place it out of the way.
3. If the vehicle is equipped with a metal floor cover over the cab support access holes, remove the screws that hold the cover to the cab deck. Remove the cover. See **Fig. 1**.

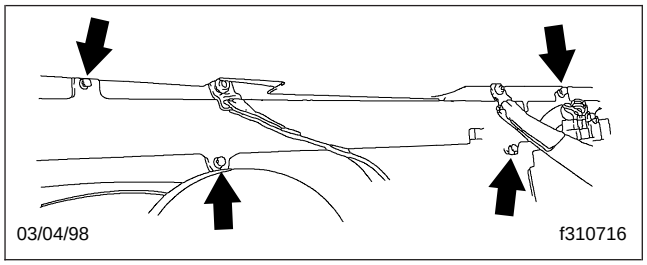


Fig. 1, Metal Floor Cover Screws

4. Remove the rubber cover from the access hole. See **Fig. 2**.

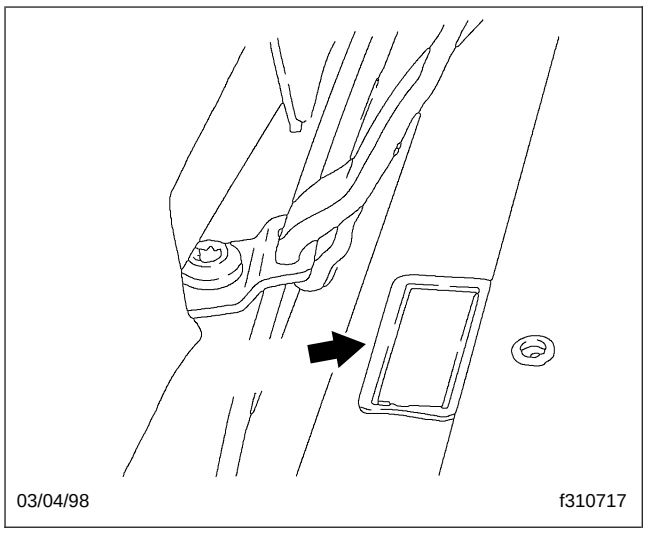

Fig. 2, Rubber Cover

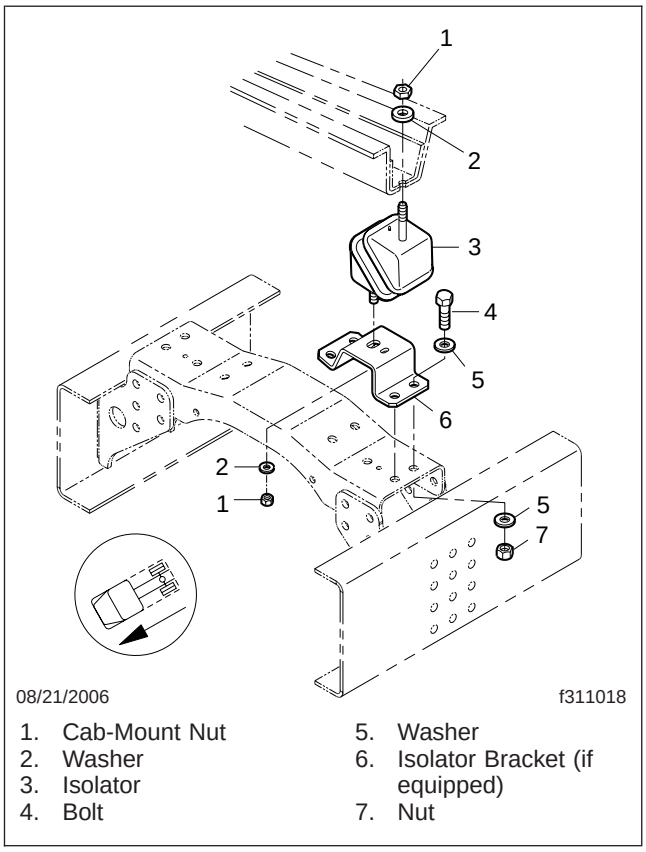
5. Through the access hole, remove the upper cab-mount nut. See **Fig. 3** (fixed mount) or **Fig. 4** (hydromount).



1. Cab-Mount Nut
2. Washer
3. Isolator
4. Bolt
5. Washer
6. Isolator Bracket (if equipped)
7. Nut

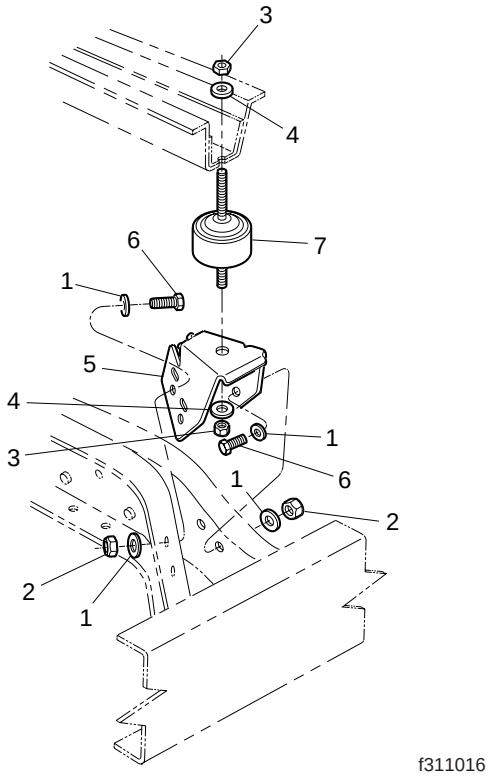
Fig. 3, Rear Fixed Mount Installation (typical)

6. Using a suitable jack, raise and support the cab enough to remove the mount and bracket.
7. Remove the lower cab-mount fasteners. Remove the isolator and isolator bracket (if so equipped), or the hydromount absorber and bracket, as applicable.

Installation

1. With the tires chocked, install the isolator and isolator bracket (if so equipped), or the hydromount absorber and bracket, using the lower cab-mount fasteners. See **Fig. 3** or **Fig. 4**. Tighten the lower cab-mount nut 68 lbf·ft (92 N·m).
2. Lower the cab.
3. Inside the cab, through the access hole, install the upper cab-mount nut. Tighten the nut 68 lbf·ft (92 N·m).

Rear Cab Support Removal and Installation



1. Washer
2. Bracket Nut
3. Cab-Mount Nut
4. Flatwasher
5. Hydromount Bracket
6. Bracket Bolt
7. Hydromount Absorber

Fig. 4, Rear Hydromount Installation

4. Install the rubber cover over the access hole. See **Fig. 2**.
5. Install the metal floor cover, if so equipped, and attach it with the screws to the cab deck. See **Fig. 1**.
6. Roll the carpet or matting in position.
7. Remove the chocks.

Specifications

Unless listed in **Table 1**, tighten all fasteners using the torque specifications found in **Section 00.06**.

Torque Specifications			
Description	**Size**	**lbf·ft**	**N·cm**
Front Cab Support-to-Isolator Mounting-Bolt Nut	3/4–10	150–175	203–237
	5/8–11	120–152	163–206
Front Cab Isolator-to-Chassis Bracket Nut	5/8–11	136	184
Front Cab Support-to-Cab Mounting-Bolt Nut	5/8–11	85–95	115–129
Rear Cab-Mount Nuts, Upper and Lower	1/2–13	68	92

Table 1, Torque Specifications

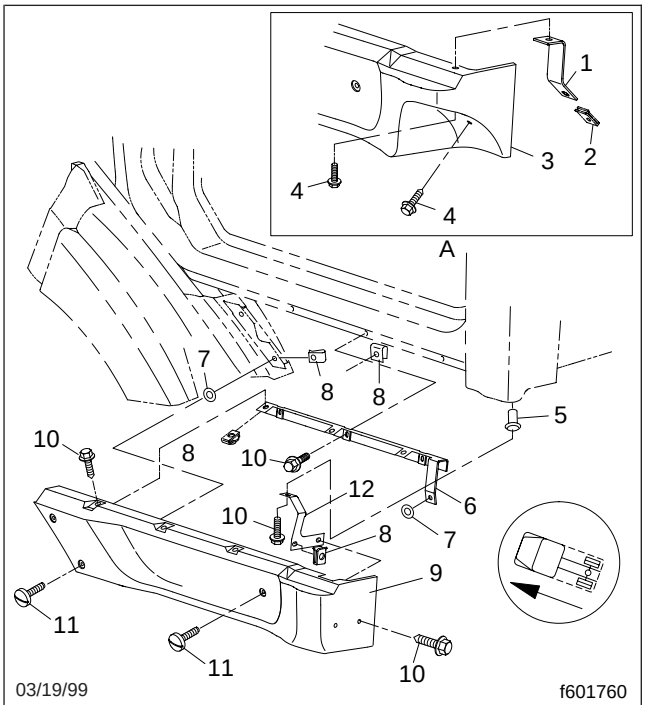
Valance Panel Removal and Installation

Removal

CAUTION

On vehicles using aluminum cab construction, only use fasteners and other replacement parts manufactured by the original equipment manufacturer. This must be strictly adhered to in order to reduce the possibility of galvanic corrosion.

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Open the door.
3. Loosen and remove the slotted screws and the hexhead screws. See **Fig. 1**.



A. Valance with rear cut-out

14. Slotted Screw
15. Screw

Fig. 2, Valance with Center Cut-Out

4.1 Pull the valance away from the cab and tilt the valance forward and rotate it counterclockwise.

4.2 Slide the bracket through the slot on the right-side of the valance. Be careful not to scratch the panel on the step.

Installation

1. Position the valance panel. For the center cut-out valance, install the valance panel by placing the right-side in first.
2. Install and tighten the hexhead screws and the slotted screws. See **Fig. 1** or **Fig. 2**. For torque values, see **Specifications, 400**.
3. Close the door.
4. Remove the chocks from the tires.

Specifications

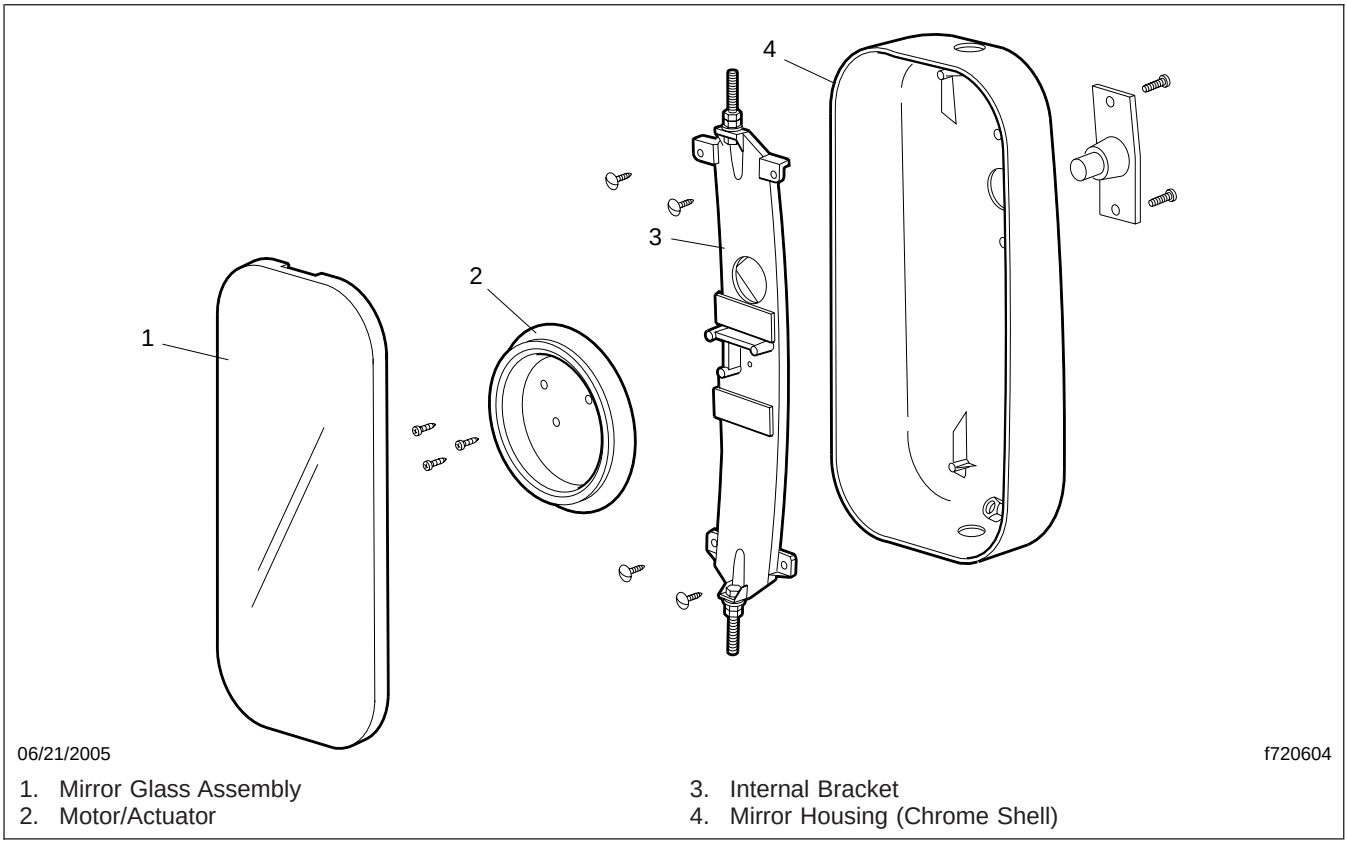
Torque Specifications	
Description	**lbf·in (N·cm)**
Slotted Screws	10–15 (100–180)
Hex Head Screws (Valance Bracket-to-Cab)	80–115 (900–1300)
Hex Head Screws (Valance-to-Bracket)	44–71 (500–800)

Table 1, Torque Specifications

General Information

The Hadley 4WAY mirror (**Fig. 1**) is manually adjustable. When adjusting the mirror, only the glass moves, not the entire mirror housing as in traditional single-axis-movement mirrors. Whether the mirror is motorized or not, its position may be changed by simply pushing on the mirror glass, without causing drive system damage.

Both the mirror glass assembly and the motor/actuator are fully replaceable in the field.



1. Mirror Glass Assembly
2. Motor/Actuator
3. Internal Bracket
4. Mirror Housing (Chrome Shell)

Fig. 1, Hadley 4WAY Mirror Assembly

Removal

1. Rotate the mirror fully to the right.
2. Find the small lever near the center of the left edge of the mirror glass. Push the lever down while holding on to the mirror glass. Pull the mirror glass assembly out of the mirror housing.
3. Disconnect the heater wire connections at the bottom of the mirror glass assembly.

Installation

1. Connect the heater wire connections to the mirror glass assembly.

NOTE: Each heater wire can be connected to either heater terminal, since the heater is not polarity-sensitive.

2. Push the mirror lever fully down, then position the mirror glass assembly on the motor/actuator. Ensure that the mirror glass assembly is fully engaged on the motor/actuator, and while holding it in place, move the lever up to lock it in place.

Motor/Actuator Replacement

1. Remove the mirror glass assembly as described in **Subject 100**.
2. Locate the wires that are routed from the harness to the motor/actuator, and remove the electrical tape. Cut the green, yellow, and white wires just below the connection to the motor/actuator wires.
3. Using a T15 Torx® driver, remove the three motor/actuator retaining screws, and set them aside. Remove the motor/actuator from the housing.
4. Strip approximately 1/4 inch of the insulation from the harness wires.
5. Connect the harness wires to the new motor/actuator wires, matching the colors as shown in **Table 1**.

Wire Color Matching	
Harness Wire Colors	**Motor/Actuator Wire Colors**
Green	White
Yellow	Black
White	Yellow and Blue

Table 1, Wire Color Matching

6. Ensure that the two black motor/actuator mounting pads are still in place on the bracket before installing the motor/actuator. Place the motor/actuator on the mounting points, and attach it with the three screws. Do not over-tighten the screws.
7. Install the mirror glass assembly as described in **Subject 100**.

Troubleshooting Tables

Problem—Mirror Glass Will Not Move When Activating Mirror Switch

Problem—Mirror Glass Will Not Move When Activating Mirror Switch	
Possible Cause	**Remedy**
The mirror head is not motorized.	Confirm that the mirror head is a motorized head by removing the glass and checking if there are wires attached to the motor/actuator.
The fuse or circuit breaker is open.	Replace the fuse or reset the circuit breaker.
An obstruction in the mirror head is preventing the mirror glass from moving.	Have an assistant listen to the motor/actuator as you activate the mirror switch. If the motor is attempting to move the mirror glass, check for any possible obstructions that may keep the mirror glass from moving.
The motor/actuator is not working.	Find and disconnect the mirror harness connector from the truck cab connector. Using the mirror operation tables in **Specifications 400**, supply power to the motor/actuator from an external power source. If the motor/actuator still does not work, replace it. If it does work, check the mirror switch and wiring.

Problem—The Mirror Will Not Stay Adjusted, Moves at High Speed, or Vibrates

Problem—The Mirror Will Not Stay Adjusted, Moves at High Speed, or Vibrates	
Possible Cause	**Remedy**
The mirror bracket is loose.	Check all mirror bracket fasteners. Tighten any that are loose.
The mirror head is loose.	Check the mirror-head mounting nuts. Tightening any that are loose.
The motor/actuator is loose.	Check the motor/actuator screws. Tighten any that are loose, using a T15 Torx driver.
The mirror has broken or worn parts.	Check for broken or worn parts. Check the mirror glass assembly, the motor/actuator mounting ring, and the internal bracket. Replace them, if necessary. NOTE: If there is noticeable wear on the motor/actuator or the mirror glass assembly, replace both components.

Problem—The Mirror Heater Does Not Work

Problem—The Mirror Heater Does Not Work	
Possible Cause	**Remedy**
The fuse or circuit breaker is open.	Replace the fuse or reset the circuit breaker.
The heater switch connections are loose.	Check the heater switch connections. Reconnect loose wires, if necessary.

Troubleshooting

Problem—The Mirror Heater Does Not Work	
Possible Cause	**Remedy**
The heater element does not work.	Remove the mirror glass assembly. Carefully disconnect the heater element wires from the heater element terminals. Place the mirror heater switch in the "On" position. With a voltage meter, check the heater element wires for the presence of 12 volts (or the battery source voltage). If the source voltage is present, replace the mirror glass assembly. If the voltage is not present, check and repair the wiring and connectors.
The wiring is damaged or disconnected.	NOTE: The heater element can also be checked by applying 12 volts directly from a battery or a power supply to the heater element terminals. Since the heater element is not polarity-sensitive, each power lead can be connected to either terminal. The heater should draw 2 to 5 amps, depending on the ambient temperature at the time of the test. Allow two minutes for the glass to become warm to the touch.

See **Fig. 1** for the Hadley 4WAY mirror wiring-harness-connector pin numbers. See **Table 1** and **Table 2** for the wire function and motor/actuator operation information.

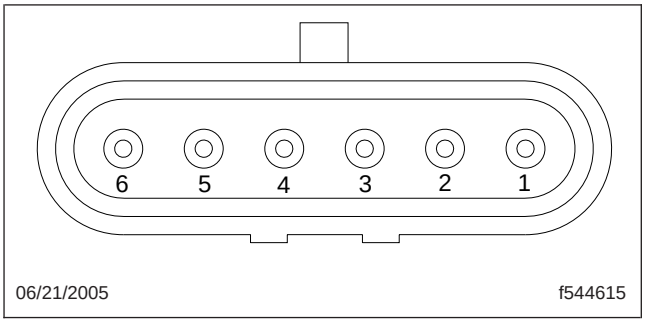


Fig. 1, Mirror Wiring Harness Connector

Mirror Wire Harness		
Pin Number (see Fig. 1)	**Wire Color**	**Wire Function**
1	Black	Heat (Ground)
2	Blue	Light (Positive)
3	Red	Heat (Positive)
4	Yellow	Motor—Y Axis
5	Green	Motor—X Axis
6	White	Motor—Common

Table 1, Mirror Wire Harness

Motor/Actuator Operation		
Apply Positive (+) Voltage	**Apply Negative (-) Ground**	**Motor Movement**
Yellow (Pin #4)	White (Pin #6)	Up
White (Pin #6)	Yellow (Pin #4)	Down
Green (Pin #5)	White (Pin #6)	Left
White (Pin #6)	Green (Pin #5)	Right

Table 2, Motor/Actuator Operation

Removal

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Roll down the window.
4. Pull the door wiring grommet from the seated position. See **Fig. 1**.

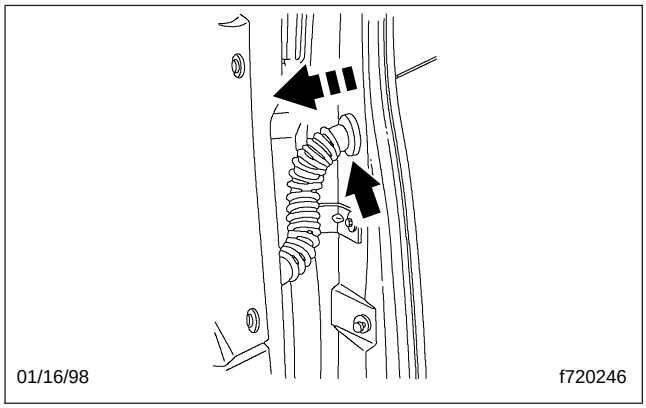

Fig. 1, Door Wiring Grommet

5. Remove the scuff panel. See **Fig. 2**.

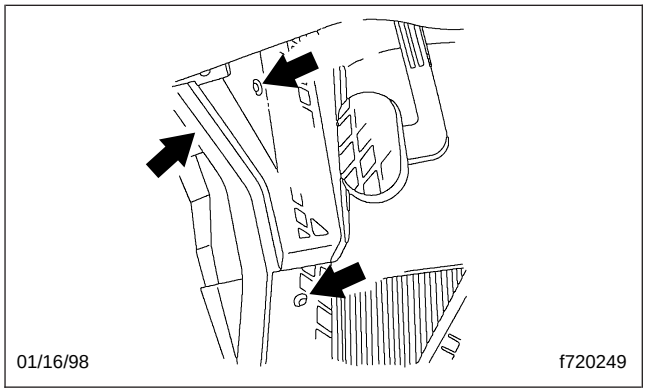

Fig. 2, Scuff Panel

6. Remove the under steering panel screws and remove the panel. See **Fig. 3**.
7. Disconnect the electrical connectors. See **Fig. 4**.
8. Disconnect the CB antenna cable.
9. Remove the ground bolt and the ground strap. See **Fig. 5**.

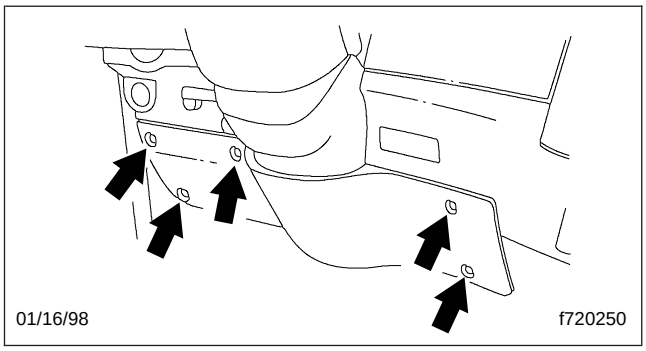

Fig. 3, Under Steering Panel Screw Locations

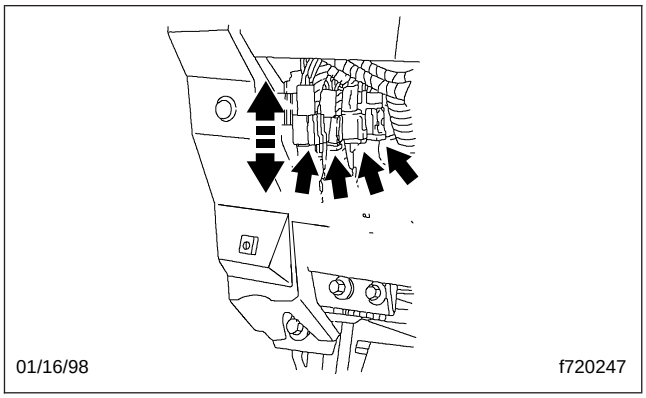

Fig. 4, Electrical Connectors

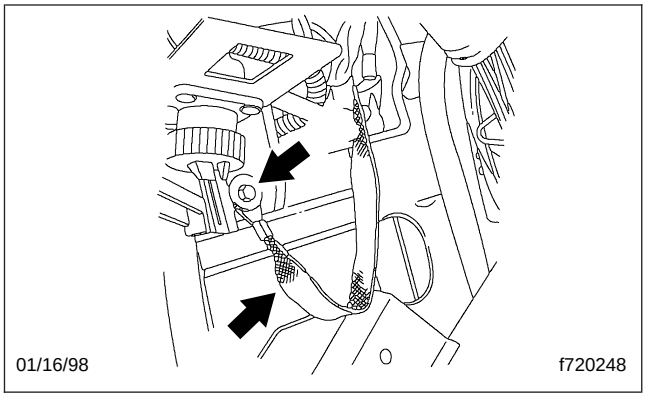

Fig. 5, Ground Bolt and Ground Strap

10. Pull the wiring out of the A-pillar, one connector at a time.
11. Remove the cowl panel. For instructions, see **Group 88**.
12. Place indicator marks around the door hinges on the door surface.

Door Removal and Installation

13. Close the door and remove the hinge-to-door bolts. Remove the door. See **Fig. 6**.

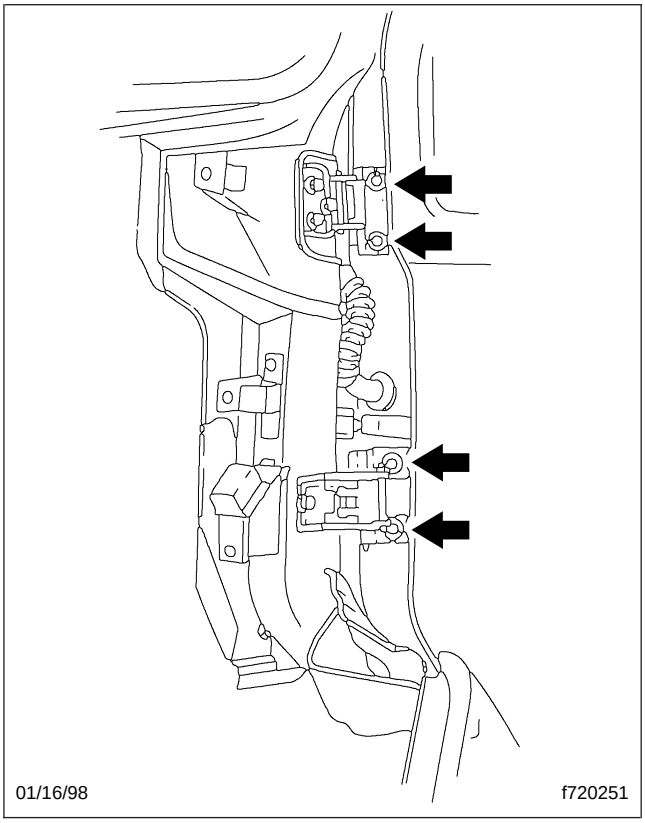

Fig. 6, Hinge-to-Door Bolts

Installation

1. Position the door and install the hinge-to-door bolts. Align the door hinges with the marks made during removal. Tighten the nuts 15 to 24 lbf·ft (21 to 32 N·m). See **Fig. 6**.
2. Install the cowl panel. For instructions, see **Group 88**.
3. Feed the wiring into the A-pillar, one connector at a time.
4. Install the ground bolt and the ground strap. See **Fig. 5**.
5. Connect the CB antenna cable.
6. Connect the electrical connectors. See **Fig. 4**.
7. Install the under steering panel. See **Fig. 3**.
8. Install the scuff panel. See **Fig. 2**.
9. Position and seat the door wiring grommet. See **Fig. 1**.
10. Roll up the window.
11. Connect the batteries.
12. Remove the chocks from the tires.

Adjustment

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the rear tires.
2. Remove the cowl panel. For instructions, see **Group 88**.
3. Loosen the bolts if necessary, and adjust the door at the A-pillar for up-down and fore-aft movement. See **Fig. 1**.

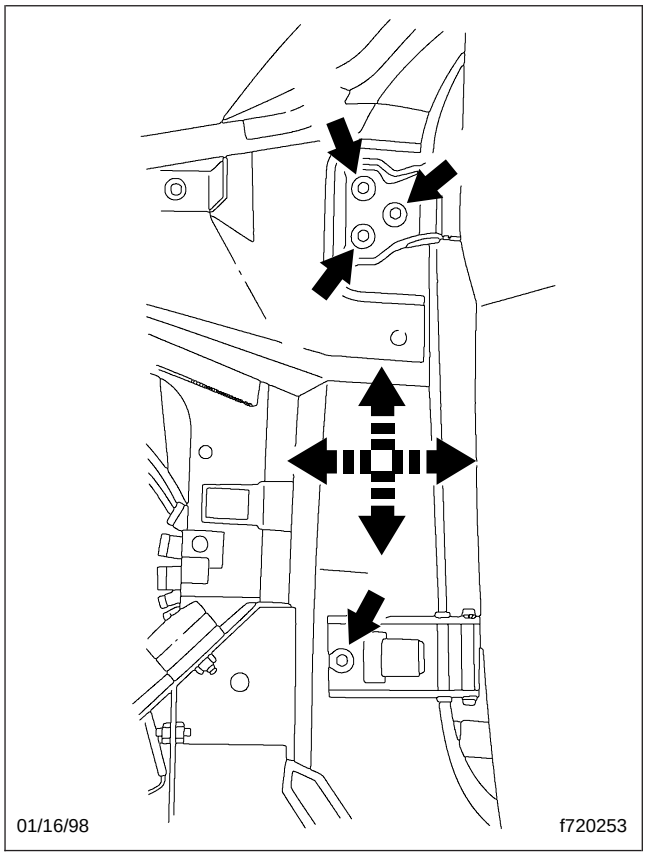

Fig. 1, Adjusting Up-Down and Fore-Aft Movement

4. Loosen the bolts if necessary, and adjust at the door for in-out movement. See **Fig. 2**.

CAUTION

To ensure proper fit of the door, this adjustment procedure must be performed on both upper and lower hinges. Failure to adjust both hinges could result in premature wear of the hinges.

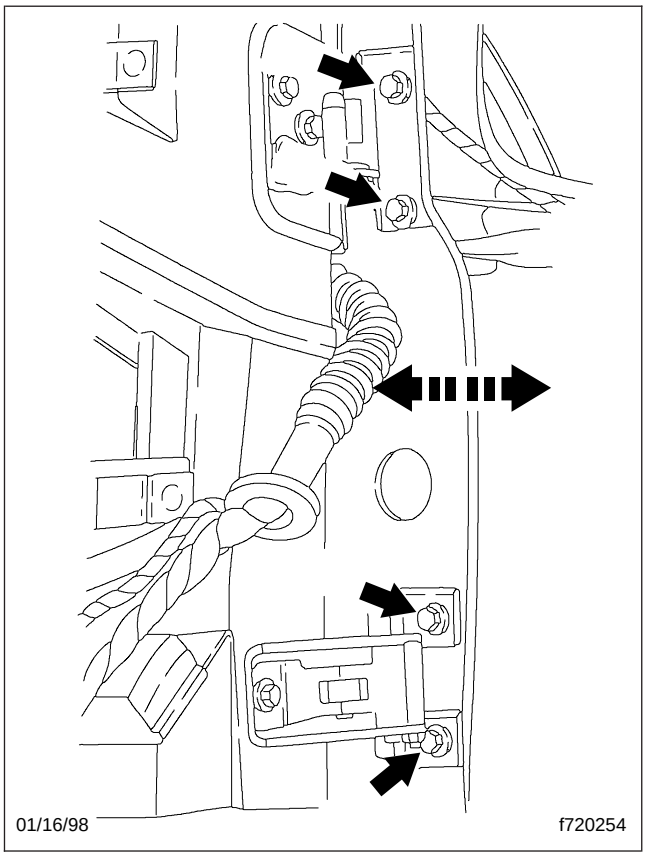

Fig. 2, Adjusting In-Out Movement

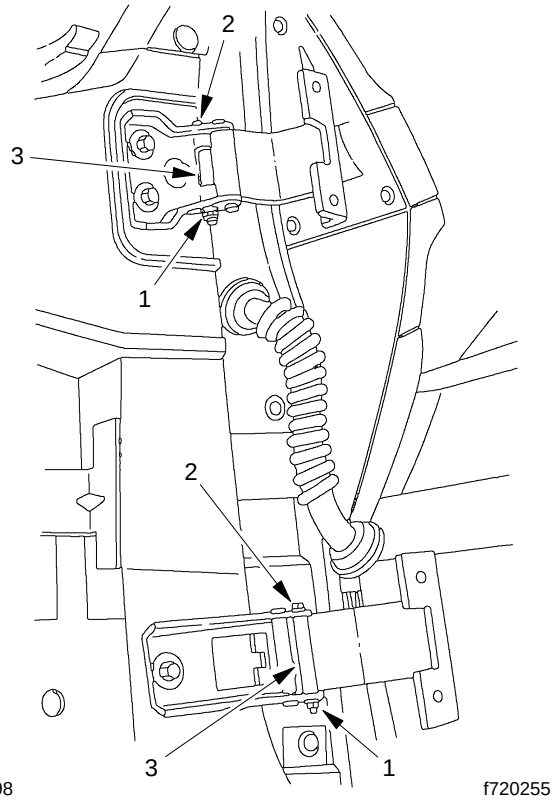
NOTE: The door opening clearance is 55 degrees with the door hinge bushings installed and 65 degrees with the door hinge bushings uninstalled.

5. Adjust the door opening clearance to 65 degrees, if necessary. See **Fig. 3**.
   - 5.1 Remove the hinge bushing nut.
   - 5.2 Pull out the hinge bushing bolt.
   - 5.3 Remove the hinge bushing, and install the hinge bushing bolt and nut.

IMPORTANT: To be certain the doors are properly positioned within the door opening, it is necessary to measure the door alignment.

6. Measure the door alignment.
   - 6.1 Locally fabricate a door alignment gauge. See **Fig. 4**.

Door Adjustment



1. Hinge Bushing Nut
2. Hinge Bushing Bolt
3. Hinge Bushing

Fig. 3, Adjusting Door Opening Clearance

6.2 Use the gauge to check the alignment of the door to the cab A-pillar. The measurement should be made on the front edge of the door, approximately 8 inches (203 mm) below the front upper corner. See **Fig. 5**. The gauge should rest on the door window frame and contact the A-pillar as shown in **Fig. 6**. If the gauge does not make contact with the A-pillar, adjust the door as necessary to obtain the proper door alignment.

7. Tighten the fasteners to specification. See **Fig. 7**.
8. Install the cowl panel. For instructions, see **Group 88**.
9. Remove the chocks from the rear tires.

Door Window Glass Replacement

Replacement

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Remove the grab handle. See **Fig. 1**.
4. Remove the power window switch cover, the power door locks switch cover and the mirror control trim cover, if equipped.
5. Remove the door window regulator crankhandle, if equipped.
6. Remove the door trim panels. See **Fig. 1**.
   - 6.1 Remove the door trim finish panel.
   - 6.2 Remove the map pocket, if equipped.
   - 6.3 Remove the courtesy lamp.
   - 6.4 Remove the door trim panel.
   - 6.5 Remove the armrest assembly.
7. Remove the door trim watershield. See **Fig. 1**.
8. Lower the window.
9. Remove the door glass run assembly and the interior door window glass weatherstrip. See **Fig. 2**.
   - 9.1 Pull the door glass run assembly from the flange.
   - 9.2 Pull the interior door window glass weatherstrip from the flange.
10. Disconnect the electrical connector from the window motor, if equipped.
11. Remove the four screws from the window regulator assembly, if equipped. Remove the window regulator assembly and the window motor. See **Fig. 2**.
12. Remove the door glass run retainer bolts.

13. Remove the four retaining screws from the vent window/door glass divider. Pull the vent window/door glass divider out. See **Fig. 3**.
14. Lower the window until the track follower end of the window regulator can be seen through the rear access hole in the door panel.
15. Push the window glass forward to remove the window regulator track follower from the window glass channel. See **Fig. 2**.
16. Lift the window out of the door and through the window opening.
17. Drill out the window glass channel rivets and replace them if new window glass is being installed. See **Fig. 4**.
18. Position the window into the door.
19. Insert the window regulator track follower into the window glass channel. See **Fig. 2**.
20. Install the vent window/door glass divider and the door glass run retainer in the door. See **Fig. 2**.
21. Using the four retaining screws, install the vent window/door glass divider. See **Fig. 3**.
22. Install the door glass run retainer bolts.
23. Position the window regulator assembly and the window motor, if equipped, in the door. Install the four retaining screws. See **Fig. 2**.

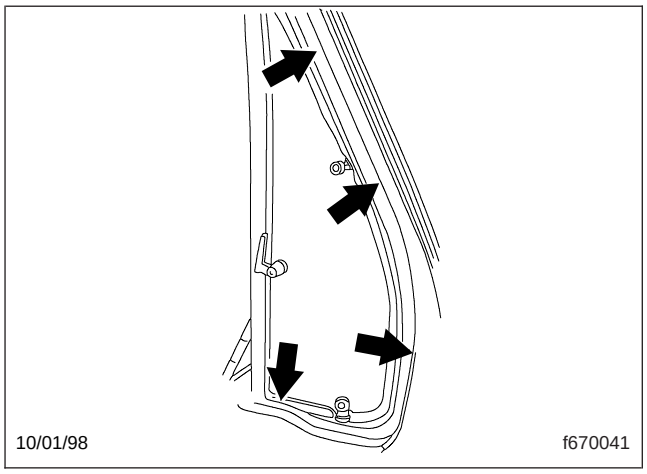

Fig. 3, Vent Window Division Bar Screw Locations

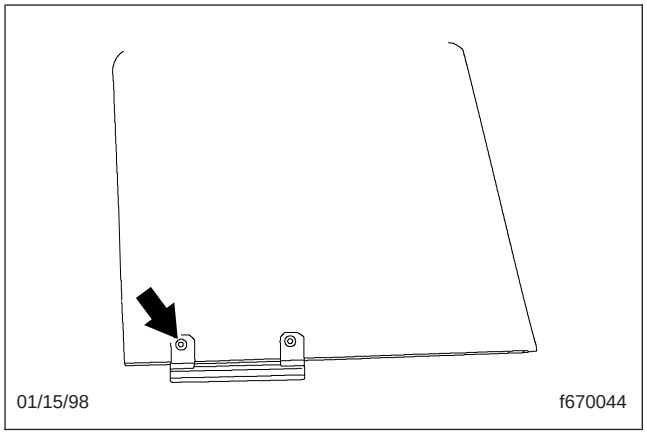

Fig. 4, Window Glass Channel Rivet

24. Connect the window motor electrical connector, if equipped.
25. Install the door window glass weatherstrip. See **Fig. 2**.
26. Push the door glass run assembly and the door window glass weatherstrip into the pinch weld. See **Fig. 2**.
27. Raise and lower the window to make sure it operates properly.
28. Install the door trim watershield. See **Fig. 1**.
29. Install the door trim panels. See **Fig. 1**.
    - 29.1 Install the armrest assembly.
    - 29.2 Install the door trim panel.
    - 29.3 Install the courtesy lamp.
    - 29.4 Install the map pocket, if equipped.
    - 29.5 Install the door trim finish panel.
30. Install the power window switch cover, the power door locks switch cover and the mirror control trim cover, if equipped.
31. Install the door window regulator crankhandle, if equipped.
32. Install the grab handle. See **Fig. 1**.
33. Connect the batteries.
34. Remove the chocks from the tires.

Observation Window Glass Replacement

Replacement

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Protect the paint finish by taping paper around the opening.
3. From outside the vehicle, unzip the integral locking tab on the rubber seal. See **Fig. 1**.

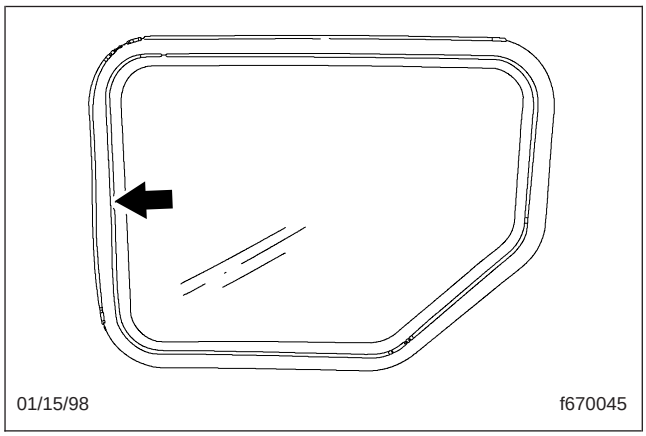

Fig. 1, Integral Locking Tab

NOTE: One assistant is necessary to push on the glass from the inside.

4. Insert an appropriate tool and pry the glass from the rubber seal. See **Fig. 2**.

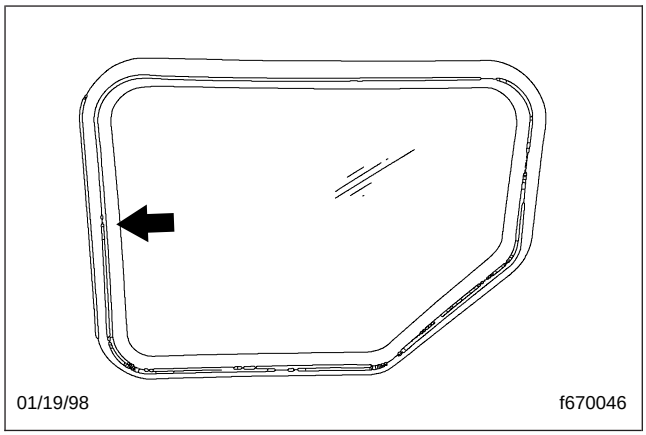

Fig. 2, Rubber Glass Seal

5. Remove the rubber seal from the door. See **Fig. 3**.

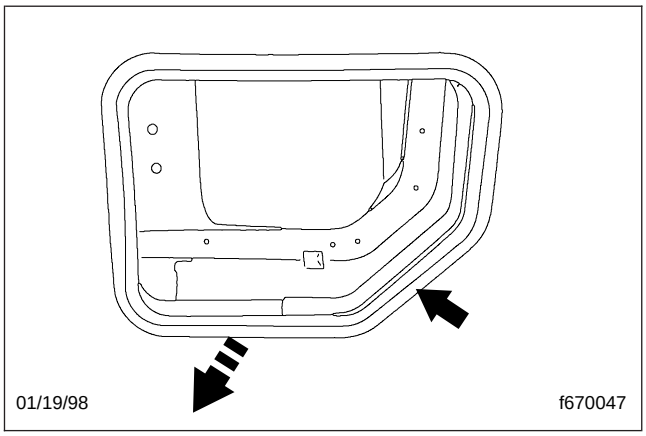

Fig. 3, Rubber Door Seal

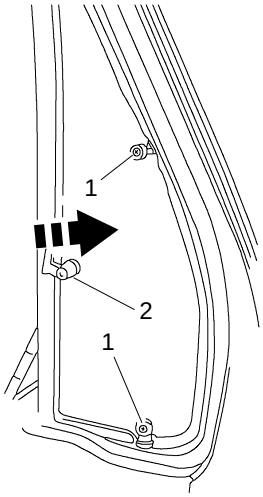
6. Install the rubber seal around the door.
7. Lubricate the rubber seal with a soap and water solution.
8. Using an appropriate tool, install the new glass into the rubber seal.
9. From outside the vehicle, install the integral locking tab on the rubber seal.
10. Remove the protective tape from around the opening.
11. Remove the chocks from the tires.

Replacement

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Roll down the window.
3. Remove the vent window glass. See **Fig. 1**.



10/01/98 f670048

1. Bolts
2. Locking Lever

Fig. 1, Vent Window

   3.1 Remove the bolts.

   3.2 Turn the locking lever clockwise and remove the vent window glass.

4. Install the vent window glass.

   4.1 Insert the vent window glass and turn the locking lever counterclockwise.

   4.2 Install the bolts.

5. Roll up the window.
6. Remove the chocks from the tires.

Vent Window Glass Latch Replacement

Replacement

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Punch out the locking lever pin and remove the handle. See **Fig. 1**.

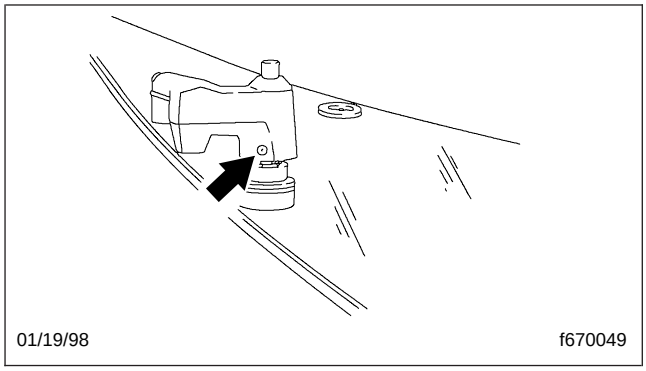


Fig. 1, Locking Lever Pin

3. Lift off the top locking lever piece. See **Fig. 2**.

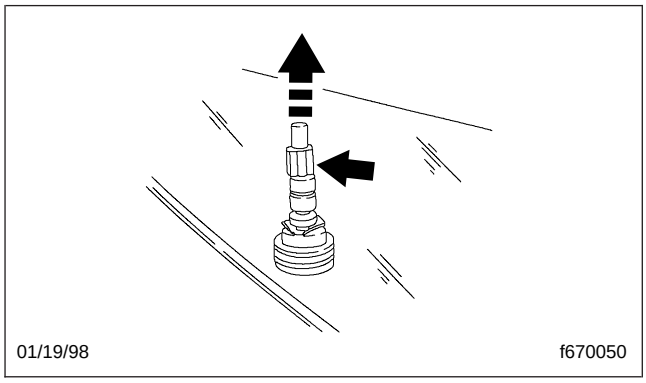

Fig. 2, Locking Lever Piece

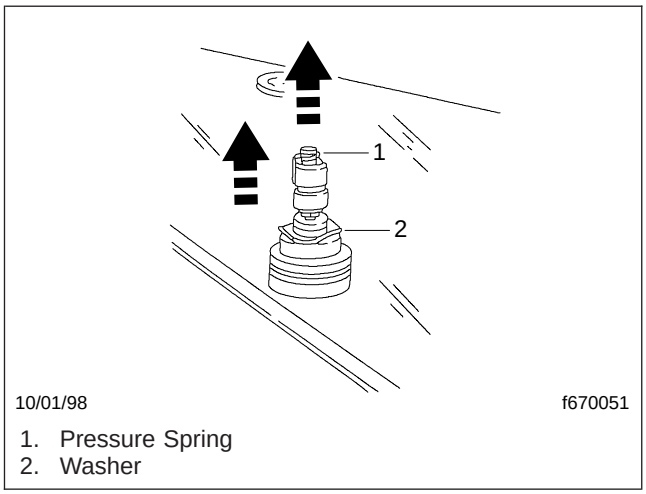
4. Remove the locking lever pressure spring and the washer. See **Fig. 3**.

NOTE: Reference the locking lever post position.

5. Remove the locking lever locking nut and slide the locking lever post and washers from the glass. See **Fig. 4**.
6. Replace the washers, locking lever post, and locking nut.



1. Pressure Spring
2. Washer

Fig. 3, Locking Lever Pressure Spring and Washer

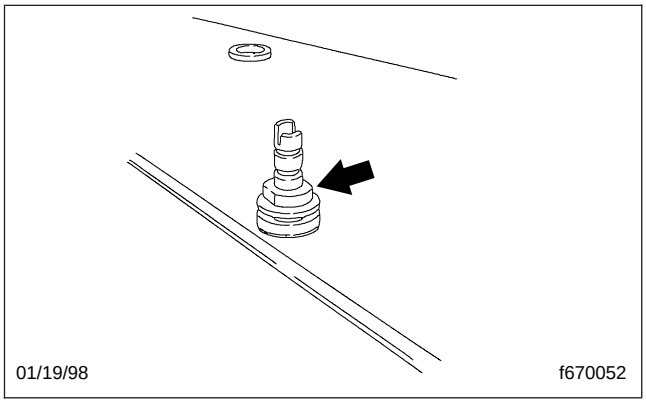


Fig. 4, Locking Lever Locking Nut

7. Replace the pressure spring and the washer. See **Fig. 3**.
8. Install the top locking lever piece.
9. Install the handle and locking lever pin.
10. Remove the chocks from the tires.

Window Motor Removal and Installation

WARNING

The window motor must be removed and installed as described below. The motor should be removed only while the regulator is firmly mounted to the door. Do not loosen or remove any fasteners that attach the regulator assembly to the door. The regulator mechanism contains a large spring under tension, which can be released if the regulator is disassembled or loosened, possibly resulting in personal injury.

Removal

If it is necessary to remove or service the regulator assembly, follow the procedure in **Subject 170**.

1. Apply the parking brakes and chock the tires.
2. Roll up the window, if possible, leaving a gap of no more than 1/4 inch (6 mm) at the top.
3. Disconnect the batteries.
4. Remove the grab handle; see **Fig. 1**.
5. Remove the power window switch cover, the power door locks switch cover, and the mirror control trim cover, if equipped. Use care when removing the covers to prevent damage to the switches.
6. Remove the door trim panels, as follows; see **Fig. 1**.
   - 6.1 Remove the door trim finish panel.
   - 6.2 Remove the map pocket, if equipped.
   - 6.3 Remove the courtesy lamp.
   - 6.4 Remove the door trim panel.
   - 6.5 Remove the armrest assembly.
7. Remove the door trim watershield; see **Fig. 1**.

NOTE: The window motor removal procedure requires drilling of the inner door. See **Fig. 2** and **Fig. 3** for the templates (to scale) to use when this procedure is required.

Window Motor Removal and Installation

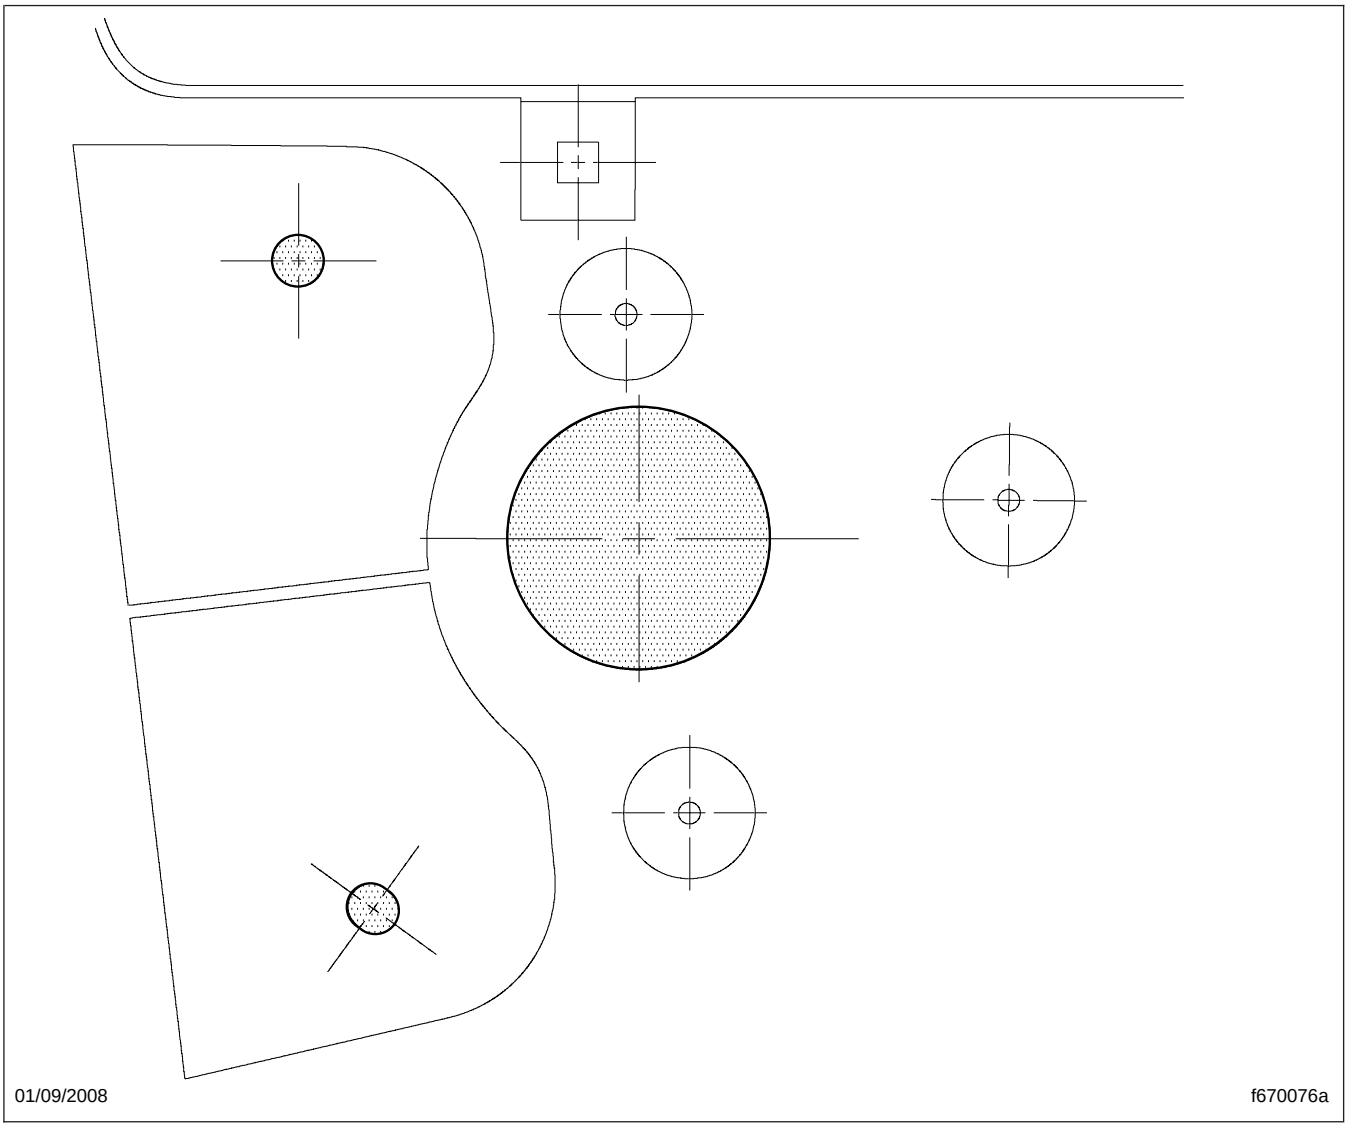

Fig. 2, Left Inner Door Window Motor Template

8. Photocopy the template without reduction or enlargement.
9. Prepare the template, and using a razor knife, cut out the inside of the shaded circles as accurately as possible.
10. Align the template and center punch the holes, as follows; see **Fig. 4**.
    - 10.1 Align the template to the door using the large hole and the upper inner door line.
    - 10.2 Tape the template securely in place.
    - 10.3 Center punch the three retaining bolt hole centers.
11. Remove the template.
12. Using an 18-mm diameter hole saw drill bit, drill out the three retaining bolt access holes; see **Fig. 5**.
13. Disconnect the motor electrical connector.
14. Tape the window glass to the door; see **Fig. 6**.
15. Support the motor and remove the retaining bolts; see **Fig. 7**. Remove the motor.

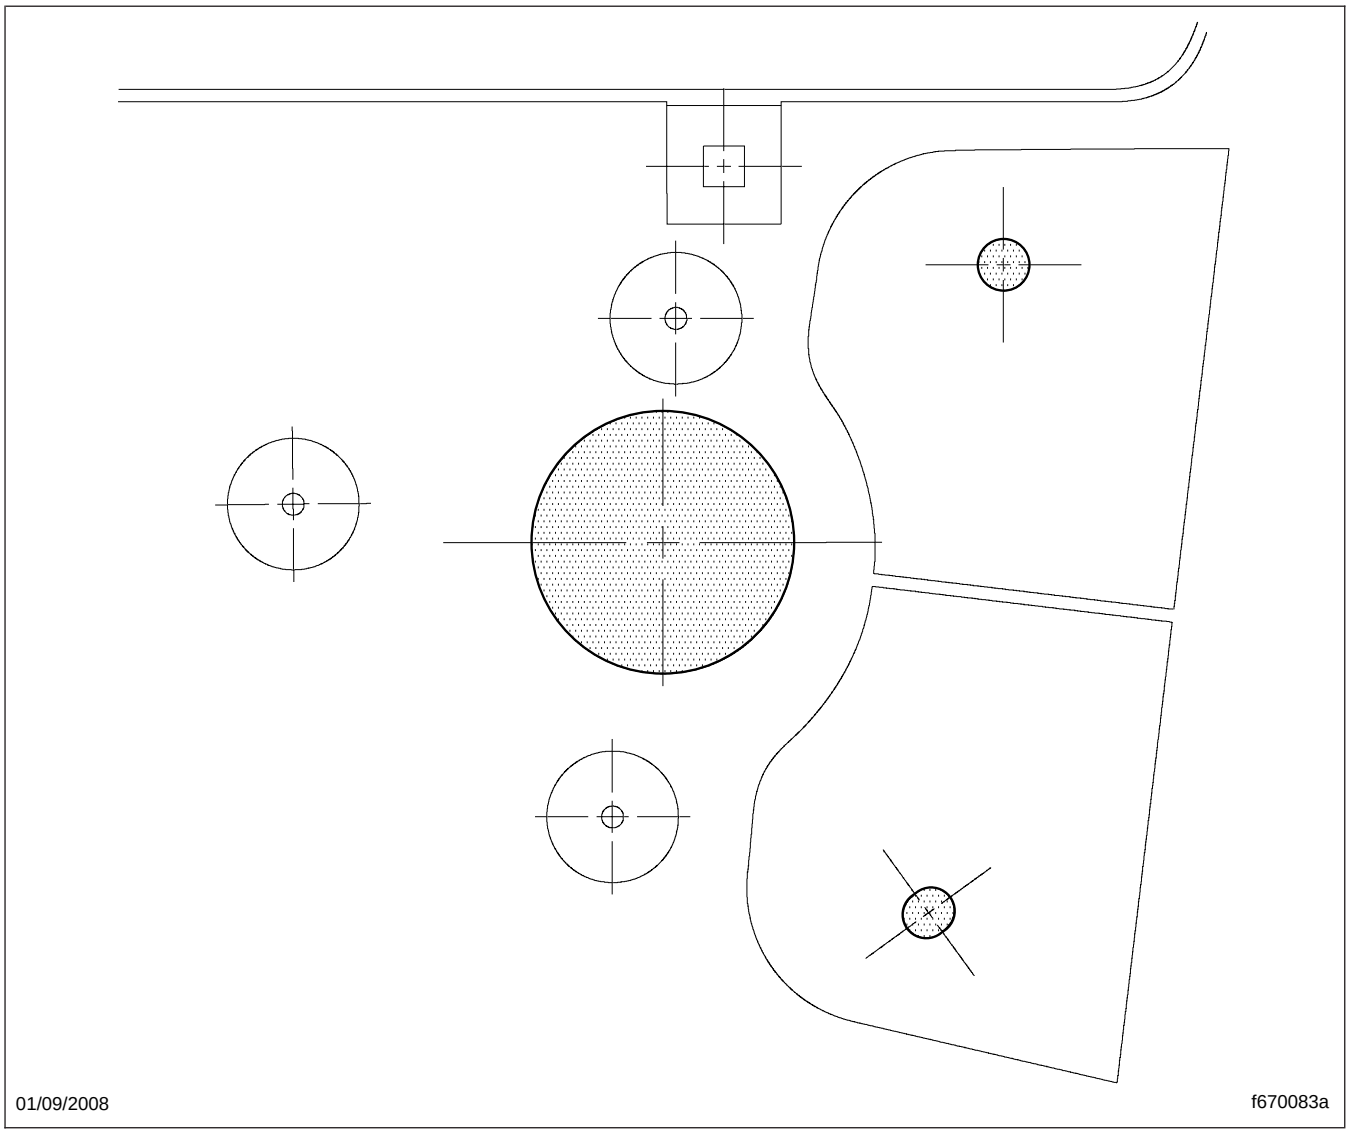

Fig. 3, Right Inner Door Window Motor Template

Installation

1. With the vehicle tires chocked, install the motor and the retaining bolts. Tighten the bolts 7 to 10 lbf·ft (9 to 13 N·m); see **Fig. 7**.
2. Remove the tape from the window; see **Fig. 6**.
3. Connect the motor electrical connector.
4. Install the door trim watershield; see **Fig. 1**.
5. Install the door trim panels, as follows; see **Fig. 1**.
   - 5.1 Install the armrest assembly.
   - 5.2 Install the door trim panel.
   - 5.3 Install the courtesy lamp.
   - 5.4 Install the map pocket, if equipped.
   - 5.5 Install the door trim finish panel.

Manual and Power Window Regulator Replacement

Replacement

WARNING

The window regulator must be removed as described below. The regulator mechanism contains a large spring under tension, which can be released, possibly resulting in personal injury. Follow the precautions listed below when replacing the regulator.

- **Keep the window motor, if so equipped, secured to the regulator while removing the regulator.**
- **Do not attempt to disassemble the regulator or motor until they have been removed from the door as an assembly. Once removed from the door, use caution if removing the motor from the regulator, as the spring is held under tension by the motor.**
- **Do not loosen or remove the regulator fasteners if the motor has been loosened or removed.**

1. Apply the parking brakes and chock the tires.
2. Disconnect the batteries.
3. Remove the grab handle; see **Fig. 1**.
4. Remove the power window switch cover, the power door locks switch cover, and the mirror control trim cover, if equipped. Use care when removing the covers to prevent damage to the switches.
5. Remove the door window regulator crankhandle, if equipped.
6. Remove the door trim panels, as follows; see **Fig. 1**.
   - 6.1 Remove the door trim finish panel.
   - 6.2 Remove the map pocket, if equipped.
   - 6.3 Remove the courtesy lamp.
   - 6.4 Remove the door trim panel.
   - 6.5 Remove the armrest assembly.
7. Remove the door trim watershield; see **Fig. 1**.

Manual and Power Window Regulator Replacement

8. Lower the window until the track follower end of the window regulator is visible; see **Fig. 2**.

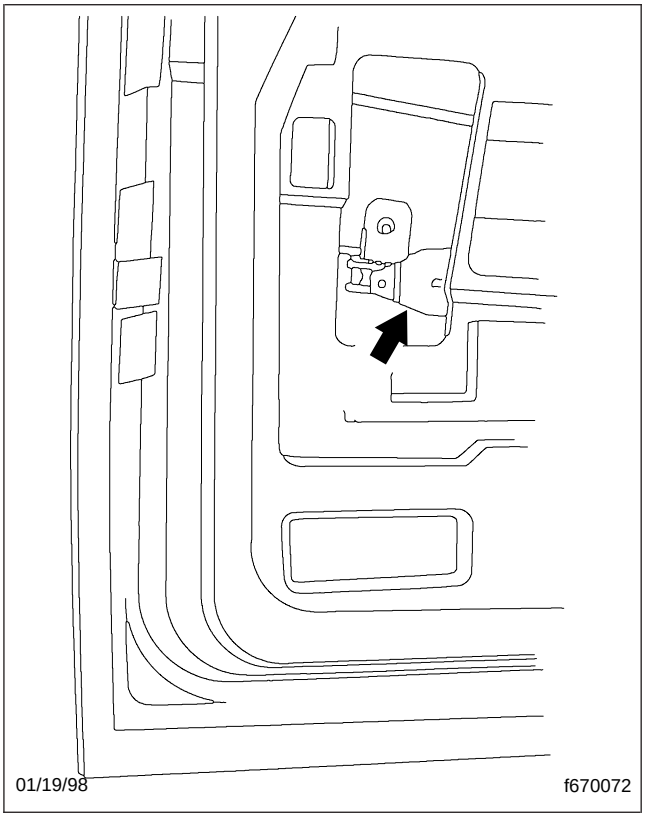

Fig. 2, Track Follower End of the Window Regulator

9. Using a suitable tool, wedge the window in place.
10. If equipped with power windows, disconnect the window motor connector.
11. Remove the window regulator bolts; see **Fig. 3**.
12. Lower the forward end of the window regulator to the forward access hole in the door.
13. Push the window regulator rearward to remove the track follower from the window glass channel.

NOTE: It may be necessary to reposition the window to align the new window regulator with the mounting holes.

14. Pull the window regulator out of the access hole in the door.
15. Place the new window regulator in the access hole in the door.

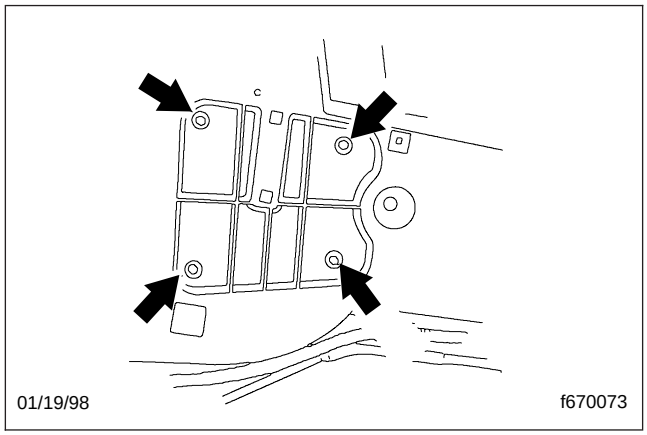

Fig. 3, Window Regulator Bolts

16. Push the window regulator forward to insert the track follower into the window glass channel.
17. Raise the forward end of the window regulator to the forward access hole in the door.
18. Install and tighten the window motor bolts 7 to 10 lbf·ft (9 to 13 N·m); see **Fig. 3**.
19. If equipped with power windows, connect the window motor connector.
20. Remove the wedge that's supporting the window.
21. Lower the window into the track follower end until the window regulator is visible; see **Fig. 2**.
22. Install the door trim watershield; see **Fig. 1**.
23. Install the door trim panels, as follows; see **Fig. 1**.
    - 23.1 Install the armrest assembly.
    - 23.2 Install the door trim panel.
    - 23.3 Install the courtesy lamp.
    - 23.4 Install the map pocket, if equipped.
    - 23.5 Install the door trim finish panel.
24. Install the power window switch cover, the power door locks switch cover, and the mirror control trim cover, if equipped.
25. Install the door window regulator crankhandle, if equipped.
26. Install the grab handle; see **Fig. 1**.
27. Connect the batteries.
28. Remove the chocks.

Door Latch Replacement

Replacement

NOTE: For this procedure, the window must be fully closed.

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Remove the grab handle. See **Fig. 1**.
   - 6.4 Remove the door trim panel.
   - 6.5 Remove the armrest assembly.
7. Remove the door trim watershield. See **Fig. 1**.
8. Remove the lower rear window run. See **Fig. 2**.
   - 8.1 Remove the bolt.
   - 8.2 Pull the run straight down to disconnect it and remove the lower rear window run.

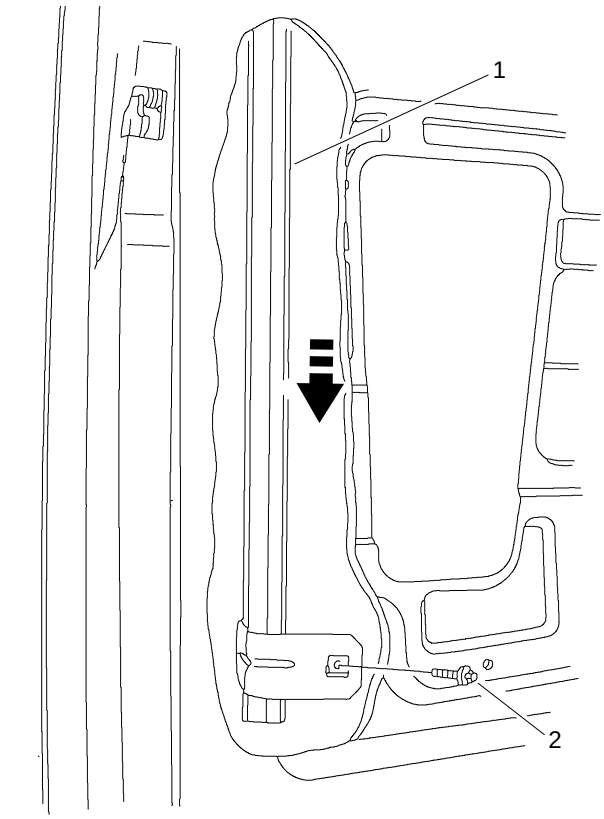
4. Remove the power window switch cover, the power door locks switch cover and the mirror control trim cover, if equipped.
5. Remove the door window regulator crankhandle, if equipped.
6. Remove the door trim panels. See **Fig. 1**.
   - 6.1 Remove the door trim finish panel.
   - 6.2 Remove the map pocket, if equipped.
   - 6.3 Remove the courtesy lamp.
9. Disconnect the outside door handle rod. See **Fig. 3**.
10. Disconnect the inside door handle remote control rod. See **Fig. 4**.
11. Disconnect the lock cylinder rod. See **Fig. 5**.
12. Drill out the power door lock actuator rivet and disconnect the electrical connector, if so equipped. See **Fig. 6**.
13. Remove the door latch attachment screws and remove the door latch. See **Fig. 7**.

Door Latch Replacement



1. Lower Rear Window Run
2. Bolt

Fig. 2, Lower Rear Window Run Removal

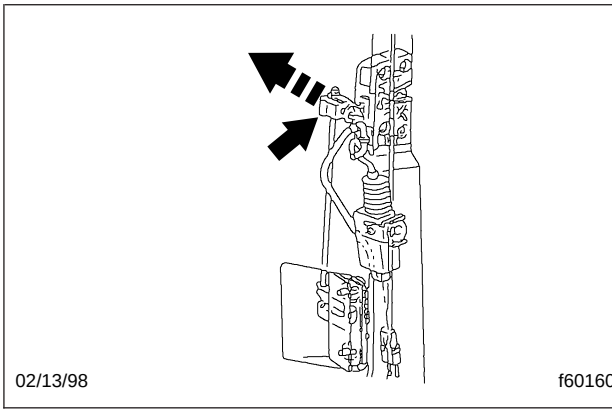


Fig. 3, Outside Door Handle Rod

IMPORTANT: Connect the inside door handle remote control rod, lock cylinder control rod, push button rod and the power door lock actuator and rod (if so equipped) to the door latch before installation of the new latch.

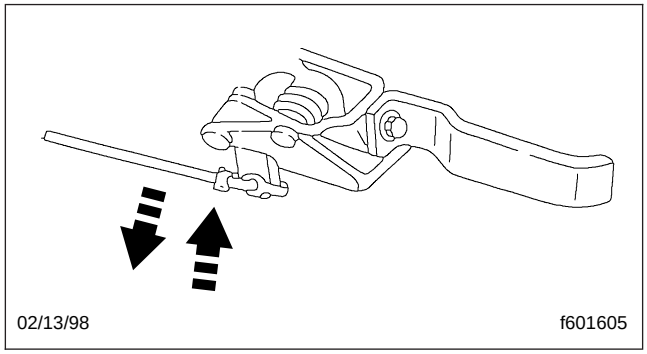

Fig. 4, Inside Door Handle Remote Control Rod

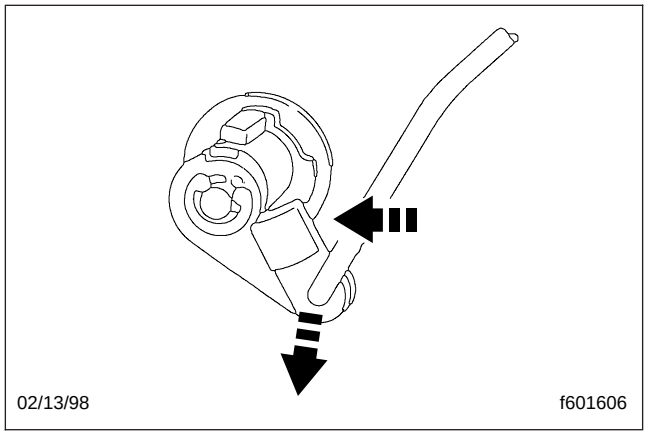

Fig. 5, Lock Cylinder Rod

14. Install the door latch. See **Fig. 7**.
    - 14.1 Position the door latch.
    - 14.2 Install the screws. Tighten the screws 7 to 10 lbf·ft (9 to 13 N·m).
15. Connect the electrical connector and install the power door lock actuator rivet, if so equipped. See **Fig. 6**.
16. Connect the lock cylinder rod. See **Fig. 5**.
17. Connect the inside door handle remote control rod. See **Fig. 4**.
18. Connect the outside door handle rod. See **Fig. 3**.
19. Install the lower rear window run. See **Fig. 2**.
    - 19.1 Pull the lower rear window run straight up and connect it.

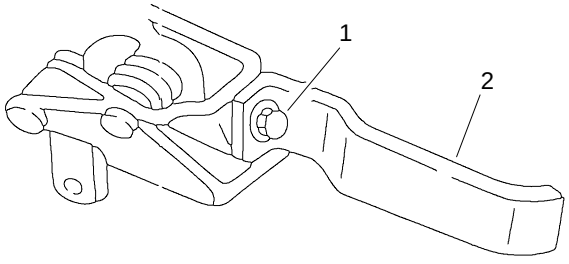
19.2 Install the bolt.

20. Install the door trim watershield. See **Fig. 1**.
21. Install the door trim panels. See **Fig. 1**.
    - 21.1 Install the armrest assembly.
    - 21.2 Install the door trim panel.
    - 21.3 Install the courtesy lamp.
    - 21.4 Install the map pocket, if equipped.
    - 21.5 Install the door trim finish panel.
22. Install the power window switch cover, the power door locks switch cover and the mirror control trim cover, if equipped.
23. Install the door window regulator crankhandle, if equipped.
24. Install the grab handle. See **Fig. 1**.
25. Connect the batteries.
26. Remove the chocks from the tires.

Replacement

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Remove the inside door handle boot.
3. Remove the handle bolt and the handle. See **Fig. 1**.



10/01/98 f601600

1. Handle Bolt
2. Handle

Fig. 1, Handle Removal

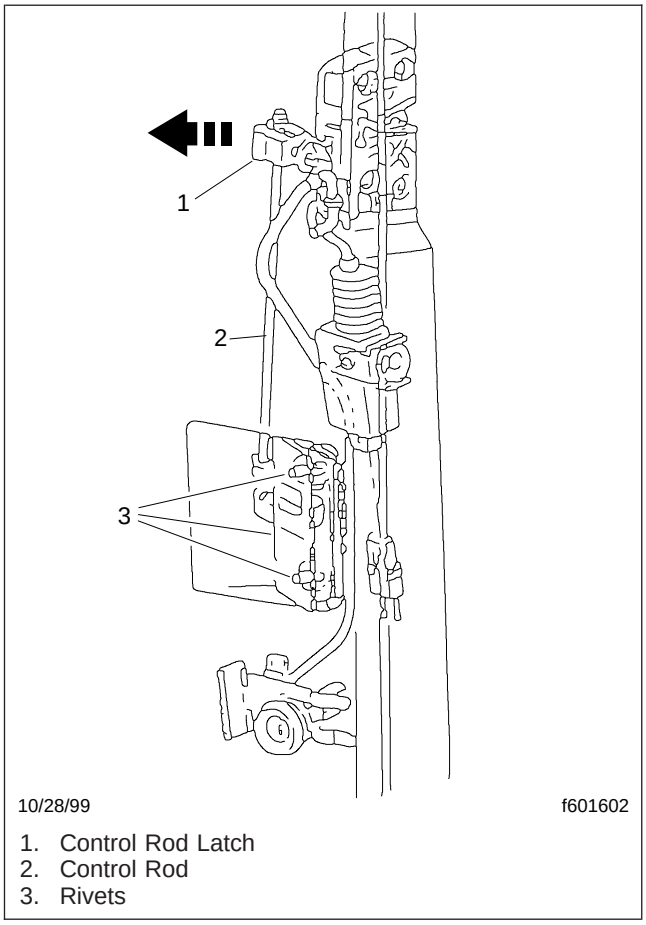
4. Position the handle and install the bolt. Tighten the bolt 7 to 10 lbf·ft (9 to 13 N·m). See **Fig. 1**.
5. Install the inside door handle boot.
6. Remove the chocks from the tires.

Outside Door Handle Replacement

Replacement

NOTE: For this procedure, the window must be fully closed.

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Remove the door trim panels.
   - 3.1 Remove the inside door handle.
   - 3.2 Remove the door window regulator crank handle, if equipped.
   - 3.3 Remove the door trim finish panel.
   - 3.4 Remove the map pocket, if equipped.
   - 3.5 Remove the courtesy lamp.
   - 3.6 Remove the door trim panel.
4. Remove the watershield.
5. Remove the outside door handle. See **Fig. 1**.
   - 5.1 Disconnect the control rod at the latch.
   - 5.2 Drill out the two rivets and remove the outside door handle.
6. Install the outside door handle. See **Fig. 1**.
   - 6.1 Connect the control rod at the latch.
   - 6.2 Install the two outside door handle rivets.
7. Install the watershield.
8. Install the door trim panels.
   - 8.1 Install the door trim panel.
   - 8.2 Install the courtesy lamp.
   - 8.3 Install the map pocket, if equipped.
   - 8.4 Install the door trim finish panel.
   - 8.5 Install the door window regulator crank handle, if equipped.
   - 8.6 Install the inside door handle.
9. Connect the batteries.
10. Remove the chocks from the tires.



1. Control Rod Latch
2. Control Rod
3. Rivets

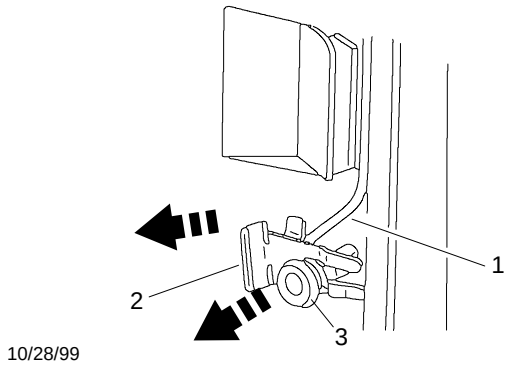
Fig. 1, Door Handle Mechanism (Inside Door)

Replacement

NOTE: When a lock cylinder is replaced, both door lock cylinders and the ignition lock cylinder should be replaced in a set; this will eliminate carrying an extra key which will fit only one lock. If a lock cylinder is to be replaced, the new key code is stamped on a metal tag attached to the key.

NOTE: For this procedure, the window must be fully closed.

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Remove the door trim panel.
   - 2.1 Remove the courtesy lamp.
   - 2.2 Remove the map pocket, if equipped.
   - 2.3 Remove the door trim panel.
3. Partially remove the watershield.
4. Remove the lock cylinder. See **Fig. 1**.



1. Door Latch Control Rod
2. Retainer Clip
3. Lock Cylinder

Fig. 1, Lock Cylinder Removal

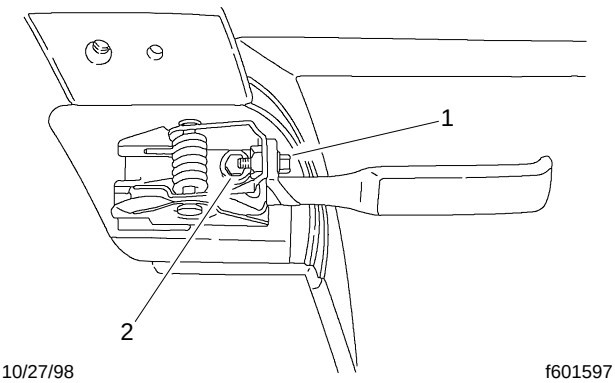
   - 4.1 Disconnect the door latch control rod at the lock cylinder.
   - 4.2 Remove the lock cylinder retainer clip and remove the lock cylinder.

NOTE: The window must be fully closed.

5. Replace the lock cylinder. See **Fig. 1**.
   - 5.1 Connect the door latch control rod at the lock cylinder.
   - 5.2 Attach the lock cylinder retainer clip.
6. Install the watershield.
7. Install the door trim panel.
   - 7.1 Install the door trim panel.
   - 7.2 Install the map pocket, if equipped.
   - 7.3 Install the courtesy lamp.
8. Remove the chocks from the tires.

Replacement

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Remove the door window regulator crank handle, if equipped.
4. Remove the door trim panels.
   - 4.1 Remove the inside door panel.
   - 4.2 Remove the door trim finish panel.
   - 4.3 Remove the map pocket, if equipped.
   - 4.4 Remove the courtesy lamp.
   - 4.5 Remove the door trim panel.
5. Remove the latch control. See **Fig. 1**.



1. Door Handle Bolt
2. Latch Control Bolt

Fig. 1, Latch Control

   - 5.1 Remove the inside door handle bolt and handle.
   - 5.2 Remove the latch control bolt.
   - 5.3 Rotate the latch control 90 degrees counterclockwise and remove the latch control.
6. Install the latch control. Tighten the bolts 7 to 10 lbf·ft (9 to 13 N·m). See **Fig. 1**.
   - 6.1 Position the latch control and install the bolt.
   - 6.2 Position the inside door handle and install the bolt.
7. Install the door trim panels.
   - 7.1 Install the door trim panel.
   - 7.2 Install the map pocket, if equipped.
   - 7.3 Install the courtesy lamp.
   - 7.4 Install the door trim finish panel.
8. Install the door window regulator crank handle, if equipped.
9. Connect the batteries.
10. Remove the chocks from the tires.

Push Button Rod Replacement

Replacement

NOTE: For this procedure, the window must be fully closed.

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Remove the door trim panel.
   - 2.1 Remove the courtesy lamp.
   - 2.2 Remove the map pocket, if equipped.
   - 2.3 Remove the door trim panel.
3. Set aside the watershield.
4. Remove the three screws from the door latch. See **Fig. 1**.

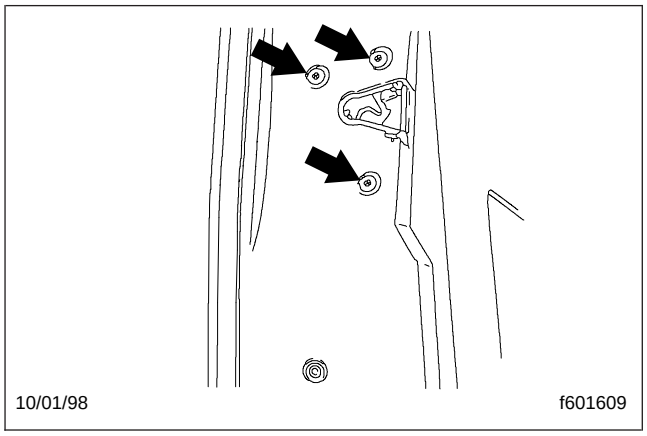


Fig. 1, Door Latch Screws

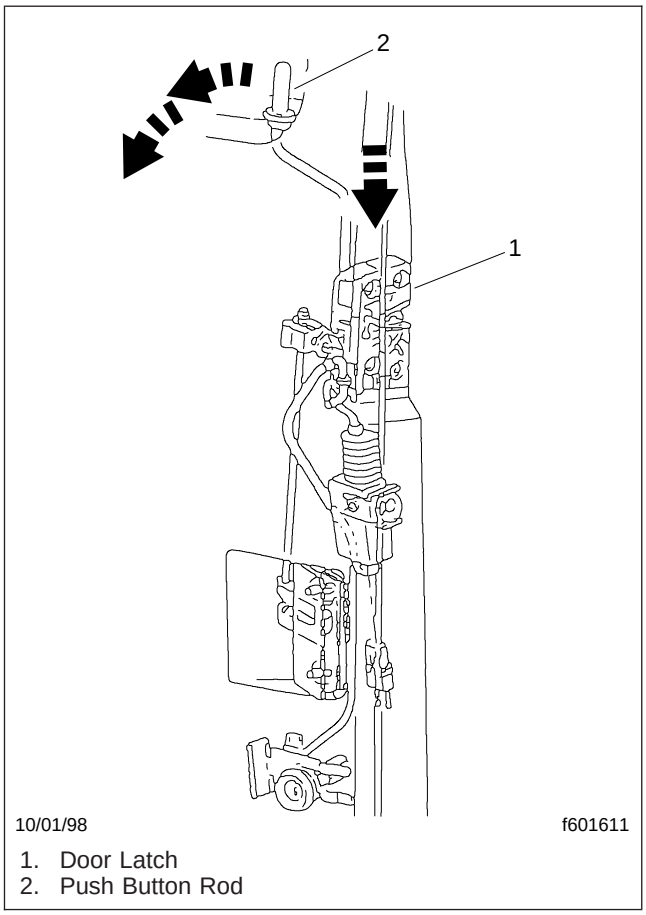
5. Remove the push button. See **Fig. 2**.
   - 5.1 Lower the door latch enough to let the push button rod clear the door.
   - 5.2 Swing the top of the push button rod away from the door latch and remove it from the door latch.
6. Replace the push button.
   - 6.1 Replace the door latch and position it with the push button rod.
   - 6.2 Swing the top of the push button rod to the door latch and connect it to the door latch.



1. Door Latch
2. Push Button Rod

Fig. 2, Push Button Assembly

7. Install the three screws to the door latch. Tighten the screws 7 to 10 lbf·ft (9 to 13 N·m). See **Fig. 1**.
8. Install the watershield.
9. Install the door trim panel.
   - 9.1 Install the door trim panel.
   - 9.2 Install the map pocket, if equipped.
   - 9.3 Install the courtesy lamp.
10. Remove the chocks from the tires.

Power Door Lock Actuator Replacement

Replacement

NOTE: For this procedure, the window must be fully closed.

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Remove the door trim panel.
   - 3.1 Remove the courtesy lamp.
   - 3.2 Remove the map pocket, if equipped.
   - 3.3 Remove the door trim panel.
4. Set aside the watershield.
5. Remove the power door lock actuator. See **Fig. 1**.
   - 5.1 Remove the door glass run.
   - 5.2 Disconnect the electrical connector.
   - 5.3 Remove the actuator from the retainer bracket.
   - 5.4 Rotate the actuator upward 90 degrees and disconnect the actuator rod and remove the actuator.
6. Install the power door lock actuator. See **Fig. 1**.
   - 6.1 With the actuator at 90 degrees, connect the actuator rod.
   - 6.2 Install the actuator into the retainer bracket.
   - 6.3 Connect the electrical connector.
   - 6.4 Connect the actuator rod.
   - 6.5 Install the rear glass door run.
7. Install the watershield.
8. Install the door trim panel.
   - 8.1 Install the door trim panel.
   - 8.2 Install the map pocket, if equipped.
   - 8.3 Install the courtesy lamp.
9. Connect the batteries.
10. Remove the chocks from the tires.

2. Rivet
3. Electrical Connector

Fig. 1, Power Door Lock Actuator

Troubleshooting

Power Windows

Inspection and Verification

1. Verify the original problem by operating the power window system to duplicate the original condition.
2. Check for one of the following electrical problems:
   - short circuits
   - power distribution box fuses E and V
   - power distribution module fuses 17, 34 CB, and 35 CB
3. If the problem(s) remains after the inspection, determine the symptom(s) and proceed to the following problem chart.

Handles, Locks, Latches, and Mechanisms

Inspection and Verification

1. Verify the owner's original problem by operating the handles, locks, latches, and mechanisms to duplicate the problem.

NOTE: Before starting any electrical diagnosis, make sure the battery is charged and check for mechanical binds by manually operating the door lock. Then operate the door lock system several times from each switch, while observing the operation of all door locks.

2. Verify that other components and systems related to the door lock fuse operate properly. If the other components and systems are not operating properly, the fuse, fuse feed circuit or load side circuit may be at fault.
3. Visually inspect for obvious signs of mechanical and electrical damage. See **Table 1**.

Visual Inspection Chart	
Mechanical	**Electrical**
Binding latch mechanisms Binding linkage Misaligned door	Open fuse: instrument panel fuse junction panel fuse 32 (15 A) Damaged door lock switch Damaged power door lock actuator Damaged circuitry Corroded connectors

Table 1, Visual Inspection Chart

4. If the problem is not visually evident, determine the possible cause and proceed to the problem charts.

Table 2, Switches

Problem—Power Windows are Inoperative

Problem—Power Windows are Inoperative (See Fig. 1, Fig. 2, Fig. 3, Fig. 4, Fig. 5, Fig. 6 and Fig. 7)	
Possible Cause	**Remedy**
Power feeds	Turn the ignition switch to the "On" position. Pull the power distribution module fuses 34 CB and 35 CB out just enough to probe the top terminals. Measure the voltage between the top terminals of the power distribution module fuses 34 CB and 35 CB, circuits 400 (BL/BK) and 296 (R) and ground. If the voltage is less than 10 volts, check the driver and passenger power window relays. If the voltage is greater than 10 volts, check the window switches.
Power window relays	Turn the ignition switch to the "Off" position. Remove the driver and passenger power window relays from the power distribution module and substitute known good relays. Turn the ignition switch to the "On" position. If the system operates correctly, replace the power window relay(s). Test the system for normal operation. If the system does not operate correctly, check the relay feed wiring.

Problem—Power Windows are Inoperative (See Fig. 1, Fig. 2, Fig. 3, Fig. 4, Fig. 5, Fig. 6 and Fig. 7)	
Possible Cause	**Remedy**
Relay feed wiring	Turn the ignition switch to the "Off" position. Disconnect the power window relay connectors C2025 and C2026. Turn the ignition switch to the "On" position. Measure the voltage between the passenger or driver power window relay connector C2025 Pins 30 and 85, circuits 37 (BK/Y) and 960 (R) and ground. If the voltage is less than 10 volts, repair the open in circuit 960 (R) at the power distribution module or circuit 37 (BK/Y) between the power distribution box, fuses V and E and the power distribution module power window relays. If the voltage is greater than 10 volts, repair the affected relay ground(s) Pin 86, circuit 57 (BK). Test the system for normal operation.
Window switch(es)	Remove, but do not disconnect, the driver window switch and the passenger window switch located on the driver door. Remove the plastic covers to gain access to the pins. Measure the voltage between the driver window switch connector C503 Pin 4, and the passenger window switch connector C502 Pin 4, circuits 400 (BL/BK) and 296 (R) and ground. Remove, but do not disconnect, the passenger window switch. Remove the plastic cover to gain access to the pins. Measure the voltage between the passenger window switch connector C604 Pin 4, circuit 296 (R) and ground. If the voltage is less than 10 volts, repair circuit 400 (BL/BK) or 296 (R) between the power distribution module and the window switch. Test the system for normal operation. If the voltage is greater than 10 volts, check the system grounds.

Troubleshooting

Problem—Power Windows are Inoperative (See Fig. 1, Fig. 2, Fig. 3, Fig. 4, Fig. 5, Fig. 6 and Fig. 7)	
Possible Cause	**Remedy**
System grounds	Turn the ignition switch to the "Off" position. Disconnect the battery ground cable(s). Disconnect the driver window switch connector C503, window regulator assembly Connector C511, driver door passenger window switch connector C502, and passenger window switch connector C604. Measure the resistance between the driver window switch connector C503 Pins 2 and 7, the window regulator assembly connector C511 Pin 5 and the driver door passenger window switch connector C502 Pins 2 and 7, circuit 57 (BK) and ground. If the resistance is more than 5 ohms, repair the open in circuit 57 (BK) between the affected window switch and ground. Test the system for normal operation. If the resistance is less than 5 ohms, check the driver or the passenger system. If the symptom is present in the passenger window, check the passenger power window. Connect the battery ground cable(s). Connect the driver window switch connector C503, window regulator assembly connector C511, driver door passenger window switch connector C503, and passenger window switch connector C604. Turn the ignition switch to the "On" position. Actuate the driver door passenger window switch to the up position. Measure the voltage between the driver door passenger window switch connector C502 Pin 6, circuit 314 (W/O) and the driver door passenger window switch connector C502 Pin 3, circuit 313 (O/W). Actuate the driver door passenger window switch to the down position. Measure the voltage between the driver door passenger window switch connector C502 Pin 3, circuit 313 (O/W) and the driver door passenger window switch connector C502 Pin 6, circuit 314 (W/O). If the voltage is less than 10 volts, replace the driver door passenger window switch. Test the system for normal operation. If the voltage is greater than 10 volts, check the vehicle options. If the vehicle equipped with a passenger power window only, check the passenger window motor connector C607. Actuate the driver door passenger window switch to the up position. Measure the voltage between the passenger window motor connector C607, circuit 314 (W/O) and the passenger window motor connector C607, circuit 313 (O/W). Actuate the driver door passenger window switch to the down position. Measure the voltage between the passenger window motor connector C607, circuit 313 (O/W) and the passenger window motor connector C607, circuit 314 (W/O). If the voltage is greater than 10 volts, replace the passenger window motor. Test the system for normal operation. If the voltage is less than 10 volts, repair the open circuit between the driver door passenger window switch and the passenger window motor. Test the system for normal operation.

Problem—Power Windows are Inoperative (See Fig. 1, Fig. 2, Fig. 3, Fig. 4, Fig. 5, Fig. 6 and Fig. 7)	
Possible Cause	**Remedy**
Passenger window switch	If the vehicle is equipped with power windows on both the passenger- and driver-sides, check the voltage at the passenger window switch. Actuate the driver door passenger window switch to the up position. Measure the voltage between the passenger window switch connector C604 Pin 7, circuit 314 (W/O) and the passenger window switch connector C604 Pin 2, circuit 313 (O/W). Actuate the driver door passenger window switch to the down position. Measure the voltage between the passenger window switch connector C604 Pin 2, circuit 313 (O/W) and the passenger window switch connector C604 Pin 7, circuit 314 (W/O). If the voltage is less than 10 volts, repair the open in the affected circuit(s). Test the system for normal operation. If the voltage is greater than 10 volts, check the passenger window switch. Actuate the passenger window switch to the up position. Measure the voltage between the passenger window switch connector C604 Pin 6, circuit 314 (W/O) and the passenger window switch connector C604 Pin 3, circuit 313 (O/W). Actuate the passenger window switch to the down position. Measure the voltage between the passenger window switch connector C604 Pin 3, circuit 313 (O/W) and the passenger window switch connector C604 Pin 6, circuit 314 (W/O). If the voltage is less than 10 volts, replace the passenger window switch. Test the system for normal operation. If the voltage is greater than 10 volts, check the passenger window motor and wiring.
Passenger window motor and wiring	Disconnect the passenger window motor connector C607. Actuate the passenger window switch to the up position. Measure the voltage between the passenger window motor connector C607, circuit 314 (W/O) and the passenger window motor connector C607, circuit 313 (O/W). Actuate the passenger window switch to the down position. Measure the voltage between the passenger window motor connector C607, circuit 313 (O/W) and the passenger window motor connector C607, circuit 314 (W/O). If the voltage is greater than 10 volts, replace the passenger window motor. Test the system for normal operation. If the voltage is less than 10 volts, repair the open in the affected circuit(s). Test the system for normal operation.

Troubleshooting

Problem—Power Windows are Inoperative (See Fig. 1, Fig. 2, Fig. 3, Fig. 4, Fig. 5, Fig. 6 and Fig. 7)	
Possible Cause	**Remedy**
Driver window switch	Connect the driver window switch connector C502, window regulator assembly connector C511, driver door passenger window switch connector C502, and the passenger window switch connector C604. Connect the battery ground cable. Turn the ignition switch to the "On" position. Actuate the driver window switch to the up position. Measure the voltage between the driver window switch connector C503 Pin 6, circuit 314 (O/W) and the driver window switch connector C503 Pin 3, circuit 313 (W/O). Actuate the driver window switch to the down position. Measure the voltage between the driver window switch connector C503 Pin 3, circuit 313 (O/W) and the driver window switch connector C503 Pin 6, circuit 314 (W/O). If the voltage is less than 10 volts, replace the driver window switch. Test the system for normal operation. If the voltage is greater than 10 volts, check the window regulator assembly switch. Disconnect the window regulator assembly connector C511. Measure the voltage between the window regulator assembly connector C511 Pin 3, circuit 400 (BL/BK) and ground. If the voltage is less than 10 volts, repair the open in circuit 400 (BL/BK) between the power distribution module fuse 34 CB and the window regulator assembly. Test the system for normal operation. If the voltage is greater than 10 volts, check the inputs to the window regulator assembly switch.
Inputs to window regulator assembly switch	Connect the window regulator assembly connector C511. Actuate the driver window switch to the up position. Using sharp probes, measure the voltage between the window regulator assembly connector C511 Pin 4 wire, circuit 314 (W/O) and the window regulator assembly connector C511 Pin 2 wire, circuit 313 (O/W). Actuate the driver window switch to the down position. Using sharp probes, measure the voltage between the window regulator assembly connector C511 Pin 2 wire, circuit 313 (O/W) and the window regulator assembly connector C511 Pin 4 wire, circuit 314 (W/O). If the voltage is less than 10 volts, repair the open in the affected circuit(s). Test the system for normal operation. If the voltage is greater than 10 volts, check the window regulator assembly.
Window regulator assembly	Actuate the driver window completely up. Actuate the driver window switch to the down position momentarily. Using sharp probes, measure the voltage between the window regulator assembly connector C511 Pin 1 wire, circuit 333 (Y/R) and the window regulator assembly connector C511 Pin 4 wire, circuit 314 (W/O). If the voltage is not greater than 10 volts for about 2.5 seconds, replace the window regulator assembly. Test the system for normal operation. If the voltage is greater than 10 volts, check the motor and wiring.
Motor and wiring	Close the driver window completely. Disconnect the driver window module connector C510. Actuate the driver window switch to the down position momentarily. Measure the voltage between the driver window motor connector C510, circuit 333 (Y/R) and the driver window motor connector C510, circuit 314 (W/O). If the voltage is greater than 10 volts for about 2.5 seconds, replace the driver window motor. Test the system for normal operation. If the voltage is not greater than 10 volts for about 2.5 seconds, repair the open in the affected circuit(s). Test the system for normal operation.

Problem—The Door Lock is Inoperative

Problem—The Door Lock is Inoperative (See Fig. 8)	
Possible Cause	**Remedy**
Stuck or binding components	Check the operation of the inoperative door lock. Manually operate the inoperative door lock. Check for a binding or stuck condition. If the door lock is stuck or binding, repair or replace the stuck or binding component. Test the system for normal operation. If the door lock is not stuck or binding, check the inoperative door lock actuator lock operation.
Lock operation	Disconnect the inoperative door lock actuator harness connector. Measure the voltage between door lock actuator connector C504, Pin 1, circuit 117 (PK/BK) for the driver door or C605, Pin 1, circuit 117 (PK/BK) for the passenger door and chassis ground while operating the door lock switch to the LOCK position. If the voltage is not greater than 10 volts, repair circuit 117 (PK/BK). Test the system for normal operation. If the voltage is greater than 10 volts, check the inoperative door lock actuator for unlock operation.
Unlock operation	Measure the voltage between door lock actuator connector C504, Pin 2, circuit 122 (PK/O) for the driver door or C605, Pin 2, circuit 122 (PK/O) for the passenger door and chassis ground while operating the door lock switch to the UNLOCK position. If the voltage is greater than 10 volts, replace the power door lock actuator. Test the system for normal operation. If the voltage is not greater than 10 volts, repair circuit 122 (PK/O). Test the system for normal operation.

Problem—The Door Locks are Inoperative

Problem—The Door Locks are Inoperative (See Fig. 8 and Fig. 9)	
Possible Cause	**Remedy**
Door lock switch	Check for power to the passenger door lock switch. Disconnect the passenger door lock switch harness connector. Measure the voltage between passenger door lock switch connector C603, Pin 4, circuit 33 (Y) and chassis ground. If the voltage is less than 10 volts, repair circuit 33 (Y). Test the system for normal operation. If the voltage is greater than 10 volts, check the ground circuit.
Ground circuit	Measure the voltage between passenger door lock switch connector C603, Pin 4, circuit 33 (Y) and Pin 2, circuit 57 (BK). If the voltage is less than 10 volts, repair circuit 57 (BK). Test the system for normal operation. If the voltage is greater than 10 volts, check the passenger door switch to driver door switch circuits.
Passenger door to driver door switch circuits	Disconnect the driver door lock switch harness connector. Measure the resistance between driver door lock switch connector C501, Pin 7, circuit 119 (PK/Y) and passenger door lock switch connector C603, Pin 6, circuit 119 (PK/Y). Measure the resistance between driver door lock switch connector C501, Pin 2, circuit 121 (PK/GN) and passenger door lock switch connector C603, Pin 3, circuit 121 (PK/GN). If the resistance is not less than 5 ohms on both circuits, repair the damaged circuit. Test the system for normal operation. If the resistance is less than 5 ohms on both circuits, check the passenger door lock switch for power.

Troubleshooting

Problem—The Door Locks are Inoperative (See Fig. 8 and Fig. 9)	
Possible Cause	**Remedy**
Passenger door lock switch power	Reconnect the passenger door lock switch harness connector. Measure the voltage between driver door lock switch connector C501, Pin 2, circuit 121 (PK/GN) and chassis ground while operating the passenger door lock switch to the UNLOCK position. Measure the voltage between driver door lock switch connector C501, Pin 7, circuit 119 (PK/Y) and chassis ground while operating the passenger door lock switch to the LOCK position. If the voltage is not greater than 10 volts on both circuits, replace the passenger door lock switch. Test the system for normal operation. If the voltage is greater than 10 volts on both circuits, check the passenger door switch for continuity to ground.
Passenger door switch continuity to ground	Measure the resistance between driver door lock switch connector C501, Pin 2, circuit 121 (PK/GN) and chassis ground while the door lock switch is in the neutral position. Measure the resistance between driver door lock switch connector C501, Pin 7, circuit 119 (PK/Y) and chassis ground while the door lock switch is in the neutral position. If the resistance is not less than 5 ohms on both circuits, replace the passenger door lock switch. Test the system for normal operation. If the resistance is less than 5 ohms on both circuits, check the driver door lock switch output circuits.
Driver door lock switch output circuit	Disconnect the driver door lock actuator harness connector. Measure the resistance between driver door lock switch connector C501, Pin 3, circuit 122 (PK/O) and driver door lock actuator connector C504, Pin 2, circuit 122 (PK/O). Measure the resistance between driver door lock switch connector C501, Pin 6, circuit 117 (PK/BK) and driver door lock actuator connector C504, Pin 1, circuit 122 (PK/BK). If the resistance is less than 5 ohms for both circuits, replace the driver door lock switch. Test the system for normal operation. If the resistance is not less than 5 ohms for both circuits, repair the damaged circuit. Test the system for normal operation.

Problem—All Locks Operate from One Switch Only

Problem—All Locks Operate from One Switch Only (See Fig. 9)	
Possible Cause	**Remedy**
Supply voltage	Disconnect the inoperative door lock switch harness connector. Measure the voltage between the inoperative door lock switch connector, C603 for the passenger door lock switch or C501 for the driver door lock switch, Pin 4, circuit 33 (Y) and chassis ground. If the voltage is greater than 10 volts, replace the inoperative door lock switch. Test the system for normal operation. If the voltage is less than 10 volts, repair circuit 33 (Y). Test the system for normal operation.

Problem—The Door Locks Operate Only One Way

Problem—The Door Locks Operate Only One Way (See Fig. 9)	
Possible Cause	**Remedy**
Ground circuits	Disconnect the driver door lock switch harness connector. Measure the resistance between driver door lock switch connector C501, Pin 2, circuit 121 (PK/GN) and chassis ground with the passenger door lock switch operated to the LOCK position. Measure the resistance between driver door lock switch connector C501, Pin 7, circuit 119 (PK/Y) and chassis ground with the passenger door lock switch operated to the UNLOCK position. If the resistance is less than 5 ohms for both circuits, replace the driver door lock switch. Test the system for normal operation. If the resistance is not less than 5 ohms for both circuits, check the passenger door lock switch.
Passenger door lock switch	Disconnect the passenger door lock switch harness connector. Measure the resistance between passenger door lock switch connector C603, Pin 2, circuit 57 (BK) and chassis ground. Measure the resistance between passenger door lock switch connector C603, Pin 7, circuit 57 (BK) and chassis ground. If the resistance is less than 5 ohms for both circuits, replace the passenger door lock switch. Test the system for normal operation. If the resistance is not less than 5 ohms for both circuits, repair the damaged circuit. Test the system for normal operation.

5. Windshield Washer Reservoir
6. Windshield Washer Pump

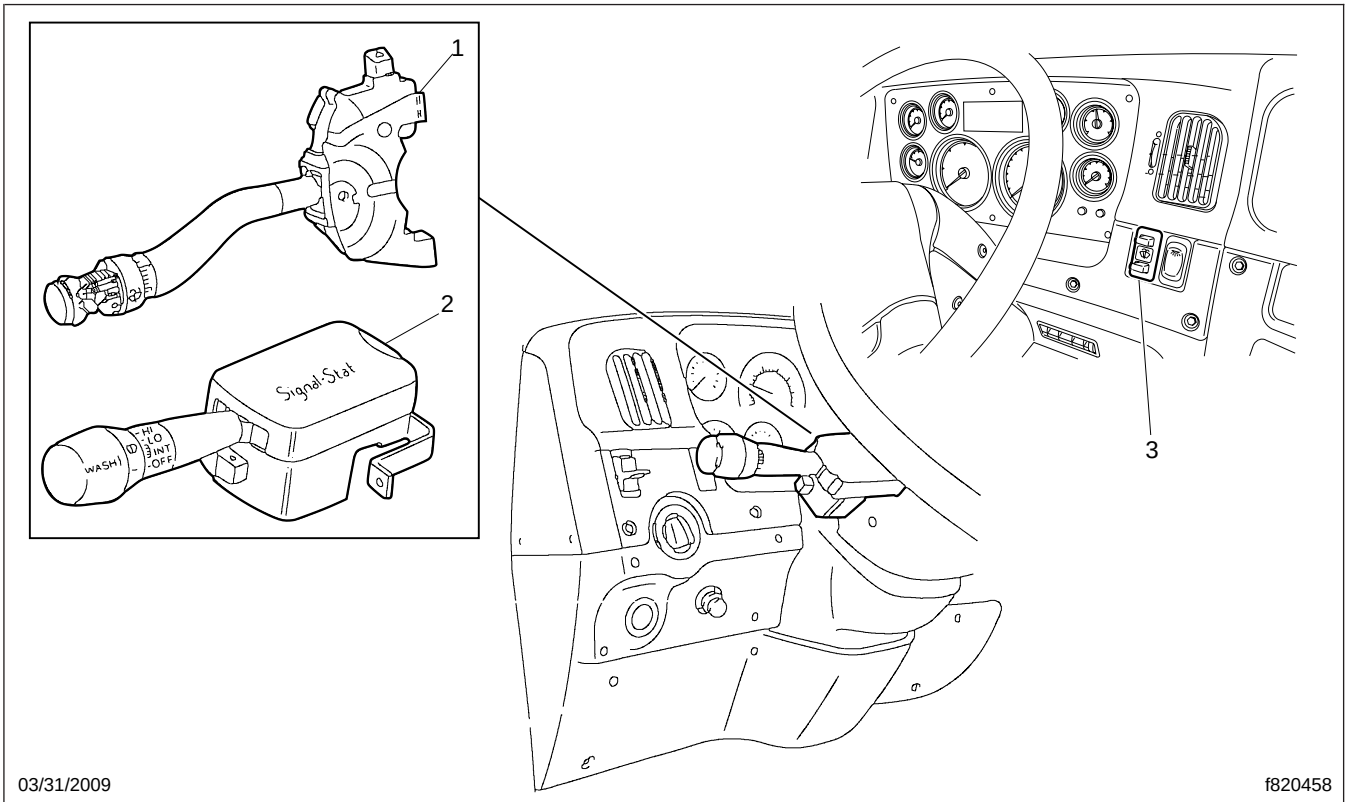
Fig. 1, Wiper/Washer System, Exterior Component Location

Wiper/Washer Switch, Multi-Function

The United Technologies multi-function switch uses a series of internal resistances to determine which mode the windshield wiper control module will place the windshield wiper motor. It is important that each resistance or combination of resistances be within the specified range.

The Signal-Stat multi-function switch uses a binary code strategy to determine which mode the windshield wiper control module will place the windshield wiper motor. This strategy is based on the windshield wiper control module receiving a combination of ground and open signals from the multi-function switch. Each different combination directs the windshield wiper control module to place the windshield wiper motor in a different mode.

General Information



1. Multi-Function Switch, United Technologies
2. Multi-Function Switch, Signal-Stat
3. Wiper/Washer Switch, Dash-Mounted

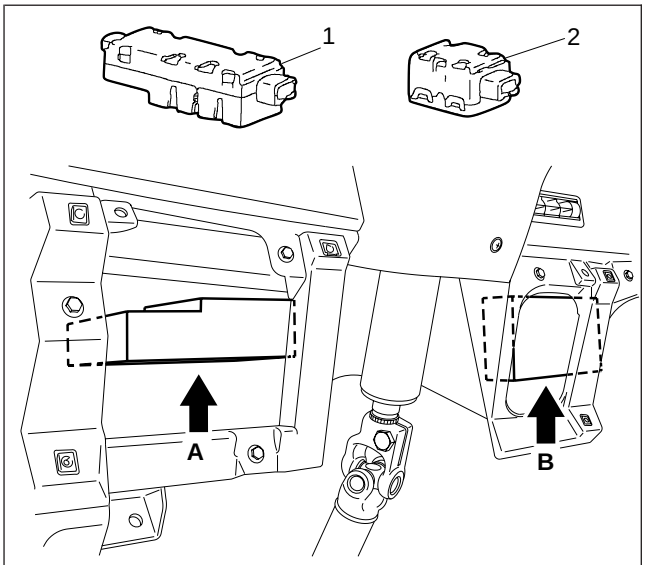
Fig. 2, Wiper/Washer System, Switch Location

There are four modes of wiper operation:

- **Off:** In this mode, there is no windshield wiper motor activity and the windshield wiper motor will be in the "Park" position.
- **Low Speed:** In this mode, the windshield wiper control module will activate the windshield wiper motor through the low speed motor winding.
- **High Speed:** In this mode, the windshield wiper control module will activate the windshield wiper motor through the high speed motor winding.
- **Interval:** In this mode, the windshield wiper control module will activate the windshield wiper motor through the low speed motor winding.

When the switch is in the interval position (**Fig. 4**), the windshield wipers will make a single sweep followed by a pause. The pause duration is controlled by the setting the operator has selected for the control knob on the end of the multi-function switch.

To engage the windshield washer, push the knob at the end of the multi-function switch; see **Fig. 5**. When the multi-function switch is in the "Off" or "Intermittent" position, the windshield wipers will run in "Low" while the knob is pushed in. When the washer knob is released, the washer will stop immediately, but the windshield wipers will continue to run for two or three sweeps, then return to their previously set mode. Washer engagement does not affect windshield wiper operation when the multi-function switch is in the "Low" or "High" position.



03/31/2009 f820459

NOTE: The wiper/washer control module is found at either location A or location B.

1. Windshield Wiper Control Module, Signal-Stat
2. Windshield Wiper Control Module, United Technologies

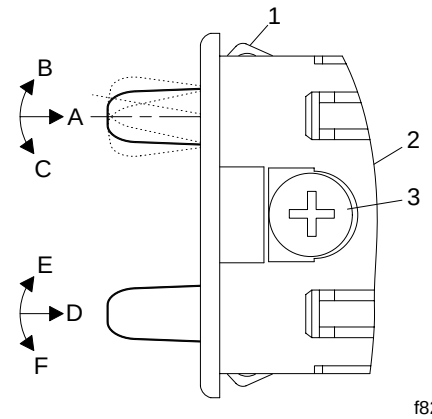
Fig. 5, Windshield Washer

Wiper/Washer Switch, Dash-Mounted

The dash-mounted wiper switch controls the wipers through relays that are located in the dash-mounted power distribution module (PDM). Wiper speed and delay timing are controlled by electronics in the switch.

The windshield wipers and washers are operated by a double-paddle switch mounted on the auxiliary instrument panel. Each paddle can be pushed in, up, or down, for three different functions. For wiper switch functions and operation, see **Fig. 6**.



10/06/95 f820178

A. Push in to turn wipers on (low speed) or off.
B. Push up for high speed.
C. Push down for low speed.
D. Push in momentarily for mist cycle. Push in and hold in for wash cycle.
E. Push up for fast delay. If already in delay, push up for the next faster delay.
F. Push down for slow delay. If already in delay, push down for the next slower delay.

1. Locking Clip
2. Wiper/Washer Switch
3. Light Bulb Screw

Fig. 6, Dash-Mounted Wiper/Washer Switch Operation

The wipers have five cycles: fast, slow, mist, wash, and delay. There are six delay intervals, 3 seconds, 5 seconds (default fast), 8 seconds, 12 seconds, 17 seconds (default slow), and 23 seconds.

The top paddle, when pushed in, turns the wipers on (if they are off) or off (if they are on). When pushed up, the top paddle switches the wipers to

high speed; when pushed down, it switches them to low speed.

The bottom paddle, when pushed in momentarily (for less than 1/2 second), turns the wipers on mist (one dry cycle at low speed). When pushed in and held in (for at least 1/2 second), the bottom paddle turns on the washers for a minimum of three cycles after release. For more wash cycles, hold the bottom paddle in longer (but it will always cycle three more times after release).

Pushing **the bottom paddle** up or down controls the delay cycle of the intermittent wipers. If the wipers are not in delay, push up for default fast delay (5 seconds) or down for default slow delay (17 seconds). If the wipers are already in delay, push up for the next faster delay or push down for the next slower delay.

Windshield Washer System

The windshield washer nozzles are an integral part of the windshield wiper arm. They are not serviceable separate from the windshield wiper arm.

Replacement

1. Apply the parking brakes and chock the tires.
2. Disconnect the batteries.

CAUTION

Disconnect the batteries before working on the wipers. This will prevent the windshield wiper motor from cycling. The motor could cycle if the wiper linkage driveshaft is forced out of the parked position, which could result in personal injury.

3. Disconnect the washer hose; see **Fig. 1**.

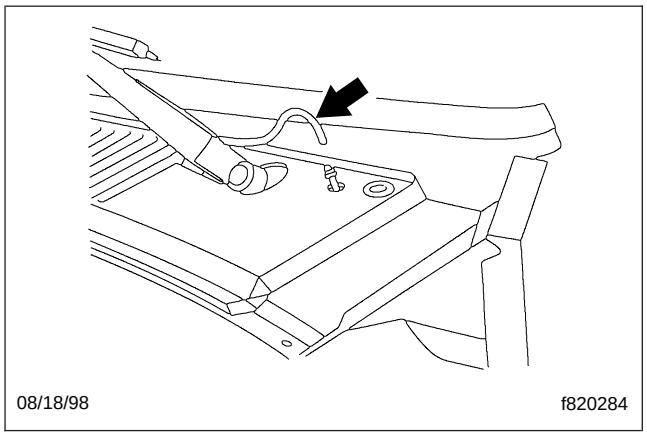


Fig. 1, Windshield Washer Hose

NOTE: The windshield wiper arm can be removed at any point in the wiper sweep without the use of any special tools.

4. Carefully raise the windshield wiper blade away from the windshield glass until it stops.
5. Pull the locking lever away from the windshield wiper arm; see **Fig. 2**.
6. Lift the windshield wiper arm from the pivot shaft; see **Fig. 3**.
7. Install the new windshield wiper arm on the pivot shaft; see **Fig. 3**.
8. Close the locking lever on the windshield wiper arm; see **Fig. 2**.
9. Connect the washer hose; see **Fig. 1**.
10. Connect the batteries.

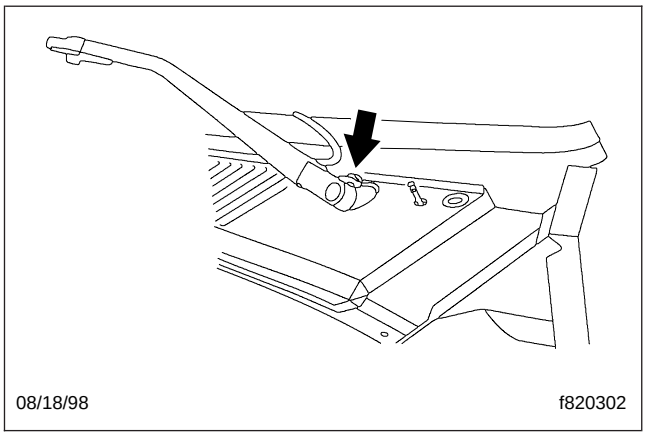

Fig. 2, Windshield Wiper Arm Locking Lever

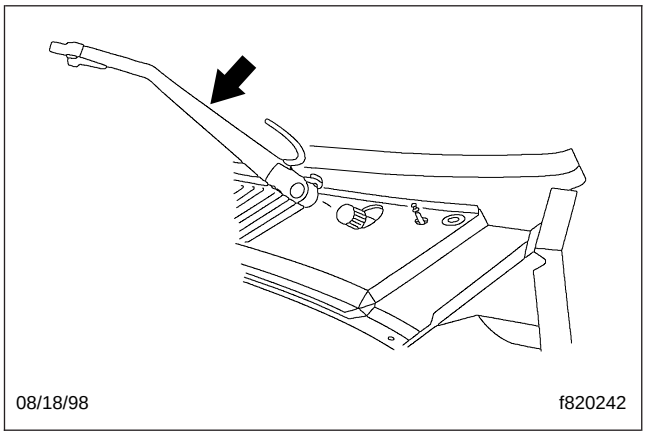

Fig. 3, Windshield Wiper Arm

11. Check and if necessary, adjust the windshield wiper arm; see **Subject 160**.

Replacement

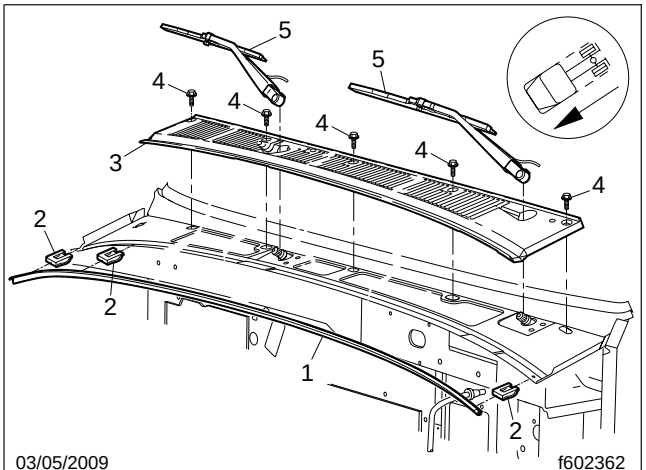
NOTE: The windshield wiper linkage and pivot shafts are serviced as an assembly.

1. Apply the parking brakes and chock the tires.
2. Disconnect the batteries.

CAUTION

Disconnect the batteries before working on the wipers. This will prevent the windshield wiper motor from cycling. The motor could cycle if the wiper linkage driveshaft is forced out of the parked position, which could result in personal injury.

3. Remove the windshield wiper arms; see **Subject 100**.
4. Remove the cowl top vent panel (rain tray grille) as follows.
   - 4.1 Remove the rubber seal from the forward edge of the rain tray.
   - 4.2 Remove the five screws that attach the vent panel to the top of the rain tray; see **Fig. 1**. Remove the vent panel.



1. Rubber Seal
2. Retainer
3. Vent Panel
4. Screw
5. Wiper Arm and Blade

Fig. 1, Cowl Top Vent Panel Installation

5. Remove the retaining clip and disconnect the windshield wiper linkage from the wiper motor arm; see **Fig. 2**. Note that some linkages are secured with an E-clip, two seals, and a washer.

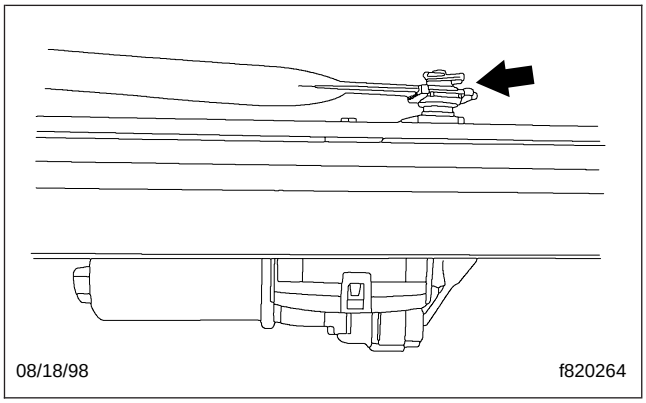


Fig. 2, Windshield Wiper Linkage Retaining Clip

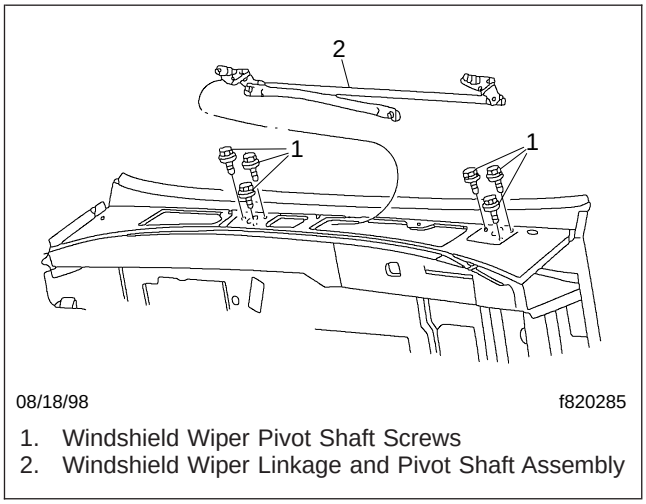
6. Remove the windshield wiper linkage and pivot shaft assembly as follows; see **Fig. 3**.



1. Windshield Wiper Pivot Shaft Screws
2. Windshield Wiper Linkage and Pivot Shaft Assembly

Fig. 3, Windshield Wiper Linkage and Pivot Shafts

   - 6.1 Remove the six pivot shaft screws.
   - 6.2 Slide the windshield wiper linkage and pivot shaft assembly to the passenger side of the vehicle until the driver-side pivot clears the opening in the cowl. Bring the assembly up and out through the large cowl opening.
7. Install the new windshield wiper linkage and pivot shaft assembly as follows; see **Fig. 3**.
   - 7.1 Slide the windshield wiper linkage assembly in through the large cowl opening to-

Wiper Linkage Replacement

ward the passenger side until it drops into the cowl rain tray. Align the assmbly and lift the pivots through the openings in the cowl top panel.

7.2 Install the six pivot shaft screws (**Fig. 3**, Items 1), then tighten them 80 to 115 lbf·in (900 to 1300 N·cm).

8. Connect the windshield wiper motor arm to the linkage and install the retaining clip (or if so equipped, the E-clip, two seals, and washer); see **Fig. 2**. Apply grease to the joint.
9. Install the cowl top vent panel (rain tray grille) as follows.

   9.1 Attach the vent panel to the top the rain tray, using the five screws.

   9.2 Install the rubber seal on the forward edge of the rain tray.
10. Install the windshield wiper arms; see **Subject 100**.
11. Connect the batteries.
12. Check and, if necessary, adjust the windshield wiper arms; see **Subject 160**.

Windshield Wiper Motor Replacement

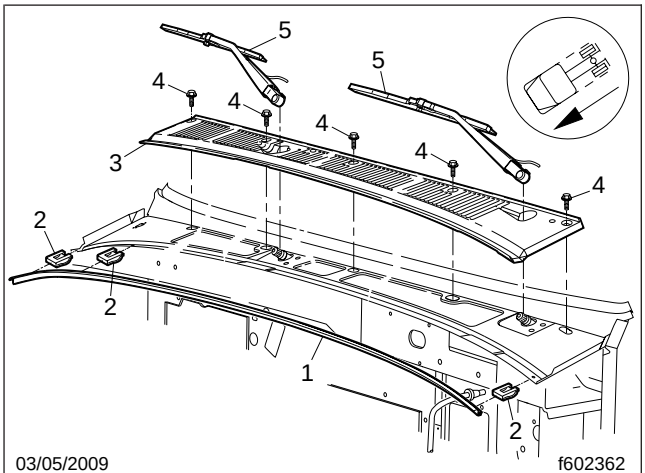
Replacement

1. Apply the parking brakes and chock the tires.
2. Open the hood.
3. Disconnect the batteries.

⚠ CAUTION

Disconnect the batteries before working on the wipers. This will prevent the windshield wiper motor from cycling. The motor could cycle if the wiper linkage driveshaft is forced out of the parked position, which could result in personal injury.

4. Remove the windshield wiper arms; see **Subject 100**.
5. Remove the cowl top vent panel (rain tray grille) as follows.
   - 5.1 Remove the rubber seal from the forward edge of the rain tray.
   - 5.2 Remove the five screws that attach the vent panel to the top of the rain tray; see **Fig. 1**. Remove the vent panel.



1. Rubber Seal
2. Retainer
3. Vent Panel
4. Screw
5. Wiper Arm and Blade

Fig. 1, Cowl Top Vent Panel Installation

6. Remove the retaining clip and disconnect the windshield wiper linkage from the wiper motor arm; see **Fig. 2**. Note that some linkages are secured with an E-clip, two seals, and a washer.

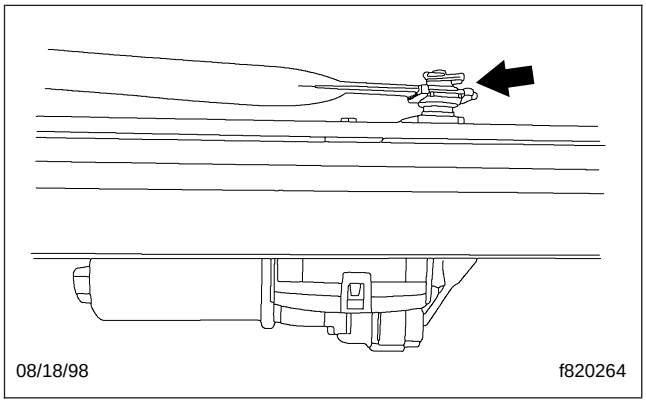


Fig. 2, Windshield Wiper Linkage Retaining Clip

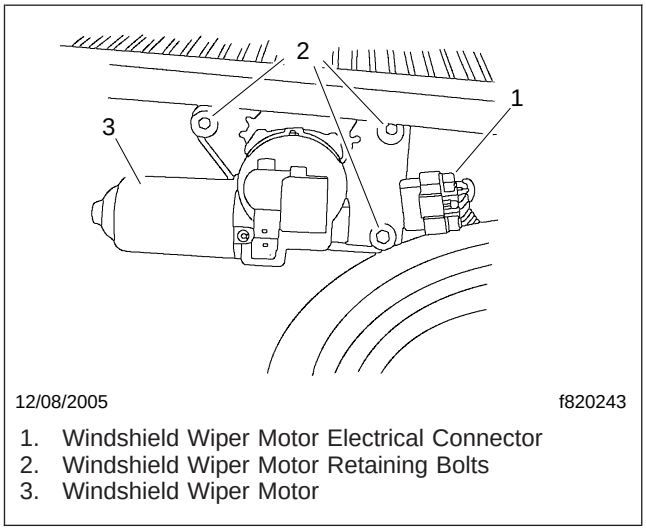
7. Disconnect the wiper motor electrical connector; see **Fig. 3**.



1. Windshield Wiper Motor Electrical Connector
2. Windshield Wiper Motor Retaining Bolts
3. Windshield Wiper Motor

Fig. 3, Windshield Wiper Motor

8. Remove the three wiper motor mounting bolts, then remove the wiper motor.
9. Install the new windshield wiper motor, using the three mounting bolts; see **Fig. 3**. Tighten the bolts 80 to 115 lbf·in (900 to 1300 N·cm).
10. Connect the wiper motor electrical connector.
11. Connect the windshield wiper motor arm to the linkage, then install the retaining clip (or if so equipped, the E-clip, two seals, and washer); see **Fig. 2**. Apply grease to the joint.

Windshield Wiper Motor Replacement

12. Install the cowl top vent panel (rain tray grille) as follows.
    - 12.1 Attach the vent panel to the top the rain tray, using the five screws.
    - 12.2 Install the rubber seal on the forward edge of the rain tray.
13. Install the windshield wiper arms; see **Subject 100**.
14. Connect the batteries and close the hood.
15. Check and, if necessary, adjust the windshield wiper arms; see **Subject 160**.

Windshield Washer Reservoir Replacement

Replacement

1. Open the hood.

NOTE: Windshield washer fluid must be collected in a container after the windshield washer hose is disconnected.

2. Disconnect the electrical connector and the washer hose. See **Fig. 1**.

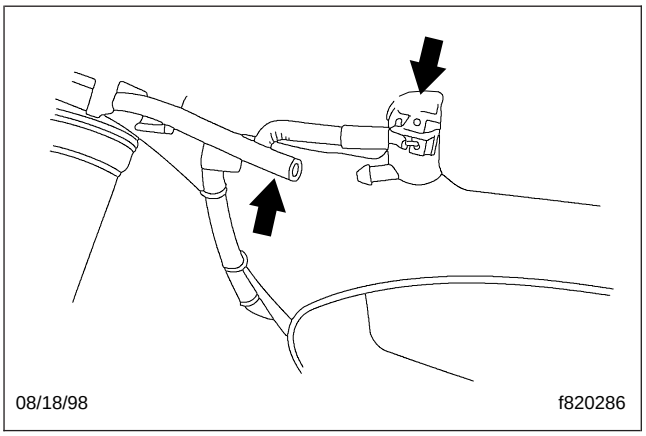


Fig. 1, Windshield Washer Pump Electrical Connector and Hose

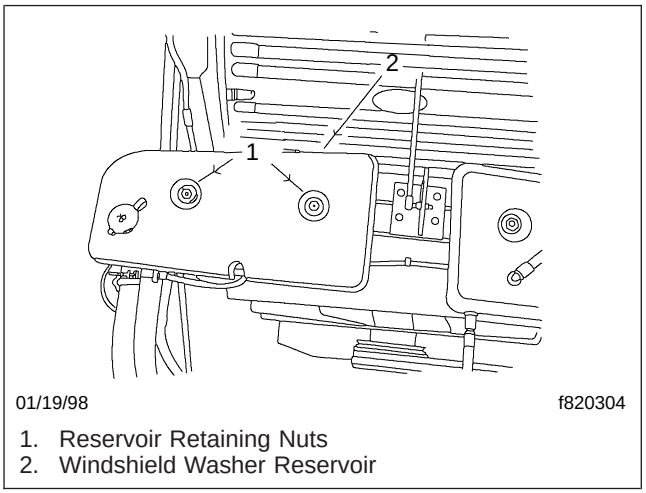
3. Remove the windshield washer reservoir. See **Fig. 2**.



1. Reservoir Retaining Nuts
2. Windshield Washer Reservoir

Fig. 2, Windshield Washer Reservoir

3.1 Remove the two retaining nuts.

3.2 Remove the windshield washer reservoir.

4. Install the windshield washer reservoir. See **Fig. 2**.

4.1 Install the windshield washer reservoir.

4.2 Install the two retaining nuts.

5. Connect the washer hose. See **Fig. 1**.

CAUTION

Do not connect the electrical connector prior to filling the windshield washer reservoir or operate the windshield washer pump prior to filling the windshield washer reservoir or damage to the pump could result.

6. Fill the windshield washer reservoir with windshield washer fluid.
7. Connect the electrical connector. See **Fig. 1**.
8. Close the hood.

Washer Pump Replacement

Replacement

1. Open the hood.

NOTE: Windshield washer fluid must be collected in a container after the windshield washer hose is disconnected.

2. Disconnect the windshield washer pump electrical connector and washer hose. See **Fig. 1**.

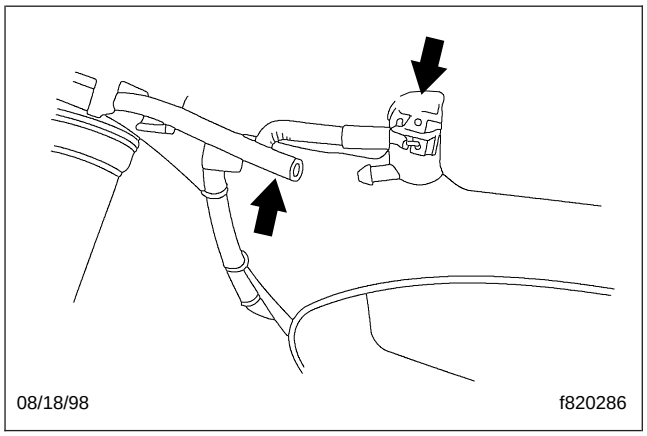


Fig. 1, Windshield Washer Pump Electrical Connector and Hose

3. Remove the windshield washer pump. See **Fig. 2**.
4. Install the windshield washer pump. See **Fig. 2**.
5. Connect the washer hose. See **Fig. 1**.

⚠ CAUTION

Do not connect the electrical connector prior to filling the windshield washer reservoir or operate the windshield washer pump prior to filling the windshield washer reservoir or damage to the pump could result.

6. Fill the windshield washer reservoir with windshield washer fluid.
7. Connect the electrical connector. See **Fig. 1**.
8. Close the hood.

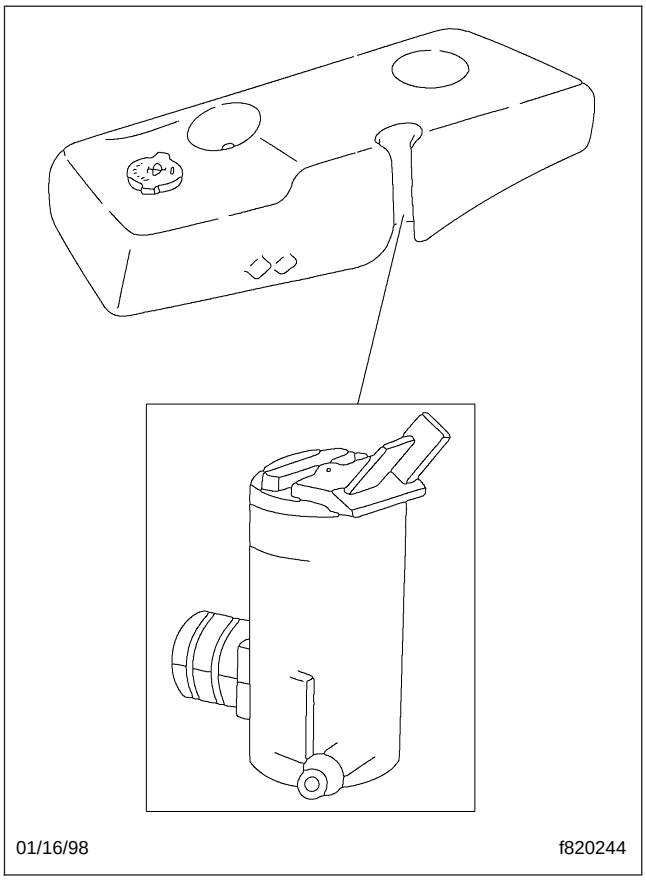

Fig. 2, Windshield Washer Pump

Wiper Control Module Replacement

NOTE: The following procedure applies to United Technologies and Signal Stat wiper systems. On the dash-mounted wiper switch systems, there is no separate wiper control module.

Replacement

1. Apply the parking brakes and chock the tires.
2. Remove the five under-steering-panel screws, then remove the panel; see **Fig. 1**.

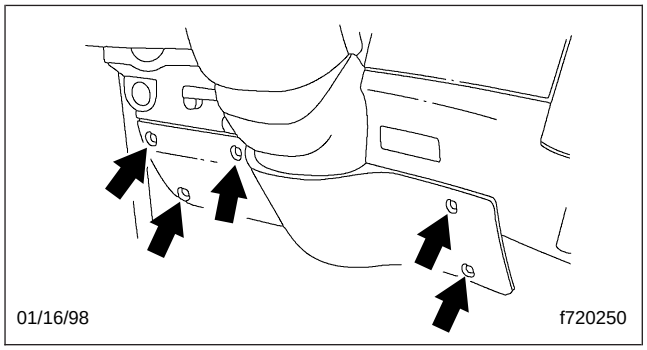

Fig. 1, Under-Steering-Panel Screws

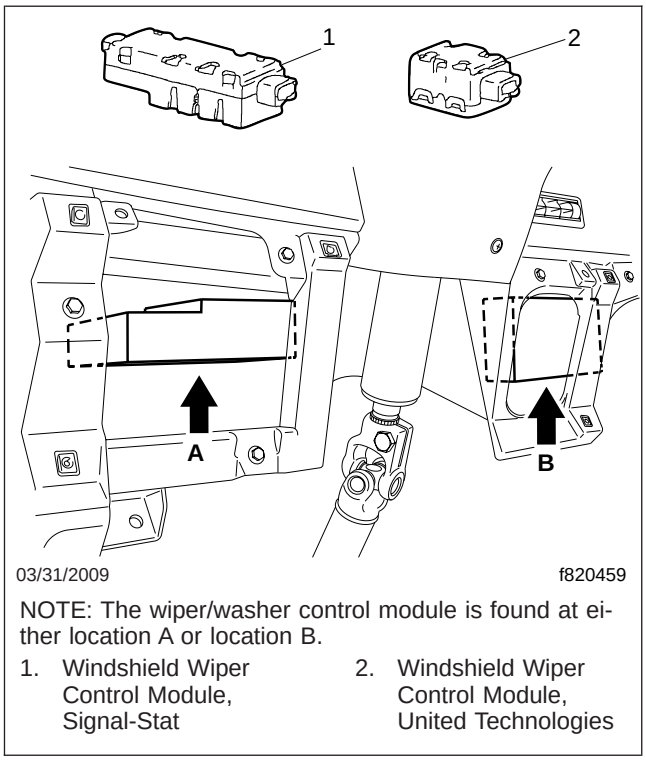
3. Locate the wiper control module, either to the left or right of the steering column; see **Fig. 2**. Disconnect the electrical connector(s).

NOTE: United Technologies wiper control modules have one electrical connector, and Signal Stat wiper control modules have two electrical connectors.

4. Pull the wiper control module off the wiper control module mounting bracket; see **Fig. 2**.
5. Install the new wiper control module.
6. Connect the electrical connector(s).
7. Attach the under-steering panel to the dash, using the five screws; see **Fig. 1**.

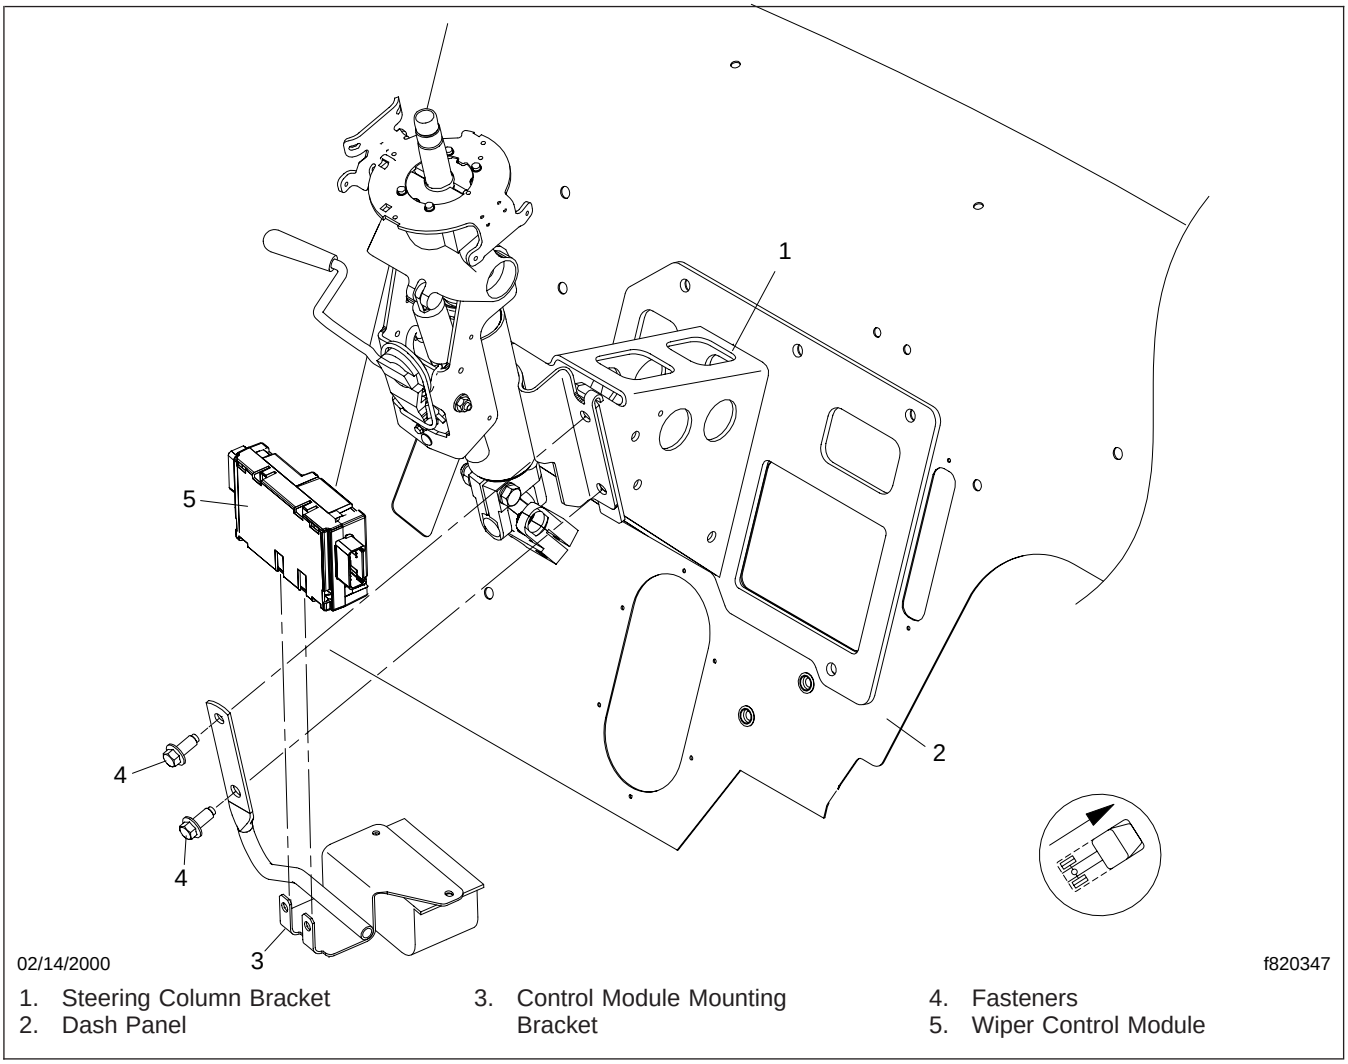


NOTE: The wiper/washer control module is found at either location A or location B.

1. Windshield Wiper Control Module, Signal-Stat
2. Windshield Wiper Control Module, United Technologies

Fig. 2, Wiper/Washer System, Control Module Location

Wiper Control Module Replacement



1. Steering Column Bracket
2. Dash Panel
3. Control Module Mounting Bracket
4. Fasteners
5. Wiper Control Module

Fig. 3, Wiper Control Module Mounting (typical)

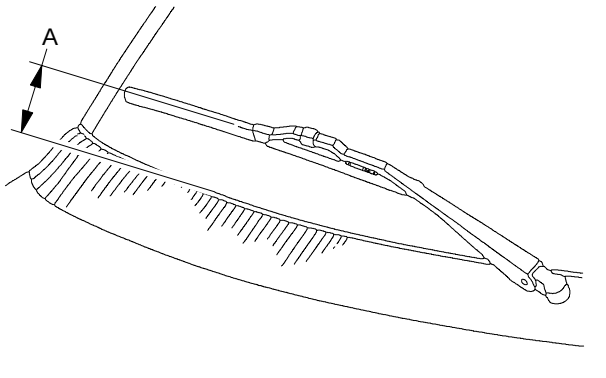
Adjustment

1. Apply the parking brakes and chock the tires.
2. Disconnect the batteries.

CAUTION

Disconnect the batteries before working on the wipers. This will prevent the windshield wiper motor from cycling. The motor could cycle if the wiper linkage driveshaft is forced out of the parked position, which could result in personal injury.

3. Cycle and park the windshield wipers.
4. Verify that the distance between the center of the right-hand windshield wiper blade and the cowl top vent panel is within 3 inches (76 mm); see **Fig. 1**.

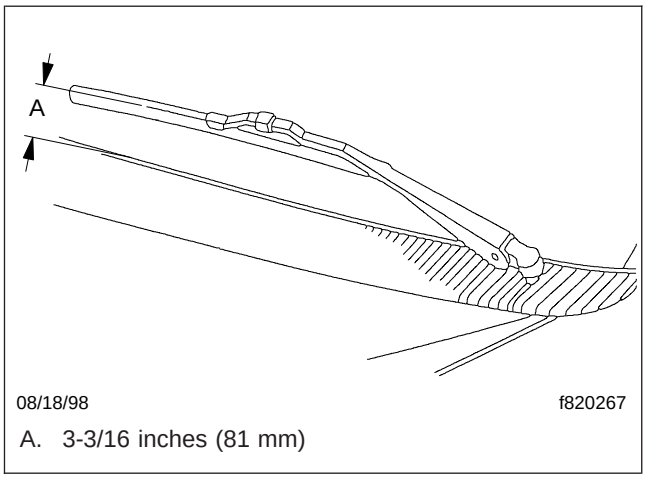


08/18/98 f820245

A. 3 inches (76 mm)

Fig. 1, Right-Hand Windshield Blade Park Dimension

5. Verify that the distance between the center of the left-hand windshield wiper blade and the cowl top vent panel is within 3-3/16 inches (81 mm); see **Fig. 2**.
6. If a windshield wiper arm is not positioned within the above specifications, remove and reposition the wiper arm; see **Subject 100**.
7. Connect the batteries.



08/18/98 f820267

A. 3-3/16 inches (81 mm)

Fig. 2, Left-Hand Windshield Blade Park Dimension

Troubleshooting, United Technologies Wiper and Washer

Troubleshooting

CAUTION

Use caution when working on or near the wiper linkage, arms, and motor. An intermittent wiper system may swipe without warning, posing a risk of personal injury.

NOTICE

Make sure the ignition switch is off before disconnecting any wiper/washer harness connectors. Removing connectors with the ignition switch on may cause electrical arcing, which will damage the pins.

Preliminary Checks

Before beginning the troubleshooting procedures, verify the driver's complaint by checking the system components, and operating the wiper and washer to duplicate the problem.

1. Check the wiper arms, blades, and linkage for wear and damage.
2. Check the washer fluid level in the reservoir.
3. Turn the ignition switch to the ON position without starting the engine.
4. Test the wipers on low speed, high speed, and several intermittent speeds.
5. Test the windshield washers.
6. Turn the ignition switch to the OFF position.
7. Check the washer hoses for leaks and damage.

Diagnostic Procedures

Symptoms

The diagnostic procedures listed in **Table 1** are described in detail in the succeeding tables. When performing the diagnostic procedures, refer to the wiring diagram (**Fig. 1**) and the tables in this subject.

NOTICE

Use caution when backprobing sealed connectors. If the seal is damaged, water could intrude into the connection, resulting in corrosion and electrical failure.

IMPORTANT: The following wiper and washer diagnostic procedures are performed with the ignition switch in the ON position, and the engine NOT running.

Troubleshooting Procedures	
Symptom	**Table Number**
Wipers are inoperative in all modes	**Table 2**
High-speed mode only is inoperative	**Table 3**
Low-speed and all intermittent speed modes are inoperative, high-speed mode is OK	**Table 4**
Some intermittent setting modes are inoperative	**Table 5**
Wipers do not park in the proper position	**Table 6**
Wipers stay on or swipe intermittently until ignition is turned off	**Table 7**
Washers are inoperative, wipers are OK	**Table 8**
Washer spray does not correctly cover wipe area	**Table 9**

Table 1, Troubleshooting Procedures

Troubleshooting, United Technologies Wiper and Washer

Wipers Are Inoperative In All Modes			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—
2	With the connector remaining connected, backprobe the wiper motor connector on pins 2 and 3 to measure for battery voltage; see **Table 10**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 120**.
		Low or at zero	Go to **step 3**.
3	Access the wiper control module (**Fig. 2**), and backprobe pin 8 to measure the voltage, with the connector remaining connected to the module; see **Fig. 3**. Is battery voltage present?	Yes	There is a wiring fault on circuit 315L or the wiper motor ground circuit. Disconnect the power, and perform continuity testing to locate the circuit fault, then repair as appropriate.
		No	Go to **step 4**.
4	Measure the voltage on pins 2 and 11 of the wiper control module; see **Fig. 3**. Is battery voltage present on both pins, one pin (either 2 or 11), or neither pin?	Both pins	Test the wiper switch; see **Table 11**. Test the wiring from the wiper switch to the wiper control module for open or short circuits. If any of the wiper switch tests fail, replace the switch.
		One pin (either 2 or 11)	Locate the open circuit between splice S48 and the wiper control module in the circuit 315 wire that does not have voltage.
		Neither pin	Verify that fuse S in the underhood PDM is not open. Fuse S supplies the wipers in addition to F1, F2, and F3 in the dashboard PDM. Test relay R11 and circuit breaker CB4 in the dashboard PDM; see **Fig. 4**. Circuit breaker CB4 or fuse S will open if the wiper control module is internally shorted. If unplugging the wiper module allows circuit breaker CB4 to reset, then replace the wiper control module; see **Subject 150**. Otherwise, troubleshoot for wiring problems with circuit 315.
5	Turn the ignition switch to the OFF position, then test for continuity to ground at pins 3 and 5 of the wiper control module connector; see **Fig. 3**. Are both pins low resistance to ground?	Yes	Go to **step 6**.
		No	Locate and repair the open ground circuit.
6	Did all the preceding tests pass?	Yes	Replace the wiper control module; see **Subject 150**.

Table 2, Wipers Are Inoperative In All Modes

High-Speed Mode Only Is Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to high speed.	—	—

Troubleshooting, United Technologies Wiper and Washer

High-Speed Mode Only Is Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
2	With the connector remaining connected, backprobe the wiper motor connector on pins 1 and 3 to measure for battery voltage; see **Table 10**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 120**.
		Low or at zero	Go to **step 3**.
3	Access the wiper control module (**Fig. 2**), and backprobe pin 14 to measure the voltage, with the connector remaining connected to the module; see **Fig. 3**. Is battery voltage present?	Yes	There is a wiring fault on circuit 315H. Disconnect the power, and perform continuity testing to locate the circuit fault, then repair as appropriate.
		No	Go to **step 4**.
4	Test the wiper switch. Perform the wiper switch resistance test; see **Table 11**. Check the wiring from the wiper switch to the wiper control module for open or short circuits. Did any of the wiper switch tests fail?	Yes	Replace the wiper switch.
		No	Replace the wiper control module; see **Subject 150**.

Table 3, High-Speed Mode Only Is Inoperative

Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—
2	With the connector remaining connected, backprobe the wiper motor connector on pins 2 and 3 to measure for battery voltage; see **Fig. 3**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 120**.
		Low or at zero	Go to **step 3**.
3	Access the wiper control module (**Fig. 2**), and backprobe pin 8 to measure the voltage, with the connector remaining connected to the module; see **Fig. 3**. Is battery voltage present?	Yes	There is a wiring fault on circuit 315L. Disconnect the power, and perform continuity testing to locate the circuit fault, then repair as appropriate.
		No	Go to **step 4**.
4	Test the wiper switch. Perform the wiper switch resistance test; see **Table 11**. Check the wiring from the wiper switch to the wiper control module for open or short circuits. Did any of the wiper switch tests fail?	Yes	Replace the wiper switch.
		No	Replace the wiper control module; see **Subject 150**.

Table 4, Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK

Troubleshooting, United Technologies Wiper and Washer

Some Intermittent Setting Modes Are Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
1	Test the wiper switch. Perform the wiper switch resistance test; see **Table 11**. Check the wiring from the wiper switch to the wiper control module (**Fig. 2**) for open or short circuits. Did all the tests pass?	Yes	Replace the wiper control module; see **Subject 150**.
		No	Replace the wiper switch.

Table 5, Some Intermittent Setting Modes Are Inoperative

Wipers Do Not Park in Proper Position			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—
2	Turn the wiper switch off when the wipers are in mid-swipe. Do the wipers stop immediately, or continue traveling, then stop?	Immediately	Go to **step 3**.
		Continue traveling, then stop	Note the stopped position. Repeat the test to make sure that the wipers always stop in the same position. If the wipers always stop in the same position, regardless of where the switch was turned off, the wiper arm position is improperly adjusted. Turn the ignition switch to OFF, disconnect the batteries, then adjust the wiper arms to the correct position; see **Subject 160**.
3	With the ignition switch in the ON position, the wipers switched off, and the connector remaining connected, backprobe to measure the voltage on pin 4 of the wiper motor connector; see **Table 10**. Is battery voltage present?	Yes	Go to **step 4**.
		No	Locate and repair the open circuit on circuit 315 between the wiper motor and splice S48.
4	With the ignition in the ON position and the wipers switched to low speed, backprobe to measure the voltage on pin 5 of the wiper motor connector; see **Table 10**. Battery voltage should be present except when the wipers travel through the park position and the circuit is momentarily at ground. Is battery voltage present?	Yes	Go to **step 5**.
		No	Replace the wiper motor; see **Subject 120**.
5	With the ignition switch in the ON position and the wipers on low speed, backprobe to measure the voltage on pin 13 of the wiper control module; see **Fig. 2** and **Fig. 3**. Is battery voltage present?	Yes	Replace the wiper control module; see **Subject 150**.
		No	Locate and repair the open circuit between pin 13 and the wiper motor in circuit 315P.

Table 6, Wipers Do Not Park in Proper Position

Troubleshooting, United Technologies Wiper and Washer

Wipers Stay On or Wipe Intermittently Until Ignition Is Turned Off			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and leave the wiper switch in the OFF position. Do the wipers remain on, swiping continuously or intermittently?	Yes	Go to **step 2**.
		No	Go to **step 3**.
2	Disconnect power, then perform the wiper switch test measuring for the resistance values shown in **Table 11**. Did any of the resistance tests fail?	Yes	Replace the wiper switch.
		No	Go to **step 3**.
3	With the ignition switch in the ON position, the wipers on low speed, and the connector remaining connected, backprobe pin 5 of the wiper motor connector to check the voltage through the wiper motor's internal park switch; see **Table 10**. When the wipers travel through the park position, pin 5 should be momentarily at ground. Most voltmeters respond quickly enough to show this momentary voltage transition. Is the momentary voltage transition to ground present?	Yes	Go to **step 4**.
		No	The wiper motor internal park switch is not working. Replace the wiper motor; see **Subject 120**.
4	With the ignition switch in the ON position, the wipers on low speed, and the connector remaining connected, backprobe pin 13 of the wiper control module; see **Fig. 2** and **Fig. 3**. Verify that the momentary voltage transition to ground is present.	Yes	Replace the wiper control module; see **Subject 150**.
		No	Locate and repair the wiring fault on circuit 315P between the wiper motor and the wiper control module.

Table 7, Wipers Stay On or Wipe Intermittently Until Ignition Is Turned Off

Washers Are Inoperative, Wipers Are OK			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed. Do the wipers work?	Yes	Turn the wipers off. Go to **step 2**.
		No	Follow the troubleshooting procedure under "Wipers Are Inoperative In All Modes"; see **Table 2**.
2	Check the washer reservoir fluid level. Add fluid if needed, then test the washer operation. Hold the washer switch on for at least 5 seconds in case the hoses are leaking, or the system has lost its prime. Is the pump running?	Yes	Check the system for leaks. Also follow the troubleshooting procedure under "Washer Spray Does Not Correctly Cover Wipe Area"; see **Table 9**.
		No	Go to **step 3**.
3	If the system is not leaking, backprobe the connections at the washer pump, and test for battery voltage when the washer switch is activated; see **Table 12**. Is battery voltage present?	Yes	Replace the washer pump; see **Subject 140**.
		No	Go to **step 4**.

Troubleshooting, United Technologies Wiper and Washer

Washers Are Inoperative, Wipers Are OK			
Step	**Test Procedure**	**Test Result**	**Action**
4	Disconnect the wiper control module connector (**Fig. 2**), and perform a continuity test between pins 9 and 7 of the harness. When the washer switch is activated, there should be continuity. Is there continuity?	Yes	Go to **step 5**.
		No	Troubleshoot for open wiring in circuits 315D and 315C, and also for an open in the wiper switch. Replace the switch if it tests open.
5	Connect the wiper module connector, then turn the ignition switch to ON. Turn on the washers while backprobing pin 4 of the wiper control module connector; see **Fig. 3**. Is battery voltage present?	Yes	Troubleshoot and repair a wiring fault in circuit 320 between the washer pump and the wiper control module.
		No	Replace the wiper control module; see **Subject 150**.

Table 8, Washers Are Inoperative, Wipers Are OK

Washer Spray Does Not Correctly Cover Wipe Area			
Step	**Test Procedure**	**Test Result**	**Action**
1	Make sure that the fluid level in the washer fluid reservoir is adequate. If needed, add fluid.	—	—
2	Test the washer operation. Hold the washer switch in the ON position for at least 5 seconds, in case the washer system has lost its prime. Is the fluid flow adequate?	Yes	Troubleshooting is completed.
		No	Check the nozzles for damage, plugging, or improper installation. Check the hoses for kinks, or tie-wraps that may be too tight. Make sure that there are no breaks or disconnected fittings. Go to **step 3**.
3	Test the washer operation. Does the washer work properly?	Yes	Troubleshooting is completed.
		No	Replace the washer pump; see **Subject 140**.

Table 9, Washer Spray Does Not Correctly Cover Wipe Area

Terminal Identification of the Wiper Motor Harness Connector			
Wiper Motor Harness Connector (wire insertion view)	**Pin**	**Circuit Number**	**Circuit Description**
 f820260b	1	315H	Wiper Motor High Speed
	2	315L	Wiper Motor Low Speed

Troubleshooting

CAUTION

Use caution when working on or near the wiper linkage, arms, and motor. An intermittent wiper system may swipe without warning, posing a risk of personal injury.

NOTICE

Make sure the ignition switch is off before disconnecting any wiper/washer harness connectors. Removing connectors with the ignition switch on may cause electrical arcing, which will damage the pins.

Preliminary Checks

Before beginning the troubleshooting procedures, verify the driver's complaint by checking the system components, and operating the wiper and washer to duplicate the problem.

1. Check the wiper arms, blades, and linkage for wear and damage.
2. Check the washer fluid level in the reservoir.
3. Turn the ignition switch to the ON position without starting the engine.
4. Test the wipers on low speed, high speed, and several intermittent speeds.
5. Test the windshield washers.
6. Turn the ignition switch to the OFF position.
7. Check the washer hoses for leaks and damage.

Diagnostic Procedures

Symptoms

The diagnostic procedures listed in **Table 1** are described in detail in the succeeding tables. When performing the diagnostic procedures, refer to the applicable wiring diagram (**Fig. 1** for vehicles built from November 2001, or **Fig. 2** for vehicles built before November 2001) and the tables in this subject.

NOTICE

Use caution when backprobing sealed connectors. If the seal is damaged, water could intrude into the connection, resulting in corrosion and electrical failure.

IMPORTANT: The following wiper and washer diagnostic procedures are performed with the ignition switch in the ON position, and the engine NOT running.

Troubleshooting Procedures	
Symptom	**Table Number**
Wipers are inoperative in all modes	**Table 2**
High-speed mode only is inoperative	**Table 3**
Low-speed and all intermittent speed modes are inoperative, high-speed mode is OK	**Table 4**
Some intermittent setting modes are inoperative	**Table 5**
Wipers do not park in the proper position	**Table 6**
Wipers stay on or swipe intermittently until ignition is turned off	**Table 7**
Washers are inoperative, wipers are OK	**Table 8**
Washer spray does not correctly cover wipe area	**Table 9**

Table 1, Troubleshooting Procedures

Troubleshooting, Signal Stat Wiper and Washer

NOTE: When working on vehicles built before November 2001, use the circuit numbers referenced in parenthesis in the troubleshooting tables.

Wipers Are Inoperative In All Modes			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—
2	With the connector remaining connected, backprobe the wiper motor connector on pins 2 and 3 to measure for battery voltage; see **Table 10**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 120**.
		Low or at zero	Go to **step 3**.
3	Access the wiper control module (**Fig. 3**), and backprobe pin 9 of the vehicle harness connector to measure the voltage, with the connector remaining connected to the module; see **Fig. 4**. Is battery voltage present?	Yes	There is a wiring fault on circuit 315L (58) or the wiper motor ground circuit. Disconnect the power, and perform continuity testing to locate the circuit fault, then repair as appropriate.
		No	Go to **step 4**.
4	Measure the voltage on pins 4 and 11 of the vehicle harness connector; see **Fig. 4**. Is battery voltage present on both pins, one pin (either 4 or 11), or neither pin?	Both pins	Test the wiper switch. Perform the wiper switch continuity test; see **Table 11**. Test the wiring from the wiper switch to the wiper control module for open or short circuits. If any of the wiper switch tests fail, replace the switch.
		One pin (either 4 or 11)	**Vehicles built from November 2001:** Locate and repair the open circuit between splice S4 and the wiper control module in the circuit 315/465 wire that does not have voltage. **Vehicles built before November 2001:** If battery voltage is present on pin 11, and not pin 4, test fuse F36 and circuit 575 for wiring faults. If battery voltage is present on pin 4, and not pin 11, test relay R11 and circuit breaker CB4 in the dashboard PDM (**Fig. 5**), in addition to testing for wiring faults in the relay ground circuit and circuit 65.
		Neither pin	Verify that fuse S in the underhood PDM is not open. Fuse S supplies the wipers in addition to F1, F2, and F3 in the dashboard PDM. Test for shorts in the circuits powered through these fuses, in addition to shorts to the wipers, if fuse S is open. Test relay 11 and circuit breaker CB4 in the dashboard PDM; see **Fig. 5**. Circuit breaker CB4 or fuse S will open if the wiper control module is internally shorted. If unplugging the wiper module allows circuit breaker CB4 to reset, then replace the wiper control module; see **Subject 150**.

Troubleshooting, Signal Stat Wiper and Washer

Wipers Are Inoperative In All Modes			
Step	**Test Procedure**	**Test Result**	**Action**
5	Turn the ignition switch to the OFF position, then test for continuity to ground at pin 6 of the wiper module vehicle harness connector; see **Fig. 4**. Is the pin low resistance to ground?	Yes	Go to **step 6**.
		No	Locate and repair the open ground circuit.
6	Did all the preceding tests pass?	Yes	Replace the wiper control module; see **Subject 150**.

Table 2, Wipers Are Inoperative In All Modes

High-Speed Mode Only Is Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to high speed.	—	—
2	With the connector remaining connected, backprobe the wiper motor connector on pins 1 and 3 to measure for battery voltage; see **Table 10**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 120**.
		Low or at zero	Go to **step 3**.
3	Access the wiper control module (**Fig. 3**), and backprobe pin 5 on the vehicle harness connector to measure the voltage, with the connector remaining connected to the module; see **Fig. 4**. Is battery voltage present?	Yes	There is a wiring fault on circuit 315H (56). Disconnect the power, and perform continuity testing to locate the circuit fault, then repair as appropriate.
		No	Go to **step 4**.
4	Test the wiper switch. Perform the wiper switch continuity test; see **Table 11**. Check the wiring from the wiper switch to the wiper control module for open or short circuits. Did any of the wiper switch tests fail?	Yes	Replace the wiper switch.
		No	Replace the wiper control module; see **Subject 150**.

Table 3, High-Speed Mode Only Is Inoperative

Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—
2	With the connector remaining connected, backprobe the wiper motor connector on pins 2 and 3 to measure for battery voltage; see **Table 10**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 120**.
		Low or at zero	Go to **step 3**.

Troubleshooting, Signal Stat Wiper and Washer

Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK			
Step	**Test Procedure**	**Test Result**	**Action**
3	Access the wiper control module (**Fig. 3**), and backprobe pin 9 on the vehicle harness connector to measure the voltage, with the connector remaining connected to the module; see **Fig. 4**. Is battery voltage present?	Yes	There is a wiring fault on circuit 315L (58). Disconnect the power, and perform continuity testing to locate the circuit fault, then repair as appropriate.
		No	Go to **step 4**.
4	Test the wiper switch. Perform the wiper switch continuity test; see **Table 11**. Check the wiring from the wiper switch to the wiper control module for open or short circuits. Did any of the wiper switch tests fail?	Yes	Replace the wiper switch.
		No	Replace the wiper control module; see **Subject 150**.

Table 4, Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK

Some Intermittent Setting Modes Are Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
1	Test the wiper switch. Perform the wiper switch continuity test; see **Table 11**. Check the wiring from the wiper switch to the wiper control module (**Fig. 3**) for open or short circuits. Did all the tests pass?	Yes	Replace the wiper control module; see **Subject 150**.
		No	Replace the wiper switch.

Table 5, Some Intermittent Setting Modes Are Inoperative

Wipers Do Not Park in Proper Position			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—
2	Turn the wiper switch off when the wipers are in mid-swipe. Do the wipers stop immediately, or continue traveling, then stop?	Immediately	Go to **step 3**.
		Continue traveling, then stop	Note the stopped position. Repeat the test to make sure that the wipers always stop in the same position. If the wipers always stop in the same position, regardless of where the switch was turned off, the wiper arm position is improperly adjusted. Turn the ignition switch to OFF, disconnect the batteries, then adjust the wiper arms to the correct position; see **Subject 160**.
3	With the ignition switch in the ON position, the wipers switched off, and the connector remaining connected, backprobe to measure the voltage on pin 4 of the wiper motor connector; see **Table 10**. Is battery voltage present?	Yes	Go to **step 4**.
		No	Locate and repair the open circuit on circuit 315 (65) between the wiper motor and the splice.

Wipers Do Not Park in Proper Position			
Step	**Test Procedure**	**Test Result**	**Action**
4	With the ignition in the ON position and the wipers switched to low speed, backprobe to measure the voltage on pin 5 of the wiper motor connector; see **Table 10**. Battery voltage should be present except when the wipers travel through the park position and the circuit is momentarily at ground. Is battery voltage present?	Yes	Go to **step 5**.
		No	Replace the wiper motor; see **Subject 120**.
5	With the ignition switch in the ON position and the wipers on low speed, backprobe to measure the voltage on pin 10 of the vehicle harness connector at the wiper control module; see **Fig. 3** and **Fig. 4**. Is battery voltage present?	Yes	Replace the wiper control module; see **Subject 150**.
		No	Locate and repair the open circuit between pin 10 and the wiper motor in circuit 315P (28).

Table 6, Wipers Do Not Park in Proper Position

Wipers Stay On or Wipe Intermittently Until Ignition Is Turned Off			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and leave the wiper switch in the OFF position. Do the wipers remain on, swiping continuously or intermittently?	Yes	Go to **step 2**.
		No	Go to **step 3**.
2	Disconnect power, then perform the wiper switch test measuring for continuity as shown in **Table 11**. Did any of the tests fail?	Yes	Replace the wiper switch.
		No	Go to **step 3**.
3	With the ignition switch in the ON position, the wipers on low speed, and the connector remaining connected, backprobe pin 5 of the wiper motor connector to check the voltage through the wiper motor's internal park switch; see **Table 10**. When the wipers travel through the park position, pin 5 should be momentarily at ground. Most voltmeters respond quickly enough to show this momentary voltage transition. Is the momentary voltage transition to ground present?	Yes	Go to **step 4**.
		No	The wiper motor internal park switch is not working. Replace the wiper motor; see **Subject 120**.
4	With the ignition switch in the ON position, and the wipers on low speed, backprobe pin 10 of the vehicle harness connector at the wiper control module; see **Fig. 3** and **Fig. 4**. Verify that the momentary voltage transition to ground is present.	Yes	Replace the wiper control module; see **Subject 150**.
		No	Locate and repair the wiring fault on circuit 315P (28) between the wiper motor and the wiper control module.

Table 7, Wipers Stay On or Wipe Intermittently Until Ignition Is Turned Off

Troubleshooting, Signal Stat Wiper and Washer

Washers Are Inoperative, Wipers Are OK			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed. Do the wipers work?	Yes	Turn the wipers off. Go to **step 2**.
		No	Follow the troubleshooting procedure under "Wipers Are Inoperative In All Modes"; see **Table 2**.
2	Check the washer reservoir fluid level. Add fluid if needed, then test the washer operation. Hold the washer switch on for at least 5 seconds in case the hoses are leaking, or the system has lost its prime. Is the pump running?	Yes	Check the system for leaks. Also follow the troubleshooting procedure under "Washer Spray Does Not Correctly Cover Wipe Area"; see **Table 9**.
		No	Go to **step 3**.
3	If the system is not leaking, backprobe the connections at the washer pump, and test for battery voltage when the washer switch is activated; see **Table 12**. Is battery voltage present?	Yes	Replace the washer pump; see **Subject 140**.
		No	Go to **step 4**.
4	Disconnect the wiper switch, and perform a continuity test between pins 1 and 6 of the switch harness connector. When the washer switch is activated, there should be continuity. Is there continuity?	Yes	Go to **step 5**.
		No	Troubleshoot for open wiring between the wiper control module (**Fig. 3**) and the wiper switch, and also for an open in the switch. Replace the switch if it tests open.
5	Connect the wiper switch, then turn the ignition switch to ON. Turn on the washers while backprobing pin 8 of the vehicle harness connector at the wiper control module connector; see **Fig. 3** and **Fig. 4**. Is battery voltage present?	Yes	Troubleshoot and repair a wiring fault in circuit 320 (941) between the washer pump and the wiper control module.
		No	Replace the wiper control module; see **Subject 150**.

Table 8, Washers Are Inoperative, Wipers Are OK

Washer Spray Does Not Correctly Cover Wipe Area			
Step	**Test Procedure**	**Test Result**	**Action**
1	Make sure that the fluid level in the washer fluid reservoir is adequate. If needed, add fluid.	—	—
2	Test the washer operation. Hold the washer switch in the ON position for at least 5 seconds, in case the washer system has lost its prime. Is the fluid flow adequate?	Yes	Troubleshooting is completed.
		No	Check the nozzles for damage, plugging, or improper installation. Check the hoses for kinks, or tie-wraps that may be too tight. Make sure that there are no breaks or disconnected fittings. Go to **step 3**.
3	Test the washer operation. Does the washer work properly?	Yes	Troubleshooting is completed.
		No	Replace the washer pump; see **Subject 140**.

Table 9, Washer Spray Does Not Correctly Cover Wipe Area

Terminal Identification of the Wiper Motor Harness Connector			
Wiper Motor Harness Connector (wire insertion view)	**Pin**	**Circuit Number**	**Circuit Description**
 f820260b	*Vehicles Built Before February 2001*		
	1	56	Wiper Motor High Speed
	2	58	Wiper Motor Low Speed
	3	57	Ground
	4	65	Ignition Power
	5	26	Park Switch Signal
	Vehicles Built From February 2001		
	1	315H	Wiper Motor High Speed
	2	315L	Wiper Motor Low Speed
	3	GND	Ground
	4	315	Ignition Power
	5	315P	Park Switch Signal

Table 10, Terminal Identification of the Wiper Motor Harness Connector

Values for Wiper Switch Positions Test*			
Switch Position	**Pin 6 to 7**	**Pin 6 to 8**	**Pin 6 to 14**
Off	1	1	1
Delay 1	1	1	0
Delay 2	1	0	1
Delay 3	1	0	0
Delay 4	0	1	1
Delay 5	0	1	0

Values for Wiper Switch Positions Test*			
Switch Position	**Pin 6 to 7**	**Pin 6 to 8**	**Pin 6 to 14**
Low Speed	0	0	1
High Speed	0	0	0

* Test for continuity betweens pin 6 and pins 7, 8, and 14. In the table, 1 indicates continuity, and 0 indicates an open circuit. When the measured resistance is less than 0.4 kohms, the continuity test passes. Replace the switch assembly if the test fails for any of the switch positions.

Table 11, Values for Wiper Switch Positions Test

Terminal Identification of the Washer Pump Connector				
Washer Pump Connector	**Terminal**	**Circuit Number**	**Color**	**Circuit Description**
 f820296a	*Vehicles Built Before November 2001*			
	1	941	Black/White	Washer Power
	2	57	Black	Washer Ground
	Vehicles Built From November 2001			
	1	320	Dark Blue	Washer Power
	2	GND	Black	Washer Ground

Troubleshooting, Wiper System with Dash-Mounted Switch

Troubleshooting

CAUTION

Use caution when working on or near the wiper linkage, arms, and motor. An intermittent wiper system may swipe without warning, posing a risk of personal injury.

NOTICE

Make sure the ignition switch is off before disconnecting any wiper/washer harness connectors. Removing connectors with the ignition switch on may cause electrical arcing, which will damage the pins.

Preliminary Checks

Before beginning the troubleshooting procedures, verify the driver's complaint by checking the system components, and operating the wiper and washer to duplicate the problem.

1. Check the wiper arms, blades, and linkage for wear and damage.
2. Check the washer fluid level in the reservoir.
3. Turn the ignition switch to the ON position without starting the engine.
4. Test the wipers on low speed, high speed, and several intermittent speeds.
5. Test the windshield washers.
6. Turn the ignition switch to the OFF position.
7. Check the washer hoses for leaks and damage.

Diagnostic Procedures

Symptoms

The diagnostic procedures listed in **Table 1** are described in detail in the succeeding tables. When performing the diagnostic procedures, refer to the wiring diagram (**Fig. 1**) and the tables in this subject.

NOTICE

Use caution when backprobing sealed connectors. If the seal is damaged, water could intrude into the connection, resulting in corrosion and electrical failure.

IMPORTANT: The following wiper and washer diagnostic procedures are performed with the ignition switch in the ON position, and the engine NOT running.

Troubleshooting Procedures	
Symptom	**Table Number**
Wipers are inoperative in all modes	**Table 2**
High-speed mode only is inoperative	**Table 3**
Low-speed and all intermittent speed modes are inoperative, high-speed mode is OK	**Table 4**
Wipers do not park in the proper position	**Table 5**
Wipers stay on until ignition is turned off	**Table 6**
Washers are inoperative	**Table 7**
Washer spray does not correctly cover wipe area	**Table 8**

Table 1, Troubleshooting Procedures

Wipers Are Inoperative In All Modes			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—

Troubleshooting, Wiper System with Dash-Mounted Switch

Wipers Are Inoperative In All Modes			
Step	**Test Procedure**	**Test Result**	**Action**
2	With the connector remaining connected, backprobe the wiper motor connector on pins 2 and 3 to measure for battery voltage; see **Table 9**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 120**.
		Low or at zero	Go to **step 3**.
3	Verify that pin 3 of the wiper motor connector is at ground potential; see **Table 9**. Is pin 3 at ground potential?	Yes	Go to **step 4**.
		No	Troubleshoot and repair the wiring fault in the ground circuit.
4	Access the wiper switch (**Fig. 2**) connector, and backprobe pin 1 to measure the voltage, with the connector remaining connected to the module; see **Table 10**. Is battery voltage present on pin 1?	Yes	Go to **step 5**.
		Low or at zero	Verify that fuse S in the underhood PDM is not open. Fuse S supplies the wipers in addition to F1, F2, and F3 in the dashboard PDM. Test for shorts in the circuits powered through these fuses, in addition to shorts to the wipers in circuits 315 and 315A, if fuse S is open. Test relay R11 and circuit breaker CB4 in the dashboard PDM; see **Fig. 3**. Circuit breaker CB4 or fuse S will open if the wiper switch is internally shorted. If unplugging the wiper switch allows circuit breaker CB4 to reset, then replace the wiper switch.
5	Test for ground at pin 6 of the wiper switch connector; see **Table 10**. Is ground present?	Yes	Go to **step 6**.
		No	Locate and repair the wiring fault in the ground circuit.
6	With the ignition set to the ON position and the wipers switched to low speed, measure the voltage on pin 3 of the wiper switch connector. Is the measured voltage at or within a few tenths of a volt to ground?	Yes	Test for an open circuit through the speed switching relays R24 and R25. Troubleshoot circuits 315, 315H, and 315L from the PDM to the wiper motor for wiring faults.
		No	Replace the wiper switch.

Table 2, Wipers Are Inoperative In All Modes

High-Speed Mode Only Is Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to high speed.	—	—
2	With the connector remaining connected, backprobe the wiper motor connector on pins 1 and 3 to measure for battery voltage; see **Table 9**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 120**.
		Low or at zero	Go to **step 3**.

Troubleshooting, Wiper System with Dash-Mounted Switch

High-Speed Mode Only Is Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
3	Access the wiper switch (**Fig. 2**) connector, and backprobe pin 4 to measure the voltage, with the connector remaining connected to the module, the ignition switch in the ON position, and the wipers set to high speed; see **Table 10**. Is the measured voltage at or within a few tenths of a volt to ground?	Yes	Test for an open circuit through relay R25 and its interconnecting wiring, including circuit 315H from the PDM to the wiper motor.
		No	Replace the wiper switch.

Table 3, High-Speed Mode Only Is Inoperative

Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—
2	With the connector remaining connected, backprobe the wiper motor connector on pins 2 and 3 to measure for battery voltage; see **Table 9**. Is battery voltage present?	Yes	Make sure that the wiper linkage is not slipping or binding. Otherwise, replace the wiper motor; see **Subject 120**.
		Low or at zero	Go to **step 3**.
3	Verify the ground at pin 3 of the wiper motor connector. Is it at ground potential?	Yes	Go to **step 4**.
		No	Repair the ground circuit 320.
4	With the wiper switch (**Fig. 2**) remaining connected to the connector, the ignition switch in the ON position, and the wipers set to low speed, backprobe the wiper switch connector on pin 3 to measure for battery voltage; see **Table 10**. Is the measured voltage at or within a few tenths of a volt to ground?	Yes	Test for an open circuit through the speed switching relays R24 and R25, and the interconnected wiring. Troubleshoot circuit 315L from the PDM to the wiper motor. Make sure that circuit 316 is at ground potential at both the wiper switch and at relay R24.
		No	Replace the wiper switch.

Table 4, Low Speed and All Intermittent Setting Modes Are Inoperative, High Speed Mode Is OK

Wipers Do Not Park in Proper Position			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed.	—	—

Troubleshooting, Wiper System with Dash-Mounted Switch

Wipers Do Not Park in Proper Position			
Step	**Test Procedure**	**Test Result**	**Action**
2	Turn the wiper switch off when the wipers are in mid-swipe. Do the wipers stop immediately, or continue traveling, then stop?	Immediately	Go to **step 3**.
		Continue traveling, then stop	Note the stopped position. Repeat the test to make sure that the wipers always stop in the same position. If the wipers always stop in the same position, regardless of where the switch was turned off, the wiper arm position is improperly adjusted. Turn the ignition switch to OFF, disconnect the batteries, then adjust the wiper arms to the correct position; see **Subject 160**.
3	With the ignition switch in the ON position and the wipers switched off, measure the voltage on pin 4 of the wiper motor connector; see **Table 9**. Is battery voltage present?	Yes	Go to **step 4**.
		No	Locate and repair the open circuit on circuit 315 between the wiper motor and splice S48.
4	With the ignition in the ON position and the wipers switched to low speed, measure the voltage on pin 5 of the wiper motor connector; see **Table 9**. Battery voltage should be present except when the wipers travel through the park position and the circuit is momentarily at ground. Is battery voltage present?	Yes	Go to **step 5**.
		No	Replace the wiper motor; see **Subject 120**.
5	With the wipers switched on, measure the voltage at terminal 87A of relay R24; see **Fig. 3**. Is battery voltage present?	Yes	Test for an open R24 relay.
		No	Locate and repair the open circuit between relay R24 and the wiper motor in circuit 315P.

Table 5, Wipers Do Not Park in Proper Position

Wipers Stay On Until Ignition Is Turned Off			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position. Leave the wiper switch in the OFF position. Do the wipers stay on at high speed or low speed?	High Speed	Troubleshoot for circuit 318 shorted to ground, and for relay R25 shorted between terminals 87 and 30.
		Low Speed	Go to **step 2**.
2	Backprobe pin 5 of the wiper motor connector to check the voltage through the wiper motor's internal park switch; see **Table 9**. When the wipers travel through the park position, pin 5 should be momentarily at ground. Most voltmeters respond quickly enough to show this momentary voltage transition. Is the momentary voltage transition to ground present?	Yes	Troubleshoot and repair for circuit 316 shorted to ground, and for relay R24 shorted between terminals 87 and 30.
		No	The wiper motor internal park switch is not working. Replace the wiper motor; see **Subject 120**.

Troubleshooting, Wiper System with Dash-Mounted Switch

Wipers Stay On Until Ignition Is Turned Off			
Step	**Test Procedure**	**Test Result**	**Action**
3	Did all the preceding tests pass?	Yes	Replace the wiper switch.

Table 6, Wipers Stay On Until Ignition Is Turned Off

Washers Are Inoperative			
Step	**Test Procedure**	**Test Result**	**Action**
1	Turn the ignition switch to the ON position, and the wiper switch to low speed. Do the wipers work?	Yes	Turn the wipers off. Go to **step 2**.
		No	Follow the troubleshooting procedure under "Wipers Are Inoperative In All Modes"; see **Table 2**.
2	Check the washer reservoir fluid level. Add fluid if needed, then test the washer operation. Hold the washer switch on for at least 5 seconds in case the hoses are leaking, or the system has lost its prime. Is the pump running?	Yes	Check the system for leaks. Also follow the troubleshooting procedure under "Washer Spray Does Not Correctly Cover Wipe Area"; see **Table 8**.
		No	Go to **step 3**.
3	If the system is not leaking, backprobe the connections at the washer pump, and test for battery voltage when the washer switch is activated. Is battery voltage present?	Yes	Replace the washer pump; see **Subject 140**.
		No	Go to **step 4**.
4	With the wiper switch (**Fig. 2**) remaining connected to the connector, and the ignition switch in the ON position, backprobe pin 5 of the wiper switch to measure for battery voltage; see **Table 10**. When the washers are activated, is the measured voltage at or within a few tenths of a volt to ground?	Yes	Troubleshoot for a fault in circuit 320 or with relay R20 and its wiring. Also troubleshoot for a fault in the ground circuit between the washer pump and the ground stud.
		No	Replace the wiper switch.

Table 7, Washers Are Inoperative

Washer Spray Does Not Correctly Cover Wipe Area			
Step	**Test Procedure**	**Test Result**	**Action**
1	Make sure that the fluid level in the washer fluid reservoir is adequate. If needed, add fluid.	—	—
2	Test the washer operation. Hold the washer switch in the ON position for at least 5 seconds, in case the washer system has lost its prime. Is the fluid flow adequate?	Yes	Troubleshooting is completed.
		No	Check the nozzles for damage, plugging, or improper installation. Check the hoses for kinks, or tie-wraps that may be too tight. Make sure that there are no breaks or disconnected fittings. Go to **step 3**.

Troubleshooting, Wiper System with Dash-Mounted Switch

Washer Spray Does Not Correctly Cover Wipe Area			
Step	**Test Procedure**	**Test Result**	**Action**
3	Test the washer operation. Does the washer work properly?	Yes	Troubleshooting is completed.
		No	Replace the washer pump; see **Subject 140**.

Thermodynamic Principles

Air conditioning is the cooling or refrigeration of the air in the passenger compartment. Refrigeration is accomplished by making practical use of three thermodynamic principles. These principles and their practical application are described below.

Heat Transfer

If two objects of different temperatures are placed near each other, the heat in the warmer object will always travel to the cooler object until both are of equal temperature.

For example, a block of ice in a refrigerator does not transfer its coldness to a nearby carton of milk. Rather, the heat in the warm milk automatically flows to the ice.

The British Thermal Unit (BTU) is used to determine the amount of heat transferred from one object to another. One BTU is the amount of heat required to raise the temperature of 1 pound (0.45 kg) of water 1°F (0.55°C).

For example, to raise the temperature of 1 pound (0.45 kg) of water from 32°F to 212°F (0°C to 100°C), one BTU of heat must be added for 1°F (0.55°C) rise in temperature or a total of 180 BTUs of heat. Conversely, in order to lower the temperature of 1 pound (0.45 kg) of water from 212°F to 32°F (100°C to 0°C), 180 BTUs of heat must be removed from the water.

Latent Heat of Vaporization

When a liquid boils, it absorbs heat without raising the temperature of the resulting gas. When the gas condenses (changes back to a liquid), it gives off heat without lowering the temperature of the resulting liquid.

For example, when 1 pound (0.45 kg) of water at 32°F (0°C) is placed in a container over a flame, the temperature of the water rises 1°F (0.55°C) with each BTU of heat that the water absorbs from the flame. Thus, after it has absorbed 180 BTUs of heat, the water reaches a temperature of 212°F (100°C).

Even though the flame continues to give its heat to the water, the temperature of the water remains at 212°F (100°C). The water however starts to boil or change from a liquid to a gaseous state. It continues to boil until the water has passed off into the atmosphere as vapor. If this vapor were checked with a thermometer, it also would show a temperature of 212°F (100°C).

In other words, there was a rise of only 180°F (from 32°F to 212°F or 0°C to 100°C) in the water and vapor temperature even though the flame applied many more than 180 BTUs of heat. In this case, the heat is absorbed by the liquid in the process of boiling and disappears in the vapor. If the vapor were brought in contact with cool air, the hidden heat would flow into the cooler air and the vapor condensed back to water. Scientists refer to this principle as the latent (hidden) heat of vaporization.

Water has a latent heat of vaporization of 970 BTUs and a boiling point of 212°F (100°C). This means that 1 pound (0.45 kg) of water at 212°F (100°C) will absorb 970 BTUs of heat when changing to vapor at 212°F (100°C). Conversely, the vapor will give off 970 BTUs of heat when condensing back to water at 212°F (100°C).

This heat transfer, occurring when a liquid boils or a vapor condenses, forms the basic principle of all conventional refrigerant systems.

For a liquid to be a refrigerant, it must also have a low boiling point. That is, the temperature at which it boils must be lower than the substance to be cooled.

R–134a is a non-CFC refrigerant. Its temperature/pressure relationship makes it suitable for mobile air conditioning systems.

Effect of Pressure on Boiling or Condensation

As refrigerant passes through an air conditioning system, it flows under high-pressure conditions, first as a high-pressure vapor between the refrigerant compressor and the condenser, then as a high-pressure liquid between the condenser and the evaporator orifice. It expands to a low-pressure vapor between the evaporator orifice and the refrigerant return port in the refrigerant compressor. As pressures in the closed refrigerant circuit vary, temperatures will also vary. As pressure increases, temperatures also increase; as the pressure decreases, temperatures also decrease. The refrigerant flow diagram highlights the changes that take place. See **Fig. 1**.

Fig. 1, Refrigerant Flow

General Information (See Fig. 1)

The heater and air conditioner assembly is mounted behind the passenger dash panels and on the engine side of the frontwall. The heater and air conditioner assembly contains the following major components:

- accumulator
- blower motor
- climate control panel
- condenser
- electric actuators
- evaporator
- heater core
- orifice tube
- refrigerant compressor
- refrigerant compressor cycling switch

The heating, air conditioning, and ventilating functions of the cab heater and air conditioner system are controlled by the cab climate control panel mounted on the dashboard. Refer to the *L-Line and A-Line Driver's Manual* for operating instructions.

Description of Components

Accumulator

When entering the inlet of the accumulator, the refrigerant contacts the liquid diverter dome and flows to the bottom of the housing. The refrigerant completes vaporization and passes into the suction inlet. A small, screened bleed hole in the bottom allows oil to be sucked into the suction tube to return to the compressor.

A desiccant bag inside the accumulator absorbs any moisture that may be in the system. A fitting on the accumulator is used to mount the refrigerant compressor cycling switch. The fitting prevents refrigerant loss when the cycling switch is removed.

Blower Motor

The blower motor forces air through the HVAC assembly and through the duct work.

Climate Control Panel

The fan switch, temperature control switch, and air selection switch are mounted on the climate control panel, which is also called the control head. The fan switch is used to control the rate of airflow through the outlets. The temperature control switch is used to select the desired temperature. The air selection switch is used to select the direction of warm or cool air through the air outlets.

Condenser

A condenser turns hot refrigerant gas coming from the refrigerant compressor into liquid. The condenser is mounted in front of the radiator. Because of its location, the condenser transfers heat to air that is drawn in by the engine fan and by air that is forced into the engine compartment as the vehicle moves forward.

Electric Actuator

The electric actuator is a combined motor and gearbox that is used to control the position of the doors within the HVAC assembly. The position of the doors is controlled by the settings on the climate control panel. There are five electric actuators on the HVAC assembly:

- the temperature/blend air actuator

- the defrost/panel actuator
- the right-side panel/demist actuator
- fresh air/recirculation actuator
- panel/floor actuator

Evaporator

The evaporator is located in the evaporator housing on the engine side of the frontwall. Because the evaporator is an area of low pressure in the refrigerant system, the boiling point of refrigerant lowers, which causes it to absorb heat from the tubing walls and fins. As it absorbs heat, liquid refrigerant quickly boils and turns into a gas.

As heat is absorbed from the outside surfaces of the evaporator, air passing over the unit loses its heat to these cooler surfaces. Moisture in the air condenses on the outside of the evaporator and drains off as water; the air becomes dehumidified.

Heater Core

When the engine is on, coolant flows through the heater core tubes heating the tubes and fins. The heat is absorbed by air that is forced through the heater core by the blower motor.

Orifice Tube

The orifice tube separates the high- and low-pressure sides of the HVAC system and meters the flow of refrigerant into the evaporator. The orifice tube is located in the inlet tube to the evaporator. The orifice tube has screens on the inlet and outlet ends of the tube. The inlet screen is a strainer for the liquid refrigerant flowing through the opening. The outlet screen reduces the noise of the refrigerant flowing through the orifice tube. O-rings on the orifice tube prevent the high pressure liquid refrigerant from bypassing the orifice tube. The orifice tube cannot be adjusted or repaired; it must be replaced.

Refrigerant Compressor

Heat in the low-pressure gas of the evaporator is not heat that can be noticed by touch because liquid refrigerant boils at a temperature much lower than the temperature at which water turns to ice. By touch, the heated gas in the evaporator is very cold. As a result, there is the problem of how to remove heat from cool gas using outside air that may be higher than 100°F (38°C).

With a refrigerant compressor, low-pressure gas from the evaporator can be squeezed into a much smaller space. When the gas is compressed, the heat it contains becomes concentrated. In this way, the gas is made hotter than the outside air without adding heat. Another function of the compressor is to move refrigerant through the system.

Refrigerant Compressor Cycling Switch

The refrigerant compressor cycling switch is mounted on the accumulator. The electrical contacts within the cycling switch are normally open below an operating pressure of about 23 psi (159 kPa). The electrical contacts close to allow compressor operation when internal pressure rises above approximately 40 to 47 psi (275 to 324 kPa). Lower ambient air temperatures (below 50°F or 10°C) during cold seasons will also open the contacts due to the pressure/temperature relationship of the refrigerant in the system.

The electrical contacts control the circuit to the compressor clutch field coil. When the contacts are closed, the compressor clutch field is energized and the clutch engages to drive the compressor. When the contacts are open, the compressor clutch field coil is de-energized and the compressor does not operate. The cycling switch, when operating properly, will control the refrigerant pressure within the evaporator at a point when the plate/fin surface of the evaporator will be maintained slightly above freezing to prevent icing and blockage of airflow.

Definition of Terms

Refer to the following terms for a better understanding of the HVAC system.

Accumulator A combination desiccant, filter, and storage container for liquid refrigerant.

Air Conditioner A system used to control the temperature, humidity, and movement of air in the cab.

Ambient Air Temperature The temperature of air around an object or the outside temperature.

Binary Switch See high-pressure switch and low-pressure switch.

General Information

Blower Motor A blower motor forces air through the HVAC assembly and through the duct work.

Blower Resistor Block Assembly Inline resistors that control the amount of voltage going to the blower motor. By controlling the voltage, you can control the fan speed.

Boiling Point The temperature at which a liquid changes to a gas. The boiling point varies with pressure.

Bulk Charging Use of large containers of refrigerant for charging a refrigerant system. Normally used for charging empty systems.

Charge A specific amount of refrigerant or oil by volume or weight. Also, the act of placing an amount of refrigerant or oil in the air conditioning system.

Clutch Cycling Switch Engages or disengages the refrigerant compressor depending on changes in system pressure on the low side. Same as low-pressure switch.

Condensate Water taken from the air, which forms on the outer surface of the evaporator.

Condenser A heat exchanger that is used to remove heat from the refrigerant, changing it from a high-pressure hot gas to a high-pressure warm liquid. Typically the condenser is mounted in front of the radiator.

Condensing Pressure Pressure as read from the gauge at the discharge service valve. Pressure from the discharge side of the compressor into the condenser.

Contaminants Anything other than refrigerant or refrigerant oil in the system. Usually means water, dirt, or air in the system.

Cycling Clutch System A system that controls compressor clutch operation in order to raise or lower the temperature in the cab.

Dehumidify To remove water from the air at the evaporator.

Dehydrate To remove all traces of moisture from the refrigerant system. This process occurs during evacuation.

Desiccant A drying agent used in the accumulator to remove water and create an extremely dry condition.

Discharge Line Connects the refrigerant compressor outlet to the condenser inlet.

Discharge Pressure High-side pressure or condensing pressure being discharged from the compressor.

Drive Pulley A pulley attached to the front of the engine crankshaft. It drives the compressor clutch pulley with a belt.

Duct A passageway for the transfer of air from one point to another.

Electric Actuator The actuator is a combined motor and gearbox used to drive the doors within the HVAC assembly.

Evacuate To place a high vacuum in the refrigerant system to remove air and dehydrate or remove traces of moisture.

Evaporate To change state from a liquid to a gas.

Evaporator A component in which liquid refrigerant changes to a gas after it absorbs heat from the air. It also removes some moisture from the air.

Expansion Valve A device that causes a pressure drop of the refrigerant and also regulates its flow.

Flooding A normal condition in the evaporator of an orifice tube system. The evaporator operates flooded and evaporates only the liquid closest to the outlet.

Flushing A process of passing liquid refrigerant through an air-conditioner component to remove dirt and water from the part. Liquid refrigerant removes heavy contamination, such as gritty dirt and large dirt buildup.

Freeze-Up Failure of a unit to operate properly because of ice forming at the expansion valve orifice or on the evaporator.

Heater Core A part of the heating system in which hot engine coolant flows to provide heat to the cab or to adjust the temperature produced by the air conditioner.

High-Pressure Switch Located on the discharge side of the refrigerant compressor, the high-pressure switch signals the fan on and the refrigerant compressor off in the event of a high pressure condition.

High-Side Service Valve A device located on the liquid line before the expansion device. It allows high-side pressure to be checked and other service operations to be performed.

Humidity The amount of water vapor in the air.

Hydraulic Lock The return of liquid refrigerant to the compressor, which could destroy the unit.

Leak Detector Any device used to detect refrigerant leaks in a refrigerant system.

Liquid Pressure Pressure of refrigerant in the liquid line from the condenser to the expansion device.

Low Head Pressure High-side pressure that is lower than normal due to a system problem.

Low-Pressure Switch Located on the suction side of the refrigerant compressor, the low pressure switch signals the clutch to cycle or shut down in extremely cold temperatures, or if there is a loss of charge.

Low-Suction Pressure Low-side pressure that is lower than normal due to a system problem.

Magnetic Clutch An electrical coupling device used to engage or disengage the compressor.

Manifold A device to control refrigerant flow for system test purposes. It is used with manifold gauges.

Manifold Gauge A calibrated instrument used for measuring system pressures.

Manifold Gauge Set A manifold that is complete with gauges and charging hoses and is used to measure or test pressure.

Micron A metric unit of length equal to one-millionth of a meter. The unit of measure is used to measure vacuum drawn from a refrigerant system by a vacuum pump.

Nitrogen A colorless, odorless, dry, inert gas.

Opacity A condition that is used to describe contamination of refrigerant oil in the compressor. Fresh refrigerant oil is clear; when contaminated, it appears cloudy or may have fine particles held in suspension.

Orifice Tube Fixed expansion device located in the cab evaporator inlet that controls the amount of refrigerant that passes into the evaporator.

Overcharge Too much refrigerant or oil in the system.

Polyalkylene Glycol (PAG) Highly refined synthetic refrigerant oil that is used in R–134a air conditioning systems.

psia Pounds per square inch, absolute pressure. Pressure exerted by the air at sea level. Atmospheric pressure is usually measured with a mercury barometer.

psig Pounds per square inch, gauge pressure. Any pressure above normal atmospheric pressure (14.7 psi) is referred to as gauge pressure.

Recovery Removal of the refrigerant from the air conditioning system.

Recycling Removal of contaminants and moisture from R–134a using a recovery and recycling station.

Refrigerant–134a (R–134a) The cooling agent used in automotive air conditioning systems. The chemical name for R–134a is tetrafluoroethane.

Refrigerant Compressor A device used to draw low-pressure refrigerant gas from the evaporator and squeeze it into a high-temperature, high-pressure gas. A second purpose of the compressor is to move refrigerant through the system.

Refrigeration Cycle The complete circulation of refrigerant through an air conditioning system, accompanied by changes in temperature and pressure.

Relative Humidity The actual water content of the air in relation to the total water vapor the air can hold at a given temperature.

Resistor A voltage-dropping device, usually wire-wound, for controlling fan speed.

Suction Line The line connecting the accumulator outlet to the compressor inlet.

Suction Pressure Compressor inlet pressure or the system's low-side pressure.

Suction Service Valve A device located on the suction hose near the accumulator that allows low-side pressure to be checked and other service operations to be performed.

Suction Side The low-pressure area of the system extending from the expansion device to the compressor inlet.

Thermistor A vacuum pressure sensor that is used to measure, in microns of mercury, internal system vacuum levels after evacuation.

Thermostatic Vacuum Gauge A high-vacuum gauge sensitive to pressures ranging from atmospheric pressure to less than 1 micron of mercury with scales reading from 25,000 microns to 1 micron of mercury.

Undercharge A system low on refrigerant resulting in lack of cooling and possible compressor damage.

Vacuum Refers to pressure that is less than atmospheric pressure.

General Information

Vacuum Pump A mechanical device used to evacuate and place a high vacuum in the refrigerant system.

Vacuum Pump Oil Water soluble oil used in some vacuum pumps to absorb moisture from the refrigerant system.

Vapor The gaseous state of a material.

Safety Precautions

Whenever repairs are made to any air conditioner parts that hold R–134a refrigerant, you must recover, flush (if contaminated), evacuate, charge, and leak test the system. In a good system, refrigerant lines are always under pressure and you should disconnect them only after the refrigerant charge has been recovered (discharged) at the service valves.

R–134a refrigerant is safe when used under the right conditions. Always wear safety goggles and non-leather gloves while recovering, evacuating, charging, and leak testing the system. Do not wear leather gloves. When refrigerant gas or liquid contacts leather, the leather will stick to your skin.

⚠ WARNING

Use care to prevent refrigerant from touching your skin or eyes, because liquid refrigerant, when exposed to the air, quickly evaporates and will freeze skin or eye tissue. Serious injury or blindness could result if you come into contact with liquid refrigerant.

Refrigerant splashed in the eyes should be rinsed with lukewarm water, not hot or cold. Do not rub the eyes. Apply a light bandage and contact a physician right away.

Refrigerant splashed on the skin should be rinsed with lukewarm water, not hot or cold. Do not rub the skin. Apply a light coat of a nonmedicated ointment, such as petroleum jelly. Contact a physician right away.

R–134a refrigerant does not burn at ambient temperatures and atmospheric pressure. However, it can be combustible at pressures as low as 5.5 psig (139 kPa absolute) at 350°F (177°C) when mixed with air concentrations that are greater than 60 percent.

⚠ WARNING

R–134a air conditioning systems should not be pressure tested or leak tested with compressed air. Combustible mixtures of air and R–134a may form, resulting in a fire or explosion that could cause personal injury or property damage.

You must work in an area where there is a constant flow of fresh air when the system is recovered, evacuated, charged, and leak tested. R–134a vapors have a slightly sweet odor that is difficult to detect. Frequent leak checks and air monitoring equipment are recommended to ensure a safe working environment.

IMPORTANT: When servicing an R–134a air conditioning system, use only service equipment certified to meet the requirements of SAE J2210 (R–134a recycling equipment). The equipment should be operated only by qualified personnel who are familiar with the recycling station manufacturer's instructions.

Because of its very low boiling point, refrigerant must be stored under pressure. To prevent the refrigerant containers from exploding, never expose them to temperatures higher than 125°F (52°C).

On R–134a refrigerant systems, polyalkylene glycol (PAG) oil is used in the compressor. When handling PAG oil:

- Keep the oil free of contaminants;
- Do not expose the air conditioning system or the PAG oil container to air for long periods of time. PAG oil has a high moisture absorption capacity and the oil container should be immediately sealed after each use;
- Use care when handling spilled oil. The oil could damage painted surfaces, plastic parts, and other components, such as drive belts;
- Never mix PAG oil with other types of refrigerant oil.

Required Equipment

You will need a machine, or machines, to identify the refrigerant and to recover, evacuate, flush, and charge the refrigerant system. Ideally, one machine can perform all the following functions:

- Identification–The machine must be able to verify the purity of the refrigerant in the refrigerant system and the presence of hydrocarbon-based refrigerants or other unapproved refrigerants.
- Recovery–The machine must be able to fully recover the refrigerant from the refrigerant system.
- Evacuation–Ideally, the machine should have a vacuum pump rated at 6 cfm and be maintenance free. A machine that requires maintenance is acceptable as long as it is properly maintained.
- Charging–The scale used in charging should be accurate to within ±1 ounce (30 mL).
- Flushing–Adaptors for the compressor(s), expansion device(s), and accumulator-drier should be purchased or fabricated to flush the system with refrigerant.

Refrigerant Identification

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

IMPORTANT: Identify the refrigerant in the refrigerant system if you suspect one of the following conditions:

- an excess noncondensable gas, such as nitrogen or air, is in the system
- an unapproved refrigerant is in the system
- the history of refrigerant system repairs is unknown

1. Using a high-quality refrigerant identifier and the manufacturer's instructions, attach the identifier to the vehicle and perform the test.
2. If the vehicle passed the test, it is safe to recover the refrigerant.
3. If the vehicle failed the test due to an excessive amount of noncondensable gas, recover the refrigerant system, then purge the recovery tank of the noncondensable gas.
4. If the vehicle failed the test due to the presence of a hydrocarbon-based refrigerant or a refrigerant other than R-134a, **do not recover the refrigerant into the general-use machine.** To recover the refrigerant system, recover the refrigerant into a separate container that contains refrigerant that must be recycled by a qualified recycling center. It is best to refer the customer to the place where the vehicle was last serviced.

Recovery

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

The recovery process removes most of the refrigerant charge in the system.

1. Turn off the engine, apply the parking brakes, chock the tires, and open the hood.
2. Remove the caps from the suction and discharge service valves.
3. If the history of refrigerant system repairs is unknown, or if you suspect that the system is charged with an unapproved refrigerant, identify the refrigerant using the "Refrigerant Identification" procedures.
4. Wearing protective goggles and nonleather gloves, attach the refrigerant recovery and charging machine hoses to the valves.

IMPORTANT: Push down firmly on the hose connectors until a clicking sound is heard. This will ensure that the coupler is locked.

5. Follow the refrigerant recovery and charging machine manufacturer's instructions and recover all of the refrigerant from the refrigerant system.

IMPORTANT: Always comply with all federal and local regulations regarding refrigerant recovery and disposal. You may be subject to substantial penalties for improper procedures.

6. Measure the oil recovered during the recovery process. The refrigerant system will have to be filled with the same quantity of new refrigerant oil. If the system is contaminated with moisture, all of the compressor oil must be replaced with clean oil. If the system is heavily contaminated with desiccant or grit, replace the compressor, expansion valve, and accumulator-drier, and flush the condenser and evaporator(s). After the system is charged, perform a performance check to ensure that the heat exchangers are not plugged.

Evacuating

The main purpose in evacuating the refrigerant system is to remove noncondensable gases (NCG), such as nitrogen and air. The secondary purpose is to boil off free water molecules.

In rare cases, water forms ice crystals at the expansion valve. Ice crystals retard or stop the flow of refrigerant, causing a reduction or complete loss of cooling. As the expansion valve warms due to the lack of refrigerant, the ice melts and passes through the expansion valve. Then refrigerant will flow again until the ice crystals re-form. The result is intermittent cooling.

Refrigerant oil has an extremely high moisture absorption capacity. Typically, the moisture picked up by the oil is passed on to the accumulator-drier. If excessive moisture exists in the system, the lubricating ability of the oil is reduced, which could damage the compressor and other components.

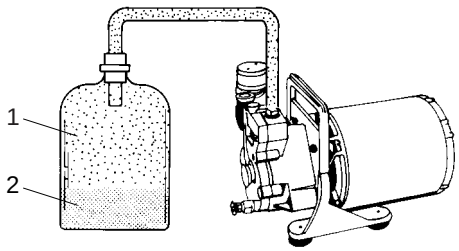
Effects of Pressure on the Boiling Point of Water

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

Water boils at 212°F (100°C) at an atmospheric pressure of 14.7 psi (101 kPa) at sea level. At higher elevations the atmospheric pressure is lower, which allows water to boil at lower temperatures. See **Table 1** for boiling temperatures of water at converted pressures.

Similarly you can boil and remove water from the air conditioning system by lowering the system pressure to a vacuum to cause the moisture to vaporize at normal ambient temperatures. A vacuum pump can reduce the pressure in the system. Since the pressure is lowest at the pump, NCG and water vapor are pulled out of the system. This process is called evacuation or dehydration. See **Fig. 1**.



11/14/95 f830489b

1. Vapor 2. Water

Fig. 1, Water to Vapor

Measuring Vacuum

Vacuum should be measured with an electronic thermistor vacuum gauge, which is designed for use with high vacuum pumps and can accurately read as low as 100 microns. This gauge can have an analog scale or a digital (LED or LCD) display.

The location of the vacuum gauge will affect the reading. The closer to the vacuum source, the lower the reading will be. Follow the manufacturer's instructions for proper use of the vacuum gauge.

If the pressure will not stabilize, it is an indication of a leak. If it does stabilize at a vacuum that is too high, for example 1500 microns Hg, it is an indication of moisture and more evacuation is required.

Boiling Temperatures of Water at Converted Pressures		
Boiling Temperature of Water: °F (°C)	**Absolute Pressure: psi (microns Hg)**	**Vacuum: inHg (mmHg)**
212 (100)	14.696 (759993.4)	0 (0)
205 (96)	12.770 (660400.0)	3.92 (99.6)
194 (90)	10.169 (523881.6)	9.22 (234.2)

Table 1, Boiling Temperatures of Water at Converted Pressures

Holding a vacuum is only an indication that there are not any leaks that are present under a vacuum. Other leaks may exist when the system is pressurized, so a proper leak test must be performed in conjunction with holding a vacuum.

Maintaining an Oil-Lubricated Vacuum Pump

Maintenance is important for a high-vacuum pump. The oil must be changed at regular intervals to prevent moisture buildup, which will cause decreased pump performance and eventual pump failure.

Pumping down for extremely wet air conditioning systems can completely saturate the pump oil, which will require the replacement of the vacuum pump oil.

⚠ CAUTION

Flush the vacuum pump every fourth time it is used, and before storing for long periods of time.

Acid will form and corrode the pump, if water-laden oil remains in the pump for an extended period.

Vacuum pump oil is water soluble. This aids the pump in reaching a high vacuum by absorbing water and sealing the pump.

Use only vacuum pump oil as a lubricant. Do not use any solvent or any other oil. Clean oil should be run through the pump until it runs out clear. Oil should be added to the fill level indicated on the pump. Check the oil level before each use.

Evacuation Procedure

1. The system must have been recovered and the refrigerant compressor filled with the correct amount of refrigerant oil. Replace the accumulator-drier if the system conditions require it.
2. Make sure the vacuum pump has been properly maintained.
3. Wearing protective goggles and nonleather gloves, attach the refrigerant recovery and charging machine hoses, or a vacuum pump, to the valves.

IMPORTANT: Push down firmly on the hose connectors until a clicking sound is heard. This will ensure that the coupler is locked.

4. Follow the refrigerant recovery and charging machine manufacturer's instructions and evacuate the refrigerant system.
5. A minimum of 10 minutes with a 6-cfm pump should be used to evacuate the system. Evacuate the system for a longer period of time if using a smaller pump. Make sure that the vacuum level reaches a point where water would boil and does not go back to zero, then proceed with charging and leak testing the system.

Flushing

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

Flushing removes moisture-laden oil and some contamination, such as dirty oil and some particle. When a part is flushed, liquid refrigerant is forced through it. The liquid picks up the contaminants and flushes them out.

Whether to flush, or replace a part depends on how much contamination there is as previously described.

Normally the system always has pressure in it. Some loss of refrigerant from one season to the next is normal and does not mean that the system is dirty. If refrigerant has leaked until the system is nearly empty and/or refrigerant parts show signs of internal corrosion and grit, the system is contaminated.

If the system is contaminated with moisture, flush all sections of the system. Then change the oil in the compressor and replace the accumulator-drier prior to evacuating and charging the system.

If the system is heavily contaminated or if desiccant has circulated through the system, replace the accumulator-drier, expansion valve(s), and inspect the compressor.

Do not flush the accumulator-drier or the compressor.

Flush the system in segments to lessen the chance of blowing deposits against a port.

Flush the system in the opposite direction of refrigerant flow. In other words, backflush the sections.

Flushing parts with refrigerant requires a refrigerant recovery and charging machine.

Flushing Procedure

Method 1

NOTE: Use this method when the recovery and charging machine is equipped with a flush cycle.

1. Recover the refrigerant from the air conditioning system.
2. Disconnect both ends of the line or part(s) being flushed. Tightly cap the lines to the rest of the system.

NOTE: You must remove the expansion device(s), accumulator-drier, and compressor(s) when flushing. These components must be removed and bypassed when performing a system flush.

3. Install the flushing adaptors and an inline filter and follow the instructions from the manufacturer of the recovery and charging machine to perform the flush. When flushing the entire system, use an adaptor that fits where the compressor was located and backflush.
4. Remove the adaptors and bypass devices and install the expansion device(s), the compressor, and a new accumulator-drier.
5. If installing the existing compressor, remove the oil in it and replace the oil with new oil. New compressors may or may not have a full charge of oil.
6. Charge the system with refrigerant and check the system performance.

Method 2

NOTE: Use this method when two recovery and charging machines are available.

1. Recover the refrigerant from the air conditioning system.
2. Disconnect both ends of the line or part(s) being flushed. Tightly cap the lines to the rest of the system.

NOTE: You must remove the expansion device(s), accumulator-drier, and compressor(s) when flushing. These components must be removed and bypassed when performing a system flush.

3. Install the flushing adaptors and an inline filter. When flushing the entire system, use an adaptor that fits where the compressor was located and backflush.
4. Charge the part with 2 pounds (0.9 kg) of refrigerant or the system with 5 pounds (2.3 kg) of refrigerant, then recover the refrigerant with a second machine. It is desirable to start the recovery slightly before the charge cycle is done since this helps to push fluid through the system. Repeat the process several times until you think that all the oil has been removed.
5. Remove the adaptors and bypass devices and install the expansion device(s), the compressor(s), and a new accumulator-drier.
6. If installing the existing compressor, remove the oil in it and replace the oil with new oil. New compressors may or may not have a full charge of oil.
7. Charge the system with refrigerant and check the system performance.

Charging

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

NOTE: Before charging, the system must be recovered and evacuated with the recovery and charging machine connected to the service and discharge port connections.

1. Obtain enough refrigerant to fully charge the system. To determine the amount of refrigerant needed to fully charge the system, read the Air Conditioner label on the vehicle or see **Specifications 400**.
2. Charge the system on the high side following the refrigerant recovery and charging machine manufacturer's instructions.
3. While the compressor is engaged, check the duct temperature and operating pressures at the suction and discharge ports. Compare the temperature and pressures to those in **Specifications 400**. If the operating pressures are not acceptable, see **Subject 300** for troubleshooting procedures.
4. Disconnect the hoses.
5. Shut down the engine.
6. Recover the refrigerant that is in the hoses.

Leak Testing Methods

General Information

⚠ WARNING

Before doing any of the work below, read the information under Safety Precautions 100. Failure to read the safety precautions, and to take precautions against the dangers involved when working with refrigerant, could lead to serious personal injury.

Refrigerant is nearly odorless. As a result, all of it may leak away and not be noticed until the system stops cooling. All vehicle refrigerant systems lose some refrigerant. Higher loss rates signal a need to locate and repair the leaks.

Leaks are most often found at the compressor hose connections and at the various fittings and joints in the system. If unapproved replacement hoses are installed, refrigerant can be lost through hose permeation.

There are two leak testing methods that can be used to detect leaks in the refrigerant system: UV (ultraviolet) dye leak detection and electronic leak detection. Freightliner recommends using the UV dye leak detection method whenever possible, even though there are some limitations to using this method. A leak on the front seal of the compressor **must** be verified using a heated diode leak detector and the instructions in the workshop manual. Visible dye on the front of the compressor clutch **does not** verify that there is a repairable leak at the front seal. Evaporator leaks may not show up with dye, and must be checked using a heated diode leak detector if dye is not present at the condensate drain.

UV Dye Leak Detection

IMPORTANT: When using the UV dye leak detection method, always wear protective eyewear that blocks UV rays and enhances the appearance of the dye. Always wear nonleather gloves and protective eyewear when servicing the air conditioning system.

1. Inspect the refrigerant system for leaks using a UV lamp.
   - 1.1 Inspect the entire refrigerant system under low lighting using a UV lamp. Low lighting will increase the apparent brightness of the UV dye at leak sights.
   - 1.2 Move the UV lamp along the entire refrigerant system, looking for signs of damage or corrosion on the fittings, hose-to-line crimps, switch ports, service ports with caps installed (dye inside the port is not an indication of a leak), brazed or welded areas, and around all connections. Check for evaporator leaks by illuminating the condensate drain tube or hole using the UV lamp.
   - 1.3 Move the UV lamp along the refrigerant system following a continuous path so that no potential leak sites are missed. If a leak is found, continue to check the remainder of the system since other leaks may be present.
2. After repairing a leak, remove all UV dye residue remaining on the outside of the refrigerant system using the cleaner provided by the dye manufacturer, or a comparable cleaner. Use a spray bottle of cleaner, a toothbrush, and a spray bottle of clean water for hard-to-reach areas.

NOTE: Minor UV dye residue, or residue that is impossible to reach, will lose its fluorescence over time.

3. See **Table 2** for a list of products that have been tested and approved for use by Freightliner dealers.
4. Close the hood and remove the chocks from the tires.

Approved Products for UV Dye Leak Detection				
Type of Refrigerant Oil	**Product Description**	**Vendor Part Number**	**Freightliner Part Number**	**Website Address**
PAG	Tracerline BigEZ Kit—Can be injected without discharging the system. • Each kit includes one 4-oz (118-mL) cartridge and an injection tool.	TP-9741CS	ABP N83 327911	www.tracerline.com
	• A 4-oz (118-mL) replacement cartridge services 16 vehicles.	TP-9760-0004CS	ABP N83 327961	
	• An 8-oz (237-mL) replacement cartridge services 32 vehicles.	TP-9760-0108	ABP N83 327951

Table 2, Approved Products for UV Dye Leak Detection

Electronic Leak Detection

NOTE: Do not try to use a leak tester right after connecting or disconnecting service hoses. Traces of refrigerant at the fittings can falsely signal a leak. Always verify a leak by blowing shop air in to the area of the suspected leak and checking the area again.

When checking for leaks, move the probe all the way around the fitting or suspected leak.

Freightliner recommends using only certain makes of the heated diode and infrared (IR) types of electronic leak detectors.

Recommended electronic heated diode type leak detectors are available from their manufacturers. See **Table 3**.

Another type of detector, the corona discharge type, is specifically **not recommended**.

Use the following procedures to locate refrigerant system refrigerant gas leaks using an electronic leak detector.

1. Operate the electronic leak detector in accordance with the manufacturer's instructions.
2. Leak test with the engine turned off.
3. Charge the air conditioning system with sufficient refrigerant to indicate a gauge pressure of at least 50 psi (345 kPa) with the system not operating. Typically, one-half pound (0.22 kg) of refrigerant is sufficient to create 50 psi (345 kPa) of pressure. It may not be possible to produce this amount of pressure and measure leakage if the ambient temperature is less than 59°F (15°C).

Refrigerant Service Operations

Electronic Leak Detectors		
Designation	**Manufacturer**	**Comments**
D-TEK, D-Tek Select, and TekMate	Leybold Inficon 2 Technology Place East Syracuse NY 13057 (315) 434–1144	• Rechargeable battery • Hand-held design • Simple to operate
H–10 Professional	Bacharach Inc. c/o Yokogawa Corp. of America 2 Dart Road Newnan GA 30265 (800) 850–0044	• Rechargeable battery • Carrying case with strap • Calibration leak bottle • Manual sensitivity control • Most sensitive available
J 39400	SPX Kent-Moore 28635 Mound Road Warren MI 48092–3499 (800) 328–6657	• 12V DC or 120V AC • Carrying case with strap • Calibration leak bottle • Manual sensitivity control • Manual balance control

Table 3, Electronic Leak Detectors

4. Be careful not to contaminate the detector probe tip if the part being tested is not clean. Wipe the part off with a dry shop towel or blow it off with shop air. Do not use cleaners or solvents as many detectors are sensitive to their chemical ingredients.
5. Visually inspect the entire refrigerant system. Look for air conditioning lubricant leakage and corrosion or damage to lines, hoses, and all other components. Inspect each questionable location carefully with the detector probe. Check all fittings, couplings, refrigerant controls, service ports (with caps installed), brazed or welded areas, and areas around attachment points and hold-downs.
6. Follow the path of the refrigerant system methodically so that no leaks are missed. If a leak is found, continue to test the rest of the system.
7. Inspect an area of possible leakage slowly and close to the part, moving completely around the part. Move the probe no faster than one to two inches (25 to 50 mm) per second and no farther away than 1/4 inch (6.4 mm) from the part.
8. If a large leak is present in either the system being serviced or the service equipment, the surrounding air will be saturated with refrigerant gas. In this situation the leak detector operates erratically and will indicate leakage without being near a possible leak source. Place a large fan so that a light breeze blows through the work area. Verify a leak by blowing shop air into the area and repeating the inspection. Pinpoint a large leak by blowing out the area often.
9. You may test the evaporator core while it is in its housing. Turn on the blower motor for a minimum of 15 seconds. Shut off the blower and wait for refrigerant gas to accumulate in the housing. Follow the detector instructions for the specific length of time to wait for the gas to accumulate. Insert the detector probe into the blower resistor block, or condensate drain tube if no water is present. If this is not possible insert the probe into the closest opening to the evaporator, such as a heater or vent duct.

NOTE: The presence of water in the condensate drain tube can be determined by inserting the eraser end of a pencil in the drain tube. Inserting the pencil will break the surface tension of any water near the opening of the drain tube and allow the water to drain out before inserting

the probe tip. It is only necessary to break the plane of the drain tube with the probe tip. It does not need to be inserted far into the tube.

10. Leak test the front seal area of the compressor. Blow shop air into the cavities in and around the clutch for at least 15 seconds. Let the compressor stand for one minute and then test for leakage. Inspect axial-type compressors (Sanden or Sel-Tec) by placing the probe near the holes at the front of the clutch. See **Fig. 2**. Inspect two-cylinder reciprocating type compressors (Climate Control) by placing the probe between the clutch coil and the compressor. See **Fig. 3**.

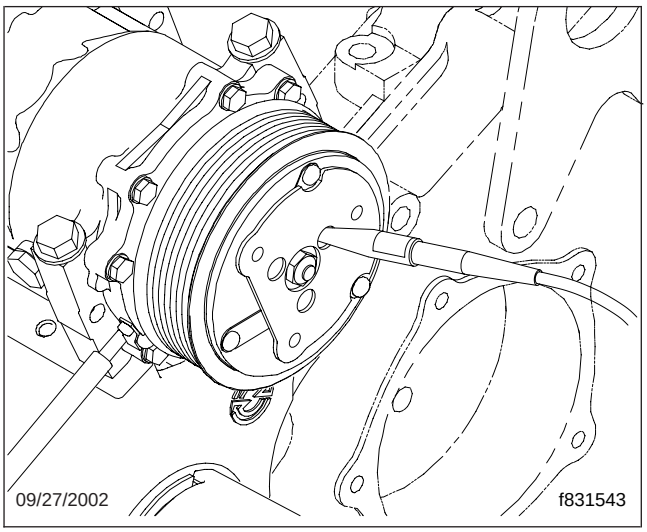

Fig. 2, Axial Type Compressor

IMPORTANT: Be careful not to damage the clutch bearing seal with high pressure shop air.

11. Leak test repaired areas of the system after repairs have been performed. Leak test the service ports (with caps installed) after any service which disturbs the refrigerant system.

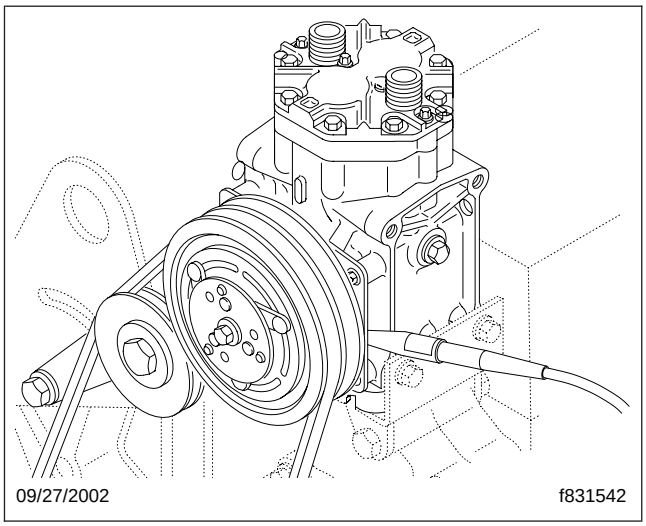

Fig. 3, Two-Cylinder Reciprocating Compressor

Replacement

Left-Hand-Drive Vehicle

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Open the hood.
3. Disconnect the batteries.
4. Disconnect the electrical connector. See **Fig. 1**.

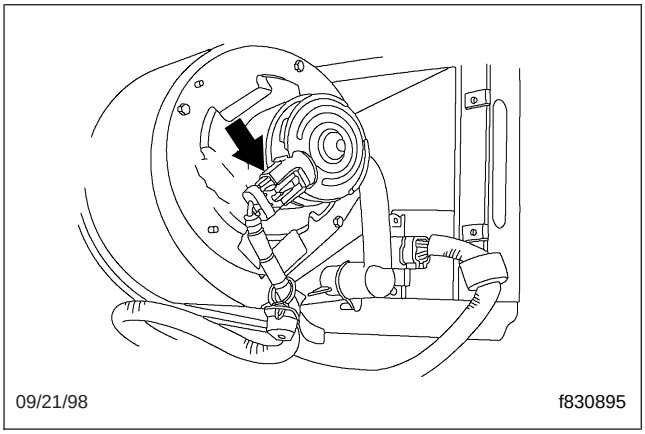

Fig. 1, Electrical Connector

5. Disconnect the blower motor tube to full open position. See **Fig. 2**.

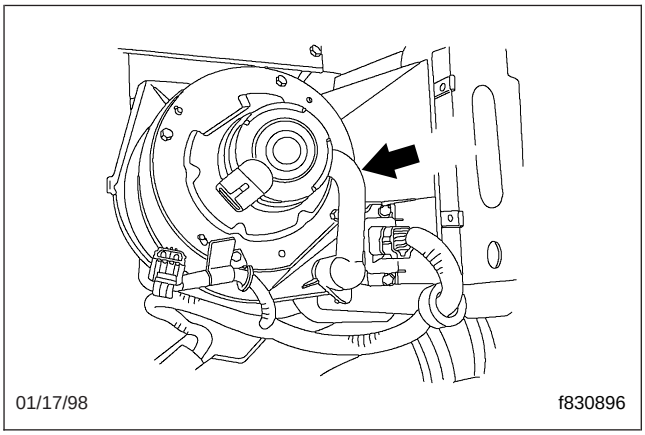

Fig. 2, Blower Motor Tube

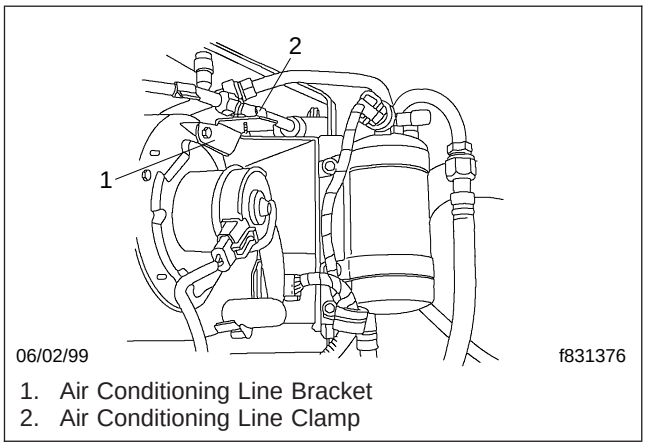
6. Remove the air conditioning line clamp and the air conditioning line support bracket. See **Fig. 3**.



1. Air Conditioning Line Bracket
2. Air Conditioning Line Clamp

Fig. 3, Air Conditioning Line Clamp and Bracket

7. Remove the screws and pull the blower motor outward. See **Fig. 4**.

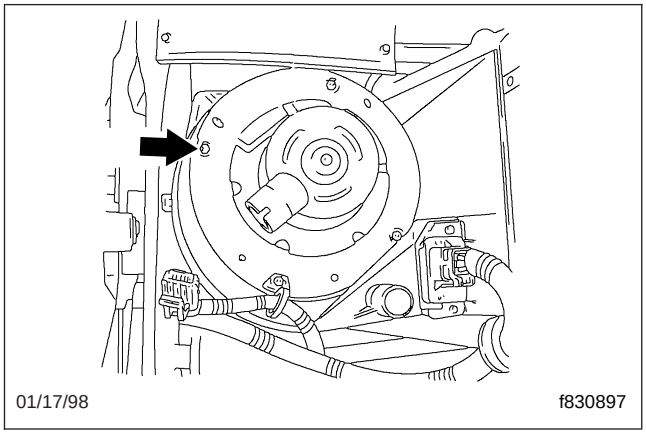


Fig. 4, Blower Motor Screws

8. Remove the push-on retaining clip that attaches the blower motor wheel to the blower motor, and remove the blower motor wheel. See **Fig. 5**.

NOTE: The push-on retaining clip that attaches the blower motor wheel to the blower motor is a single-use item. If the blower motor and blower motor wheel are separated, the retaining clip must be replaced with a new one.

9. Install the blower motor wheel. Install a new push-on retaining clip. See **Fig. 5**.
10. Install the blower motor and the screws. See **Fig. 4**.

Blower Motor Replacement

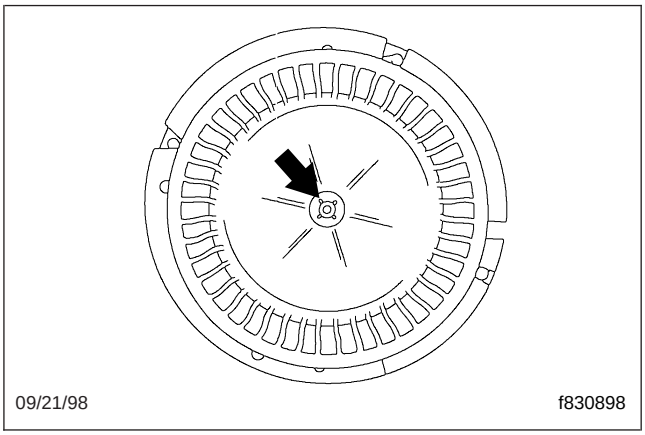

Fig. 5, Push-On Retaining Clip

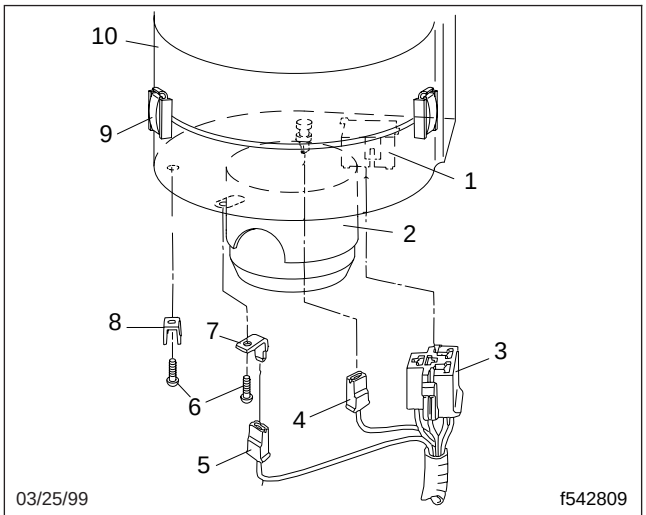
11. Install the air conditioning line clamp and the air conditioning line support bracket.
12. Install the blower motor tube.
13. Connect the electrical connector.
14. Close and latch the hood.
15. Connect the batteries.
16. Remove the chocks from the tires.

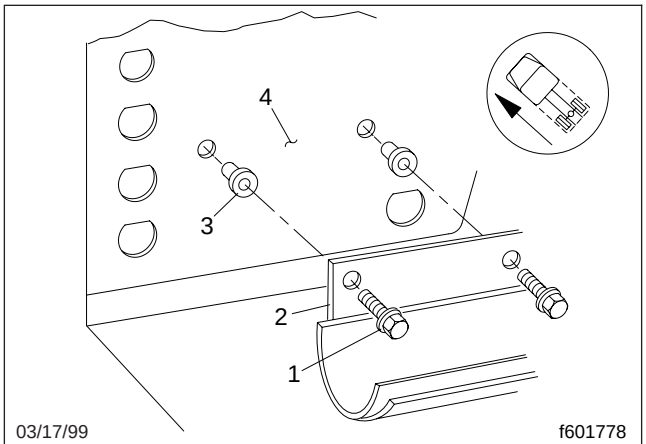
Right-Hand-Drive Vehicle

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Remove the glove compartment door trim panel and the lower air conditioning housing cover assembly. For instructions, see **Group 60**.
4. Disconnect the blower motor electrical connectors. See **Fig. 6**.
5. Remove the wiring harness support bracket mounting screws to access the blower motor assembly retaining screws. See **Fig. 7**.
6. Remove the blower motor tube.
7. Remove the blower motor assembly from the HVAC unit.
8. Remove the push-on retaining clip that attaches the blower motor wheel to the blower motor and remove the blower motor wheel.



1. Blower Motor Resistor
2. Blower Motor
3. Blower Motor Resistor Connector
4. Blower Motor Connector (+)
5. Blower Motor Connector (–)
6. Blower Motor Retaining Screw
7. Blower Motor Connector
8. Blower Motor Assembly Screw Retainer
9. HVAC Unit Retaining Clip
10. HVAC Unit

Fig. 6, Blower Motor and Components



1. Retaining Bolt
2. Support Bracket
3. Retaining Nut
4. Cab Wall

Fig. 7, Wiring Harness Support Bracket

NOTE: The push-on retaining clip that attaches the blower motor wheel to the blower motor is a single-use item. If the blower motor and blower

motor wheel are separated, the retaining clip must be replaced with a new one.

9. Install the blower motor wheel. Install a new retaining clip.
10. Connect the blower motor resistor electrical connector.
11. Install the blower motor tube.
12. Install the blower motor assembly and the screws.
13. Connect the blower motor electrical connectors.
14. Position and install the wiring harness support bracket and the mounting screws.
15. Install the glove compartment door trim panel and the lower air conditioning housing cover assembly. For instructions, see **Group 60**.
16. Connect the batteries.
17. Remove the chocks from the tires.

Heater Core Housing Replacement

Replacement

1. Remove the heater core. For instructions, see **Subject 150**.
2. Remove the evaporator housing. For instructions, see **Subject 140**.
3. Disconnect the electrical connector.
4. Remove the two nuts that attach the heater core housing to the dash panel. See **Fig. 1**.

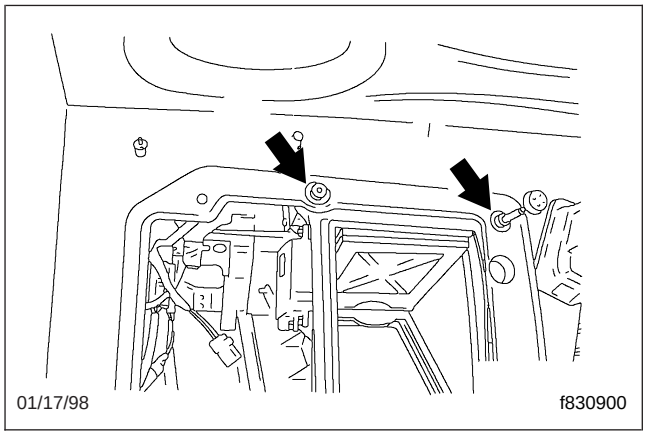


Fig. 1, Heater Core Housing Nuts

5. Pull the heater core housing outward and remove the heater core housing. See **Fig. 2**.

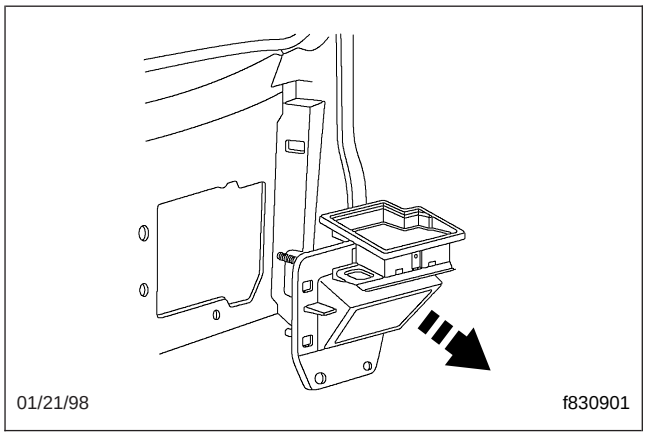

Fig. 2, Heater Core Housing

6. Install the heater core housing.
7. Install the two nuts that attach the heater core housing to the dash panel. See **Fig. 1**.
8. Connect the electrical connector.
9. Install the evaporator housing. For instructions, see **Subject 140**.
10. Install the heater core. For instructions, see **Subject 150**.

Evaporator Housing Removal and Installation

Removal

WARNING

The engine must be off and fully cool and the cooling system fully depressurized before attempting to disconnect any heater water hoses. Failure to comply with these warnings can result in serious injury and burns from the engine cooling system.

NOTE: For vehicles equipped with air conditioning, the system must be discharged and the evaporator disconnected.

1. Partially drain the engine cooling system. For instructions, see **Group 20**.
2. If necessary, remove the blower motor. For instructions, see **Subject 120**.
3. Remove the outside-recirculation door pneumatic actuator.
4. Remove the bolts and the instrument panel support brace. See **Fig. 1**.

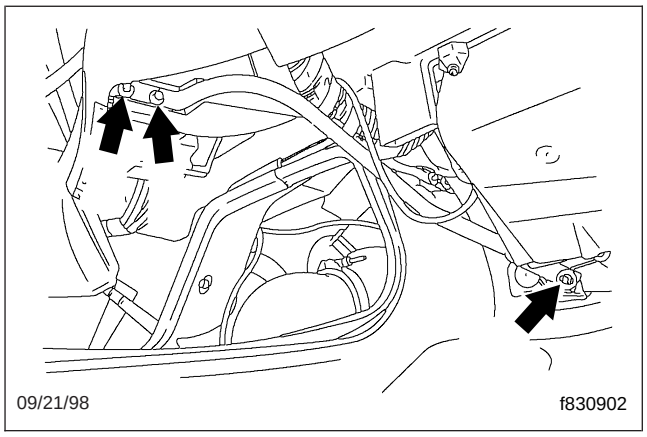

Fig. 1, Instrument Panel Support Brace

5. Remove the nuts that attach the evaporator housing to the inside of the dash panel. See **Fig. 2**.
6. Loosen the hose clamps and remove the heater hoses from the heater core. See **Fig. 3**.
7. Remove the screw retaining the wiring harness to the evaporator housing. See **Fig. 4**
8. Remove the blower motor resistor connector and the wiring harness fastener. See **Fig. 5**.

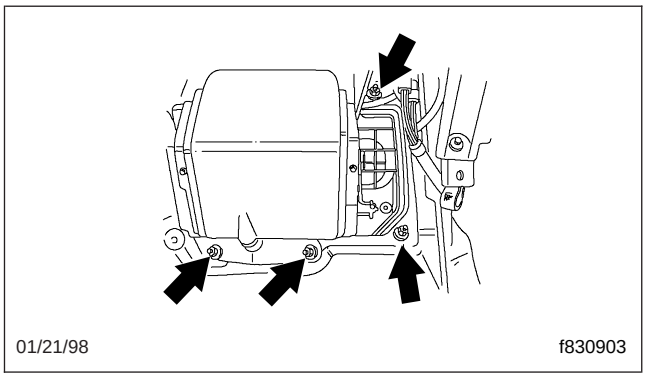

Fig. 2, Evaporator Housing Nuts

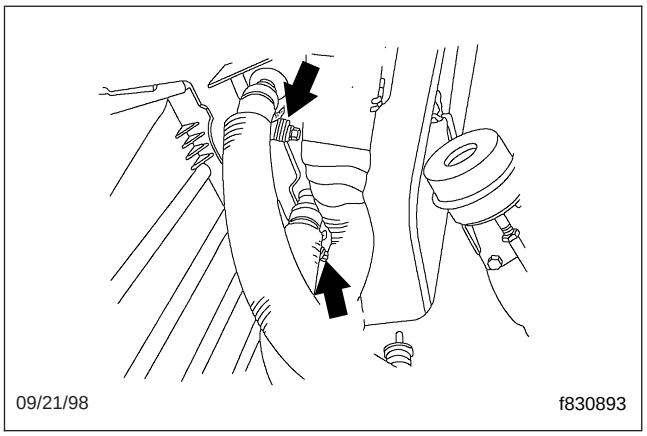

Fig. 3, Hose Clamps

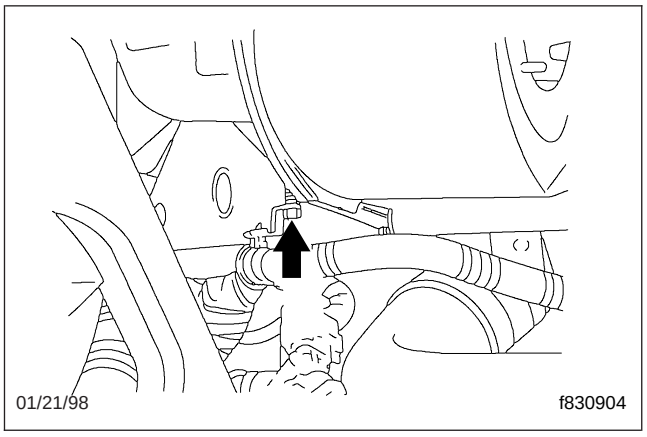

Fig. 4, Wiring Harness Screw

9. Remove the nut that attaches the evaporator housing to the outside of the dash panel. See **Fig. 6**.
10. Remove the bolts. See **Fig. 7**.

Evaporator Housing Removal and Installation

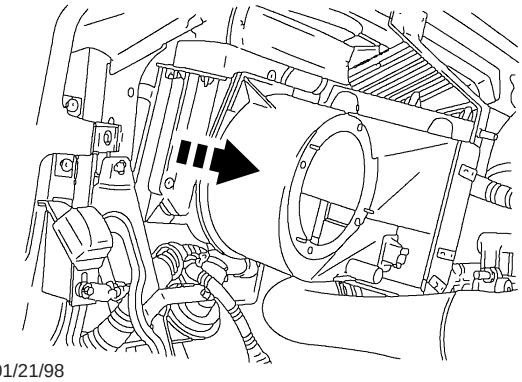
11. Remove the evaporator housing. See **Fig. 8**.



01/21/98 f830908

Fig. 8, Evaporator Housing

Installation

NOTE: If a new evaporator housing is to be installed, the blower motor and wheel, blower motor tube, air inlet duct heater, heater blower motor switch resistor, air inlet duct actuator, evaporator housing support bracket and fresh air filter must be transferred to the new evaporator housing. These procedures can be done prior to installation of the evaporator housing to ease the installation.

1. Install the evaporator.
2. Install the evaporator housing. See **Fig. 8**.
3. Install the bolts.
4. Install the nut that attaches the evaporator housing to the outside of the dash panel.
5. Install the blower motor resistor connector and the wiring harness fastener.
6. Install the screw retaining the wiring harness to the evaporator housing.
7. Install the heater hoses to the heater core and tighten the hose clamps.
8. Install the nuts that attach the evaporator housing to the inside of the dash panel. See **Fig. 2**.
9. Install the instrument panel support brace and the bolts. See **Fig. 1**.
10. Install the outside-recirculation door pneumatic actuator.

11. If necessary, install the blower motor. For instructions, see **Subject 120**.
12. Refill the engine cooling system. For instructions, see **Group 20**.

Replacement

Left-Hand-Drive Vehicle

⚠ WARNING

The engine must be fully cooled and the cooling system fully depressurized before attempting to disconnect any heater water hoses. Failure to comply with these warnings may result in serious injury and burns from the hot liquid escaping from the engine cooling system.

1. Close the heater core shutoff valve and partially drain the engine cooling system. For instructions, see **Group 20**.
2. Loosen the hose clamps and remove the heater hoses from the heater core. See **Fig. 1**.

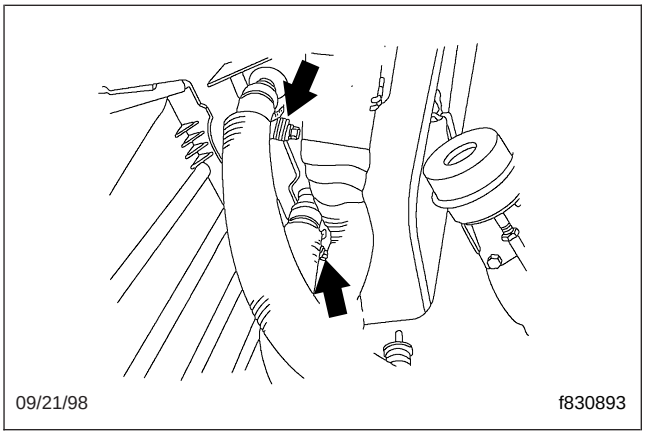


Fig. 1, Hose Clamps

3. Remove the screws that secure the passenger-side heater outlet floor duct. See **Fig. 2**.
4. Remove the seven screws and the heater core cover. See **Fig. 3**.

NOTE: Use care not to spill the coolant remaining in the heater core during removal.

5. Remove the heater core from the heater core housing. See **Fig. 4**.

NOTE: Apply rubber suspension insulator lube or equivalent to the tube ends and on the inside dash seals to allow the heater core tubes to pass easily through the dash seal during installation.

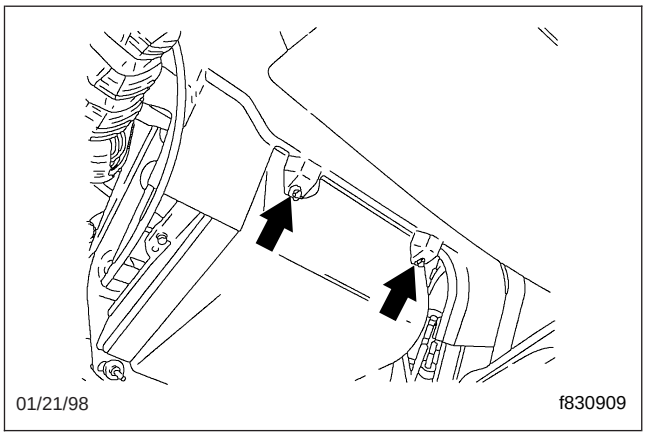

Fig. 2, Floor Duct Screws

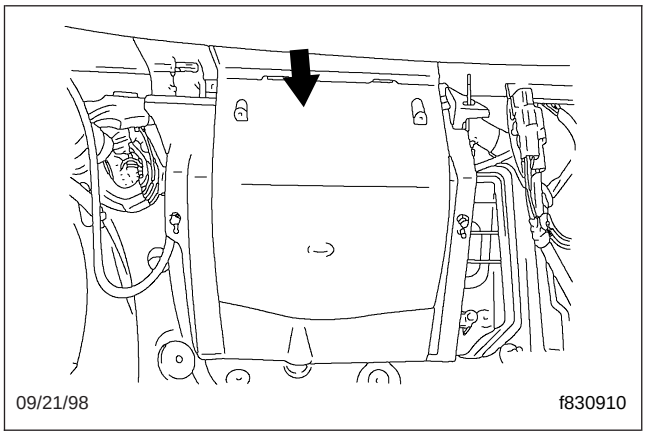

Fig. 3, Heater Core Cover

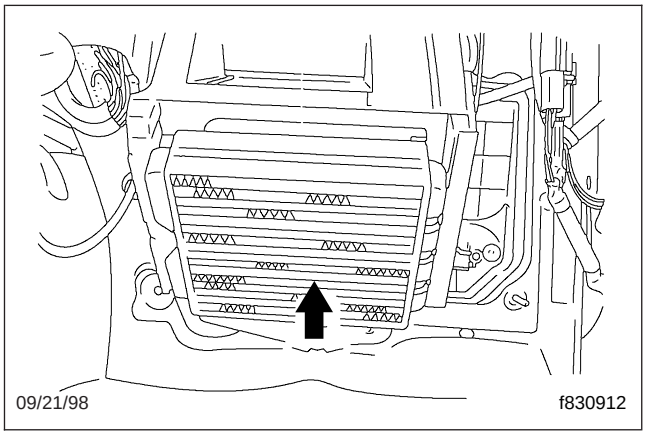

Fig. 4, Heater Core

6. Install the heater core in the heater core housing. See **Fig. 4**.

Heater Core Replacement

7. Install the heater core cover and the seven screws.
8. Install the screws securing the passenger-side heater outlet floor duct.
9. Install the heater hoses to the heater core and tighten the hose clamps.
10. Open the heater core shutoff valve and refill the engine cooling system. For instructions, see **Group 20**.

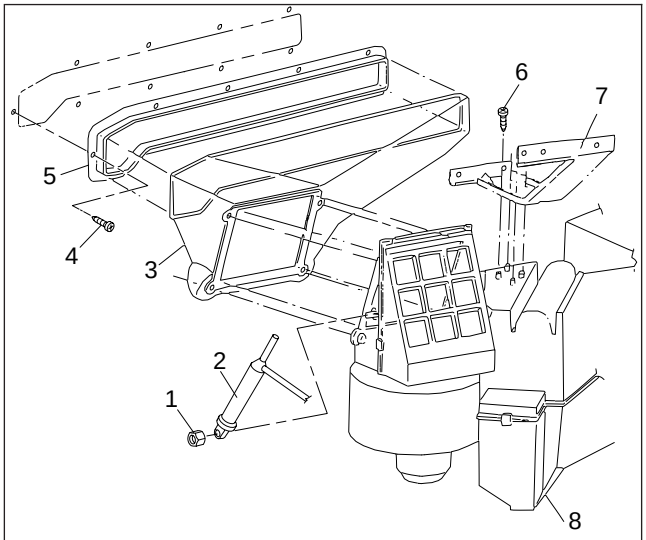
Right-Hand-Drive Vehicle

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.

⚠ WARNING

The engine must be fully cooled and the cooling system fully depressurized before attempting to disconnect any heater water hoses. Failure to comply with these warnings may result in serious injury and burns from the hot liquid escaping from the engine cooling system.

2. Close the heater core shutoff valve and partially drain the engine cooling system. For instructions, see **Subject 250**.
3. Remove the instrument panel. For instructions, see **Section 60.01**.
4. Remove the HVAC unit. For instructions, see **Subject 280**.
5. Remove the ducting from the HVAC unit. See **Fig. 5**.
6. Remove the vacuum actuators from the HVAC unit. See **Fig. 5**.
7. Remove the HVAC air blend motor retaining screws. Remove the component. See **Fig. 6**.
8. Remove the clips. Separate the HVAC unit into two halves.
9. Remove the heater core. See **Fig. 7**.
10. Replace the heater core.
11. Install the HVAC air blend motor and the retaining screws in the HVAC unit. See **Fig. 6**.
12. Join the two halves of the HVAC unit and install the clips.



1. Nut
2. Vacuum Actuator
3. Air Intake Duct
4. Screw
5. Duct Retainer
6. Screw
7. PDM Mounting Bracket

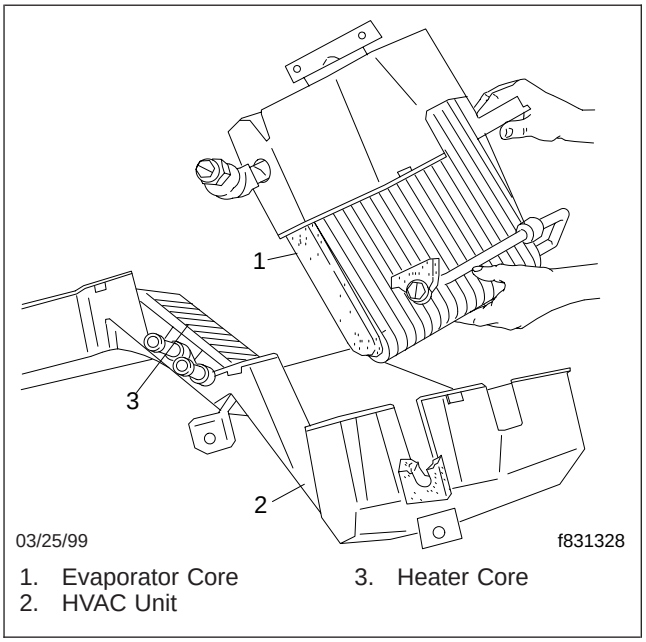
13. Install the vacuum actuators on the HVAC unit. See **Fig. 5**.
14. Install the ducting on the HVAC unit.
15. Install the HVAC unit. For instructions, see **Subject 280**.



1. Evaporator Core
2. HVAC Unit
3. Heater Core

Fig. 7, Heater Core Location

16. Install the instrument panel. For instructions, see **Section 60.01**.
17. Open the heater core shutoff valve and replace the drained coolant. For instructions, see **Group 20**.
18. Remove the chocks from the tires.

Evaporator and Evaporator Orifice Replacement

WARNING

Before starting any of the procedures below, see "Safety Precautions" in Subject 100. Failure to do so may result in personal injury.

Evaporator Replacement

Left-Hand-Drive Vehicle

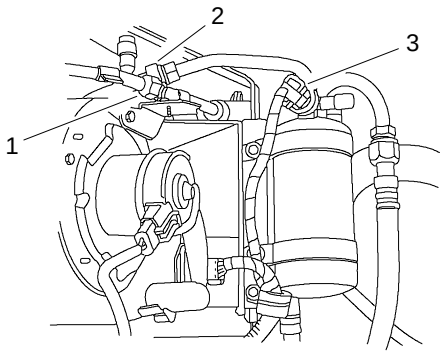
WARNING

The engine must be fully cooled and the cooling system fully depressurized before attempting to disconnect any heater water hoses. Failure to comply with these warnings may result in serious injury and burns from the hot liquid escaping from the engine cooling system.

1. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.01, Subject 110**.

NOTE: All open refrigerant lines and connections must be capped or plugged to prevent dirt and moisture from entering and contaminating the system during repair.

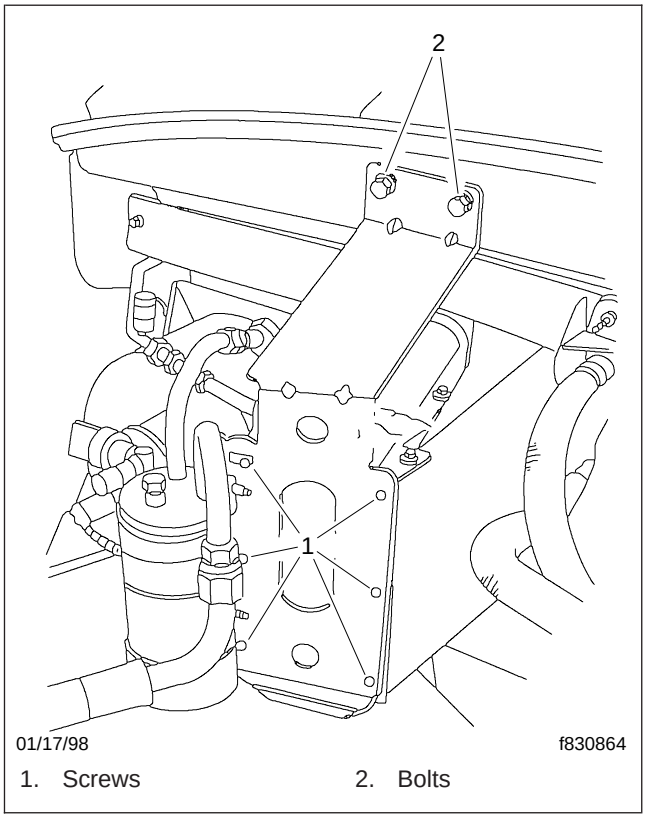
2. Disconnect the evaporator inlet and outlet lines. See **Fig. 1**.



1. Inlet Line
2. Outlet Line
3. Electrical Connector

Fig. 1, Evaporator Lines and Electrical Connector

3. Disconnect the electrical connector.
4. Remove the screws that secure the accumulator/drier and bracket, then swing the accumulator/drier and bracket out of the way. See **Fig. 2**.



1. Screws
2. Bolts

Fig. 2, Accumulator/Drier and Bracket

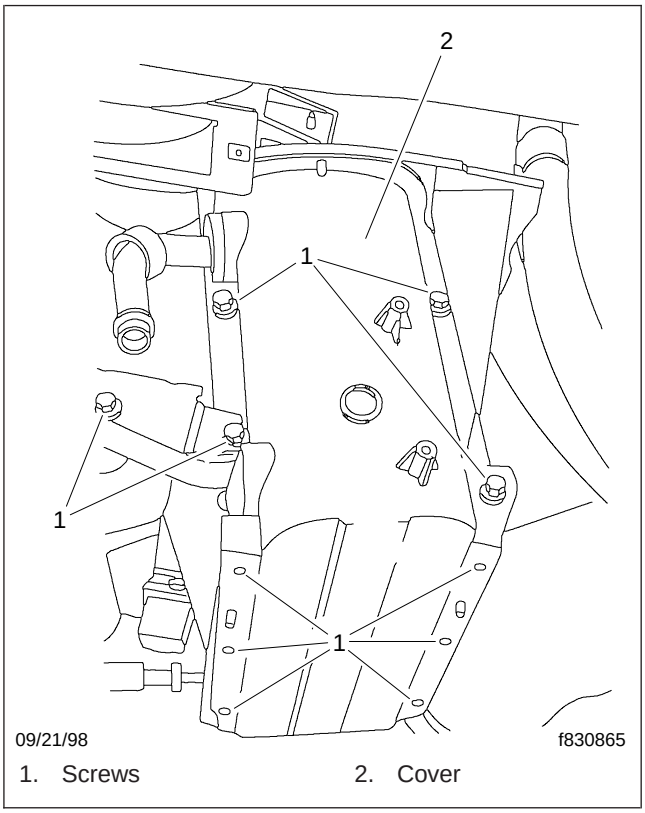
5. Remove the screws that secure the evaporator case cover, then remove the cover.
6. Remove the evaporator case cover. See **Fig. 3**.
7. Remove the evaporator core and seals. See **Fig. 4**.

NOTE: When the A/C system connections have been opened, the O-rings must be replaced with new O-rings lubricated in clean refrigerant oil.

NOTE: If the evaporator core is to be replaced, see "Refrigerant Oil Replacement and Measurement" in **Section 83.02**.

8. Install the evaporator core and seals.
9. Using screws, install the evaporator case cover.
10. Using screws, install the accumulator/drier and bracket.
11. Connect the evaporator core. See **Fig. 1**.

Evaporator and Evaporator Orifice Replacement



1. Screws 2. Cover

Fig. 3, Evaporator Case Cover

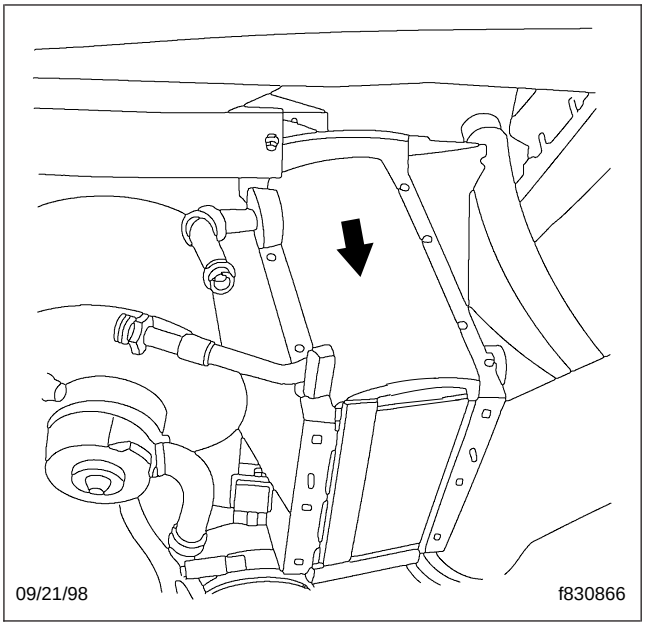


Fig. 4, Evaporator and Seals

11.1 Connect the evaporator inlet line and torque the fitting 15 to 20 lbf·ft (20 to 27 N·m).

11.2 Connect the evaporator outlet line and torque the fitting 25 to 30 lbf·ft (34 to 41 N·m).

11.3 Connect the electrical connector.

12. Evacuate, charge, and leak test the air conditioning system. For instructions, see **Section 83.01, Subject 110**.

Right-Hand-Drive Vehicle

⚠ WARNING

The engine must be fully cooled and the cooling system fully depressurized before attempting to disconnect any heater water hoses. Failure to comply with these warnings may result in serious injury and burns from the hot liquid escaping from the engine cooling system.

1. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.01, Subject 110**.
2. Remove the HVAC unit. For instructions, see **Subject 280**.
3. Disassemble the HVAC unit. For instructions, see **Subject 290**.
4. Remove the evaporator slide tab. See **Fig. 5**.

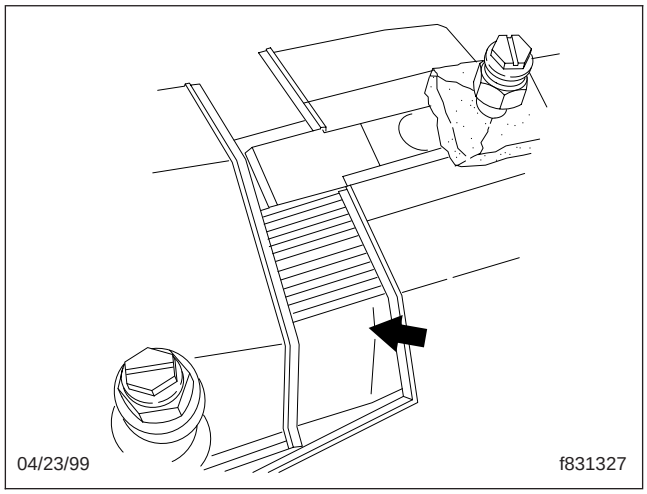

Fig. 5, Evaporator Tab

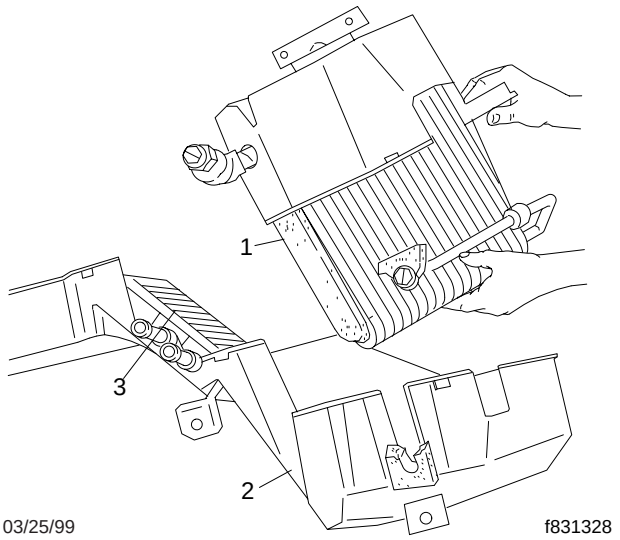
5. Replace the evaporator. See **Fig. 6**.



1. Evaporator
2. HVAC Unit
3. Heater Core

Fig. 6, Evaporator Core

6. Install the evaporator core support.
7. Assemble the HVAC unit. For instructions, see **Subject 290**.
8. Install the HVAC unit. For instructions, see **Subject 280**.
9. Open the heater core shutoff valve and replace the drained coolant. For instructions, see **Group 20**.
10. Evacuate, charge, and leak test the air conditioning system. For instructions, see **Section 83.01, Subject 110**.

Evaporator Orifice Replacement

NOTE: All open refrigerant lines and connections must be capped or plugged to prevent dirt and moisture from entering and contaminating the system during repair.

NOTE: When the A/C system connections have been opened, the O-rings must be replaced with new O-rings lubricated in clean refrigerant oil.

1. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.01, Subject 110**.
2. Disconnect the evaporator orifice fitting. See **Fig. 7**.

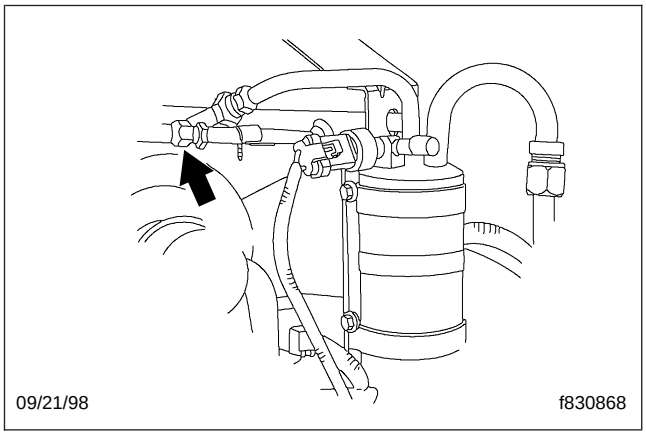


Fig. 7, Evaporator Orifice Fitting

3. Remove the orifice tube.
4. Install the orifice tube.
5. Connect the fitting. See **Fig. 7**. Tighten the fitting 15 to 20 lbf·ft (20 to 27 N·m).
6. Evacuate, charge, and leak test the air conditioning system. For instructions, see **Section 83.01, Subject 110**.

Accumulator/Drier Replacement

⚠ WARNING

Before starting any of the procedures below, see "Safety Precautions" in Subject 100. Failure to do so may result in personal injury.

Replacement Guidelines

NOTE: The accumulator/drier contains a desiccant bag to absorb any moisture that may be in the system. It is important to protect the accumulator/drier by capping any open lines when performing service work on the refrigerant system. Replacement of the accumulator/drier is necessary anytime a major component of the refrigerant system is replaced. Major components include the condenser, the refrigerant compressor, the evaporator, or a refrigerant hose or line. An orifice tube or an O-ring is not considered a major component. However, the orifice tube must be replaced whenever the compressor is replaced.

In addition, the accumulator/drier must be replaced if:

- The accumulator/drier is leaking;
- There has been any significant leak or loss of charge in the refrigerant system;
- There is evidence of moisture in the system, such as internal corrosion of metal refrigerant lines or the refrigerant oil is thick and dark.

NOTE: When replacing the accumulator/drier, this procedure must be followed to make sure that the total oil charge in the system is correct after the new accumulator/drier is installed.

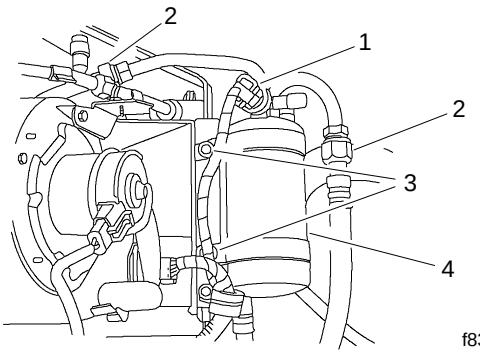
1. Drain the oil from the removed accumulator/drier into a measuring container. It may be necessary to drill one or two 1/2-inch (12.7-mm) holes in the bottom of the accumulator/drier to make sure all the oil has been drained out.
2. Add the same amount of new, clean refrigerant oil, plus the amount of oil that was removed from the system during refrigerant recovery, to the new accumulator/drier. Use only the oil specified for the specific vehicle being serviced.

Replacement

1. Park the vehicle on a level surface and apply the parking brakes. Shut down the engine. Chock the tires.
2. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.01, Subject 110**.

NOTE: All open refrigerant lines and connections must be capped or plugged to prevent dirt and moisture from entering and contaminating the system during repair.

3. Disconnect the electrical connector from the accumulator/drier. See **Fig. 1**.



1. Electrical Connector
2. Fitting
3. Capscrew
4. Accumulator/Drier

Fig. 1, Accumulator/Drier

4. Disconnect the fittings from the accumulator/drier.
5. Remove the capscrews that secure the accumulator/drier and remove the accumulator/drier.
6. Using capscrews, install a new accumulator/drier.
7. Connect the fittings to the accumulator/drier, then torque the fittings 22 to 27 lbf·ft (30 to 37 N·m).
8. Connect the electrical connector to the accumulator/drier.
9. Evacuate, charge, and leak test the air conditioning system. For instructions, see **Section 83.01, Subject 110**.
10. Remove the chocks from the tires.

Condenser Removal and Installation

WARNING

Before doing any of the work below, read the safety precautions in Section 83.01, Subject 100. Failure to read the safety precautions and to be aware of the dangers involved when working with refrigerant could lead to serious personal injury.

Removal

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.01, Subject 110**.
4. Disconnect the refrigerant lines from the condenser. Quickly cap the refrigerant lines, and cap the condenser inlet and outlet ports if the condenser will be reinstalled.

IMPORTANT: Under no circumstances should the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through the refrigerant lines since shop air is wet (humid).

5. Remove the fasteners that attach the condenser to the radiator. Remove the condenser.

Installation

1. Using fasteners, install the condenser on the radiator. Torque the fasteners 23 to 29 lbf·ft (31 to 39 N·m).
2. Uncap the inlet and outlet ports on the condenser and uncap the refrigerant lines.
3. On refrigerant line connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

   On refrigerant line connections that have Mini Stat-O-Seals, replace the seals. **Do not** lubricate Mini Stat-O-Seals prior to installation. Use only a Mini Stat-O-Seal on a Mini Stat-O-Seal assembly.
4. Connect the refrigerant lines to the condenser.

   On refrigerant line connections that threaded fittings, tighten the fittings to the appropriate torque specification in **Table 1**.

   On refrigerant line connections that have a Mini Stat-O-Seal assembly, torque the bolt on the Mini Stat-O-Seal assembly 13 to 15 lbf·ft (18 to 20 N·m).
5. Add refrigerant oil to the compressor to replace that which is lost in the old condenser. For instructions, see **Section 83.02, Subject 150**.
6. Evacuate and charge the air conditioning system with refrigerant. For instructions, see **Section 83.01, Subject 110**.
7. Return the hood to the operating position.
8. Remove the chocks from the tires.

A/C Threaded Fitting Torque Specifications*	
Refrigerant Line Size	**Torque: lbf·ft (N·m)**
#6	20 to 25 (27 to 34)
#8	30 to 35 (41 to 47)
#10 and #12	35 to 40 (47 to 54)

* One-inch fittings on the A/C compressor need to be torqued 21 to 27 lbf·ft (28 to 37 N·m) regardless of refrigerant line size.

Table 1, A/C Threaded Fitting Torque Specifications

WARNING

Before starting any of the procedures below, see "Safety Precautions" in Subject 100. Failure to do so may result in personal injury.

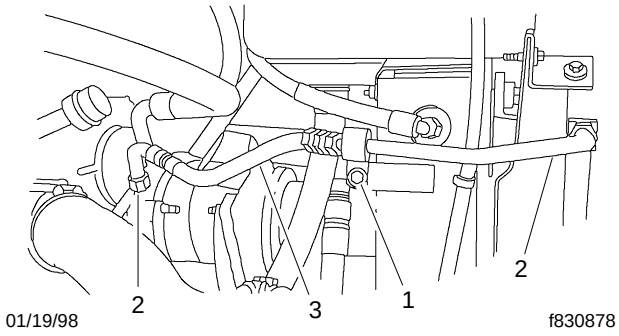
Replacement of the Discharge Line Between the Refrigerant Compressor and Condenser

1. Recover the refrigerant from the air conditioning system. For instructions, see **Subject 110**.

NOTE: The following is a procedure typical of all engine applications.

NOTE: All open refrigerant lines and connections must be capped or plugged to prevent dirt and moisture from entering and contaminating the system during repair.

2. Remove the clamp that secures the discharge line. Disconnect the fittings and remove the discharge line. See **Fig. 1**.



1. Clamp
2. Fitting
3. Discharge Line

Fig. 1, Discharge Line

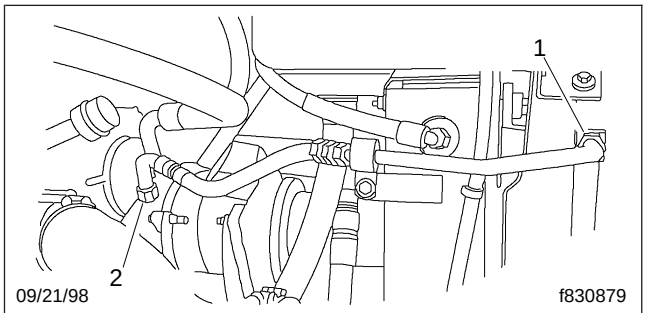
NOTE: When the air conditioning system connections have been opened, the O-rings must be replaced with new O-rings lubricated in clean refrigerant oil.

NOTE: If the discharge line is to be replaced, see "Refrigerant Oil Replacement and Measurement" in **Section 83.02**.

NOTE: The following is a procedure typical of all engine applications.

NOTE: All open refrigerant lines and connections must be capped or plugged to prevent dirt and moisture from entering and contaminating the system during repair.

3. Install the discharge line, then connect the fittings. Torque the fitting at the refrigerant compressor 15 to 20 lbf·ft (20 to 27 N·m). Torque the fitting at the condenser 20 to 25 lbf·ft (27 to 34 N·m). See **Fig. 2**.



1. Compressor Fitting
2. Condenser Fitting

Fig. 2, Discharge Line Fittings

4. Install the clamp on the discharge line.
5. Evacuate, charge, and leak test the air conditioning system. For instructions, see **Subject 110**.

Replacement of the Liquid Line Between the Condenser and Evaporator

1. Discharge the air conditioning system. For instructions, see **Subject 110**.

NOTE: The following is a procedure typical of all engine applications.

NOTE: All open refrigerant lines and connections must be capped or plugged to prevent dirt and moisture from entering and contaminating the system during repair.

2. Disconnect the line at the condenser and remove the clamps. See **Fig. 3**.
3. Disconnect the pressure cut out switch connector.

Line Replacement

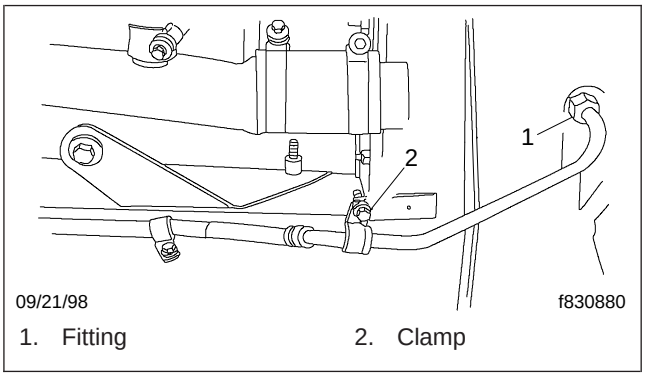


Fig. 3, Condenser Line

4. Disconnect the line at the evaporator and remove the line. See **Fig. 4**.

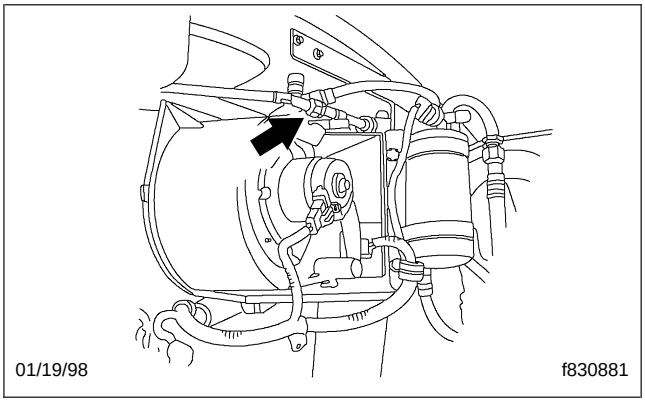

Fig. 4, Evaporator Line

5. Install and connect the line at the evaporator.
6. Connect the pressure cut out switch connector.
7. Install the clamps and connect the line at the condenser.

NOTE: When the air conditioning system connections have been opened, the O-rings must be replaced with new O-rings lubricated in clean refrigerant oil.

NOTE: If the liquid line is to be replaced, see "Refrigerant Oil Replacement and Measurement" in **Section 83.02**.

8. Tighten the condenser fitting 10 to 15 lbf·ft (14 to 20 N·m). Tighten the evaporator fitting in 15 to 20 lbf·ft (20 to 27 N·m).
9. Evacuate, charge, and leak test the air conditioning system. For instructions, see **Subject 110**.

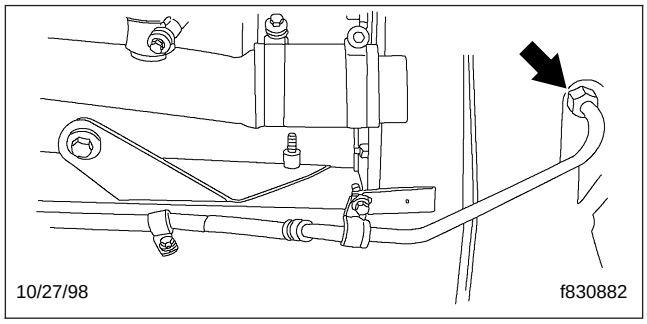

Fig. 5, Condenser Fitting

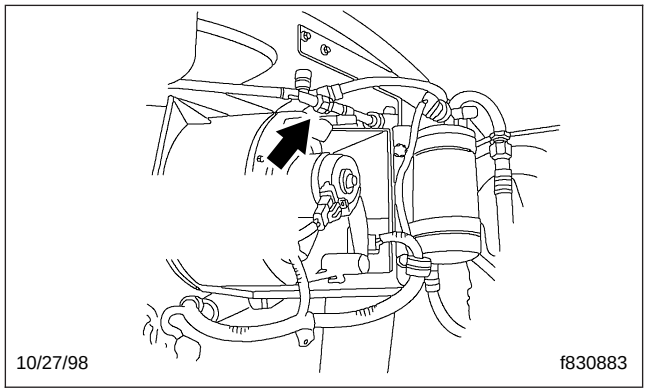

Fig. 6, Evaporator Fitting

Replacement of the Suction Line Between the Evaporator and Compressor

1. Recover the refrigerant from the air conditioning system. For instructions, see **Subject 110**.

NOTE: The following is a procedure typical of all engine applications.

NOTE: All open refrigerant lines and connections must be capped or plugged to prevent dirt and moisture from entering and contaminating the system during repair.

2. Disconnect the fittings on the suction line and remove the line. See **Fig. 7**.

NOTE: When the air conditioning system connections have been opened, the O-rings must be replaced with new O-rings lubricated in clean refrigerant oil.

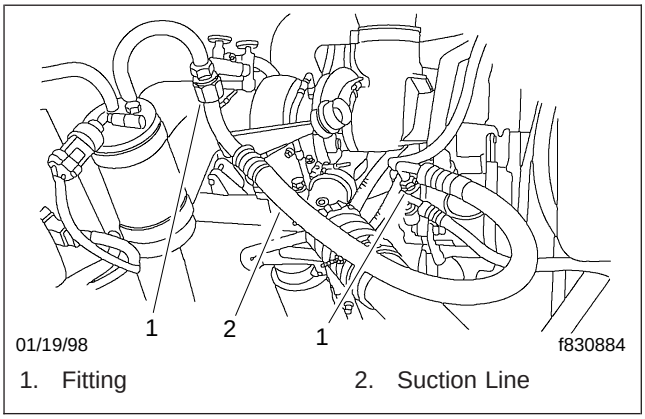

Fig. 7, Suction Line

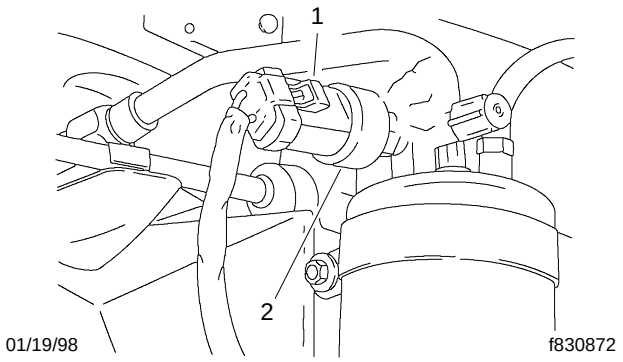
NOTE: If the suction line is to be replaced, see "Refrigerant Oil Replacement and Measurement" in **Section 83.02**.

3. Connect the fittings to the suction line and install the line. Torque the fitting at the accumulator 22 to 27 lbf·ft (30 to 37 N·m). Torque the fitting at the compressor 21 to 27 lbf·ft (28 to 37 N·m).
4. Evacuate, charge, and leak test the air conditioning system. For instructions, see **Subject 110**.

Replacement

1. Disconnect the electrical connector from the A/C cycling switch. See **Fig. 1**.
2. Remove the A/C cycling switch.



1. Electrical Connector 2. A/C Cycling Switch

Fig. 1, A/C Cycling Switch

NOTE: Make sure the O-ring is not damaged and is in place before installing the switch.

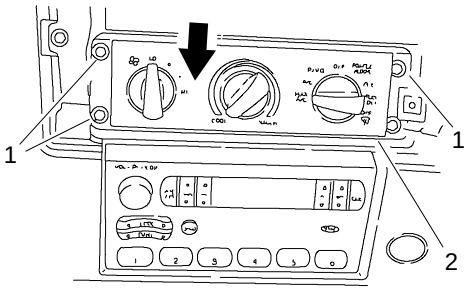
3. Install a new A/C cycling switch. Tighten the switch by hand only.
4. Connect the electrical connector to the A/C cycling switch.

Replacement

WARNING

To reduce the risk of personal injury, the brake system must be bled of all air pressure before removal of any tubes or lines carrying air pressure to any component.

1. Remove the instrument panel center trim panel. For instructions, see **Group 54**.
2. Remove the screws that attach the climate control panel to the dashboard, then pull the control panel forward. See **Fig. 1**.



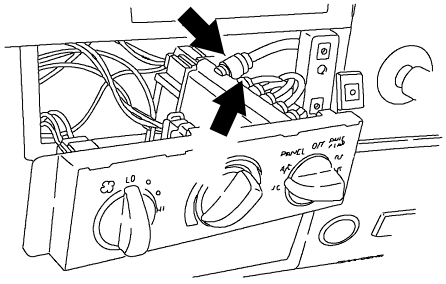
02/11/98 f831137

1. Screw
2. Climate Control Panel

Fig. 1, Climate Control Panel

NOTE: The pneumatic lines are quick-release lines.

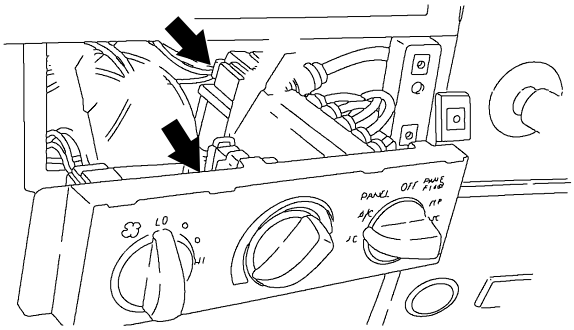
3. Disconnect the pneumatic lines. For instructions, see **Subject 260**. See **Fig. 2**.



02/11/98 f831138

Fig. 2, Pneumatic Lines

4. Disconnect the electrical connectors and remove the climate control panel. See **Fig. 3**.



02/11/98 f831139

Fig. 3, Electrical Connectors

5. Using screws, install a new climate control panel.
6. Connect the electrical connectors to the climate control panel.
7. Connect the pneumatic lines to the climate control panel. For instructions, see **Subject 260**.
8. Using screws, install the control panel to the dashboard.
9. Install the instrument panel center trim panel. For instructions, see **Group 54**.

Fan Switch Replacement

1. Remove the fan switch knob by pulling it off the fan switch.
2. Remove the climate control panel. For instructions, see **Subject 210**.
3. Remove the screw, then rotate and remove the fan switch. See **Fig. 1**.

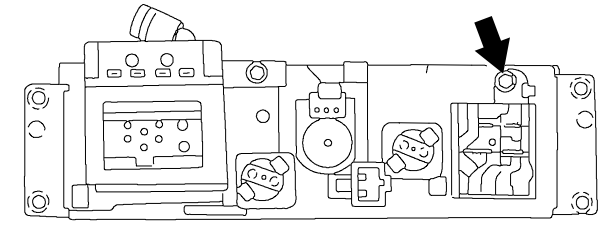


Fig. 1, Fan Switch Screw

4. Using a screw, install a new fan switch. See **Fig. 1**.
5. Install the climate control panel. For instructions, see **Subject 210**.
6. Install the fan switch knob by pushing it on the fan switch.

Temperature Control Switch Replacement

1. Remove the temperature control switch knob by pulling it off the temperature control switch.
2. Remove the climate control panel. For instructions, see **Subject 210**.
3. Remove the screw, then rotate and remove the temperature control switch. See **Fig. 2**.
4. Using a screw, install a new temperature control switch. See **Fig. 2**.
5. Install the climate control panel. For instructions, see **Subject 210**.
6. Install the temperature control switch knob by pushing it on the temperature control switch.

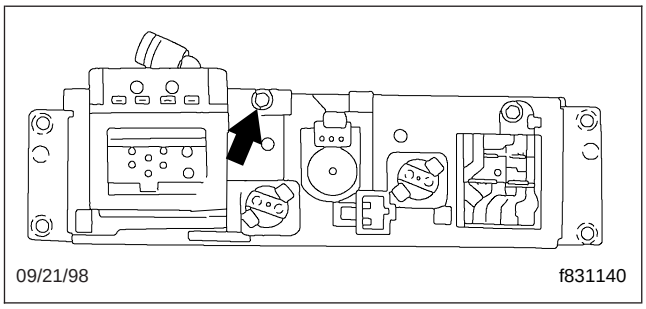

Fig. 2, Temperature Control Switch Screw

Air Selection Switch Replacement

1. Remove the air selection switch knob by pulling it off the air selection switch.
2. Remove the climate control panel. For instructions, see **Subject 210**.
3. Remove the screw, then rotate and remove the air selection switch.
4. Using a screw, install a new air selection switch.
5. Install the climate control panel. For instructions, see **Subject 210**.
6. Install the air selection switch knob by pushing it on the air selection switch.

Temperature Actuator Replacement

NOTE: The first two steps of the following procedure apply only if the vehicle is equipped with a passenger-side lower instrument panel trim cover.

1. Remove the quick-release screws, then remove the IP fuse junction panel trim cover. See **Fig. 1**.

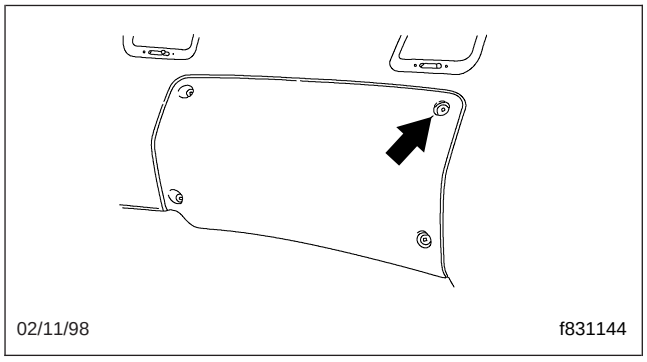

Fig. 1, Quick-Release Screw

2. Remove the instrument panel lower trim cover. See **Fig. 2**.

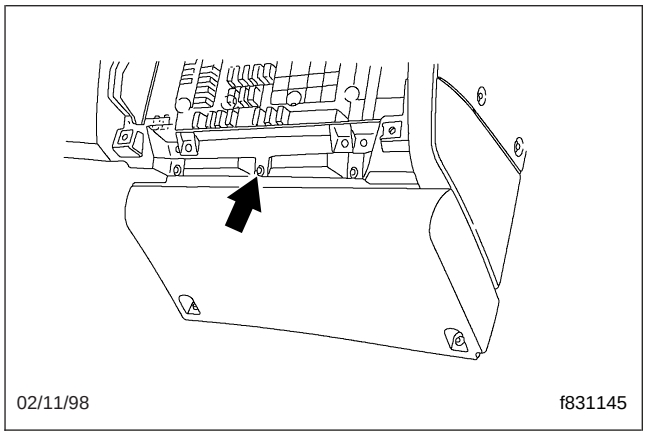

Fig. 2, Instrument Panel Lower Trim Cover

3. Remove the floor duct. See **Fig. 3**.
4. Disconnect the electrical connector from the blend door actuator. See **Fig. 4**.
5. Remove the screws that secure the blend door actuator, then remove the actuator.
6. Using screws, install a new blend door actuator.

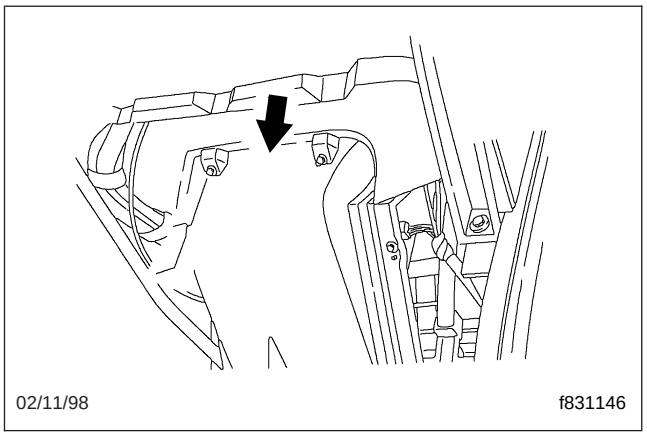

Fig. 3, Floor Duct

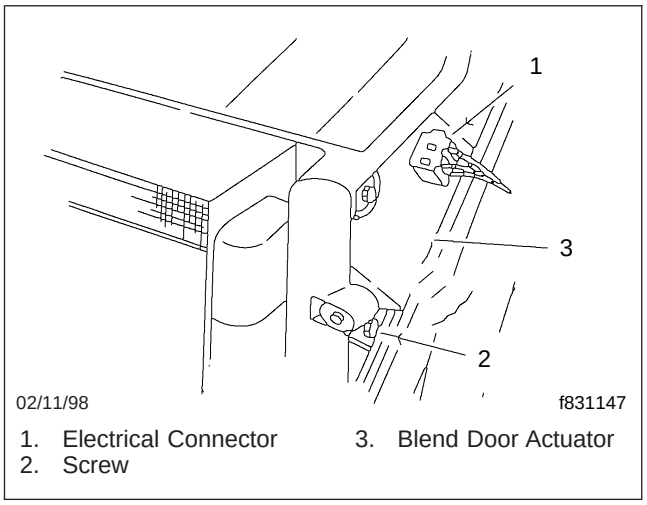

1. Electrical Connector
2. Screw
3. Blend Door Actuator

Fig. 4, Blend Door Actuator

7. Connect the electrical connector to the actuator.
8. Install the floor duct.
9. Install the instrument panel lower trim cover.
10. Using quick-release screws, install the IP fuse junction panel trim cover. Torque the screws 18 to 27 lbf·in (170 to 280 N·cm).

Pneumatic Actuator Replacement, Panel/Defrost Doors

1. Remove the panel/defrost pneumatic actuator trim cover. See **Fig. 5**.

Actuator Replacement

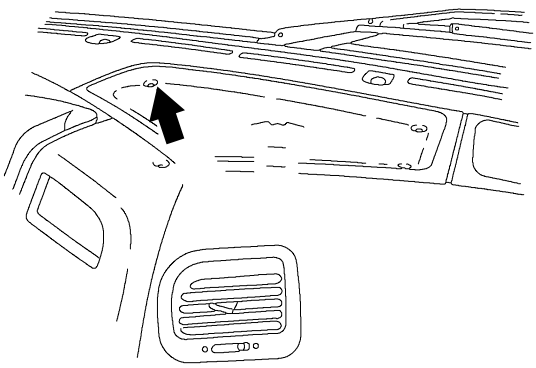

Fig. 5, Panel/Defrost Pneumatic Actuator Trim Cover

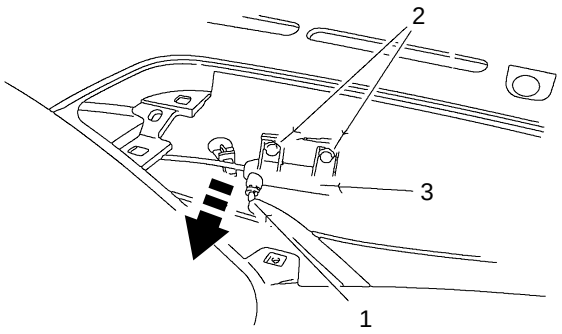
WARNING

All air pressure in the vehicle air brake system must be relieved before disconnecting any pneumatic tubes. Hoses will whip dangerously if disconnected under pressure.

2. Disconnect the pneumatic tube from the panel/defrost door actuator. See **Fig. 6**.



1. Pneumatic Tube
2. Screw
3. Actuator

Fig. 6, Panel/Defrost Actuator

3. Remove the screws that secure the actuator, then remove the actuator.
4. Using screws, install a new actuator.
5. Connect the pneumatic tube to the actuator.
6. Install the panel/defrost pneumatic actuator trim cover.

Pneumatic Actuator Replacement, Panel/Floor Doors

NOTE: Items 3 and 12 in **Fig. 7** are bonded together when manufactured and are shown separated for clarification only.

1. If necessary, remove the engine cover.
2. Access the panel/floor door actuator that is located behind the instrument panel between the fuse junction panel and the radio. Note the orientation of the actuator so that it is installed correctly later.

WARNING

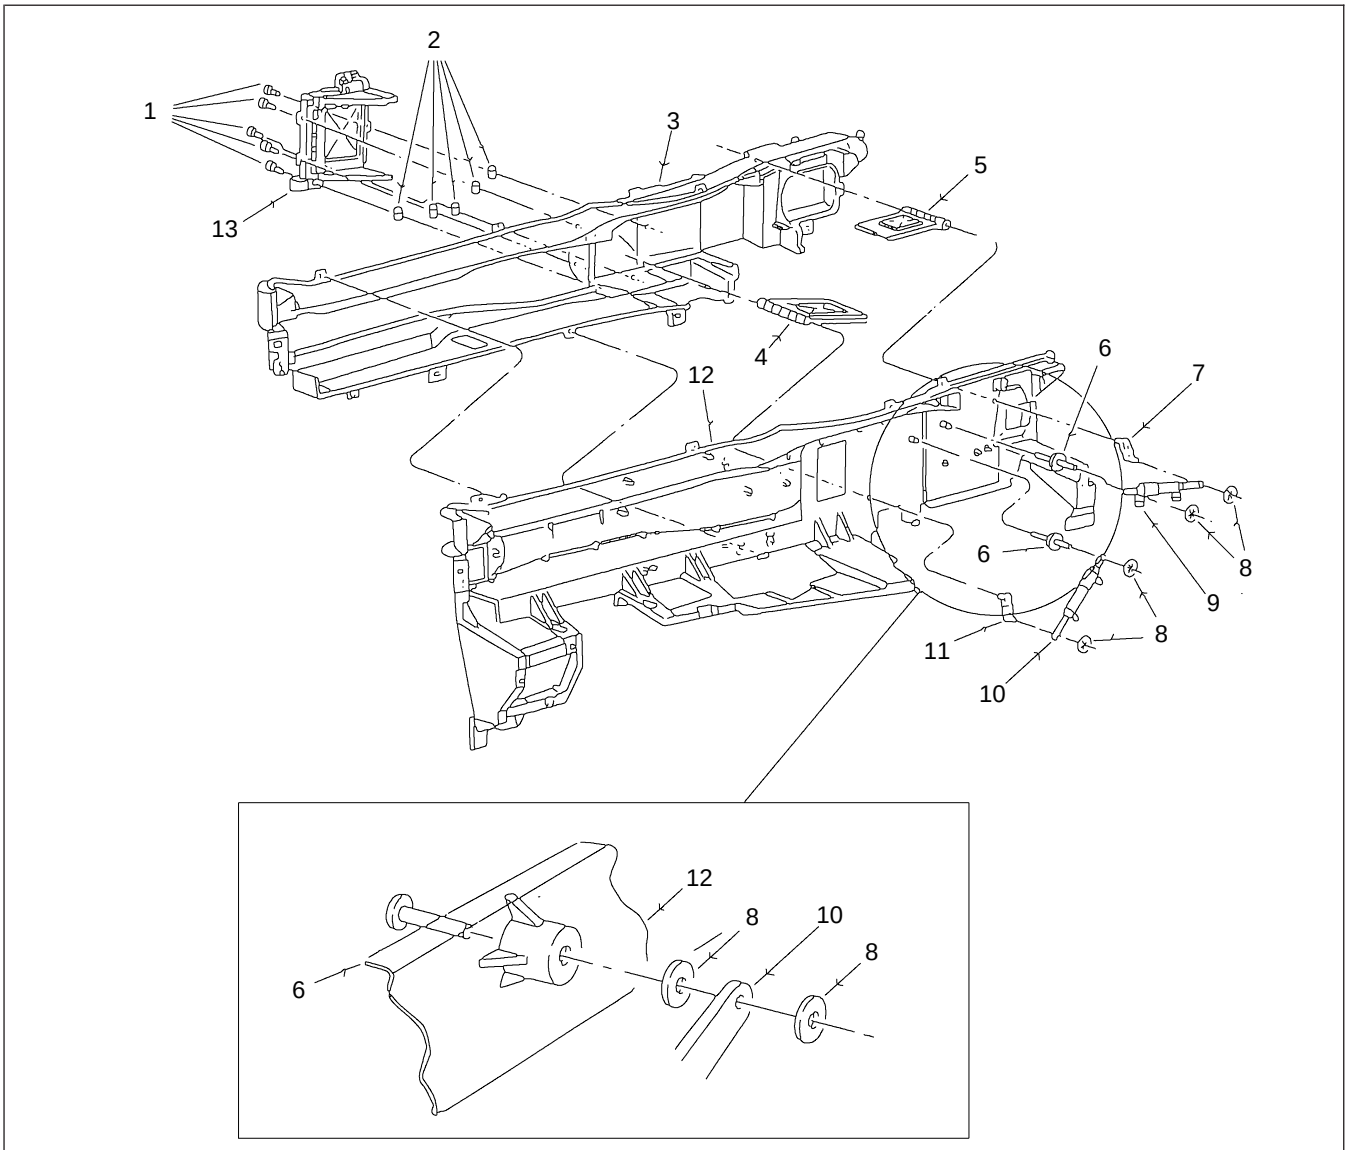
All air pressure in the vehicle air brake system must be relieved before disconnecting any pneumatic tubes. Hoses will whip dangerously if disconnected under pressure.

3. Disconnect the two pneumatic tubes from the actuator.
4. Remove the spring nuts, then remove the actuator.
5. Using new spring nuts, install a new actuator. Make sure the orientation of the actuator is correct.
6. Connect the two pneumatic tubes to the actuator.
7. If necessary, install the engine cover.

Pneumatic Actuator Replacement, Demister/Panel Doors

NOTE: The first two steps of the following procedure apply only if the vehicle is equipped with a passenger-side lower instrument panel trim cover.

1. Remove the quick-release screws, then remove the IP fuse junction panel trim cover. See **Fig. 1**.
2. Remove the IP fuse junction panel dust cover. See **Fig. 8**.



02/11/98 f831135

1. Screw
2. Pushnut
3. Plenum
4. Heater and A/C Inlet Duct Door (left panel/floor)
5. Heater and A/C Inlet Duct Door (right panel/demister)
6. Pivot Stud
7. Actuator Crank Arm (right panel/demister)
8. Spring Nut
9. Pneumatic Door Actuator (right panel/demister)
10. Pneumatic Door Actuator (left panel/floor)
11. Actuator Crank Arm (left panel/floor)
12. Plenum
13. Defrost Door Assembly

Fig. 7, Plenum, Exploded View

Actuator Replacement

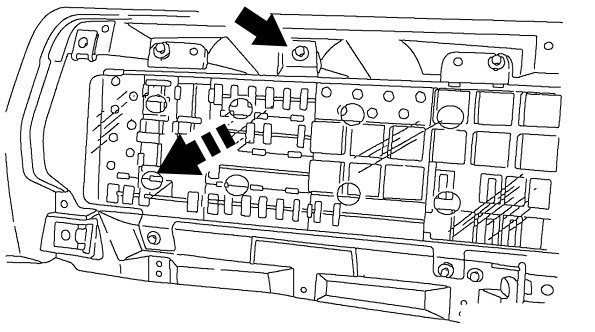


Fig. 8, IP Fuse Junction Panel Dust Cover

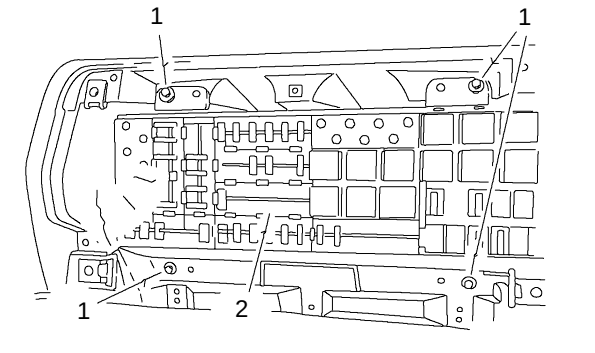
3. Remove the screws that secure the IP fuse junction panel and move the panel out of the way. See **Fig. 9**.



1. Screw 2. Junction Panel

Fig. 9, IP Fuse Junction Panel

WARNING

All air pressure in the vehicle air brake system must be relieved before disconnecting any pneumatic tubes. Hoses will whip dangerously if disconnected under pressure.

NOTE: Note the orientation of the demister/panel door actuator so that it is installed correctly later.

4. Disconnect the two pneumatic tubes from the demister/panel door actuator.
5. Remove the two spring nuts that secure the actuator, then remove the actuator.
6. Using spring nuts, install a new actuator.
7. Connect the two pneumatic tubes to the actuator.
8. Using screws, install the IP fuse junction panel.
9. Install the IP fuse junction panel dust cover.
10. Using quick-release screws, install the IP fuse junction panel trim cover.

Pneumatic Actuator Replacement, Outside-Recirculation Door

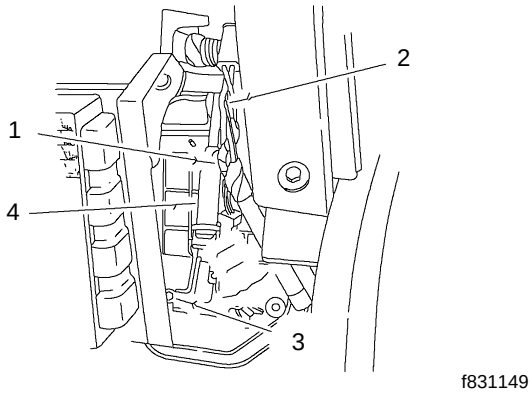
NOTE: The first two steps of the following procedure apply only if the vehicle is equipped with a passenger-side lower instrument panel trim cover.

1. Remove the quick-release screws, then remove the IP fuse junction panel trim cover. See **Fig. 1**.
2. Remove the instrument panel lower trim cover. See **Fig. 2**.
3. Remove the floor duct. See **Fig. 3**.

WARNING

All air pressure in the vehicle air brake system must be relieved before disconnecting any pneumatic tubes. Hoses will whip dangerously if disconnected under pressure.

4. Disconnect the pneumatic tube from the outside-recirculation door actuator. See **Fig. 10**.
5. Remove the pivot pin and the clevis pin, then remove the actuator.
6. Install a new actuator.
7. Install the clevis pin and the pivot pin.
8. Connect the pneumatic tube to the actuator.
9. Install the floor duct.
10. Install the instrument panel lower trim cover.
11. Using quick-release screws, install the IP fuse junction panel trim cover.



02/11/98 f831149

1. Pneumatic Tube
2. Pivot Pin
3. Clevis Pin

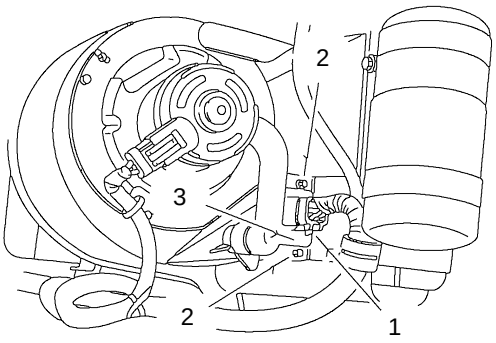
Fig. 10, Actuator

Blower Motor Resistor Replacement

Replacement

Left-Hand-Drive Vehicles

1. Disconnect the batteries.
2. Open the hood.
3. Disconnect the electrical connector from the blower motor resistor. See **Fig. 1**.
4. Remove the screws that secure the blower motor resistor, then remove the resistor.



02/11/98 f831148

1. Electrical Connector
2. Screws
3. Resistor

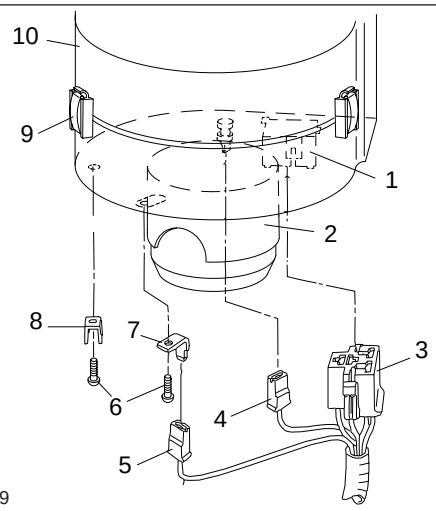
Fig. 1, Blower Motor Resistor

NOTE: The weatherproof gasket on the blower motor resistor flange must be inspected before installing the unit in the vehicle. If the gasket is damaged, replace the resistor or seal the resistor mounting flange using silicone rubber.

5. Using screws, install a new resistor. Torque the screws 18 to 27 lbf·in (170 to 280 N·cm).
6. Connect the electrical connector to the resistor.
7. Connect the batteries.
8. Close the hood.

Right-Hand-Drive Vehicles

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Disconnect the batteries.
3. Remove the glove compartment door trim panel.
4. Remove the lower A/C housing cover assembly.
5. Disconnect the electrical connectors from the blower motor. See **Fig. 2**.
6. Remove the wiring harness support bracket mounting screws to access the blower motor mounting screws.
7. Remove the blower motor air tube.
8. Remove the blower motor.
9. Disconnect the electrical connector from the blower motor resistor.
10. Remove the screws that secure the blower motor resistor, then remove the resistor. See **Fig. 2**.



03/25/99 f542809

1. Blower Motor Resistor
2. Blower Motor
3. Blower Motor Resistor Connector
4. Blower Motor Connector (+)
5. Blower Motor Connector (-)
6. Blower Motor Mounting Screw
7. Blower Motor Connector
8. Blower Motor Assembly Screw Retainer
9. HVAC Unit Retaining Clip
10. HVAC Unit

Fig. 2, Blower Motor Resistor and Components

11. Using screws, install a new resistor. Torque the screws 18 to 27 lbf·in (170 to 280 N·cm).
12. Connect the electrical connector to the resistor.
13. Install the blower motor.
14. Install the blower motor air tube.

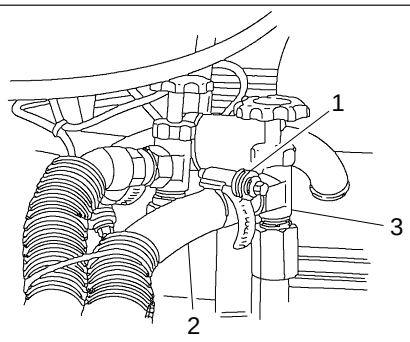
Blower Motor Resistor Replacement

15. Install the wiring harness support bracket mounting screws.
16. Connect the electrical connectors to the blower motor.
17. Install the lower A/C housing cover assembly.
18. Install the glove compartment door trim panel.
19. Connect the batteries.
20. Remove the chocks from the tires.

Replacement

NOTE: The following procedure is typical for all L-Line and A-Line heater core shutoff valves.

1. Allow the engine to cool, then drain the cooling system. For instructions, see **Group 20**.
2. Loosen the hose clamp, then remove the heater hose. See **Fig. 1**.



1. Hose Clamp
2. Heater Hose
3. Shutoff Valve

Fig. 1, Shutoff Valve

3. Remove the shutoff valve.

NOTE: Before installing the heater core shutoff valve, apply a coating of Pipe Sealant with Teflon® D8AZ–19554–A or equivalent meeting specifications WSK–M2G350–AZ and ESR–M18P7–A to the valve threads.

4. Install a new shutoff valve.
5. Install the heater hose on the shutoff valve and secure the hose with a hose clamp.
6. Fill the cooling system. For instructions, see **Group 20**.

Pneumatic Tube Removal and Installation

Removal

NOTE: Each pneumatic tube is color-coded and corresponds to a color-coded port on the air selection manifold and to a color-coded port on each of the pneumatic actuators. This color coding ensures correct operation in each function selection setting when properly matched between the tube and the various ports.

NOTE: When removing a pneumatic tube, pay particular attention to the tube routing for installation purposes.

1. Remove the climate control panel. For instructions, refer to **Subject 210**.
2. Locate the tube to be removed on the air selection manifold, and push it inward toward the manifold port.
3. Maintain pressure on the tube and push in the color-coded retaining collar toward the manifold port.

NOTE: Each port has a metal insert or sleeve that engages the tube inside diameter. If this insert pulls out with the tube during removal, make sure it is re-engaged into the replacement tube upon installation.

4. Pull the tube away from the manifold maintaining pressure on the retaining collar.
5. Locate the pneumatic actuator that corresponds with the port on the manifold and, using the same method as previously outlined in this procedure, remove the tube.

NOTE: Pay close attention to the tube routing for installation purposes.

6. Remove the tube from the vehicle.

Installation

1. Route the tube in the same manner as the tube removed.
2. Insert the tube into the actuator or manifold and push until fully seated.
3. Repeat the procedure for the opposite end of the tube.
4. Install the control. For instructions, refer to **Subject 210**.

Right-Hand-Drive HVAC Unit Removal and Installation

⚠ WARNING

Before starting any of the procedures below, see "Safety Precautions" in Subject 100. Failure to do so may result in personal injury.

Removal

1. Park the vehicle on a level surface and set the parking brake. Shut down the engine. Chock the tires.
2. Remove the instrument panel. For instructions, see **Section 60.01**.
3. Disconnect the heater hoses from the heater core. For instructions, see **Group 20**.
4. Recover the air conditioning refrigerant, then disconnect the evaporator. For instructions, see **Subject 110**.
5. Remove the air filter housing. For instructions, see **Group 09**.
6. Remove the heater core grommets and the air conditioning evaporator condensation drain tube.
7. Remove the HVAC unit from the cab.

Installation

1. Using screws, install the HVAC unit in the cab.
2. Install the heater core grommets and the air conditioning evaporator condensation drain tube.
3. Install the instrument panel. For instructions, see **Section 60.01**.
4. Connect the heater hoses to the heater core. For instructions, see **Group 20**.
5. Connect the evaporator core lines and charge the air conditioning refrigerant. For instructions, see **Subject 110**.
6. Remove the chocks from the tires.

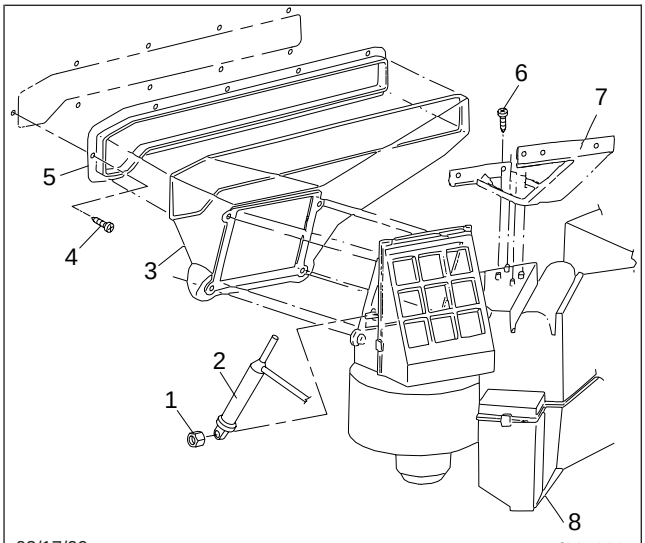
Right-Hand-Drive HVAC Unit Disassembly and Assembly

⚠ WARNING

Before starting any of the procedures below, see "Safety Precautions" in Subject 100. Failure to do so may result in personal injury.

Disassembly

1. Remove the HVAC unit. For instructions, see **Subject 280**.
2. Remove the ducting from the HVAC unit. See **Fig. 1**.



1. Nut
2. Vacuum Actuator
3. Air Intake Duct
4. Mounting Screw
5. Duct Retainer
6. Retaining Screw
7. PDM Mounting Bracket
8. HVAC Unit

Fig. 1, HVAC Unit and Ducting

3. Remove the vacuum actuators from the HVAC unit. See **Fig. 1**.
4. Remove the HVAC air blend motor mounting screws, then remove the motor. See **Fig. 2**.
5. Remove the clips and fasteners, then separate the HVAC unit into two halves.

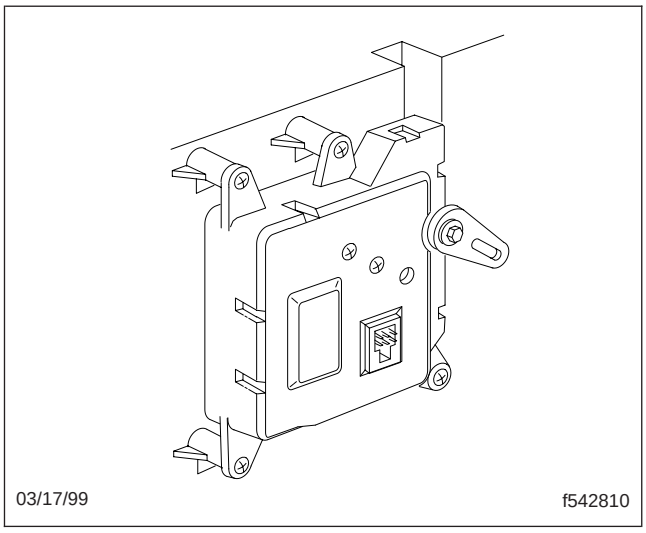


Fig. 2, Air Blend Motor

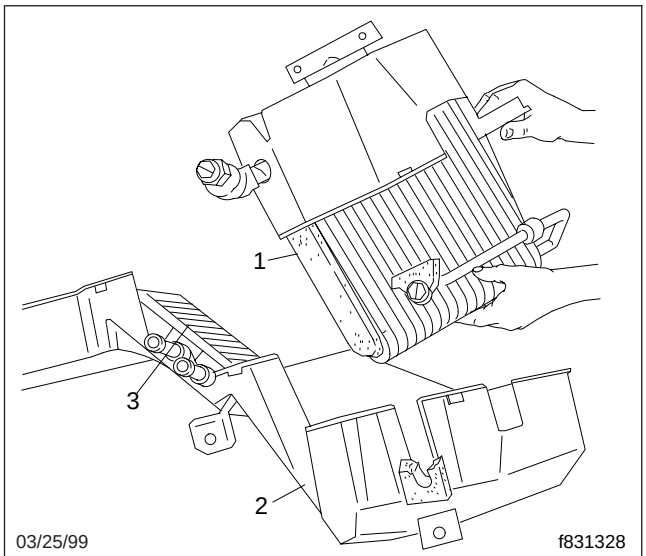
6. Remove the heater core and the evaporator. See **Fig. 3**.



1. Evaporator
2. HVAC Unit
3. Heater Core

Fig. 3, HVAC Unit and Ducting

Assembly

1. Install the heater core and the evaporator. See **Fig. 3**.

Right-Hand-Drive HVAC Unit Disassembly and Assembly

2. Using mounting screws, install the HVAC air blend motor in the HVAC unit. See **Fig. 2**.
3. Join the two halves of the HVAC unit and install the clips and fasteners.
4. Install the vacuum actuators on the HVAC unit. See **Fig. 1**.
5. Install the ducting on the HVAC unit.
6. Install the HVAC unit. For instructions, see **Subject 280**.

Troubleshooting

For a schematic of the air lines, see **Fig. 1**.

NOTE: All actuators fully extend with 0 air pressure and retract with 80 to 130 psi (552 to 896 kPa) air pressure applied.

Panel/floor and demister/panel actuators are dual position, providing half stroke and full stroke retraction of actuator rods.

Inspection and Verification

1. Verify the customer complaint by operating the climate control system.
2. Visually inspect for obvious signs of mechanical and electrical damage. See **Table 1**.
3. If the fault is not visually evident, determine the symptom and proceed to the troubleshooting tables.

Visual Inspection Chart	
Mechanical	**Electrical**
Drive belt	Fuse
A/C clutch	Blower motor
Pneumatic lines	Refrigerant compressor
Discharged A/C system	Cooling fan
Refrigerant lines	Circuit
Pneumatic actuator	Electrical connectors

Table 1, Visual Inspection Chart

Component Tests

Heater Core, In-Vehicle Pressure Test

For an illustration of the heater core in-vehicle pressure test, see **Fig. 2**.

1. Drain the engine coolant system. For instructions, see **Group 20**.
2. Disconnect the inlet and outlet heater water hoses.
3. Install a short piece of heater water hose, approximately 4 inches (100 mm) long, on each heater core tube.
4. Fill the heater core and heater core water hoses with water.
5. Install a plug and adaptor, from the Radiator/Heater Core Pressure Tester, in the ends of the heater hoses. Secure the heater hoses, plug, and adaptor with hose clamps.
6. Attach the Radiator/Heater Core Pressure Tester to the adaptor. Close the bleed valve at the base of the gauge and pump 30 psi (206 kPa) of air pressure into the heater core.
7. Observe the pressure gauge for a minimum of three minutes. The pressure should not drop.
8. If the pressure does not drop, no leaks are indicated.

NOTE: Severe distortion of the heater core tubes can cause leakage at the coupling connection. Repair or replace as necessary.

9. If the pressure drops, check the coupling and hose connections to the heater core tubes for leaks. If the couplings and hose connections do not leak, perform the following bench test.

Heater Core, On-Bench Pressure Test

For an illustration of the heater core on-bench pressure test, see **Fig. 3**.

1. Drain the engine cooling system. For instructions, see **Group 20**.
2. Remove the heater core.
3. Connect the four-inch (100-mm) test heater water hoses to the heater core.
4. Install the plug and adaptor.
5. Connect the Radiator/Heater Core Pressure Tester to the adaptor.
6. Apply 30 psi (206 kPa) of air pressure to the heater core.
7. Submerge the heater core in water.
8. If a leak is observed, repair or replace the heater core.

A/C Evaporator, A/C Vacuum Leak Test

IMPORTANT: See **Safety Precautions 100** before performing this procedure.

⚠ CAUTION

The A/C refrigerant of all vehicles must be identified and analyzed prior to refrigerant recovery. Failure to do so can contaminate the shop bulk refrigerant and other vehicles.

1. Verify that the manifold gauge set is capable of holding a vacuum.

   1.1 Connect the red and blue hoses together using a 1/4-inch flare coupling.

   1.2 Connect the gauge set yellow hose to a known good vacuum pump.

   1.3 Turn the vacuum pump ON and open both gauge set valves.

   1.4 Operate the vacuum pump for 1 minute and close both gauge set valves. The low side gauge should indicate approximately 30 in Hg (762 mm Hg) of vacuum.

   1.5 Allow the gauge set, with vacuum applied, to set for at least 30 minutes.

   1.6 If the gauge reading drops during that time, the gauge set hose connections, gauges or valves are leaking and must be repaired before proceeding with the leak test.

2. Discharge the A/C system. For instructions, see **Subject 110**.

NOTE: Do not leak test an evaporator with the suction accumulator/drier attached to the evaporator tubes. Refrigerant outgassing from the oil and desiccant in the suction accumulator/drier will indicate a false leak condition.

3. Disconnect both the liquid line and suction accumulator line from the evaporator. Plug the liquid and the suction accumulator/drier lines.

NOTE: Polish the tube O-fitting using a twisting motion so that any scratches made will not cross the O-ring sealing surface.

4. Clean the evaporator lines.
   - 4.1 Remove any surface residue from the fitting by polishing with a 400-grit emery cloth.
   - 4.2 Perform additional polishing with a 600-grit emery cloth.
   - 4.3 Remove all polishing residue with a lint-free rag.

NOTE: The automatic shutoff valves on some gauge set hoses do not open when connected to the test fittings. Use hoses without the shutoff valves if they are available. If hoses with shutoff valves are used, make sure that the valves open when they are attached to the test fittings before installing them and proceeding with the leak test. The test will be invalid if the automatic shutoff valves do not open, in which case only the hose will be tested.

5. Connect the appropriate test fittings from the test adaptor set to the evaporator connections. Then, connect the gauge set red and blue hoses to the test fittings. Connect the yellow gauge set hose to a known good quality vacuum pump.

NOTE: Use only a good quality vacuum pump. A vacuum pump requires maintenance for optimum performance. The condition of the vacuum pump oil is critical to pump performance and durability. Dirty or moisture-laden oil reduces the vacuum pump's ability to draw high vacuum levels which are required to extract refrigerant from the oil in the evaporator. As a general rule, vacuum pump manufacturers recommend replacing the oil in the vacuum pump after every 10 hours of operation. Some manufacturers may recommend even more frequent oil change intervals.

6. Open both gauge valves and start the vacuum pump. Turn the heater blower motor switch to LO and allow the vacuum pump to operate for a minimum of 30 minutes after the gauge set low-pressure gauge indicates 30 in Hg (762 mm Hg). The 30-minute evacuation is necessary to remove any refrigerant from oil left in the evaporator. If the refrigerant is not completely removed from the oil, gassing will occur and degrade the vacuum and appear as a refrigerant leak. After evacuation for 30 minutes, close the gauge set valves and stop the vacuum pump. Observe the low pressure gauge; it should remain at the 30 in Hg (762 mm Hg) mark.
7. If the low pressure gauge reading will not drop to 30 in Hg (762 mm Hg) when the gauge and manifold set valves are open and the vacuum pump is operating, then close the valves and observe the low pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Check the test fitting connections and gauge set connections before replacing the evaporator.
8. If the low pressure gauge reading rises 10 or more in Hg (254 mm Hg) from the 30 in Hg (762 mm Hg) mark in 10 minutes, a leak is indicated. If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge. If a small amount of vacuum is lost, operate the vacuum pump with the gauge valves open for an additional 30 minutes with the heater blower motor switch on LO to remove any remaining refrigerant from the evaporator. Then, check for the loss of vacuum as outlined above. If a very small leak is suspected, allow the system to sit overnight with a vacuum applied and check for a vacuum loss the next day. Always remember that a leaking fitting, gauge set, or hose connection will appear as a leaking evaporator.

A/C Condenser, A/C Vacuum Leak Test

IMPORTANT: Refer to **Safety Precautions 100** before performing this procedure.

⚠ CAUTION

The A/C refrigerant of all vehicles must be identified and analyzed prior to refrigerant recovery. Failure to do so can contaminate the shop bulk refrigerant and other vehicles.

1. Verify that the manifold gauge set is capable of holding a vacuum.
   - 1.1 Connect the red and blue hoses together using a 1/4-inch flare coupling.
   - 1.2 Connect the gauge set yellow hose to a known good vacuum pump.
   - 1.3 Turn the vacuum pump on and open both gauge set valves.
   - 1.4 Operate the vacuum pump for 1 minute and close both gauge set valves. The low side gauge should indicate approximately 30 inches of vacuum.
   - 1.5 Allow the gauge set, with vacuum applied, to set for at least 30 minutes.
   - 1.6 If the gauge reading drops during that time, the gauge set hose connections, gauges, or valves are leaking and must be repaired before proceeding with the leak test.
2. Discharge the A/C system. For instructions, see **Subject 110**.
3. Disconnect the high-pressure line and discharge line from condenser. Plug the lines leading to the refrigerant compressor and the evaporator.

NOTE: Polish the tube O-fitting using a twisting motion so that any scratches made will not cross the O-ring sealing surface.

4. Clean the condenser lines.
   - 4.1 Remove any surface residue from the fitting by polishing with a 400-grit emery cloth.
   - 4.2 Perform additional polishing with a 600-grit emery cloth.
   - 4.3 Remove all polishing residue with a lint-free rag.

NOTE: The automatic shutoff valves on some gauge set hoses do not open when connected to the test fittings. Use hoses without the shutoff valves if they are available. If hoses with shutoff valves are used, make sure that the valves open when they are attached to the test fittings before installing them and proceeding with the leak test. The test will be invalid if the automatic

shutoff valves do not open in which case only the hose will be tested.

5. Connect the appropriate test fittings from the test adaptor set to the condenser tube connections. Then connect the gauge set red and blue hoses to the test fittings. Connect the yellow gauge set hose to a known good quality vacuum pump.

NOTE: Use only a good quality vacuum pump. A vacuum pump requires maintenance for optimum performance. The condition of the vacuum pump oil is critical to pump performance and durability. Dirty or moisture-laden oil reduces the vacuum pump's ability to draw high vacuum levels which are required to extract refrigerant from the oil in the condenser. As a general rule, vacuum pump manufacturers recommend replacing the oil in the vacuum pump after every 10 hours of operation. Some manufacturers may recommend even more frequent oil change intervals.

6. Open both gauge valves and start the vacuum pump. Turn the heater blower motor on to LO and allow the vacuum pump to operate for a minimum of 45 minutes after the gauge set low-pressure gauge indicates 30 in Hg (762 mm Hg). The 45-minute evacuation is necessary to remove any refrigerant from oil left in the condenser. If the refrigerant is not completely removed from the oil, gassing will occur and degrade the vacuum and appear as a refrigerant leak. After evacuation for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low pressure gauge; it should remain at the 30 in Hg (762 mm Hg) mark.
7. If the low pressure gauge reading will not drop to 30 in Hg (762 mm Hg) when the gauge and manifold set valves are open and the vacuum pump is operating, then close the valves and observe the low pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Check the test fitting connections and gauge set connections before replacing the condenser.
8. If the low pressure gauge reading rises 10 or more in Hg (254 mm Hg) from the 30 in Hg (762 mm Hg) mark in 10 minutes, a leak is indicated. If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge. If a small amount of vacuum is lost, operate the vacuum pump with the gauge valves open for an additional 45 minutes with the heater blower motor switch on LO to remove any remaining refrigerant from the condenser. Then, recheck for the loss of vacuum as outlined above. If a very small leak is suspected, allow the system to sit overnight with a vacuum applied and check for a vacuum loss the next day. Always remember that a leaking fitting, gauge set, or hose connection will appear as a leaking condenser.

Blower Motor

1. Connect a jumper wire (10 gauge or larger) directly from the positive battery terminal to Terminal No. 1 of the blower motor. See **Fig. 4**.

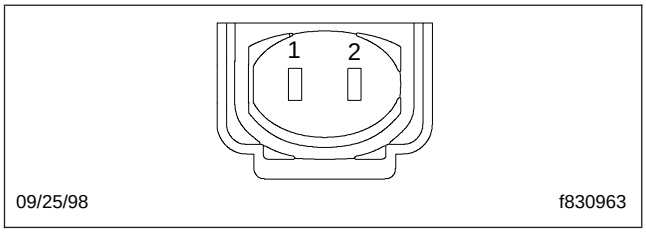

Fig. 4, Blower Motor Switch Connector Terminal Identification

2. Connect a second jumper wire (10 gauge or larger) from Terminal No. 2 to a known good ground. See **Fig. 4**.
3. If the blower motor does not run, then the blower motor needs to be replaced.

Main System Heater Blower Motor Switch Resistor

For indentification of the teminals on the main system blower motor switch resistor, see **Fig. 5**. For acceptable values for the main system heater blower motor switch resistor test, see **Table 2**.

Table 6, Main or Auxiliary SilverStar Blower Motor Switch Test

Thermal Protection Switch

1. Disconnect the refrigerant compressor connector C125 from the main wiring harness.
2. Measure the resistance between the refrigerant compressor connector C125 pin 4 (BR) and pin 2 (BK/W). If the resistance is less than 5 ohms, the thermal protection switch is good. If the resistance is greater than 5 ohms, replace the thermal protection switch.
3. Disconnect the A/C clutch connector. See **Fig. 9**.
4. Install a jumper wire between the A/C clutch connector pin 1 and pin 2. See **Fig. 10**.

Main System Temperature Potentiometer Switch

For identification of the pins of the main system temperature potentiometer switch, see **Fig. 11**.

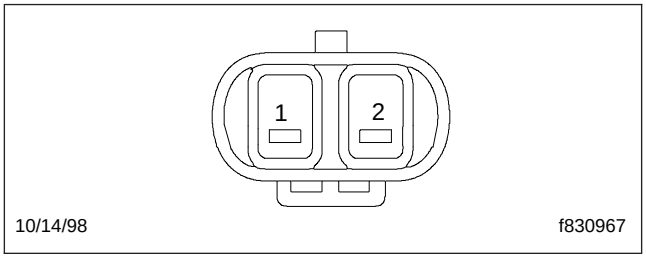

Fig. 9, A/C Clutch Connector

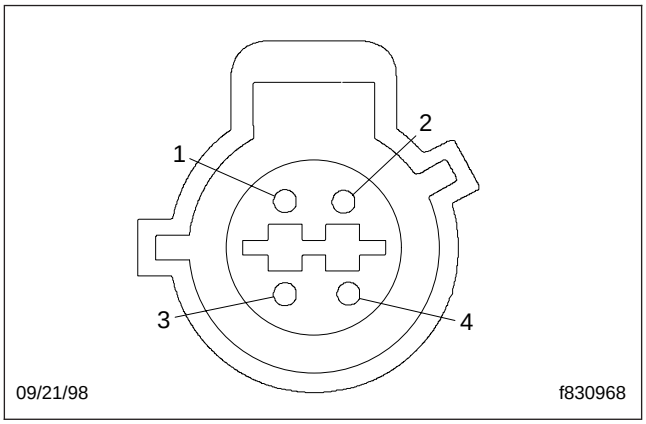

Fig. 10, A/C Clutch Test

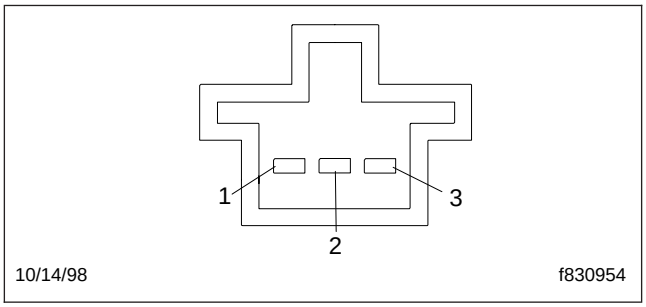

Fig. 11, Main System Temperature Potentiometer Switch

Measure the resistance between the temperature potentiometer pin 1 and pin 2 with the switch at full COOL and full WARM. With the switch at full COOL, the resistance should be less than 100 ohms. With the switch at full WARM, the resistance should be 4 to 6 kohms. If the switch does not meet the specifications, replace the switch.

A-Line Auxiliary System Thermal Potentiometer Switch

For identification of the pins of the A-Line auxiliary system thermal potentiometer switch, see **Fig. 12**.

ISO Relay

1. Measure the resistance between the relay terminal 85 and all other terminals. If the resistance is 5 ohms or less, replace the relay. See **Fig. 13**.

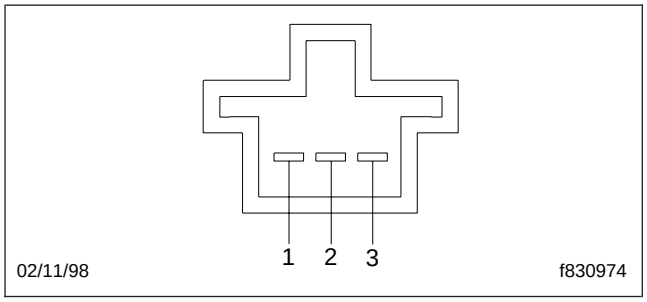

Fig. 12, A-Line Auxiliary System Thermal Potentiometer Switch

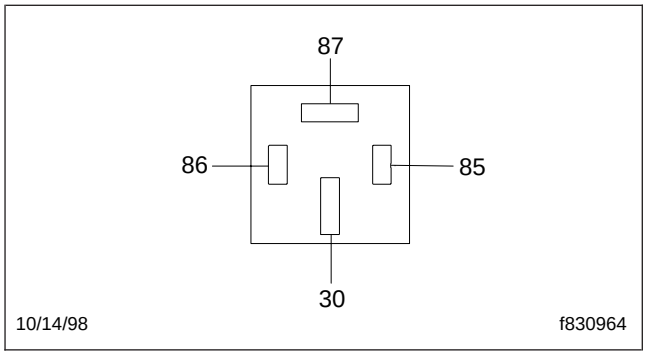

Fig. 13, Relay Resistance Check

2. Using two jumper wires (10 gauge or larger), connect the relay terminals 86 and 30 directly to the positive battery terminal.
3. Measure the voltage between the relay terminal 87 and ground. If the voltage is 10 volts or greater, replace the relay.
4. Using a third jumper wire (10 gauge or larger), connect the relay terminal 85 to a known good ground.
5. Measure the voltage between the relay terminal 87 and ground. If the voltage is less than 10 volts, replace the relay.

Refrigerant System Tests

For the system pressure and cycle timing evaluation chart, see **Fig. 14**.

IMPORTANT: See **Safety Precautions 100** before performing this procedure.

NOTE: Poor air conditioning system performance can be caused by a plugged evaporator or if the airflow is restricted.

This condition can be detected by checking the center register discharge temperature. An abnormally low temperature indicates air is spending more time in the evaporator and is very cold when discharged, although the airflow volume is not enough to cool the vehicle properly.

Additional causes are listed at the bottom of the chart for poor compressor operation or a damaged compressor condition.

These diagnosis charts provide the most direct and sure way to determine the cause of any problem in a poorly performing refrigerant system.

After servicing and correcting a refrigerant system problem, take additional pressure readings and observe the cycle rate while meeting the conditional requirements to be sure the problem has been corrected.

To diagnose a concern in the refrigerant system, note the system pressure (shown by the gauges) and the clutch cycle rate, then compare readings with the charts.

The system pressures are low (compressor suction) and high (compressor discharge).

A cycle is the time the A/C clutch is engaged plus the time it is disengaged (time on plus time off).

Cycle times are the lengths of time (in seconds) that the A/C clutch is on or off.

The test conditions specified at the top of each of the charts must be met to obtain accurate test results.

To achieve accurate diagnosis results in the least amount of time, use the following proce-

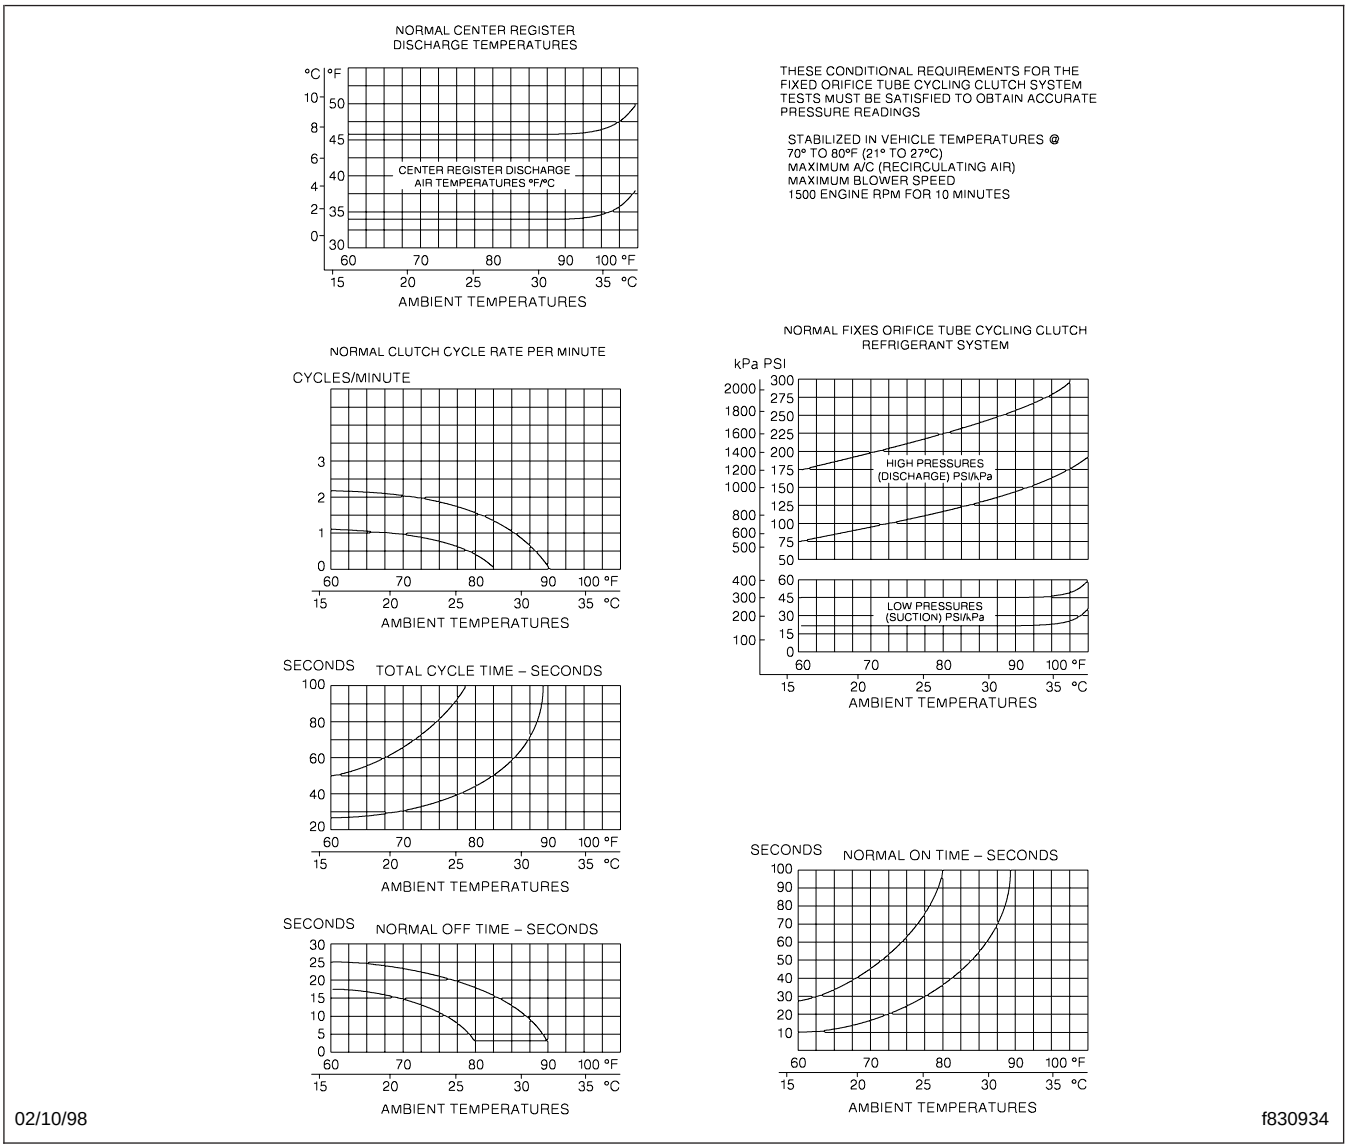

Fig. 14, System Pressure and Cycle Timing Evaluation Chart

dure and refer to the "Refrigerant System Pressure and Cycle Timing Evaluation Chart for Evaporator Orifice Cycling Systems."

1. Connect a gauge set to the system.
2. When the system has stabilized, record high and low pressures as shown by the gauges.
3. Determine the cycle rate per minute (on time plus off time equals one cycle).
4. Record the off time in seconds.
5. Record the on time in seconds.
6. Note center register discharge temperature.
7. Determine and record the ambient temperature.
8. Compare the test readings on the appropriate chart.

   Plot a vertical line for recorded ambient temperature from the scale at the bottom to the top of each chart.

Plot a horizontal line for other test readings from the scale at the left side of the appropriate chart.

If the point where the two lines cross on each chart falls within the heavy lines, the system is operating normally. If the lines cross outside the heavy lines on one or more of the charts, there is a problem and the specific cause must be determined. The following five system operating conditions are indicated where the lines cross the chart:

- system high (discharge) pressure is high, low, or normal
- system low (suction) pressure is high, low, or normal
- cycle rate is fast, slow, or A/C clutch runs continuously
- on time is long or short
- off time is long or short

NOTE: Normal system conditional requirements must be maintained to properly evaluate refrigerant system pressures. Refer to the charts applicable to the system under the test.

9. Match these conditions to the conditions shown in the five columns toward the left in **Table 7**. All five system conditions will be indicated on one line. The most likely component(s) causing the concern is indicated in the right column.

Refrigerant System Pressure and Cycle Timing Evaluation Chart for Evaporator Orifice Cycling Systems

High (discharge) Pressure	Low (suction) Pressure	Clutch Cycle Time			Component and Causes
		Rate	On	Off	
High	High	Continuous Run	Continuous Run	Continuous Run	A/C condenser, inadequate airflow.
High	Normal to High	Continuous Run	Continuous Run	Continuous Run	Engine overheating.
Normal to High	Normal	Continuous Run	Continuous Run	Continuous Run	Air in refrigerant. Refrigerant overcharge.* Humidity or ambient temperature very high.†
Normal	High	Continuous Run	Continuous Run	Continuous Run	Evaporator orifice missing. O-rings leaking/missing.
Normal	High	Slow	Long	Long	A/C clutch cycling pressure switch, high cut-in.
Normal	Normal	Slow or No Cycle	Long or Continuous	Normal or No Cycle	Moisture in refrigerant system. Excessive refrigerant oil.
Normal	Normal	Fast	Short	Short	A/C clutch cycling pressure switch, cut-in or high cut-out.
Normal	Low	Slow	Long	Long	A/C clutch cycling pressure switch, low cut-out.
Normal to Low	High	Continuous Run	Continuous Run	Continuous Run	Compressor, low performance.
Normal to Low	Normal to High	Continuous Run	Continuous Run	Continuous Run	Evaporator to compressor suction line—partially restricted or plugged.‡
Normal to Low	Normal	Fast	Short	Normal	Evaporator, low airflow.
Normal to Low	Normal	Fast	Short to Very Short	Normal to Long	Condenser, evaporator orifice, or dryer to evaporator liquid line, partially restricted or plugged.

Troubleshooting

Refrigerant System Pressure and Cycle Timing Evaluation Chart for Evaporator Orifice Cycling Systems					
High (discharge) Pressure	**Low (suction) Pressure**	**Clutch Cycle Time**			**Component and Causes**
		Rate	**On**	**Off**	
Normal to Low	Normal	Fast	Short to Very Short	Short to Very Short	Low refrigerant charge.
Normal to Low	Normal	Fast	Short to Very Short	Long	Evaporator, partially restricted or plugged.
Normal to Low	Low	Continuous Run	Continuous Run	Continuous Run	Evaporator to compressor suction line—partially restricted or plugged.§ A/C clutch cycling switch, sticking closed.
Low	Normal	Very Fast	Very Short	Very Short	A/C clutch cycling switch, cycling range too close.
Erratic Operation or Compressor Not Running	Erratic Operation or Compressor Not Running	—	—	—	A/C clutch cycling switch—dirty contacts or sticking open. Poor connection at A/C clutch connector or A/C clutch cycling pressure switch connector. A/C electrical circuit erratic.
Additional Possible Cause Components Associated with Inadequate Refrigerant Compressor Operation					
Refrigerant Compressor Drive Belt	—	—	—	—	Refrigerant compressor drive belt loose.
A/C Clutch	—	—	—	—	A/C clutch slipping.
A/C Clutch Field Coil	—	—	—	—	A/C clutch field coil open, shorted, or loose mounting.
Climate Control Panel Switch	—	—	—	—	Climate control panel switch, dirty contacts or sticking open.
A/C Clutch Wiring Circuit	—	—	—	—	A/C clutch wiring circuit, high resistance, open or blown fuse.
Additional Possible Cause Components Associated with a Damaged Compressor					
A/C Cycling Switch	—	—	—	—	A/C cycling switch, sticking closed or A/C clutch seized.
A/C Suction Accumulator Drier	—	—	—	—	A/C suction accumulator drier, refrigerant oil bleed hole plugged.
Refrigerant Low	—	—	—	—	Refrigerant leaks.

* The compressor may make noise on the initial run. This is a slugging condition caused by excessive liquid refrigerant.

† The A/C clutch may not cycle in ambient temperatures above 80°F (27°C) depending on humidity conditions.

‡ The low pressure reading will be normal to high if pressure is taken at the accumulator and if the restriction is downstream of the service access valve.

§ The low pressure reading will be low if the pressure is taken near the compressor and the restriction is upstream of the service access valve.

Troubleshooting

Problem—Improper/Erratic Direction of Airflow from Outlets (main system)

Problem—Improper/Erratic Direction of Airflow from Outlets (main system)	
Possible Cause	**Remedy**
No pressure to A/C-heater air selection switch	Check the air selection valve connections. Remove the climate control panel to gain access to the pneumatic hose connections. Inspect the pneumatic hose connections at the rear of the panel. If all of the pneumatic hoses are not securely connected to the panel, repair or replace pneumatic hoses as necessary. Test the system for normal operation. If all of the pneumatic hoses are securely connected to the panel, check the source operating pressure.
A/C-heater air selection switch leaks	Disconnect the black pneumatic hose from the rear of the climate control panel. Connect the Vacuum/Pressure Tester to the black pneumatic hose. Start the vehicle and observe the Vacuum/Pressure Tester gauge. If the Vacuum/Pressure Tester gauge indicates no pressure reading, locate the restriction or break in the pneumatic hose. Repair or replace as necessary. Restore the vehicle. Test the system for normal operation. If the Vacuum/Pressure Tester gauge indicates a pressure reading, test the air selection switch.
Damaged/kinked/pinched air line(s)	Connect the black pneumatic hose to the rear of the climate control panel. Disconnect the red, blue and gray pneumatic hoses from the rear of the panel. Start the vehicle. Move the air selection knob through each position while testing the corresponding port for operating pressure using the Vacuum/Pressure Tester. Refer to the appropriate "Mode Selector Valve Logic Chart" at the beginning of this section for corresponding port operating pressures. If the air selection valve does not deliver pressure to each port correctly, replace the air selection switch. Restore the vehicle. Test the system for normal operation. If the air selection valve does deliver pressure to each port correctly, restore the vehicle.
Leaking/damaged pneumatic actuator	
Leaking/damaged check valve	Test the floor/defrost door actuator pneumatic operation. Connect the red, blue and gray pneumatic hoses to the rear of the climate control panel. Disconnect the red pneumatic hose from the floor/defrost door actuator. Connect the Vacuum/Pressure Tester to the red pneumatic hose. Start the vehicle and cycle the air selection knob between the FLOOR and DEFROST positions while observing the gauge on the Vacuum/Pressure Tester.
Pneumatic actuator not connected to door crank	If the Vacuum/Pressure Tester gauge indicates a pressure reading, check for binding in the defrost door. Repair as necessary. If no binding is observed, replace the floor/defrost door actuator. Restore the vehicle. Test the system for normal operation. If the Vacuum/Pressure Tester gauge indicates no pressure reading, locate the restriction or break in the pneumatic hose. repair or replace as necessary. Restore the vehicle. Test the system for normal operation.

Problem—Improper/Erratic Direction of Airflow from Outlets (main system)	
Possible Cause	**Remedy**
No pressure to A/C-heater air selection switch	Test the panel/floor door actuator pneumatic operation. Connect the red pneumatic hose to the floor/defrost door actuator. Disconnect the gray pneumatic hose (spliced to the blue pneumatic hose) from the panel/floor door actuator. Connect the Vacuum/Pressure Tester to the gray pneumatic hose. Start the vehicle and cycle the air selection knob between the PANEL and FLOOR positions while observing the gauge on the Vacuum/Pressure Tester. If the Vacuum/Pressure Tester gauge indicates a pressure reading, check for binding in the panel/floor door. Repair as necessary. If no binding is observed, replace the panel/floor door actuator. Restore the vehicle. Test the system for normal operation. If the Vacuum/Pressure Tester gauge indicates a pressure reading, locate the restriction or break in the pneumatic hose. Repair or replace as necessary. Restore the vehicle. Test the system for normal operation. Test the outside air door actuator pneumatic operation. Connect the gray pneumatic hose to the panel/floor door actuator. Disconnect the black pneumatic hose from the outside air door actuator. Connect the Vacuum/Pressure Tester to the black pneumatic hose. Start the vehicle and place the air selection knob in the PANEL position while observing the gauge on the Vacuum/Pressure Tester. If the Vacuum/Pressure Tester gauge indicates a pressure reading, check the binding in the outside air door. Repair as necessary. If no binding is observed, replace the outside air door actuator. Restore the vehicle. Test the system for normal operation. If the Vacuum/Pressure Tester gauge indicates a pressure reading, locate the restriction or break in the pneumatic hose. Repair or replace as necessary. Restore the vehicle. Test the system for normal operation.
A/C-heater air selection switch leaks	
Damaged/kinked/pinched air line(s)	
Leaking/damaged pneumatic actuator	
Leaking/damaged check valve	
Pneumatic actuator not connected to door crank	

Problem—Insufficient, Erratic, or No Heat (main and auxiliary systems)

Problem—Insufficient, Erratic, or No Heat (main and auxiliary systems)	
Possible Cause	**Remedy**
Low engine coolant level.	Check for the proper engine coolant level. If the engine coolant is not at the proper level, check the coolant system including the radiator cap for leaks. Fill the engine coolant system to the specified level. For instructions, refer to **Group 20**. NOTE: It is not necessary to check each of the engine coolant system components separately at this time. Perform a pressure check on the engine coolant system. For instructions, refer to **Group 20**. If the engine cooling system, including the radiator cap, does not hold pressure, repair the engine cooling system. For instructions, refer to **Group 20**. Restore the vehicle. Test the system for proper operation. Check for hot water to the heater core inlet hose. Start the engine. Bring the engine to normal operating temperature. Lightly touch the inlet heater water hose. If the inlet heater water hose is not hot, repair or replace the heater core. Restore the vehicle. Test the system for proper operation. If the inlet heater water hose is hot, check the heater core outlet hose for hot water. Run the engine. Bring the engine to normal operating temperature. Lightly touch the outlet heater water hose. If the heater outlet water hose is cool or cold, refer to "Problem—A/C Does Not Operate Properly" chart in this subject.
Plugged or partially plugged heater core.	
Inoperative A/C electronic door actuator motor.	
Engine overheating.	

Troubleshooting

Problem—A/C Does Not Operate Properly

Problem—A/C Does Not Operate Properly See Fig. 15, Fig. 16, Fig. 17, Fig. 18, Fig. 19, Fig. 20, Fig. 21 and Fig. 22.	
Possible Cause	**Remedy**
Restricted evaporator orifice	Check the A/C clutch operation. NOTE: The outside air temperature must be above 50°F (10°C) for refrigerant compressor operation. Start the engine. Set the A/C-heater air selection switch to MAX A/C. Set the heater blower motor switch to HIGH. Observe the A/C clutch for proper operation. If the A/C clutch engages, check for an intermittent problem. Restore the vehicle. Test the system for proper operation. If the A/C clutch does not engage, check the A/C cycling switch.
Low refrigerant level	
Damaged/inoperative A/C cycling switch	Install a jumper wire between the A/C cycling switch connector C1014 pin 1 and pin 2. Start the engine. Set the A/C-heater air selection switch to A/C. Set the heater blower motor switch to HI. Check for A/C clutch engagement. If the A/C clutch engages, check the refrigerant system pressure. Install an R–134a manifold gauge set. For instructions, refer to Subject 110. Measure the refrigerant system pressure. If the refrigerant system pressure is greater than 50 psi, replace the A/C cycling switch. Restore the vehicle. Test the system for operation. If the refrigerant system pressure is less than 50 psi, check the system for leaks. For instructions, refer to Subject 110.
Inoperative A/C electronic door actuator motor	
Thermal protection switch	Check the voltage at the A/C pressure cutoff switch. Set the A/C-heater air selection switch to MAX A/C. Measure the voltage between the A/C pressure cutoff switch connector C1010, pin 4 (viscous fan) or connector C1011, pin 4 ("On/Off" fan), circuit 350 (Y) and ground. If the voltage is greater than 10 volts, measure the A/C pressure cutoff switch resistance. Measure the resistance between the A/C pressure cut-off switch connector C1010 pin 1 and pin 3 (viscous fan) or connector C1011 pin 2 and pin 4 (on/off fan). If the resistance is not less than 5 ohms, replace the A/C pressure cut-off switch. Restore the vehicle. Test the system for proper operation. If the resistance is less than 5 ohms, check the voltage at the A/C cycling switch. Set the A/C-heater air selection switch to MAX A/C.
Circuitry	
A/C clutch field coil	Measure the voltage between the A/C cycling switch connector C1014 pin 1, circuit 350 (Y) and ground. If the voltage is less than 10 volts, repair circuit 350 (Y). Restore the vehicle. Test the system for normal operation. Measure the resistance between the thermal protection switch terminals. Refer to "Thermal Protection Switch" under "Component Tests" in this subject. If the resistance does not meet the specifications in the component test, replace the thermal protection switch. Restore the vehicle. Test the system for normal operation. If the resistance meets the specifications in the component test, check the voltage supply to the A/C clutch. Set the A/C-heater air selection switch to MAX A/C.
A/C-heater air selection switch	

<table>
<tr><th colspan="2">Problem—A/C Does Not Operate Properly</th></tr>
<tr><th>Possible Cause</th><th>Remedy</th></tr>
<tr><td>Restricted evaporator orifice</td><td rowspan="8">Measure the voltage between the A/C clutch connector pin 1 (BR) and ground. If the voltage is not greater than 10 volts, repair circuit 350 (Y). Restore the vehicle. Test the system for proper operation. If the voltage is greater than 10 volts, check the A/C clutch ground circuit.

Measure the resistance between the A/C clutch connector pin 2 (BR) and ground. If the resistance is more than 5 ohms, repair circuit 57 (BK). Restore the vehicle. Test the system for proper operation. If the resistance is less than 5 ohms, check the A/C clutch field coil resistance.

Measure the resistance between the A/C clutch field coil connector pin 1 and pin 2. If the resistance is greater than 6 ohms, replace the A/C clutch field coil. Restore the vehicle. Test the system for proper operation. If the resistance is less than 6 ohms, check the A/C clutch field coil current draw. Install a jumper wire between the A/C clutch connector pin 1 (BR) and the A/C clutch field coil connector pin 2 (BR).

WARNING

Always use jumper wires when measuring the A/C clutch field coil amperage draw or serious injury can occur.

Measure the current draw between the A/C clutch connector pin 2 (BR) and the A/C clutch field coil connector pin 1 (BR). If the current draw is 3.6 to 3.7 amperes, adjust the A/C clutch air gap. For instructions, refer to Subject 110. Restore the vehicle. Test the system for proper operation. If the current draw is not 3.6 to 3.7 amperes, replace the A/C clutch field coil. Restore the vehicle. Test the system for proper operation.

Check the voltage at the A/C-heater air selection switch. Measure the voltage between the A/C-heater air selection switch connector C229 pin 1, circuit 670 (PK) and ground. If the voltage is less than 10 volts, check fuse 9 (10A). If the fuse is OK, check for an open in circuit 670 (PK). Repair circuit 670 (PK) as necessary. Restore the vehicle. Test the system for proper operation. If the fuse is not OK, replace the A/C-heater air selection switch fuse 9 (10A). Test the system for proper operation. If the fuse blows again, check circuits 670 (PK) and 350 (Y) for a short. Repair damaged circuits as necessary. Restore the vehicle. Test the system for proper operation.

Check the A/C-heater air selection switch positions. Set the A/C-heater air selection switch to each air selection position.

NOTE: The voltage measurement will be taken from the back of the connector with it connected to the A/C-heater air selection switch.

Measure the voltage between the A/C-heater air selection switch pin 2, circuit 350 (Y) and ground. If the voltage is greater than 10 volts, repair circuit 350 (Y). Restore the vehicle. Test the system for proper operation. If the voltage is greater than 10 volts, replace the A/C-heater air selection switch. Restore the vehicle. Test the system for proper operation.</td></tr>

Troubleshooting

Problem—A/C Electronic Blend Door Actuator Inoperative, Intermittent, or Improper Operation (main system)

Problem—A/C Electronic Blend Door Actuator Inoperative, Intermittent, or Improper Operation (main system) See Fig. 23, Fig. 24, and Fig. 25.	
Possible Cause	**Remedy**
Damaged/inoperative A/C electronic door actuator motor	Check the A/C electronic blend door actuator system. Start the engine. Bring the engine to normal operating temperature. Set the A/C-heater air selection switch to MAX A/C. Set the temperature control switch to full COOL. Check the discharge air temperature. Set the temperature control switch to full WARM. Check the discharge air temperature. Set the temperature control switch to the midpoint of the temperature range. Check the discharge air temperature. If the discharge air temperature changes, check for an intermittent problem. Restore the vehicle. Test the system for proper operation. If the discharge air temperature does not change, check the A/C electronic blend door actuator system fuse. If the fuse is not OK, replace the A/C-heater air selection switch fuse 18 (15A). Test the system for proper operation. If the fuse blows again, check for a short in circuit 190 (Y). Repair circuit 190 (Y) as necessary. Restore the vehicle. Test the system for proper operation. If the fuse is OK, check the A/C electronic blend door actuator supply voltage. NOTE: A quick check can be done by connecting a replacement A/C electronic door actuator motor to the 8-way electrical hardshell connector and operating the system to check for proper operation.
Damaged/inoperative temperature control switch	Measure the voltage between the A/C electronic door actuator motor connector C222 pin 6, circuit 190 (Y) and pin 5, circuit 57 (BK). If the voltage is less than 9 volts, check for shorts/opens in circuits 190 (Y) and 57 (BK). Repair circuits 190 (Y) and 57 (BK) as necessary. Restore the vehicle. Test the system for proper operation. If the voltage is equal to or greater than 9 volts, check the control head potentiometer voltage. Measure the voltage between the temperature control switch connector C228 pin 3, circuit 348 (GN/W) and pin 1, circuit 349 (BR). If the voltage is equal to or greater than 9 volts, check the control head potentiometer. Measure the resistance between the temperature control switch pin 1 and pin 2. With the switch at full COOL, the resistance should be less than 100 ohms. With the switch at full WARM, the resistance should be between 4 and 6 kohms. If the resistance is less than 100 ohms at full COOL and between 4 and 6 kohms at full WARM, replace the A/C electronic door actuator motor. Restore the vehicle. Test the system for proper operation. If the resistance is not less than 100 ohms at full COOL and between 4 and 6 kohms at full WARM, replace the temperature control switch. Restore the vehicle. Test the system for proper operation.
Circuitry open/shorted	Check circuit 351 (R). Measure the resistance between the temperature control switch connector C228 pin 2, circuit 351 (R) and the A/C electronic door actuator motor connector C222 pin 2, circuit 351 (R). If the resistance is not less than 5 ohms, repair circuit 351 (R). Restore the vehicle. Test the system for proper operation. If the resistance is less than 5 ohms, check circuit 349 (BR). Measure the resistance between the temperature control switch connector C228 pin 1, circuit 349 (BR) and the A/C electronic door actuator motor connector C222 pin 1, circuit 349 (BR). If the resistance is less than 5 ohms, replace the A/C electronic door actuator motor. Restore the vehicle. Test the system for proper operation. If the resistance is not less than 5 ohms, repair circuit 349 (BR). Restore the vehicle. Test the system for proper operation.

Problem—Blower Motor Does Not Operate (main system)

Problem—Blower Motor Does Not Operate (main system) See Fig. 21, Fig. 26, Fig. 27, and Fig. 28.	
Possible Cause	**Remedy**
Blown fuse	Check the blower motor operation. Set the A/C-heater air selection switch to FLR. Set the heater blower motor switch to HI. Check the blower motor for operation. If the blower motor operates, check for intermittent operation. Repair or replace if necessary. Restore the vehicle. Test the system for proper operation. If the blower motor does not operate, check the A/C-heater air selection switch fuse 18 (15A). If the fuse is not OK, replace the A/C-heater air selection switch fuse 18 (15A). Test the system for proper operation. If the fuse blows, check circuits 190 (Y) and 277 (GN) for a short. Repair damaged circuits as necessary. Restore the vehicle. Test the system for proper operation. If the fuse is OK, check the blower motor relay fuse (40A).
Circuitry open/shorted	If the fuse is not OK, replace the blower motor relay fuse (40A). Test the system for proper operation. If the fuse blows, check circuits 37 (BK/Y) and 183 (BR). Repair damaged circuits as necessary. Restore the vehicle. Test the system for proper operation. If the fuse is OK, check the voltage at the A/C-heater air selection switch. NOTE: The voltage measurement will be taken at the back of the connector with the connector installed.
Damaged/inoperative heater blower motor switch	Remove the A/C control far enough to gain access to the A/C-heater air selection switch. Set the A/C-heater air selection switch to each operation position. Measure the voltage between the A/C-heater air selection switch connector C229 pin 3, circuit 277 (GN) and ground in each selection position. If the voltage is not greater than 10 volts in each selection position, check the A/C-heater air selection switch. NOTE: The voltage measurement will be taken at the back of the connector with the connector installed. Measure the voltage between the A/C-heater air selection switch connector C229 pin 4, circuit 190 (Y) and ground in each selection position. If the voltage is not greater than 10 volts in each selection position, measure the resistance in all of the A/C-heater air selection switch positions. Refer to "Main A/C-Heater Air Selection Switch" under "Component Tests" in this subject. Replace the A/C-heater air selection switch as necessary. Restore the vehicle. Test the system for proper operation. If the voltage is greater than 10 volts in each selection position, check circuit 190 (Y) for a short/open. Repair as necessary. Restore the vehicle. Test the system for proper operation.
Damaged/inoperative blower motor	
Damaged/inoperative heater blower motor switch resistor	Check for voltage in circuit 277 (GN). Set the A/C-heater air selection switch to FLR. Set the heater blower motor switch to HI. Measure the voltage between the IP fuse junction panel relay 8, circuit 277 (GN) and ground. If the voltage is not greater than 10 volts, repair circuit 277 (GN). Restore the vehicle. Test the system for proper operation. If the voltage is greater than 10 volts, check the blower motor switch relay. Check the blower motor relay for proper operation. Refer to "ISO Relay" under "Component Tests" in this subject. If the blower motor relay does not meet the specifications in the component test, replace the blower motor relay. Restore the vehicle. Test the system for proper operation. If the blower motor relay meets the specifications in the component test, check circuit 57 (BK).

Troubleshooting

Problem—Blower Motor Does Not Operate (main system)	
Possible Cause	**Remedy**
Blown fuse	Measure the resistance between the IP fuse junction panel relay 8, circuit 57 (BK) and ground. If the resistance is not less than 5 ohms, repair circuit 57 (BK). Restore the vehicle. Test the system for proper operation. If the resistance is less than 5 ohms, check the voltage in circuit 37 (BK/Y)
Circuitry open/shorted	Measure the voltage between the IP fuse junction panel relay 8, circuit 37 (BK/Y) and ground. If the voltage is not greater than 10 volts, repair circuit 37 (BK/Y). Restore the vehicle. Test the system for proper operation. If the voltage is greater than 10 volts, check circuit 183 (BR).
Damaged/inoperative heater blower motor switch	Measure the resistance between the IP fuse junction panel relay 8, circuit 183 (BR) and the blower motor connector C1013 pin 2, circuit 183 (BR). If the resistance is not less than 5 ohms, repair circuit 183 (BR). Restore the vehicle. Test the system for proper operation. If the resistance is less than 5 ohms, check circuit 270 (BK/Y).
Damaged/inoperative blower motor	Measure the resistance between the blower motor connector C1013 pin 1, circuit 270 (BK/Y) and the blower motor switch resistor connector C1015 pin 4, circuit 270 (BK/Y). Measure the resistance between the blower motor connector C1013 pin 1, circuit 270 (BK/Y) and the heater blower motor switch connector C226 pin 1, circuit 270 (BK/Y). If the resistance is not less than 5 ohms, repair circuit 270 (BK/Y). Restore the vehicle. Test the system for proper operation. If the resistance is less than 5 ohms, check the heater blower motor switch.
Damaged/inoperative heater blower motor switch resistor	Measure the resistance between the heater blower motor switch terminals. Refer to "Main A/C-Heater Air Selection Switch" under "Component Tests" in this section. If the resistance meets the specifications in the component test, check the blower motor. Refer to "Blower Motor" under "Component Tests" in this section. Replace the blower motor if necessary. Restore the vehicle. Test the system for proper operation. If the resistance does not meet the specifications in the component test, replace the heater blower motor switch. Restore the vehicle. Test the system for proper operation.

Problem—Blower Motor Operates in High Speed Only (main system)

Problem—Blower Motor Operates in High Speed Only (main system) See Fig. 26 and Fig. 27.	
Possible Cause	**Remedy**
Damaged/inoperative heater blower motor switch	Check the blower motor operation. Set the A/C-heater air selection switch to FLR. Set the heater blower motor switch to LO. Check for blower motor operation. If the blower motor operates, check the blower motor switch. Set the heater blower motor switch in each position several times. Check for proper blower motor operation. If the blower motor operates properly, check the climate control system operation in all function positions and blower speeds. If the system is OK, instruct the owner on the correct operation of the system. If the blower motor does not operate properly, check the blower switch resistance. Measure the resistance through the heater blower motor switch circuits. Refer to "Main or Auxiliary SilverStar Blower Motor Switch" under "Component Tests" in this subject. If the resistance meets the specifications shown in the component test, check circuits 268 (R/BK) and 269 (BL/R) for shorts/opens. Repair as necessary. Restore the vehicle. Test the system for proper operation. If the resistance does not meet the specifications shown in the component test, replace the heater blower motor switch. Restore the vehicle. Test the system for proper operation.
Damaged/inoperative heater blower motor switch resistor	If the blower motor does not operate, check the blower switch operation. Set the A/C-heater air selection switch to FLR. Slowly set the heater blower motor switch to each position. Check for blower motor operation. If the blower motor operates HI position only, check the ground circuit. Measure the resistance between the heater blower motor switch resistor connector C101 pin 1, circuit 57 (BK) and ground. If the resistance is less than 5 ohms, replace the heater blower motor switch. Restore the vehicle. Test the system for proper operation. If the resistance is not less than 5 ohms, repair circuit 57 (BK). Restore the vehicle. Test the system for proper operation.
Circuitry open/shorted	If the blower motor operates in any position except for HI, check circuit 270 (BK/Y). Measure the resistance between the blower motor connector C1013 pin 1, circuit 270 (BK/Y) and the heater blower motor switch resistor connector C1015 pin 4, circuit 270 (BK/Y). If the resistance is less than 5 ohms, replace the heater blower motor switch resistor. Restore the vehicle. Test the system for proper operation. If the resistance is not less than 5 ohms, repair circuit 270 (BK/Y). Restore the vehicle. Test the system for proper operation.

Troubleshooting

Problem—No Operation in High Blower Setting

Problem—No Operation in High Blower Setting	
Possible Cause	**Remedy**
Damaged/inoperative heater blower motor switch	Check the blower motor speed. Set the A/C-heater air selection to FLR. Set the heater blower motor switch to HI. If the heater blower motor operates on HI, check for an intermittent problem. Restore the vehicle. Test the system for proper operation. If the heater blower motor does not operate on HI, check the heater blower motor switch.
Circuitry open/shorted	Measure the resistance between the heater blower motor switch terminals. Refer to "Heater Blower Motor Switch" under "Component Tests" in this subject. If the resistance meets the specifications in the component test, repair circuit 270 (BK/Y). Restore the vehicle. Test the system for proper operation. If the resistance does not meet the specifications in the component test, replace the heater blower motor switch. Restore the vehicle. Test the system for proper operation.

A-Line Auxiliary System Thermal Potentiometer Switch Test			
To Test	**Measure the Resistance Between**	**Set the Switch to These Positions**	**Resistance Should Read**
Temperature Potentiometer Switch	Terminal 1 and Terminal 2	Full COOL	Less than 100 ohms
		Full WARM	4–6 kohms

Specifications

⚠ WARNING

R–134a is the only refrigerant that is approved for use on Sterling vehicles. Several companies offer less expensive, hydrocarbon-based refrigerant, such as propane and methane. Use of these refrigerants will void the warranty on the air conditioning system, cause damage to the air conditioning system, and possibly result in personal injury or property damage. Leaking air conditioning systems charged with hydrocarbon-based refrigerants pose a serious risk of fire or explosion under the hood, or inside the passenger compartment. No vehicle built by Sterling Trucks can be safely charged with hydrocarbon-based refrigerants, regardless of what the refrigerant supplier states.

When servicing an air conditioning system, be sure to use a refrigerant identifier to ensure that the system has not been charged with something other than R–134a. This should be standard practice since there is no way to tell what services have been previously performed. Identification by service technicians will help to avoid the risk of explosion and guard against contamination of equipment when refrigerant is recovered and recycled.

General Information

Refrigerant Compressor

The Sanden refrigerant compressor has:

- seven cylinders;
- an axial design with mounting brackets for radial mounting;
- reed-type suction and discharge valve plates located between the cylinder assembly and the head;
- an integral cycling-type magnetic clutch with a compressor clutch field coil.

The compressor is engine mounted in line with the accessory drive belt. The drive belt rotates the compressor clutch. When the compressor clutch field coil is energized, it causes the compressor clutch hub to magnetically draw inward against the pulley. This magnetic force locks the clutch plate and hub assembly against the pulley which then drives the compressor main shaft causing the piston to draw the refrigerant gas through the compressor and circulate through the system. See **Fig. 1**.

8. Compressor
9. Pressure Relief Valve

Fig. 1, Compressor, Side View

The compressor is equipped with a thermal protection switch to automatically shut down the operation of the compressor by interrupting the electrical power to the compressor clutch field coil when the compressor temperature exceeds approximately 240°F (116°C). The compressor will automatically restart when it has cooled to approximately 210°F (99°C). See **Fig. 2**.

Fig. 2, Compressor, Rear View

Refrigerant Compressor Pressure Relief Valve

Under extreme pressure conditions, the compressor pressure relief valve will momentarily open, allowing refrigerant vapor to escape. This relieves excessive pressure that may damage the compressor. The valve closes as soon as pressure is lower than the relief setting. This prevents complete loss of the re-

General Information

frigerant charge. The compressor pressure relief valve is located in the rear of the compressor.

Refrigerant Compressor Removal and Installation

⚠ WARNING

Before doing any of the work below, read the safety precautions in Section 83.01, Subject 100. Failure to read the safety precautions and to be aware of the dangers involved when working with refrigerant could lead to serious personal injury.

Removal

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.01, Subject 110**, or **Section 83.05, Subject 130**.
4. Remove the serpentine belt. Do not pry or roll the belt off the pulleys.
5. Disconnect the electrical connector from the refrigerant compressor.
6. Disconnect the discharge and suction lines from the refrigerant compressor. Quickly cap the discharge and suction ports and the refrigerant lines.

IMPORTANT: Under no circumstances should the ports on the refrigerant compressor or the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through the refrigerant lines since shop air is wet (humid).

7. Being careful not to spill any refrigerant oil, remove the capscrews and washers that attach the refrigerant compressor to the engine and remove the compressor.

Installation

IMPORTANT: A new refrigerant compressor is filled with refrigerant oil and nitrogen gas. The quantity is printed on a label attached to the compressor. When installing a new compressor on the vehicle, do all the steps below. If installing a used compressor, disregard the first step.

1. Prepare a new refrigerant compressor.
   - 1.1 Gently release the nitrogen gas from the discharge side of the refrigerant compressor. Be careful not to let the oil flow out.
   - 1.2 Turn the refrigerant compressor shaft several times by hand to distribute oil which has settled in the cylinder.
2. If installing a new refrigerant compressor, adjust the refrigerant oil level in the new compressor. For instructions, see **Section 83.02, Subject 150**.
3. Using capscrews and washers, install the refrigerant compressor on the engine. Torque the capscrews 15 to 19 lbf·ft (20 to 26 N·m).
4. Uncap the discharge and suction ports and the refrigerant lines. Check the refrigerant lines and the discharge and suction ports. They must be clean and free of nicks, gasket residue, and other foreign material.
5. On refrigerant line connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.

   On refrigerant line connections that have Mini Stat-O-Seals, replace the seals. **Do not** lubricate Mini Stat-O-Seals prior to installation. Use only a Mini Stat-O-Seal on a Mini Stat-O-Seal assembly.
6. Connect the refrigerant lines to the refrigerant compressor.

   On refrigerant line connections that have threaded fittings, torque the fittings 33 lbf·ft (45 N·m).

   On refrigerant line connections that have Mini Stat-O-Seal assemblies, torque the bolts on the Mini Stat-O-Seal assemblies 13 to 15 lbf·ft (18 to 20 N·m).
7. Connect the electrical connector to the refrigerant compressor.
8. Install the serpentine belt.
9. If replacing a refrigerant compressor that had an internal failure or if the system was without any refrigerant pressure before repairs were started, replace the accumulator/drier. For instructions, see **Section 83.01, Subject 170**, or **Section 83.05, Subject 170**.

Refrigerant Compressor Removal and Installation

10. Evacuate, charge, and leak test the system. For instructions, see **Section 83.01, Subject 110**, or **Section 83.05, Subject 130**.
11. Remove the chocks from the tires.

Replacement

1. Recover the refrigerant from the air conditioning system.
2. Remove the pressure relief valve from the refrigerant compressor. See **Fig. 1**.

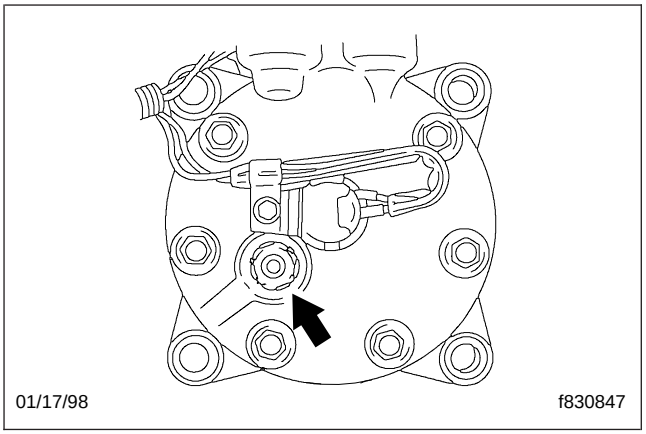

Fig. 1, Pressure Relief Valve

3. Coat the O-ring on the new pressure relief valve with clean refrigerant oil.
4. Install the new pressure relief valve on the refrigerant compressor. Tighten the pressure relief valve 72 to 108 lbf·in (813 to 1220 N·cm).
5. Evacuate, charge, and leak test the system. For instructions, see **Section 83.01, Subject 110** or **Section 83.05, Subject 130**.

Compressor Clutch and Pulley Removal and Installation

Removal

1. Remove the refrigerant compressor. For instructions, see **Subject 100**.
2. Place the compressor in a bench-mounted holding device.
3. Hold the clutch plate stationary using a suitable spanner wrench and remove the nut. See **Fig. 1**.

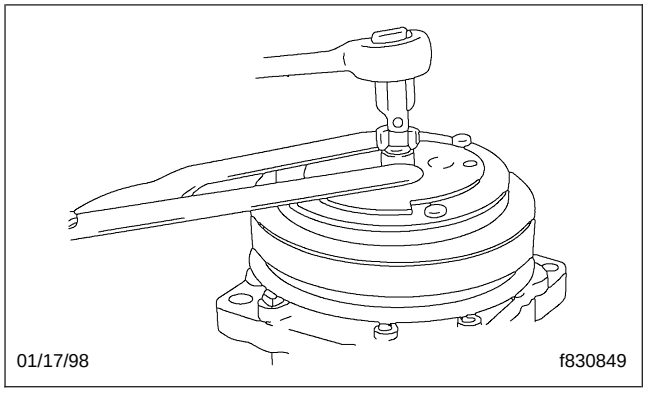

Fig. 1, Clutch Plate Nut

4. Using a suitable puller, remove the clutch plate from the compressor shaft. See **Fig. 2**.

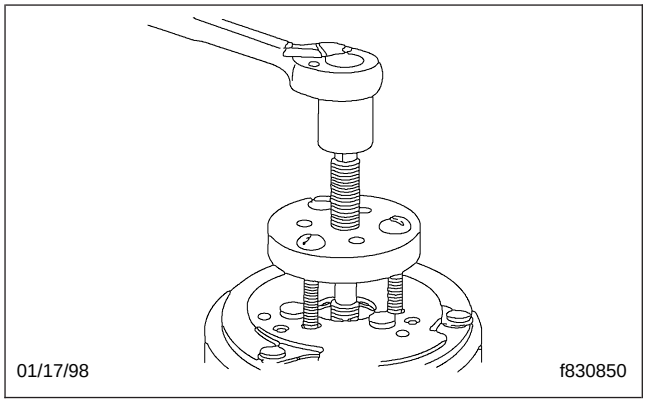

Fig. 2, Clutch Plate

5. Carefully remove the bearing dust cover. See **Fig. 3**.
6. Carefully tap the shaft key loose using a hammer and slotted screwdriver and remove the shaft key. See **Fig. 4**.
7. Remove the snap ring. See **Fig. 5**.
8. Remove the second snap ring. See **Fig. 6**.

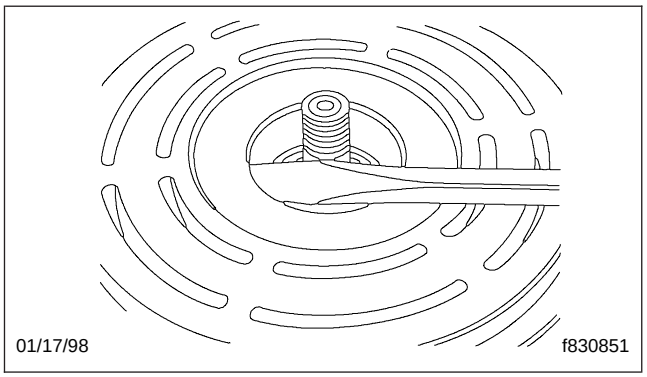

Fig. 3, Bearing Dust Cover

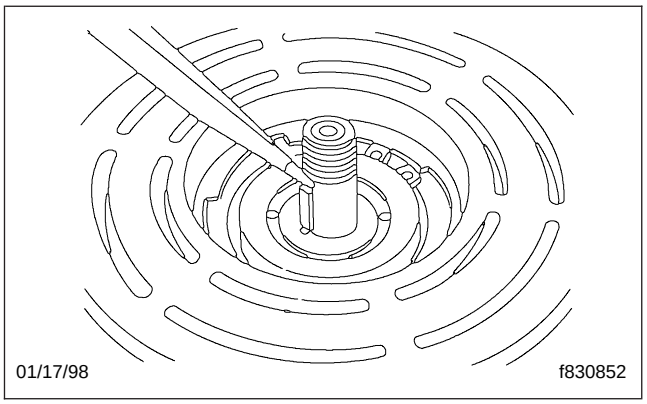

Fig. 4, Shaft Key

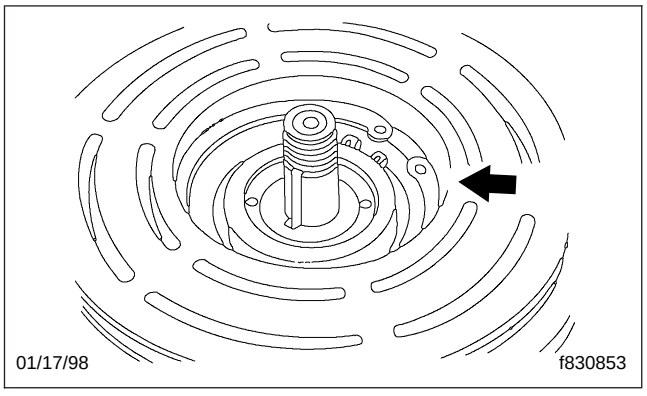

Fig. 5, Snap Ring

9. Install the pulley remover. See **Fig. 7**.
10. Remove the pulley.

Compressor Clutch and Pulley Removal and Installation

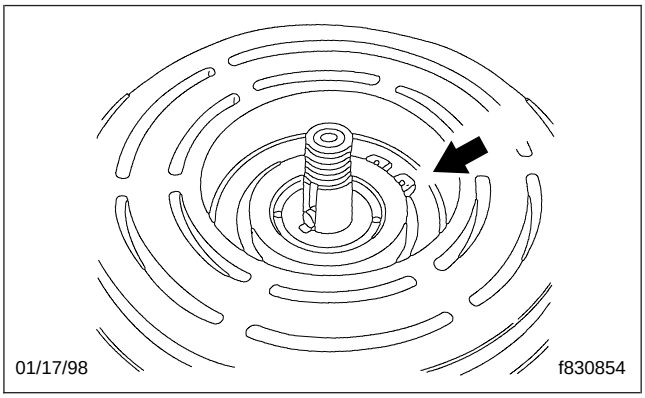

Fig. 6, Snap Ring

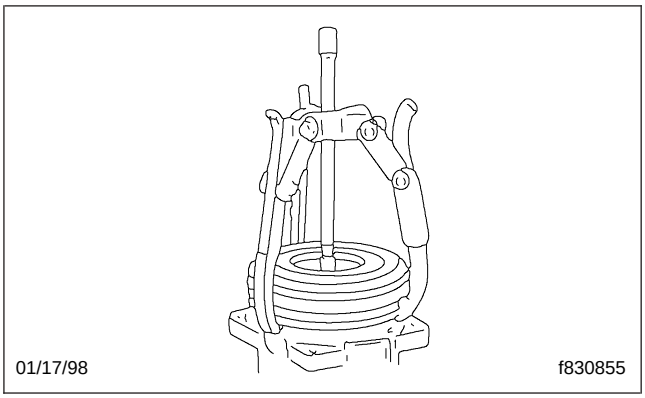

Fig. 7, Pulley Remover

Installation

1. Align the pulley squarely on the refrigerant compressor housing hub. See **Fig. 8**.

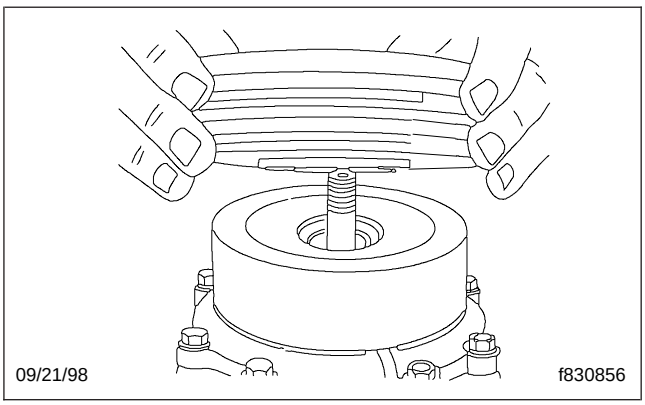

Fig. 8, Aligning Pulley

2. Install the pulley. See **Fig. 9**.

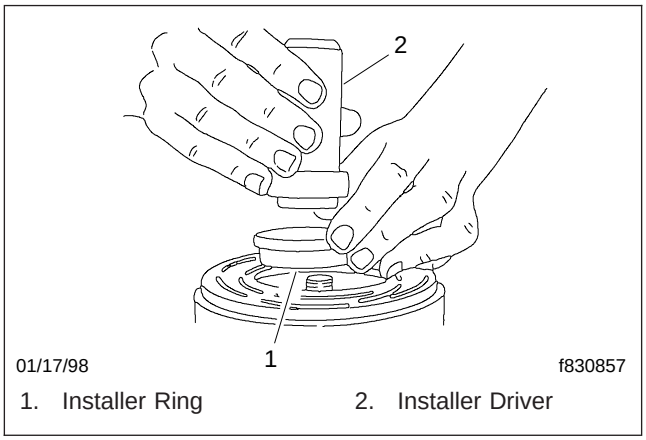

Fig. 9, Installing Pulley

2.1 Place the installer ring in the bearing cavity.

2.2 Using a hammer, place the installer driver in the installer ring and carefully drive the pulley until it is fully seated on the refrigerant compressor.

3. Install the snap rings.
4. Install the bearing dust cover.
5. Install the clutch plate.
6. Align the clutch plate keyway with the compressor shaft keyway and install the compressor shaft key.
7. Seat the clutch plate. See **Fig. 10**.

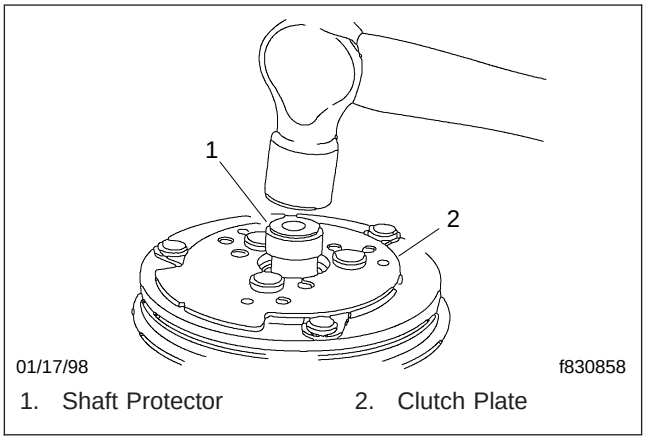

Fig. 10, Seating Clutch Plate

7.1 Install the shaft protector.

7.2 Carefully drive the clutch plate onto the compressor until fully seated.

8. Install the clutch plate nut. Tighten the nut 25 to 30 lbf·ft (34 to 40 N·m). See **Fig. 11**.

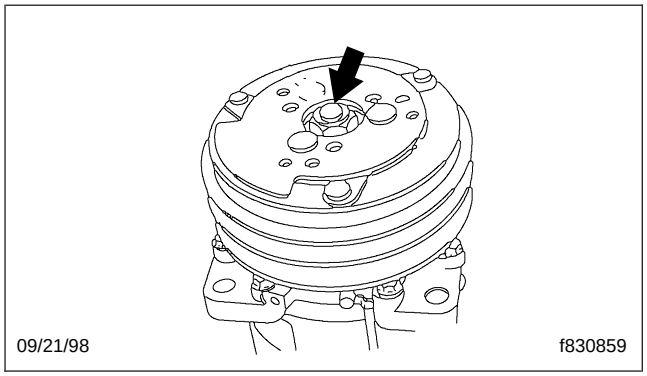

Fig. 11, Tightening Nut

9. Using a 0.016-inch to 0.031-inch feeler gauge, check the compressor air gap between the clutch plate and pulley surface in three locations equally spaced around the pulley. See **Fig. 12**.

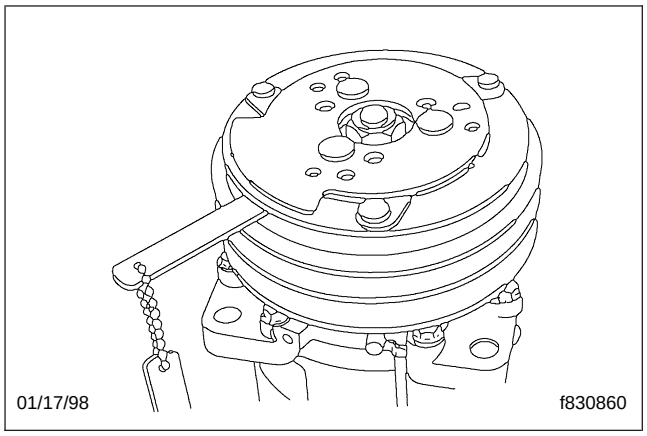

Fig. 12, Checking Air Gap

10. Rotate the compressor pulley one-half turn (180 degrees) and repeat the air gap measurement. The smallest air gap measurement must be within specified limits for the air gap.

11. Install the refrigerant compressor. For instructions, see **Subject 100**.

Clutch Field Coil Replacement

Replacement

1. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.01, Subject 110** or **Section 83.05, Subject 130**.
2. Remove the refrigerant compressor. For instructions, see **Subject 100**.
3. Remove the clutch and pulley.
4. Remove the coil lead wire clip. See **Fig. 1**.

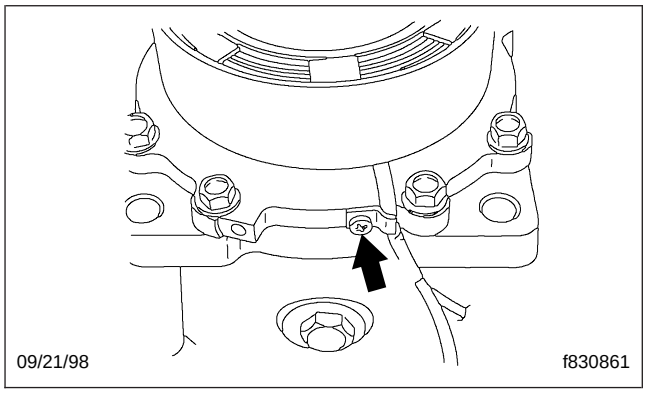

Fig. 1, Coil Lead Wire Clip

5. Remove the field coil. See **Fig. 2**.

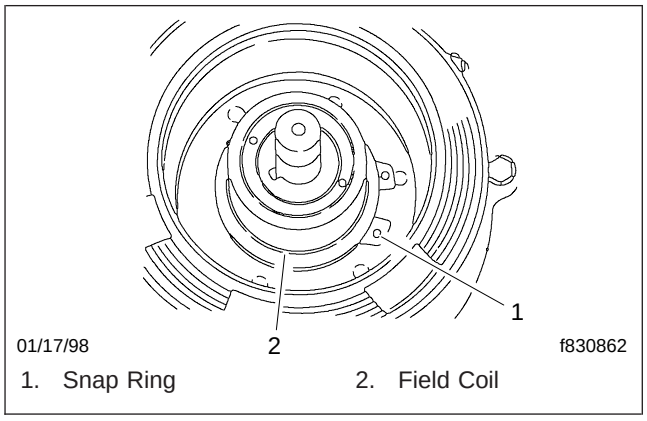

Fig. 2, Field Coil

   5.1 Remove the snap ring.

   5.2 Remove the field coil.

6. Install the field coil.

   6.1 Install the field coil.

   6.2 Install the snap ring.

7. Install the coil lead wire clip.
8. Install the clutch and pulley.
9. Install the refrigerant compressor. For instructions, see **Subject 100**.
10. Evacuate, charge, and leak test the system. For instructions, see **Section 83.01, Subject 110** or **Section 83.05, Subject 130**.

Adjustment

1. Check the clutch air gap at three equally spaced places between the clutch hub and the clutch pulley. See **Fig. 1**.

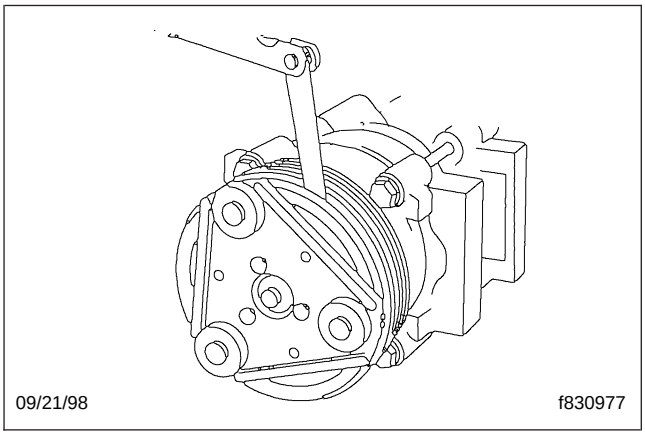

Fig. 1, Checking Air Gap

2. Add or remove shims between the clutch and the refrigerant compressor shaft until the clearance is within 0.016 to 0.031 inch (0.40 to 0.80 mm).

Refrigerant Oil Replacement and Measurement

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

General Information

Compressors are charged with 10 fl oz (296 mL) of refrigerant oil. When the air conditioning system is operating, some refrigerant oil leaves the compressor and is circulated through the system with the refrigerant, but the refrigerant oil cannot leave the system except when there is a leak, when the refrigerant is recovered, or when a system part is replaced.

It is important that the air conditioning system has the correct amount of refrigerant oil for proper operation. Too little oil will result in compressor failure. Too much oil will degrade the performance of the air conditioner and may cause damage to the compressor.

IMPORTANT: Whenever the air conditioning system is discharged or recovered, the recovered oil, from the charging machine, must be measured in order to know how much oil must be returned to the system. When a system component is replaced, a quantity of new oil equal to the recovered oil plus the oil coating the inside of the component must be returned to the system. New oil must be from a container that has not been opened or that has been tightly sealed since its last use.

Order Sanden PAG oil SKI 7803 1997 (type SP–20) for an 8.45-ounce (250-mL) can of refrigerant oil from your local Daimler parts distribution center. Tubing, funnels, or other equipment used to transfer the oil should be very clean and dry.

When handling refrigerant oil:

- Be sure that the oil is free of water, dust, metal powder, and other foreign substances;
- Do not mix the refrigerant oil with other types or viscosities of oil;
- Quickly seal the oil container after use. Refrigerant oil absorbs moisture when exposed to the air for any period of time.

Checking and Adding Refrigerant Oil

WARNING

Do not remove the oil fill plug on the refrigerant compressor without first recovering the system. Failure to recover the system could cause uncontrolled release of high-pressure refrigerant, which can freeze skin and eye tissue causing serious injury or blindness.

1. Before beginning the refrigerant recovery process, make sure that the oil accumulator and oil drain bottle on the recovery/recycle machine are emptied of oil from previous repairs.
2. Recover all of the refrigerant from the system. See **Section 83.01, Subject 110** for instructions.
3. Drain the recovered oil into the calibrated drain bottle of the recovery/recycle machine. Record the amount of oil recovered.
4. Inspect the refrigerant oil. If the oil has any of the following characteristics, flush and charge the system with 10 fl oz (296 mL) of oil.
   - silver or black oil—indicates metal in the air conditioning system due to compressor wear
   - milky oil—may indicate moisture in the system
   - grit or debris in the oil
5. Properly dispose of the recovered oil.
6. After repairs are finished, refer to **Table 1** and use the following equation to determine the quantity of refrigerant oil that needs to be added to the system.

   [Quantity Recovered] + [Quantity for All Replaced Components] = [Quantity to add to the System]

   Table 1 provides the quantities of oil that need to be added to the system for each component that was replaced. Add the quantities listed in the table for each component that was replaced. Use the sum of the quantities or 6 fl oz (177 mL), whichever is less.

Refrigerant Oil Replacement and Measurement

Refrigerant Oil Quantities for Replaced Components	
Add the quantities listed in this table for each component that was replaced. Use the sum of the quantities or 6 fl oz (177 mL), whichever is less.	
Component	**Quantity: oz (mL)**
High Pressure Line (main A/C)	1 (30)
Low Pressure Line (main A/C)	2 (59)
High Pressure Line (auxiliary A/C)	1 (30)
Low Pressure Line (auxiliary A/C)	3 (89)
Condenser	1 (30)
Evaporator (main A/C)	3 (89)
Evaporator (auxiliary A/C)	2 (59)
Receiver-Drier	3 (89)
Minor Leak at Connector Only	0.5 (15)
Major Leak at Connector Only	2 (59)

Table 1, Refrigerant Oil Quantities for Replaced Components

7. Remove the oil fill plug on the refrigerant compressor and add the refrigerant oil. Never add more than 8 fl oz (237 mL) to the system unless the system has been flushed.
8. Evacuate, charge, and leak test the refrigerant system. See **Section 83.01, Subject 110** for instructions.

Adjusting the Refrigerant Oil Level in a New Compressor

Sanden refrigerant compressors are charged with 10 fl oz (296 mL) of refrigerant oil. If the air conditioning system has been flushed, the compressor will need a 10-ounce charge. If the system has not been flushed, use the following procedure to adjust the oil level in the compressor.

Use the "Worksheet for Adjusting the Refrigerant Oil Level in a New Compressor" shown in **Fig. 1** to adjust the refrigerant oil level in a new compressor.

Worksheet for Adjusting the Refrigerant Oil Level in a New Compressor

1. Drain the oil from the old compressor.
   - 1.1 Remove the oil plug and drain as much oil as possible into a clean, calibrated container.
   - 1.2 If there are caps on the suction and discharge ports, remove them.
   - 1.3 Drain the oil from the suction and discharge ports into the container while turning the shaft clockwise using a socket wrench on the armature retaining nut.
   - 1.4 Enter the amount of oil that was drained from the compressor. 1. ☐
2. See Table 1 of this subject to determine the total amount of refrigerant oil that is needed for each component that was replaced. Enter the amount, up to 6 fl oz (177 mL), here. 2. ☐
3. Add the amounts from steps 1 and 2 and enter the total. 3. ☐
4. Subtract the total in step 3 from 10 and enter that number. For example, if the total in line 3 was six, the calculation would be 10 − 6 = 4. 4. ☐
5. Refer to the table below for the amount of oil that must be drained from the new compressor.

If the number in step 4 is:	Drain this amount from the new compressor:
a negative number(−)	2 fl oz (59 mL)
0	2 fl oz (59 mL)
1	2 fl oz (59 mL)
2	2 fl oz (59 mL)
3	3 fl oz (89 mL)
4	4 fl oz (118 mL)
5	4 fl oz (118 mL)
6	4 fl oz (118 mL)
7	4 fl oz (118 mL)
8	4 fl oz (118 mL)
9	4 fl oz (118 mL)
10	4 fl oz (118 mL)

10/03/2007 f020169

Fig. 1, Worksheet for Adjusting the Refrigerant Oil Level in a New Compressor

Specifications

⚠ WARNING

R–134a is the only refrigerant that is approved for use on Sterling vehicles. Several companies offer less expensive, hydrocarbon-based refrigerant, such as propane and methane. Use of these refrigerants will void the warranty on the air conditioning system, cause damage to the air conditioning system, and possibly result in personal injury or property damage. Leaking air conditioning systems charged with hydrocarbon-based refrigerants pose a serious risk of fire or explosion under the hood, or inside the passenger compartment. No vehicle built by Sterling Trucks can be safely charged with hydrocarbon-based refrigerants, regardless of what the refrigerant supplier states.

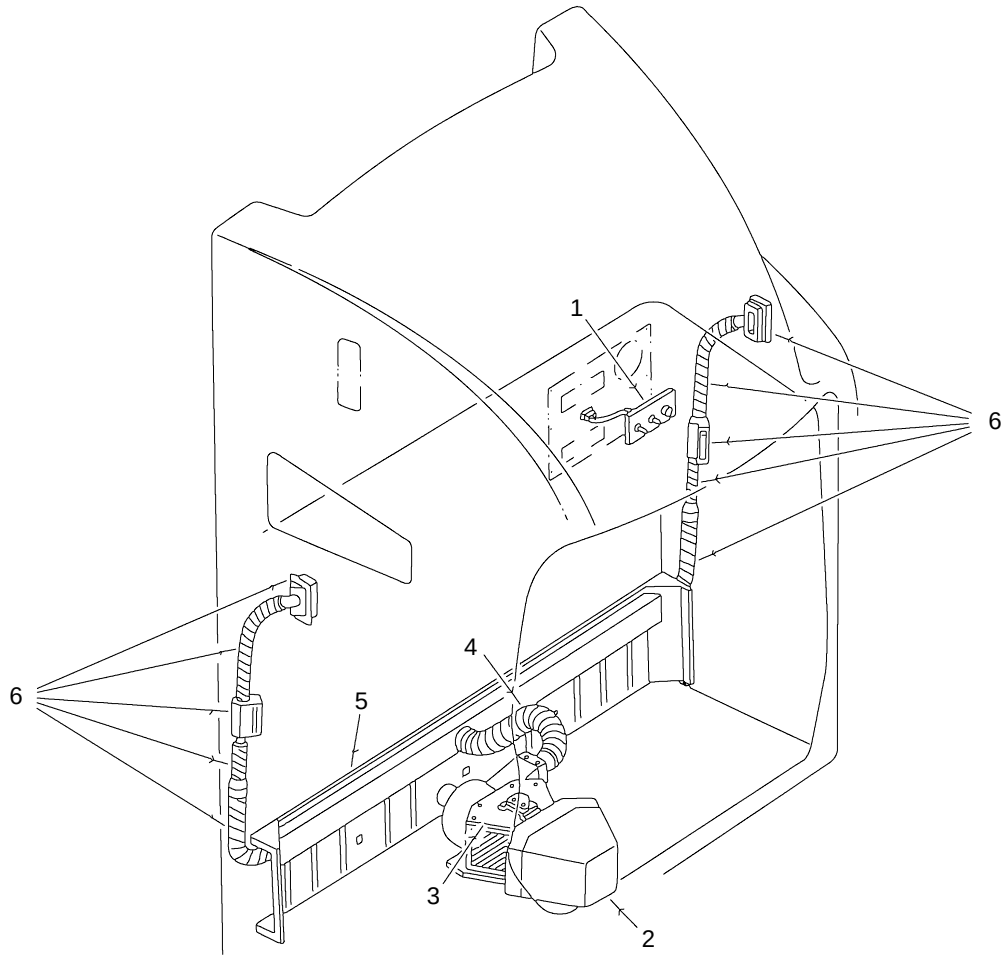
When servicing an air-conditioning system, be sure to use a refrigerant identifier to ensure that the system has not been charged with something other than R–134a. This should be standard practice since there is no way to tell what services have been previously performed. Identification by service technicians will help to avoid the risk of explosion and guard against contamination of equipment when refrigerant is recovered and recycled.

Freightliner LLC recommends using SP-15 or equivalent refrigerant oil for a Sanden refrigerant compressor.

Torque Specifications	
Description	**Value**
Compressor End of Suction Line Between the Evaporator and Compressor	21–27 lbf·ft (28–37 N·m)
Compressor End of Discharge Line Between the Refrigerant Compressor and the Condenser	15–20 lbf·ft (20–27 N·m)
Pressure Relief Valve	9–13 lbf·ft (12–18 N·m)
Refrigerant Clutch Plate Nut	25–30 lbf·ft (30–40 N·m)
Mini Stat-O-Seal Bolt	13–15 lbf·ft (18–20 N·m)

Table 1, Torque Specifications

General Information (See Fig. 1)



1. Auxiliary Climate Control Assembly
2. Auxiliary Air Conditioning and Heating Assembly Shroud
3. Auxiliary Air Conditioning and Heating Assembly
4. Flex Tubing
5. Rear Plenum Duct
6. Registers and Ductwork

Fig. 1, Auxiliary A/C and Heating System Component Locations

The auxiliary air conditioning and heating assembly is a compact unit encompassing both air conditioning and heating capabilities. The one-piece unit housing the major components of the system is mounted on the floor of the sleeper, beneath the lower bunk. The ductwork and registers are located behind the sleeper side and rear trim panels. The A/C and heating unit can be serviced as an assembly or as individual components. The components are serviced under Able Body part numbers and are handled only by Able Body Corporation of Joplin, Missouri.

Except for line and hose connection or disconnection, all components, including the auxiliary climate control assembly, blower motor, blower motor resistor, blower motor relay, blower wheel, heater core, A/C evaporator core, evaporator expansion valve, blend door actuator and ductwork, are serviceable from inside the vehicle.

General Information

The auxiliary air conditioning system will only operate when the engine is running and the front air conditioning mode switch is in an air conditioning setting. There is no direct control of the A/C compressor from the auxiliary climate control assembly.

Heater and Air Conditioning Assembly Removal and Installation

Removal

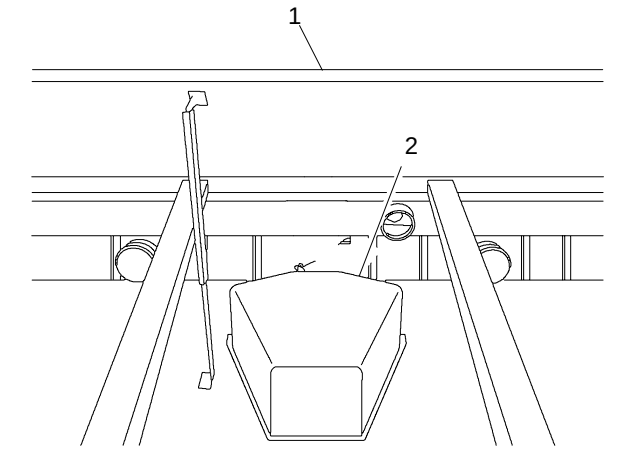
1. Prepare the vehicle for auxiliary heating and air conditioning assembly removal.

   1.1 Recover the air conditioning refrigerant. For instructions, refer to **Section 83.00**.

   NOTE: Cap or plug all open refrigerant line fittings to prevent entry of dirt and moisture.

   1.2 Drain the engine cooling system. For instructions, refer to **Group 20**.

2. Remove the auxiliary air conditioning and heating assembly shroud. See **Fig. 1**.



1. Lower Bunk
2. Auxiliary Air Conditioning and Heating Assembly Shroud

Fig. 1, Heating and Auxiliary Air Conditioning Assembly Shroud

   2.1 Raise the lower bunk.

   2.2 Remove the auxiliary air conditioning and heating assembly shroud.

3. Disconnect the air outlet flex hose. See **Fig. 2**.
4. Disconnect the electrical connectors. See **Fig. 3**.
5. Disconnect the inlet lines. See **Fig. 4**.

   5.1 Disconnect the A/C expansion valve refrigerant lines.

   5.2 Disconnect the heater core lines.

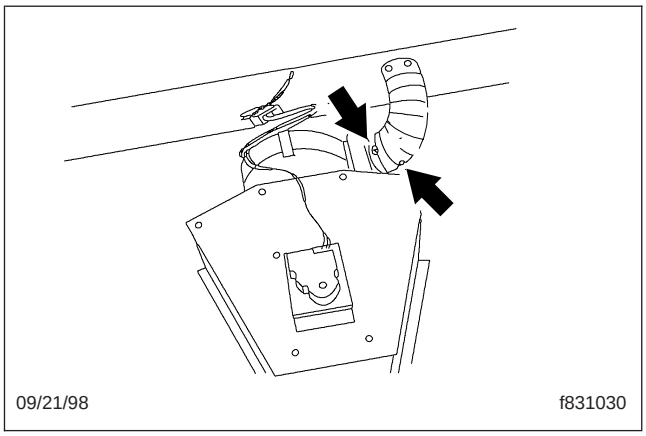


Fig. 2, Air Outlet Flex Hose

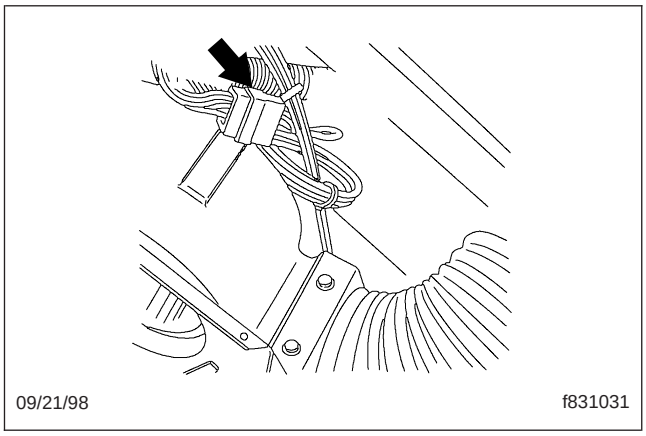

Fig. 3, Electrical Connectors

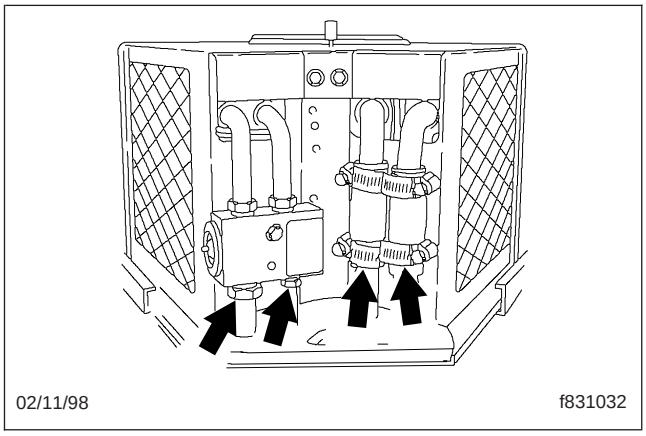

Fig. 4, Auxiliary Heating and Air Conditioning Line Connection Location

Heater and Air Conditioning Assembly Removal and Installation

6. Remove the auxiliary air conditioning and heating assembly bolts and remove the assembly. See **Fig. 5**.

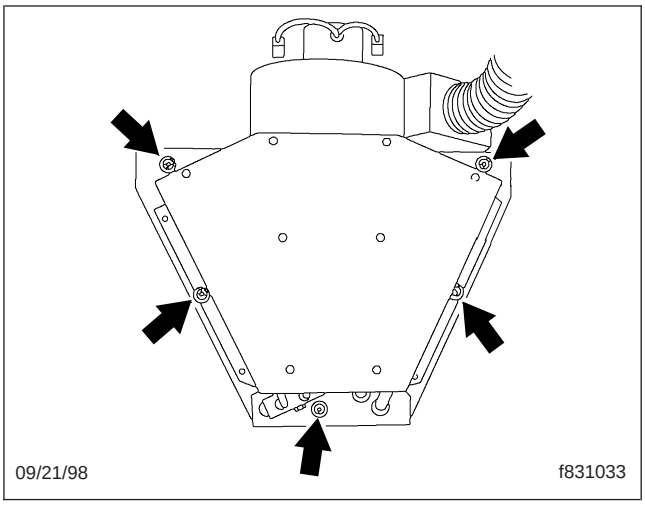

Fig. 5, Auxiliary Heating and Air Conditioning Assembly Bolts

Installation

1. Install the heating and auxiliary air conditioning assembly and the retaining bolts. See **Fig. 5**.
2. Connect the inlet lines. See **Fig. 4**.
   - 2.1 Connect the expansion valve refrigerant lines.
   - 2.2 Connect the heater core lines.
3. Connect the electrical connectors. See **Fig. 3**.
4. Connect the air outlet flex hose. See **Fig. 2**.
5. Install the heating and auxiliary air conditioning assembly shroud. See **Fig. 1**.
   - 5.1 Install the heating and auxiliary air conditioning assembly shroud.
   - 5.2 Lower the lower bunk.
6. Fill the engine cooling system. For instructions, refer to **Group 20**.
7. Evacuate, charge, and leak test the A/C system. For instructions, refer to **Section 83.00**.

Replacement

1. Remove the screws from the auxiliary climate control assembly. See **Fig. 1**.

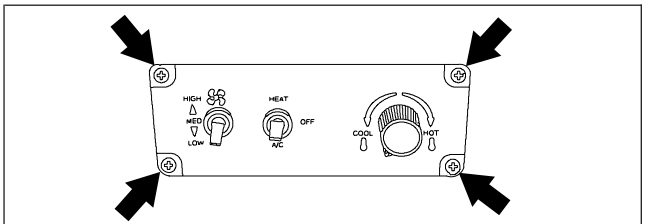

Fig. 1, Auxiliary Climate Control Assembly Screws

2. Disconnect the electrical connector and remove the auxiliary climate control assembly. See **Fig. 2**.

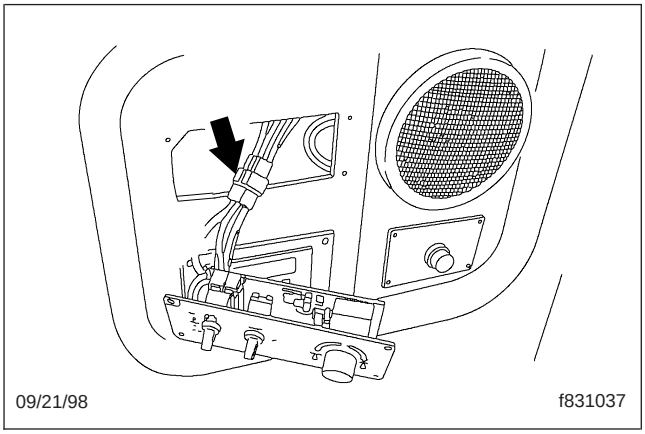

Fig. 2, Electrical Connector

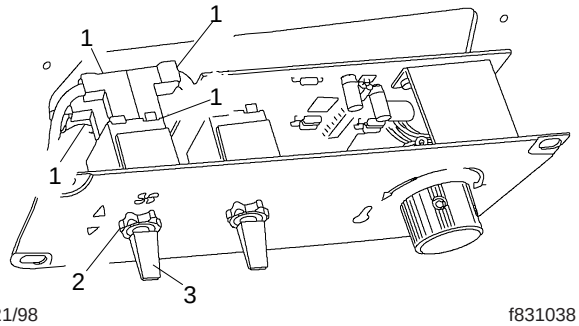
3. Install the auxiliary climate control assembly and connect the electrical connector. See **Fig. 2**.
4. Install and securely tighten the screws. See **Fig. 1**.

Blower Motor Switch Replacement

1. Remove the auxiliary climate control assembly.
2. Remove the switch. See **Fig. 1**.



09/21/98 f831038

1. Electrical Connectors
2. Retaining Nut
3. Switch

Fig. 1, Blower Motor Switch

2.1 Disconnect the four electrical connectors.

2.2 Remove the retaining nut and remove the switch.

3. Install the switch. See **Fig. 1**.

3.1 Install the switch and install the retaining nut.

3.2 Connect the four electrical connectors.

4. Install the auxiliary climate control assembly.

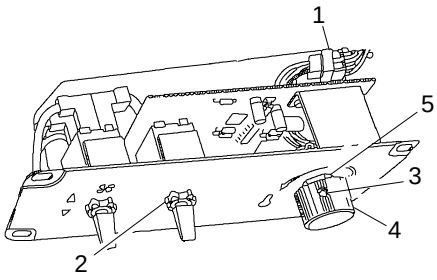
Mode Switch and Temperature Control Assembly Replacement

1. Remove the auxiliary climate control assembly enough to gain access to the rear of the assembly.
2. Remove the mode switch and temperature control assembly. See **Fig. 2**.

2.1 Disconnect the electrical connector.

2.2 Remove the switch retaining nut.

2.3 Loosen the temperature control knob setscrew and remove the knob.



09/21/98 f831039

1. Electrical Connectors
2. Retaining Nut
3. Setscrew
4. Control Knob
5. Retaining Nut

Fig. 2, Mode Switch and Temperature Control Assembly

2.4 Remove the temperature control retaining nut and remove the assembly.

3. Install the mode switch and temperature control assembly. See **Fig. 2**.

3.1 Install the assembly and install the temperature control retaining nut.

3.2 Install the knob and tighten the temperature control knob setscrew.

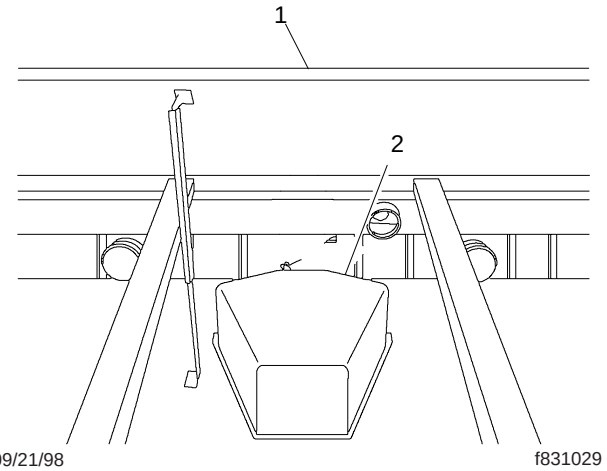
3.3 Install the switch retaining nut.

3.4 Connect the electrical connector.

4. Install the auxiliary climate control assembly.

Replacement

1. Remove the auxiliary heating and air conditioning assembly shroud, then raise the lower bunk. See **Fig. 1**.

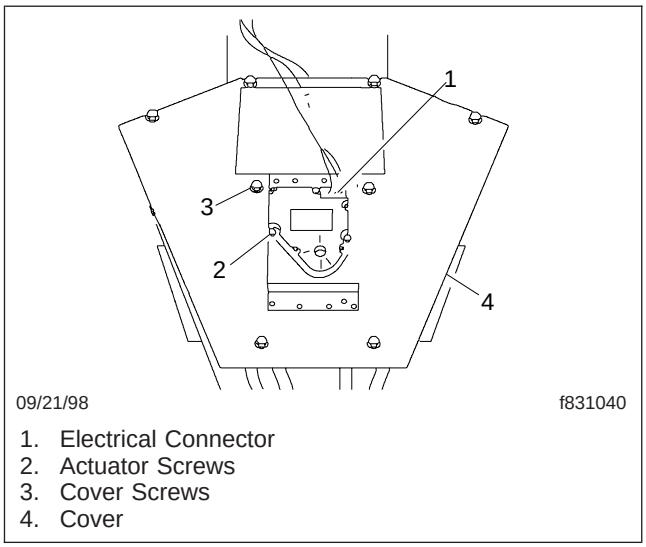


1. Lower Bunk
2. Auxiliary Heating and Air Conditioning Assembly Shroud

Fig. 1, Auxiliary Heating and Air Conditioning Assembly Shroud

NOTE: Care must be taken not to lose the plastic bushing between the blend door actuator and the blend door.

2. Remove the auxiliary heating and air conditioning assembly case cover. See **Fig. 2**.
   - 2.1 Remove the blend door actuator electrical connector.
   - 2.2 Loosen the blend door actuator screws.
   - 2.3 Remove the eight case cover screws.
   - 2.4 Remove the case cover.
3. Remove the blower wheel retaining clamp. See **Fig. 3**.
4. Remove the blower motor. See **Fig. 4**.
   - 4.1 Remove the retaining screws.
   - 4.2 Separate the blower motor from the blower motor wheel, and remove the blower motor.



1. Electrical Connector
2. Actuator Screws
3. Cover Screws
4. Cover

Fig. 2, Auxiliary Heating and Air Conditioning Assembly Case Cover

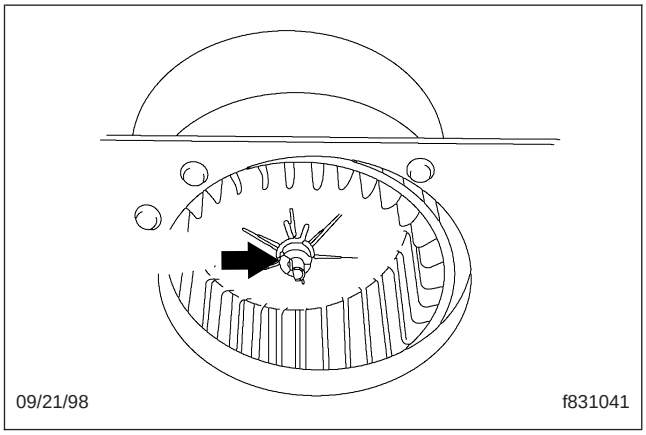


Fig. 3, Blower Wheel Retaining Clamp

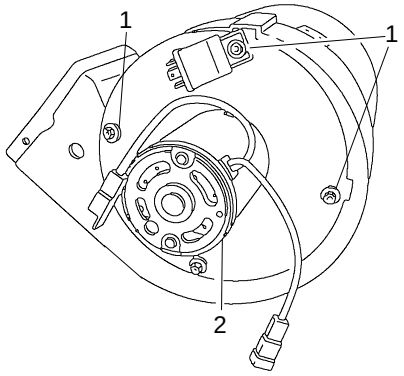
5. Remove the blower motor wheel from the blower motor plenum.
6. Install the blower motor wheel to the blower motor plenum.
7. Install the blower motor. See **Fig. 4**.
   - 7.1 Install the retaining screws.
   - 7.2 Install the blower motor to the blower motor wheel.
8. Install the blower wheel retaining clamp. See **Fig. 3**.

Blower Motor and Wheel Replacement



1. Retaining Screws
2. Blower Motor

Fig. 4, Blower Motor

9. Install the auxiliary heating and air conditioning assembly case cover. See **Fig. 2**.
   - 9.1 Install the case cover.
   - 9.2 Install the eight case cover screws.
   - 9.3 Tighten the blend door actuator screws.
   - 9.4 Install the blend door actuator electrical connector.
10. Lower the lower bunk, then install the auxiliary heating and air conditioning assembly shroud. See **Fig. 1**.

Blower Motor Housing Replacement

Replacement

1. Remove the blower motor and wheel.
2. Remove the blower motor resistor.
3. Remove the three air conditioning and heater outlet duct screws and remove the outlet duct. See **Fig. 1**.

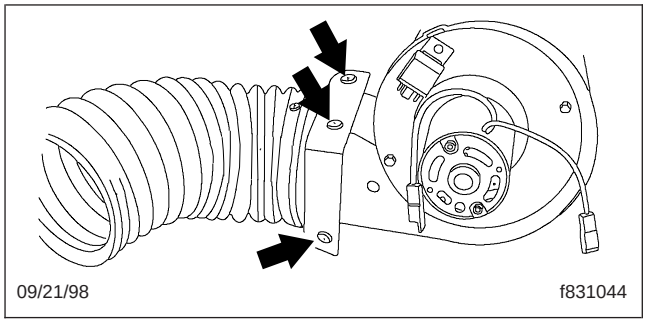


Fig. 1, Outlet Duct Screws

4. Remove the thermistor from the blower motor housing. See **Fig. 2**.

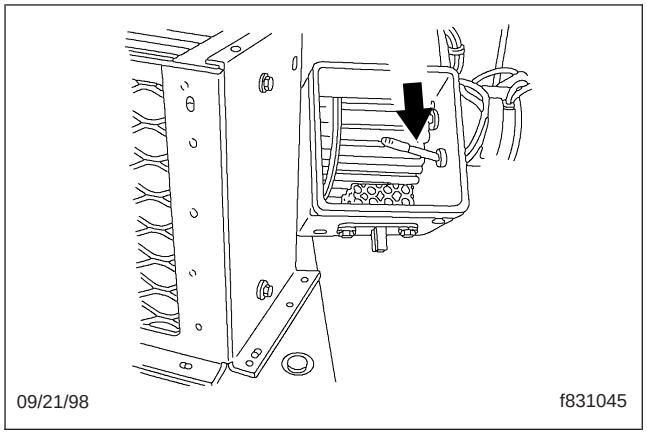

Fig. 2, Thermistor

5. Remove the screws and remove the housing. See **Fig. 3**.
6. Install the housing and the screws. See **Fig. 3**.
7. Install the thermistor to the blower motor housing. See **Fig. 2**.
8. Install the outlet duct and the three air conditioning and heater outlet duct screws. See **Fig. 1**.
9. Install the blower motor resistor.

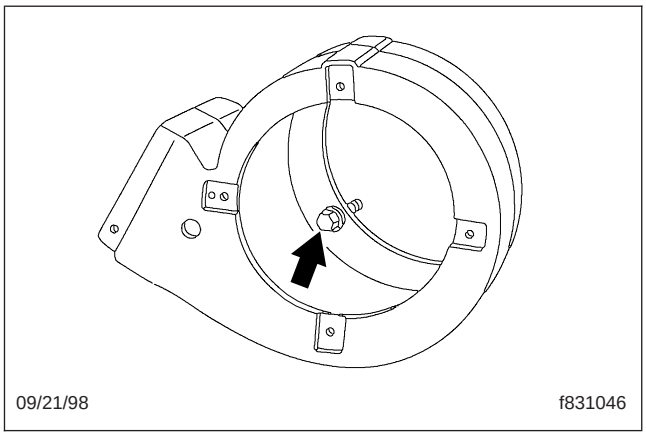

Fig. 3, Housing and Screws

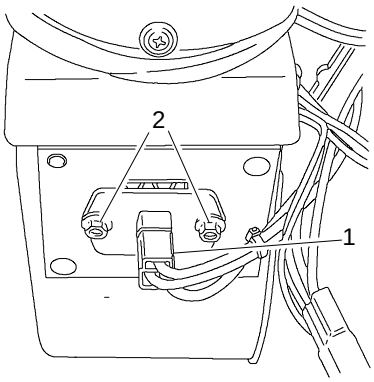
10. Install the blower motor and wheel.

Replacement

1. Remove the blower motor resistor. See **Fig. 1**.



1. Electrical Connector
2. Screws

Fig. 1, Blower Motor Resistor

1.1 Disconnect the electrical connector.

1.2 Remove the screws and remove the resistor.

2. Install the blower motor resistor. See **Fig. 1**.

2.1 Connect the electrical connector.

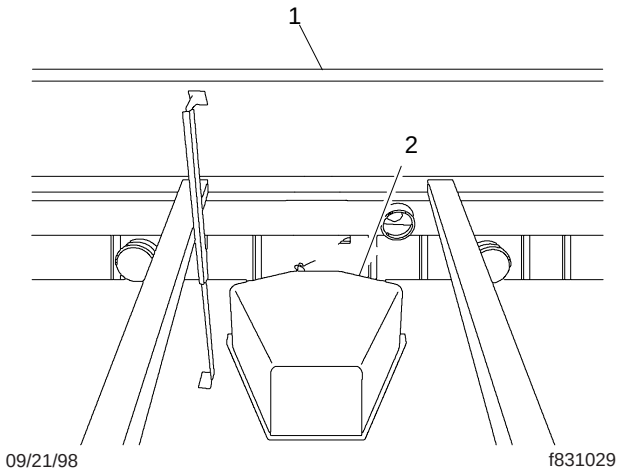
2.2 Install the resistor and the screws.

Evaporator Core Removal and Installation

Removal

NOTE: Cap or plug all open refrigerant line fittings to prevent entry of dirt and moisture.

1. Recover the refrigerant. For instructions, refer to **Section 83.00**.
2. Raise the lower bunk, then remove the auxiliary air conditioning and heating assembly shroud. See **Fig. 1**.



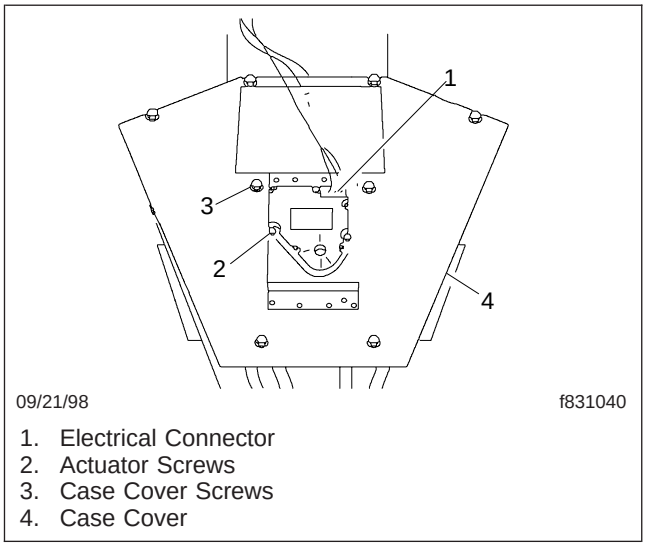
1. Lower Bunk
2. Auxiliary Heating and Air Conditioning Assembly Shroud

Fig. 1, Auxiliary Heating and Air Conditioning Assembly Shroud

NOTE: Care must be taken not to lose the plastic bushing between the blend door actuator and the blend door.

3. Remove the auxiliary heating and air conditioning assembly case cover. See **Fig. 2**.
   - 3.1 Remove the blend door actuator electrical connector.
   - 3.2 Loosen the blend door actuator screws.
   - 3.3 Remove the eight case cover screws.
   - 3.4 Remove the case cover.

NOTE: Cap or plug all open refrigerant line fittings to prevent entry of dirt and moisture.



1. Electrical Connector
2. Actuator Screws
3. Case Cover Screws
4. Case Cover

Fig. 2, Auxiliary Heating and Air Conditioning Assembly Case Cover

4. Disconnect the evaporator core refrigerant tubes from the evaporator expansion valve. See **Fig. 3**.

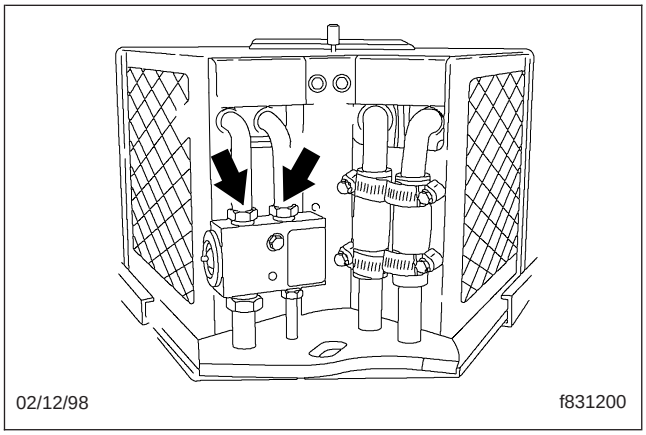


Fig. 3, A/C Evaporator Core Refrigerant Tubes

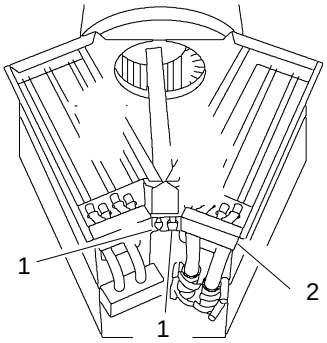
5. Remove the evaporator core. See **Fig. 4**.
   - 5.1 Remove the evaporator core/heater core retaining bracket screws.
   - 5.2 Remove the evaporator core/heater core retaining bracket and remove the evaporator core.

Installation

1. Install the evaporator core. See **Fig. 4**.

Evaporator Core Removal and Installation



09/21/98 f831201

1. Retaining Screws
2. Retaining Bracket

Fig. 4, Evaporator Core

1.1 Install the evaporator core and the evaporator core/heater core retaining bracket.

1.2 Install the evaporator core/heater core retaining bracket screws.

2. Connect the A/C evaporator core refrigerant tubes to the evaporator expansion valve. See **Fig. 3**.

NOTE: Make sure the plastic blend door bushing is placed on the blend door shaft prior to installation of the case cover. The blend door actuator can be aligned with the bushing by looking through the blend door actuator.

3. Install the auxiliary air conditioning and heating assembly case cover. See **Fig. 2**.

3.1 Install the blend door actuator electrical connector.

3.2 Tighten the blend door actuator screws.

3.3 Install the case cover, then install the eight case cover screws.

4. Install the auxiliary air conditioning and heating assembly shroud. See **Fig. 1**.

4.1 Install the auxiliary air conditioning and heating assembly shroud.

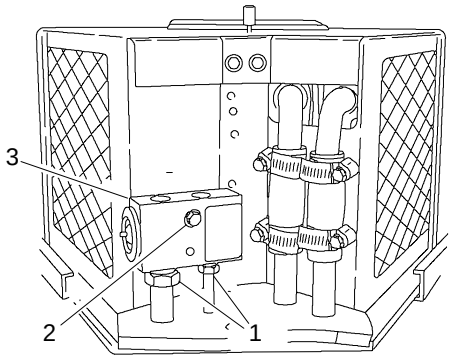
4.2 Lower the lower bunk.

5. Restore the vehicle to operating condition. Evacuate, charge and leak test the A/C system. For instructions, refer to **Section 83.00**.

Evaporator Core Expansion Valve Replacement

Replacement

1. Recover the R–134a refrigerant from the system. For instructions, refer to **Section 83.00**.
2. Remove the evaporator core.
3. Remove the expansion valve. See **Fig. 1**.



09/21/98 f831203

1. Refrigerant Lines
2. Bolt
3. Expansion Valve

Fig. 1, Expansion Valve

   3.1 Disconnect the refrigerant lines.

   3.2 Remove the bolt.

   3.3 Remove the expansion valve.

4. Install the expansion valve. See **Fig. 1**.

   4.1 Install the expansion valve.

   4.2 Install the bolt.

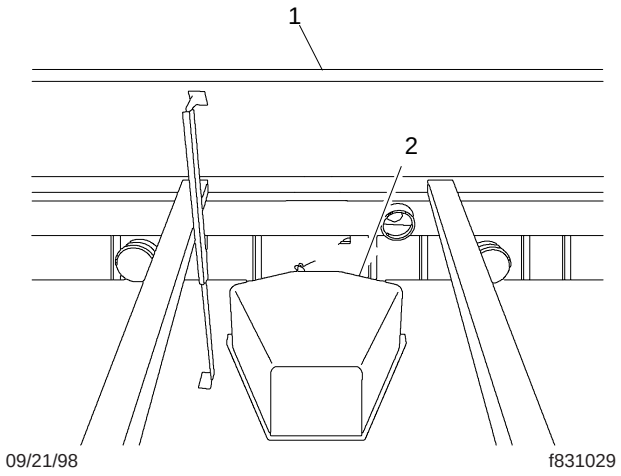
   4.3 Connect the refrigerant lines. See **Specifications, 400**. See **Fig. 1**.

5. Install the evaporator core.
6. Restore the vehicle to operating condition. Evacuate, charge, and leak test the A/C system. For instructions, refer to **Section 83.00**.

Heater Core Removal and Installation

Removal

1. Drain the engine coolant. Refer to **Group 20**.
2. Raise the lower bunk, then remove the auxiliary heating and air conditioning assembly shroud. See **Fig. 1**.

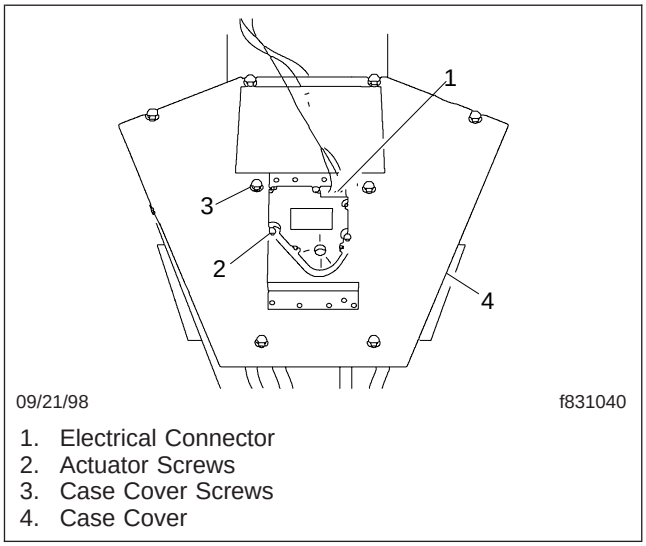


1. Lower Bunk
2. Auxiliary Heating and Air Conditioning Assembly Shroud

Fig. 1, Auxiliary Heating and Air Conditioning Assembly Shroud

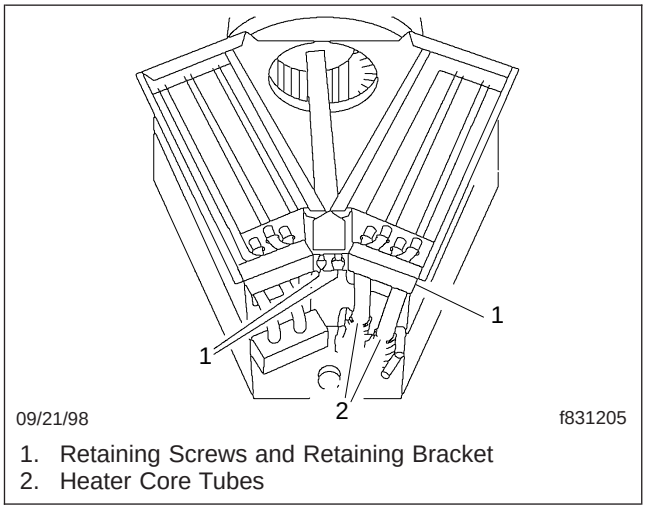
NOTE: Care must be taken not to lose the plastic bushing between the blend door actuator and the blend door.

3. Remove the auxiliary heating and air conditioning assembly case cover. See **Fig. 2**.
   - 3.1 Remove the blend door actuator electrical connector.
   - 3.2 Loosen the blend door actuator screws.
   - 3.3 Remove the eight case cover screws.
   - 3.4 Remove the case cover.
4. Remove the heater core. See **Fig. 3**.
   - 4.1 Remove the evaporator core/heater core retaining bracket screws and bracket.
   - 4.2 Disconnect the heater core tubes, and remove the heater core.



1. Electrical Connector
2. Actuator Screws
3. Case Cover Screws
4. Case Cover

Fig. 2, Auxiliary Heating and Air Conditioning Assembly Case Cover



1. Retaining Screws and Retaining Bracket
2. Heater Core Tubes

Fig. 3, Heater Core

Installation

1. Install the heater core. See **Fig. 3**.
   - 1.1 Install the heater core and connect the heater core tubes.
   - 1.2 Install the evaporator core/heater core retaining bracket and bracket screws.
2. Install the auxiliary heating and air conditioning assembly case cover. See **Fig. 2**.

Heater Core Removal and Installation

2.1 Install the case cover.

2.2 Install the eight case cover screws.

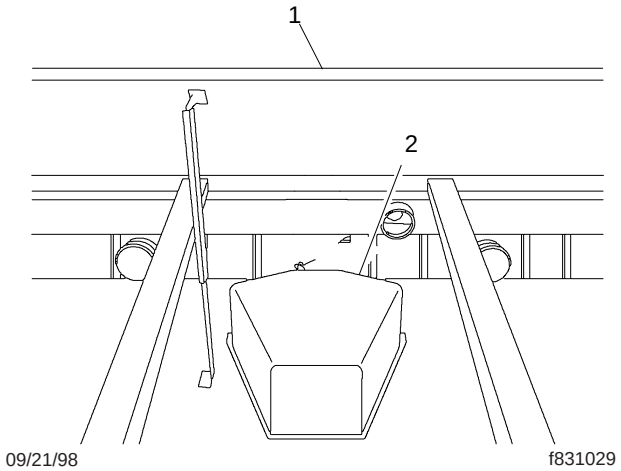
2.3 Tighten the blend door actuator screws.

2.4 Install the blend door actuator electrical connector.

3. Install the auxiliary heating and air conditioning assembly shroud and lower bunk. See **Fig. 1**.
4. Restore the vehicle to operating condition. Refill the engine cooling system. For instructions, refer to **Group 20**.

Replacement

1. Raise the lower bunk, then remove the auxiliary air conditioning and heating assembly shroud. See **Fig. 1**.



1. Lower Bunk
2. Auxiliary Air Conditioning and Heating Assembly Shroud

Fig. 1, Auxiliary Air Conditioning and Heating Assembly Shroud

NOTE: Care must be taken not to lose the plastic spacers and blend door bushing.

2. Remove the screws and remove the blend door actuator. See **Fig. 2**.

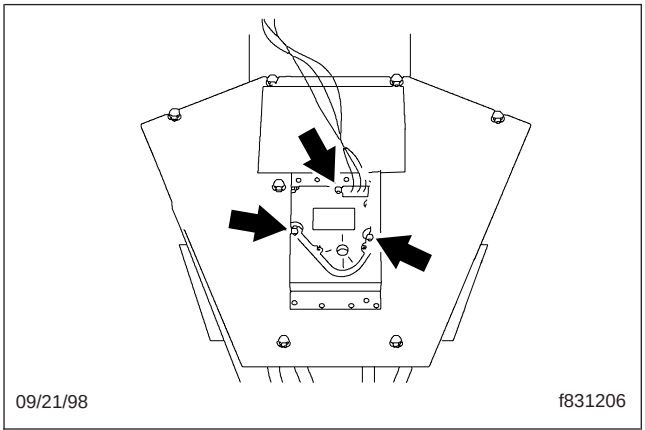


Fig. 2, Blend Door Actuator

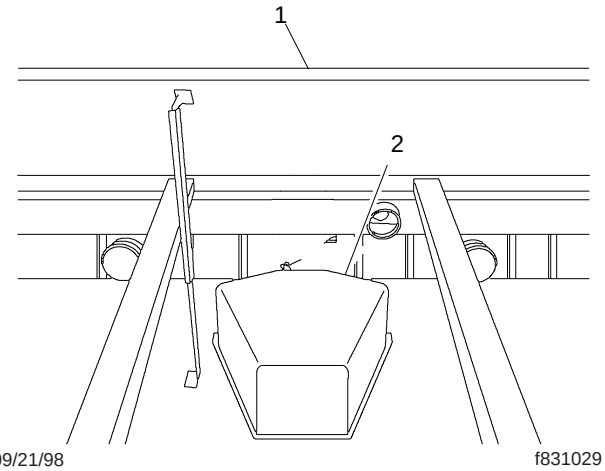
3. Install the blend door actuator and the screws. See **Fig. 2**.
4. Install the auxiliary air conditioning and heating assembly shroud, then lower the lower bunk. See **Fig. 1**.

Replacement

1. Raise the lower bunk, then remove the auxiliary heating and air conditioning assembly shroud. See **Fig. 1**.



1. Lower Bunk
2. Auxiliary Heating and Air Conditioning Assembly Shroud

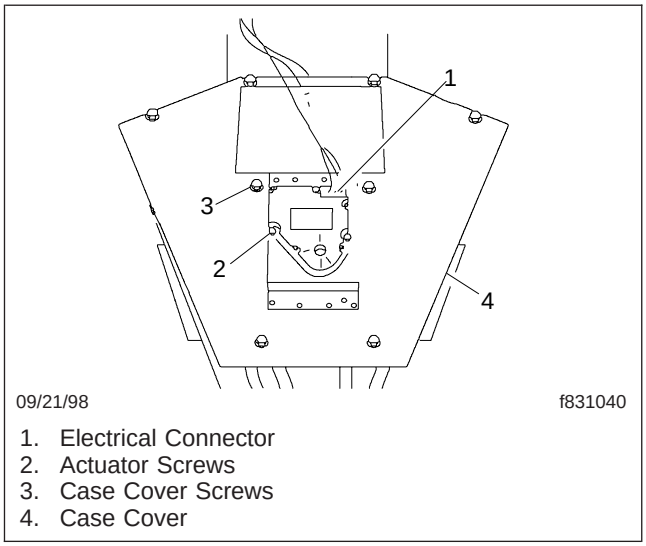
Fig. 1, Auxiliary Heating and Air Conditioning Assembly Shroud

NOTE: Care must be taken not to lose the plastic bushing between the blend door actuator and the blend door.

2. Remove the auxiliary heating and air conditioning assembly case cover. See **Fig. 2**.
   - 2.1 Remove the blend door actuator electrical connector.
   - 2.2 Loosen the blend door actuator screws.
   - 2.3 Remove the eight case cover screws.
   - 2.4 Remove the case cover.
3. Push down on the end of the blend door, and remove it from the case. See **Fig. 3**.

NOTE: Installing the blend door plastic bushing on the blend door shaft will facilitate the installation process.

4. Install the blend door in the case. See **Fig. 3**.



1. Electrical Connector
2. Actuator Screws
3. Case Cover Screws
4. Case Cover

Fig. 2, Auxiliary Heating and Air Conditioning Assembly Case Cover

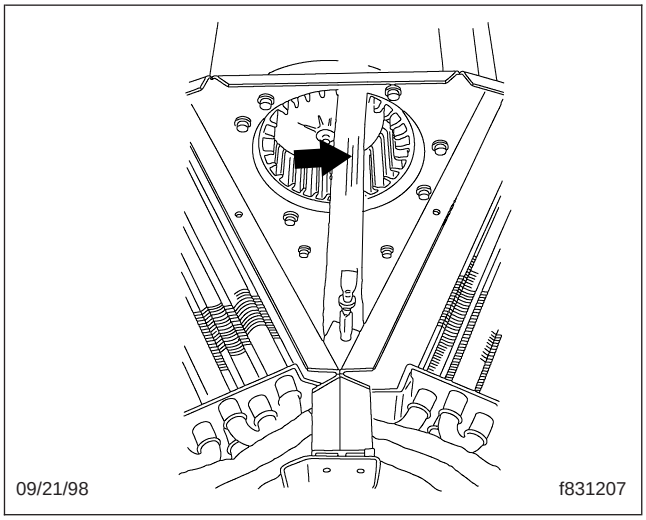


Fig. 3, Blend Door Removal/Installation

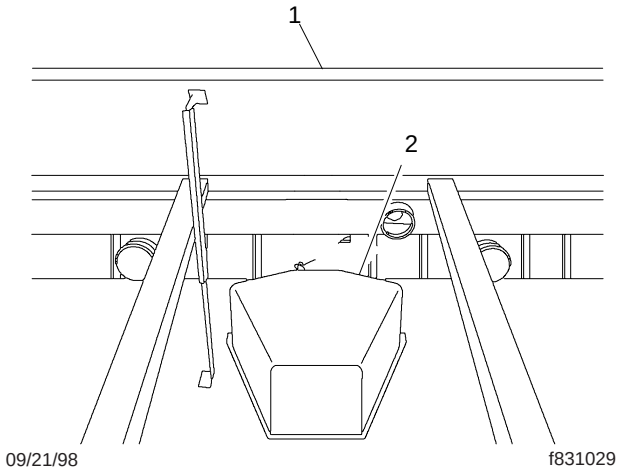
5. Install the auxiliary heating and air conditioning assembly case cover. See **Fig. 2**.
   - 5.1 Install the case cover.
   - 5.2 Install the eight case cover screws.
   - 5.3 Tighten the blend door actuator screws.
   - 5.4 Install the blend door actuator electrical connector.

Blend Door Replacement

6. Install the auxiliary heating and air conditioning assembly shroud, then lower the lower bunk. See **Fig. 1**.

Replacement

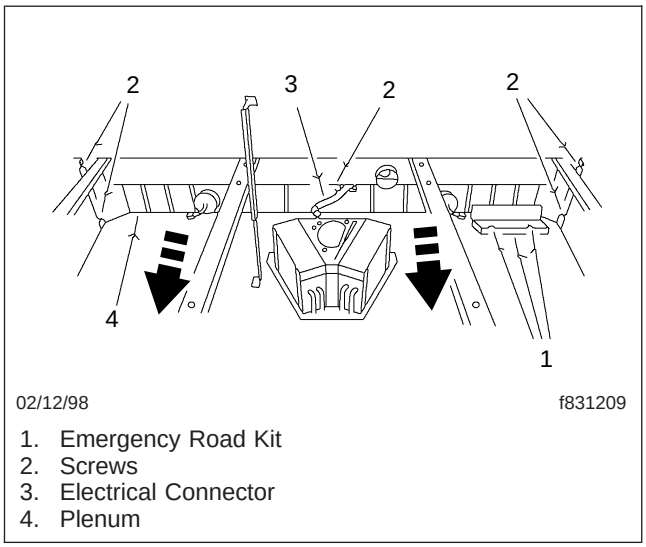
1. Raise the lower bunk, then remove the auxiliary air conditioning and heating assembly shroud. See **Fig. 1**.



1. Lower Bunk
2. Auxiliary Air Conditioning and Heating Assembly Shroud

Fig. 1, Auxiliary Air Conditioning and Heating Assembly Shroud

2. Remove the blower housing.
3. Remove the cargo lamps.
4. Pull the rear plenum duct forward to gain access to the lower register ductwork. See **Fig. 2**.
   - 4.1 Remove the emergency road kit.
   - 4.2 Remove the plenum retaining screws.
   - 4.3 Disconnect the main 10-pin auxiliary air conditioning and heating assembly electrical connector.
   - 4.4 Tilt the bottom of the plenum forward, and pull the plenum forward.
5. Disconnect the lower register ductwork and remove the rear plenum duct. See **Fig. 3**.
6. Install the rear plenum duct and connect the lower register ductwork. See **Fig. 3**.
7. Install the cargo lamps.
8. Install the blower housing.



1. Emergency Road Kit
2. Screws
3. Electrical Connector
4. Plenum

Fig. 2, Accessing Lower Register Ductwork

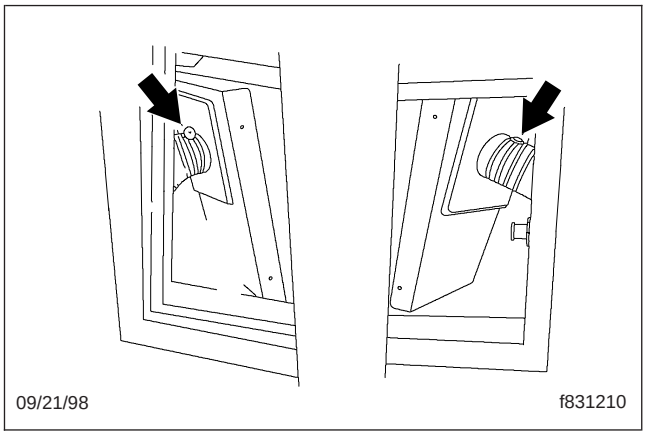


Fig. 3, Lower Register Ductwork

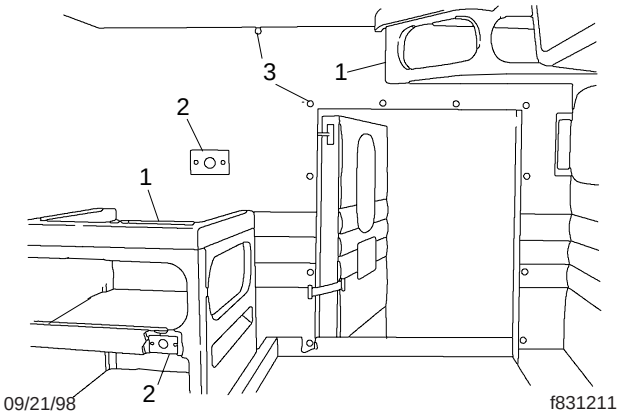
9. Install the auxiliary air conditioning and heating assembly shroud, then lower the lower bunk. See **Fig. 1**.

Right-Hand Lower Register Replacement

1. Remove the right-hand lower trim panel. See **Fig. 1**.



1. Storage Accessories
2. Power Points
3. Trim Panel Screws

Fig. 1, Right-Hand Lower Trim Panel

   1.1 Remove the storage accessories.

   1.2 Remove both power points.

   1.3 Remove the screws, and remove the trim panel.

2. Remove the rear lower trim panel.
3. Remove the right-hand lower register. See **Fig. 2**.

   3.1 Remove the register retaining screw.

   3.2 Remove the retaining screws, and disconnect the upper and lower ductwork.

   3.3 Remove the register.

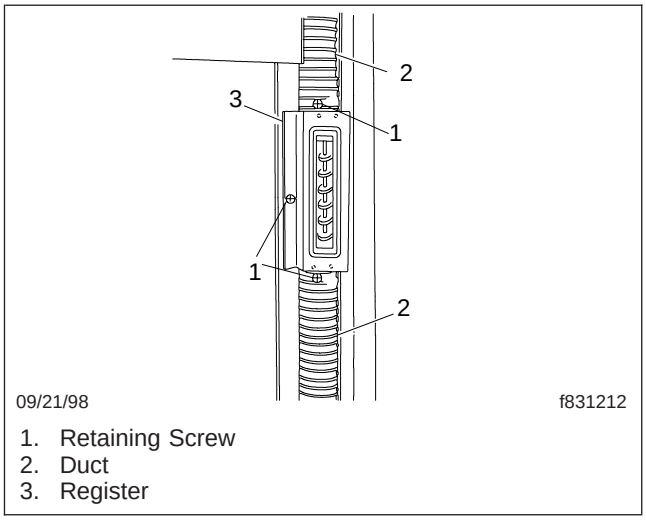
4. Install the right-hand lower register. See **Fig. 2**.

   4.1 Install the register.

   4.2 Connect the upper and lower ductwork and install the retaining screws.

   4.3 Install the register retaining screw.

5. Install the rear lower trim panel.



1. Retaining Screw
2. Duct
3. Register

Fig. 2, Right-Hand Lower Register

6. Install the right-hand lower trim panel. See **Fig. 1**.

   6.1 Install the trim panel and the screws.

   6.2 Install both power points.

   6.3 Install the storage accessories.

Left-Hand Lower Register Replacement

1. Remove the left-hand lower trim panel. See **Fig. 3**.

   1.1 Remove the storage accessories.

   1.2 Remove the vent trim.

   1.3 Remove the reading lamp.

   1.4 Remove the retaining screws and remove the trim panel.

2. Remove the rear lower trim panel.
3. Remove the left-hand lower register. See **Fig. 4**.

   3.1 Remove the register retaining screw.

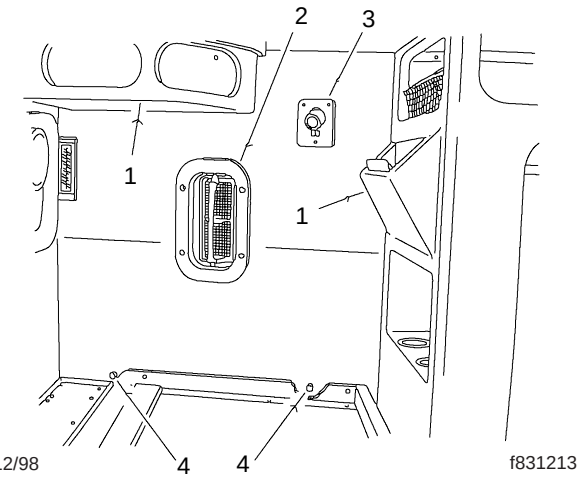
   3.2 Remove the retaining screws, and disconnect the upper and lower ductwork.

   3.3 Remove the register.

4. Install the left-hand lower register. See **Fig. 4**.

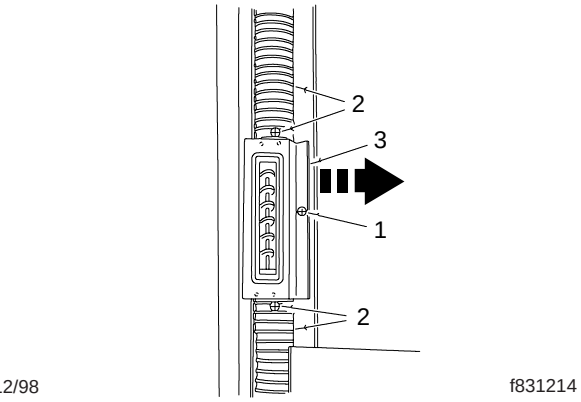
   4.1 Install the register.

Register Replacement



1. Storage Accessories
2. Vent Trim
3. Reading Lamp
4. Trim Panel Screws

Fig. 3, Left-Hand Lower Trim Panel



1. Retaining Screw
2. Duct and Retaining Screw
3. Register

Fig. 4, Left-Hand Lower Register

4.2 Connect the upper and lower ductwork and install the retaining screws.

4.3 Install the register retaining screw.

5. Install the rear lower trim panel.
6. Install the left-hand lower trim panel. See **Fig. 3**.

6.1 Install the trim panel and the retaining screws.

6.2 Install the reading lamp.

6.3 Install the vent trim.

6.4 Install the storage accessories.

Troubleshooting

INSPECTION AND VERIFICATION

Before doing any testing on the auxiliary air conditioning and heating system, make sure the front air conditioning and heating system is functioning properly and that the engine cooling system is functioning properly. Refer to diagnosis and testing of the front air conditioning and heating system. Refer to **Group 20** for diagnosis and testing of the engine cooling system.

Diagnosis and testing of the auxiliary air conditioning and heating evaporator core and heater core is the same as the front air conditioning and heating evaporator core and heater core.

1. Verify the owner's original concern by operating the system to duplicate the concern.
2. Visually inspect for obvious signs of mechanical and electrical damage. Refer to the following chart:

Visual Inspection Chart	
Mechanical	**Electrical**
Damaged evaporator core	Open fuse: sleeper fuse junction panel Fuse 6 (30 A) or Fuse 22 (25 A)
Damaged heater core	Damaged HVAC relay or blower relay
Kinked, bent or damaged A/C or coolant hoses	Damaged circuitry
Damaged blower motor housing	Corroded connectors
Damaged ductwork	Damaged control panel components
Damaged A/C heater assembly housing	
Coolant leak	
Refrigerant leak	

Table 1, Visual Inspection Chart

3. If the fault is not visually evident, determine the problem and proceed to the problem charts.

Problem—Insufficient or No Heat

Problem—Insufficient or No Heat	
Possible Cause	**Remedy**
Inoperative blend door actuator	Repair or replace as necessary.
Damaged blend door	
Plugged or partially plugged heater core—internally or externally	

Problem—Insufficient Cooling

Problem—Insufficient Cooling	
Possible Cause	**Remedy**
Inoperative blend door actuator	Repair or replace as necessary.
Damaged blend door	
Plugged or partially plugged evaporator core—internally or externally	
Damaged evaporator expansion valve	

Troubleshooting

Problem—No Operation in All Temperature Settings

Problem—No Operation in All Temperature Settings

Table 1, Torque Specifications

General Information

The auxiliary air conditioning and heating system is standard on the SilverStar sleeper. This system is equipped with an auxiliary air conditioning and heating assembly, an auxiliary climate control assembly, an auxiliary air conditioning control module, a return air temperature sensor and the ducts and registers for the direction of air distribution.

AUXILIARY AIR CONDITIONING AND HEATING ASSEMBLY

The auxiliary air conditioning and heating assembly is a one-piece unit mounted on the right-hand rear of the sleeper, under the lower bunk. Some components of the assembly, including the auxiliary blower motor, the auxiliary blower motor resistor, the auxiliary air conditioning temperature blend door actuator and the air conditioning evaporator expansion valve are serviceable from inside the sleeper. The internal components of the assembly, including the heater core, the evaporator core and the temperature blend door are serviced on-bench.

AUXILIARY CLIMATE CONTROL PANEL

The auxiliary climate control panel located in the control panel assembly provides settings for temperature, function selection (ON/OFF) and blower speed selection.

AUXILIARY AIR CONDITIONING CONTROL MODULE

The auxiliary air conditioning control module controls the positioning of the temperature blend door. Using input signals from the temperature potentiometer switch in the auxiliary climate control panel and the return air temperature sensor in the auxiliary air conditioning and heating assembly, the auxiliary air conditioning control module provides an output to the auxiliary air conditioning temperature blend door actuator to properly position the temperature blend door.

RETURN AIR TEMPERATURE SENSOR

The return air temperature sensor is located in the right-hand rear corner of the sleeper, under the lower bunk, and adjacent to the auxiliary air conditioning and heating assembly blower motor air inlet. The sensor provides return air temperature input signals to the auxiliary air conditioning control module.

DUCTS AND REGISTERS

The ducts and registers of the auxiliary air conditioning and heating system provide air distribution to the lower, mid and upper portions of the sleeper.

Auxiliary Air Conditioning and Heating Assembly Replacement

Replacement

1. Recover the air conditioning system refrigerant. For instructions, see Section 83.00, **Subject 110**.
2. Disconnect the battery ground cable.
3. Place a suitable container under the sleeper to collect the coolant.
4. Clamp off the auxiliary heater jumper hoses near the bulkhead elbows under the sleeper. See **Fig. 1**.

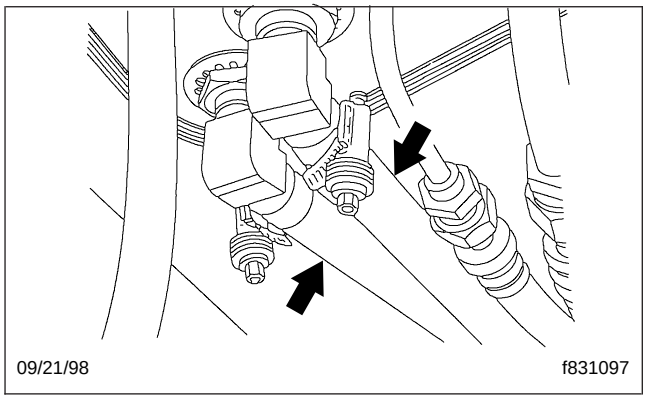

Fig. 1, Auxiliary Heater Jumper Hoses

⚠ WARNING

The engine must be off and fully cool, and the cooling system fully depressurized before attempting to disconnect any heater hoses. Failure to comply with these warnings can result in serious injury and burns from hot liquid escaping from the engine cooling system.

5. Disconnect the auxiliary heater jumper hoses from the bulkhead elbows and allow the coolant to drain from the heater core and auxiliary heater hoses.
6. Raise the lower bunk.
7. Disconnect the auxiliary air conditioning control module electrical connector. See **Fig. 2**.
8. Remove the retaining screws, then remove the auxiliary air conditioning and heating assembly shield. See **Fig. 3**.
9. Disconnect the air distribution ducts. See **Fig. 4**.
10. Remove the auxiliary air conditioning and heating assembly. See **Fig. 5**.

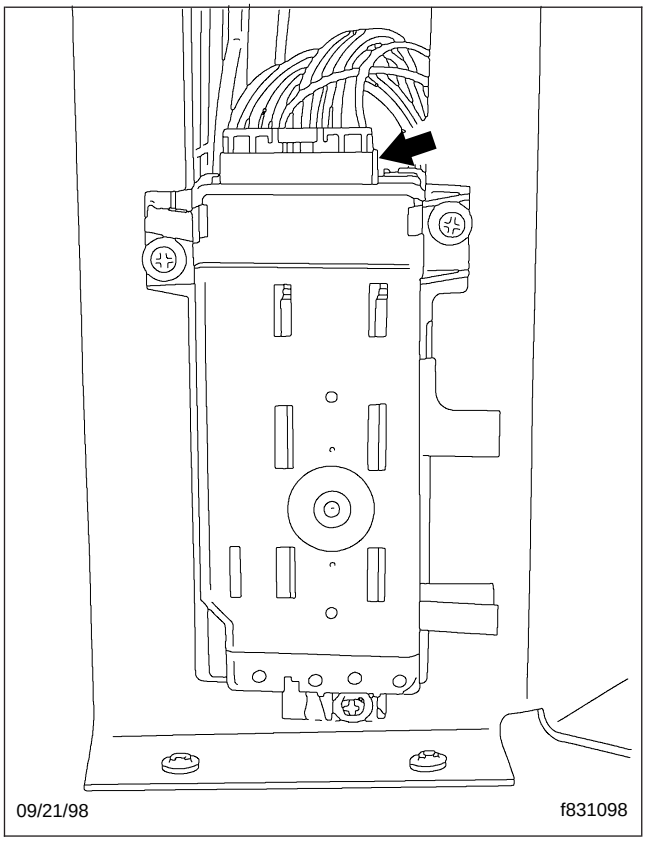

Fig. 2, Auxiliary Air Conditioning Control Module Electrical Connector

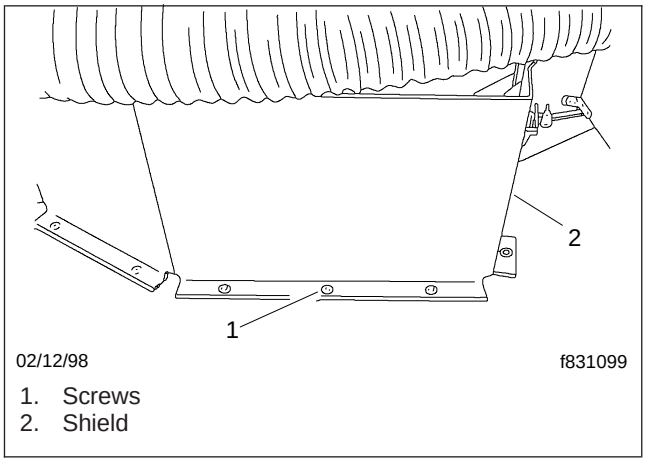

1. Screws
2. Shield

Fig. 3, Auxiliary Air Conditioning and Heating Assembly Shield

10.1 Disconnect the auxiliary heater hoses from the heater core.

Auxiliary Air Conditioning and Heating Assembly Replacement

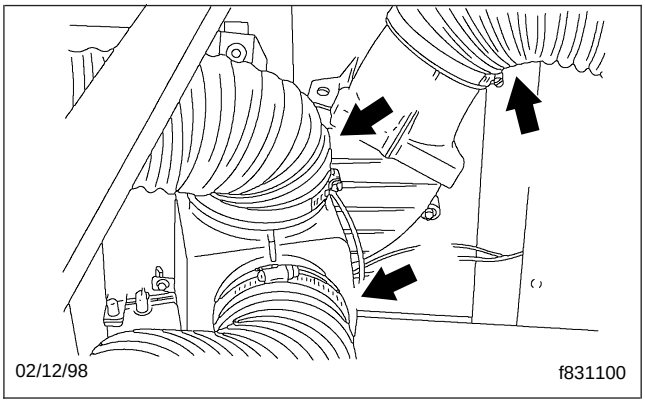

Fig. 4, Air Distribution Ducts

10.2 Disconnect the evaporator core from the thermal expansion valve.

10.3 Disconnect the electrical connectors.

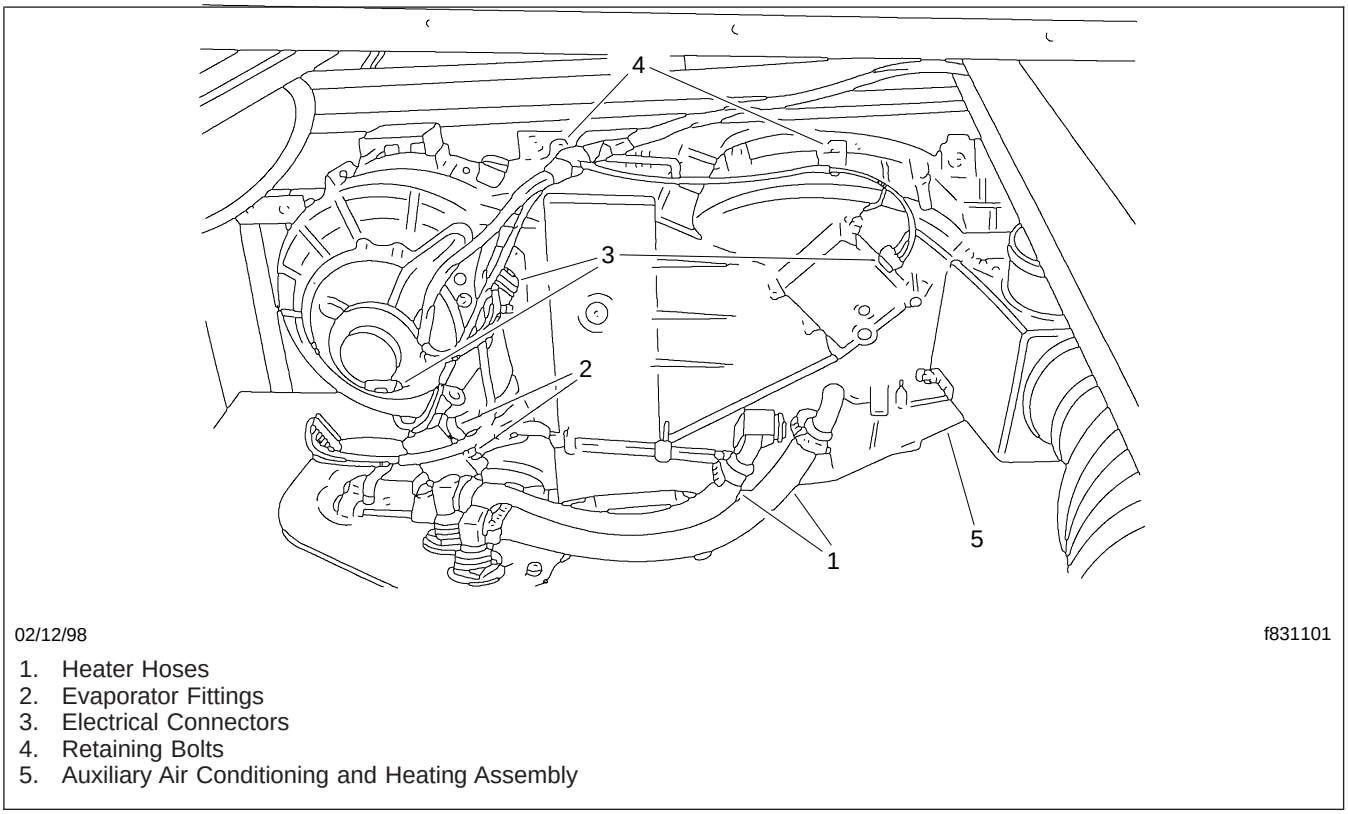
10.4 Remove the auxiliary air conditioning and heating assembly retaining bolts.

10.5 Remove the auxiliary air conditioning and heating assembly.

11. Install the auxiliary air conditioning and heating assembly. See **Fig. 5**.
12. Install the auxiliary air conditioning and heating assembly retaining bolts.
13. Connect the electrical connectors.
14. Connect the evaporator core to the thermal expansion valve.
15. Connect the auxiliary heater hoses to the heater core.
16. Connect the air distribution ducts. See **Fig. 4**.
17. Install the auxiliary air conditioning and heating assembly shield. See **Fig. 3**.

    17.1 Install the auxiliary air conditioning and heating assembly shield.

    17.2 Install the retaining screws.



1. Heater Hoses
2. Evaporator Fittings
3. Electrical Connectors
4. Retaining Bolts
5. Auxiliary Air Conditioning and Heating Assembly

Fig. 5, Auxiliary Air Conditioning and Heating Assembly

18. Connect the auxiliary air conditioning control module electrical connector. See **Fig. 2**.
19. Lower the lower bunk.
20. Connect the auxiliary heater jumper hoses from the bulkhead elbows.
21. Remove clamps from the auxiliary heater jumper hoses near the bulkhead elbows under the sleeper. See **Fig. 1**.
22. Connect the battery ground cable.

CAUTION

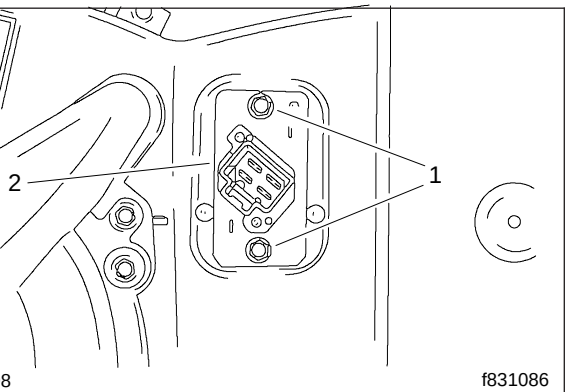
Make certain that the auxiliary heater hose connections are installed correctly and that the heater hoses cannot become pinched.

23. Fill and bleed the cooling system. For instructions, refer to **Group 20**.
24. Evacuate, charge and leak-test the air conditioning system.

Auxiliary Heater Blower Motor Resistor Replacement

Replacement

1. Disconnect the battery ground cable.
2. Raise the lower bunk.
3. Disconnect the auxiliary heater blower motor resistor electrical connector.
4. Remove the retaining screws, then remove the resistor. See **Fig. 1**.



1. Retaining Screws
2. Resistor

Fig. 1, Auxiliary Heater Blower Motor Resistor

5. Install the auxiliary heater blower motor resistor. See **Fig. 1**.
   - 5.1 Install the auxiliary heater blower motor resistor.
   - 5.2 Install the auxiliary heater blower motor resistor retaining screws.
6. Connect the auxiliary heater blower motor resistor electrical connector.
7. Lower the lower bunk.
8. Connect the battery ground cable.

Auxiliary Heater Blower Motor Replacement

Replacement

1. Disconnect the battery ground cable.
2. Disconnect the auxiliary air conditioning control module electrical connector. See **Fig. 1**.

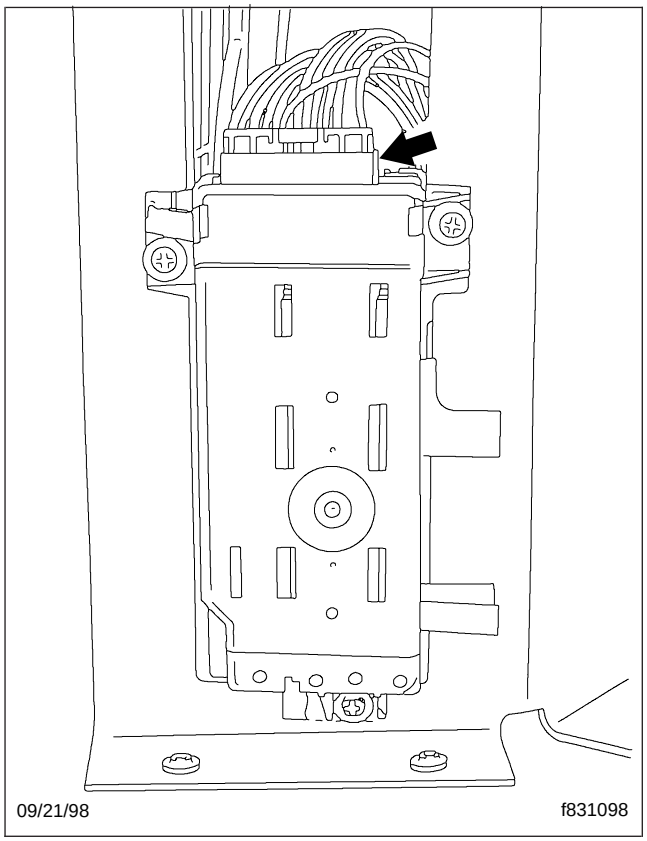


Fig. 1, Auxiliary Air Conditioning Control Module Electrical Connector

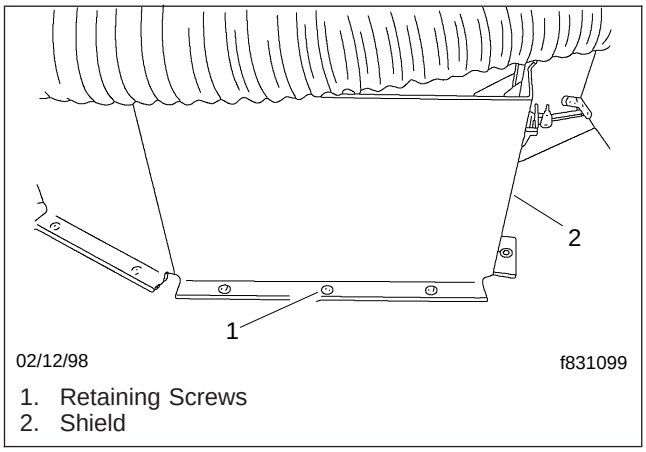
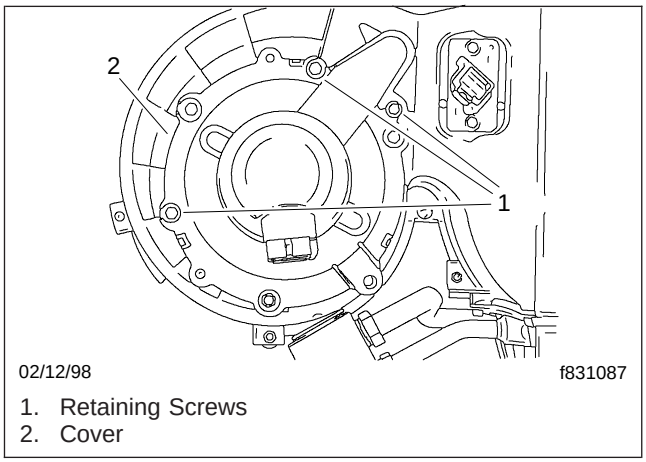
3. Remove the retaining screws, then remove the auxiliary air conditioning and heating assembly shield. See **Fig. 2**.
4. Disconnect the auxiliary heater blower motor electrical connector.
5. Remove the auxiliary heater blower motor cover. See **Fig. 3**.
   - 5.1 Remove the auxiliary heater blower motor cover retaining screws.
   - 5.2 Remove the auxiliary heater blower motor cover.



1. Retaining Screws
2. Shield

Fig. 2, Auxiliary Air Conditioning and Heating Assembly Shield

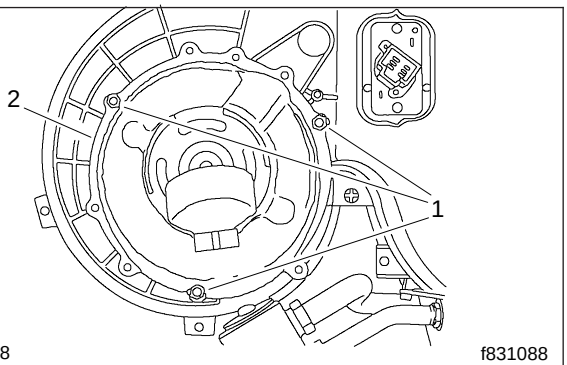


1. Retaining Screws
2. Cover

Fig. 3, Auxiliary Heater Blower Motor Cover

6. Remove the auxiliary heater blower motor retaining screws, then remove the auxiliary heater blower motor. See **Fig. 4**.
7. Install the auxiliary heater blower motor retaining screws, then install the auxiliary heater blower motor. See **Fig. 4**.
8. Install the auxiliary heater blower motor cover retaining screws, install the auxiliary heater blower motor cover. See **Fig. 3**.
9. Connect the auxiliary heater blower motor electrical connector.
10. Install the auxiliary air conditioning and heating assembly shield and install the retaining screws. See **Fig. 2**.

Auxiliary Heater Blower Motor Replacement



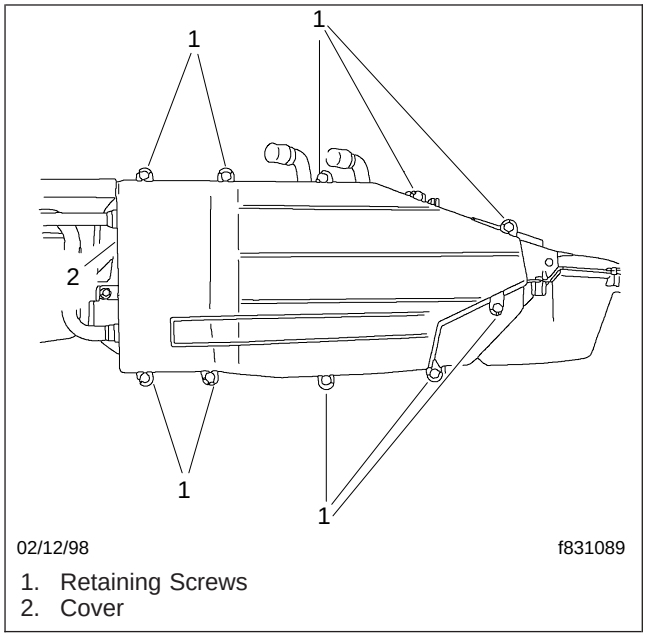
1. Retaining Screws
2. Blower Motor

Fig. 4, Auxiliary Heater Blower Motor

11. Connect the auxiliary air conditioning control module electrical connector. See **Fig. 1**.
12. Connect the battery ground cable.

Replacement

1. Remove the auxiliary air conditioning and heating assembly.
2. Remove the heater/evaporator core cover retaining screws, then remove the heater/evaporator core cover. See **Fig. 1**.



1. Retaining Screws
2. Cover

Fig. 1, Heater/Evaporator Core Cover

3. Remove the evaporator core. See **Fig. 2**.

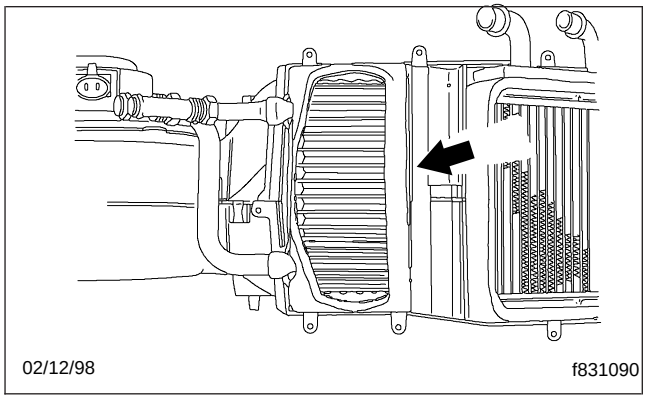


Fig. 2, Evaporator Core

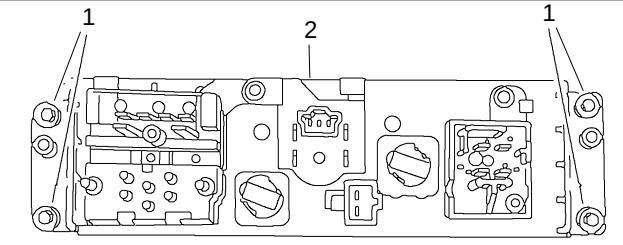
4. Install the evaporator core. See **Fig. 2**.
5. Install the heater/evaporator core cover retaining screws, then install the heater/evaporator core cover. See **Fig. 1**.
6. Install the auxiliary air conditioning and heating assembly.

Auxiliary A/C-Heater Control Assembly Replacement

Replacement

1. Disconnect the battery ground cable.
2. Remove the auxiliary A/C-heater control back cover.
3. Disconnect the auxiliary A/C-heater control assembly electrical connectors.
4. Remove the auxiliary A/C-heater control assembly retaining screws, then remove the auxiliary A/C-heater control assembly. See **Fig. 1**.



1. Retaining Screws
2. Control

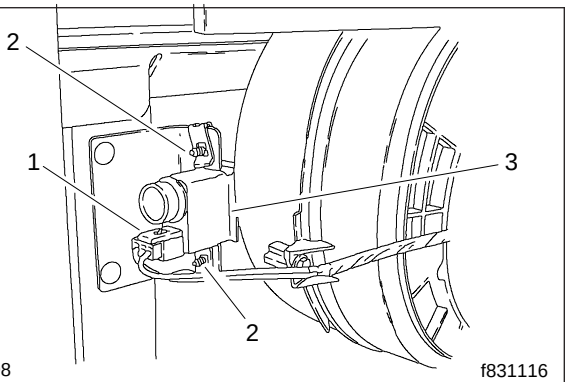
Fig. 1, Auxiliary A/C-Heater Control Assembly

5. Install the auxiliary A/C-heater control assembly retaining screws, then install the auxiliary A/C-heater control assembly. See **Fig. 1**.
6. Connect the auxiliary A/C-heater control assembly electrical connectors.
7. Install the auxiliary A/C-heater control back cover.
8. Connect the battery ground cable.

Automatic Temperature Sensor Control Assembly Replacement

Replacement

1. Remove the blower motor. For instructions, see **Subject 120**.
2. Remove the automatic temperature control sensor. See **Fig. 1.**



1. Electrical Connector
2. Screws
3. Sensor

Fig. 1, Automatic Temperature Control Sensor

2.1 Disconnect the electrical connector.

2.2 Remove the screws.

2.3 Remove the sensor.

3. Install the automatic temperature control sensor. See **Fig. 1**.

3.1 Install the sensor.

3.2 Install the screws.

3.3 Connect the electrical connector.

4. Install the blower motor.

Auxiliary Heater Hose Replacement

Replacement

1. Place a suitable container under the sleeper to collect the coolant.
2. Clamp off the auxiliary heater jumper hoses. See **Fig. 1**.

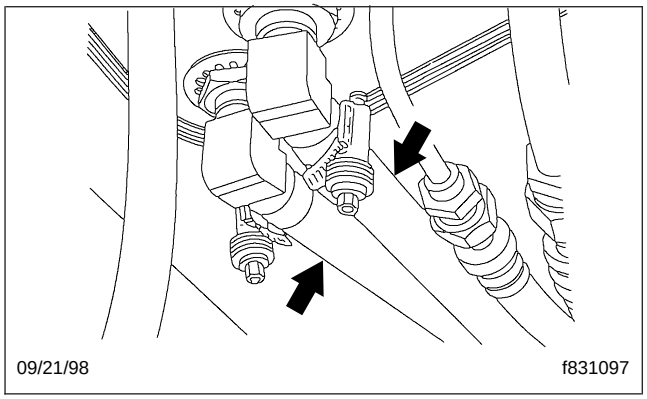


Fig. 1, Auxiliary Heater Jumper Hoses

⚠ WARNING

The engine must be off and fully cool and the cooling system fully depressurized before attempting to disconnect any heater hoses. Failure to comply with these warnings can result in serious injury and burns from hot liquid escaping from the engine cooling system.

3. Disconnect the auxiliary heater jumper hoses from the bulkhead elbows and allow the coolant to drain from the heater core and auxiliary heater hoses.
4. Disconnect the auxiliary air conditioning control module electrical connector. See **Fig. 2**.
5. Remove the retaining screws, then remove the auxiliary air conditioning and heating assembly shield. See **Fig. 3**.
6. Disconnect the auxiliary heater hoses from the heater core. See **Fig. 4**.
7. Disconnect the auxiliary heater hoses from the bulkhead elbows.
8. Remove the auxiliary heater hoses.
9. Connect the auxiliary heater hoses from the bulkhead elbows. See **Fig. 4**.

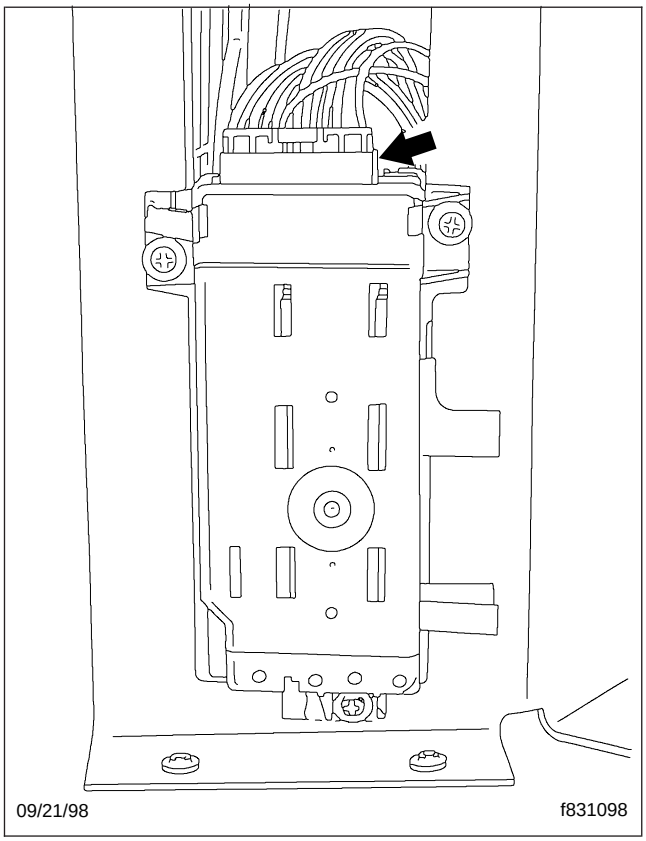

Fig. 2, Auxiliary Air Conditioning Control Module Electrical Connector

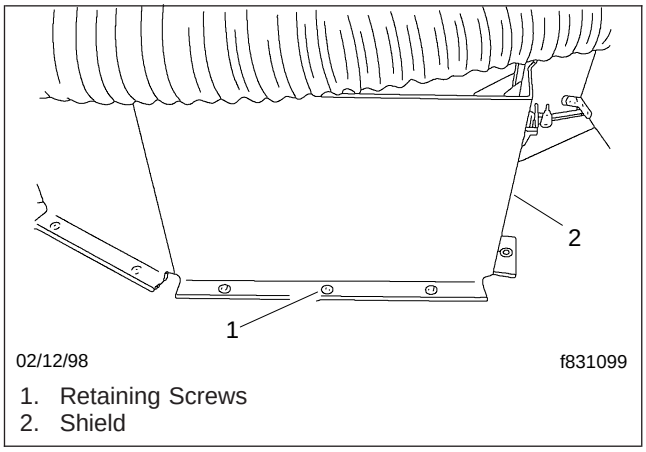
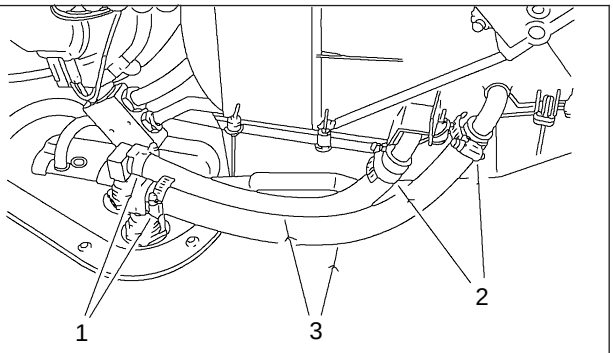


1. Retaining Screws
2. Shield

Fig. 3, Auxiliary Air Conditioning and Heating Assembly Shield

10. Connect the auxiliary heater hoses to the heater core.

Auxiliary Heater Hose Replacement



1. Heater Hoses (heater core side)
2. Heater Hoses (bulkhead side)
3. Heater Hoses

Fig. 4, Auxiliary Heater Hoses

11. Install the auxiliary air conditioning and heating assembly shield, then Install the retaining screws. See **Fig. 3**.
12. Connect the auxiliary air conditioning control module electrical connector. See **Fig. 2**.
13. Connect the auxiliary heater jumper hoses to the bulkhead elbows.
14. Remove clamps from the auxiliary heater jumper hoses. See **Fig. 1**.

⚠ CAUTION

Make certain that the auxiliary heater hose connections are installed correctly and that the auxiliary heater hoses cannot become pinched.

15. Refill and bleed the cooling system. For instructions, refer to **Group 20**.

Auxiliary Heater Jumper Hose Replacement

Rear Hose Replacement

1. Close the supply heater water control valve. See **Fig. 1**.

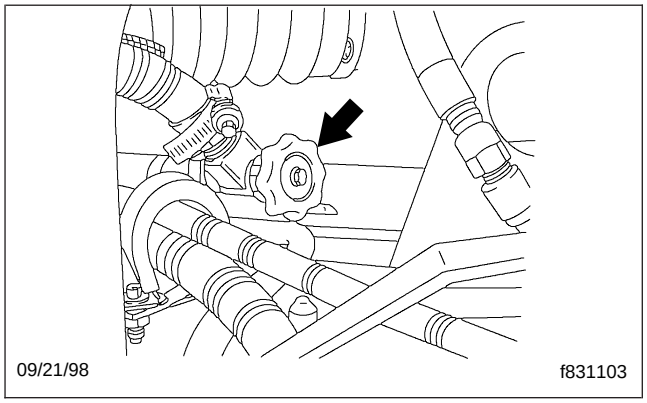


Fig. 1, Supply Heater Water Control Valve

2. Close the return water control valve. See **Fig. 2**.

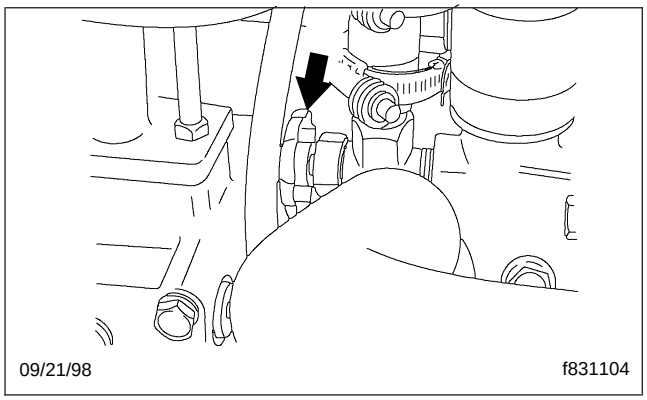

Fig. 2, Return Water Control Valve

3. Place a suitable container under the sleeper to collect the coolant.
4. Disconnect the auxiliary air conditioning control module electrical connector. See **Fig. 3**.
5. Remove the retaining screws, then remove the auxiliary air conditioning and heating assembly shield. See **Fig. 4**.
6. Clamp off the auxiliary heater hoses. See **Fig. 5**.

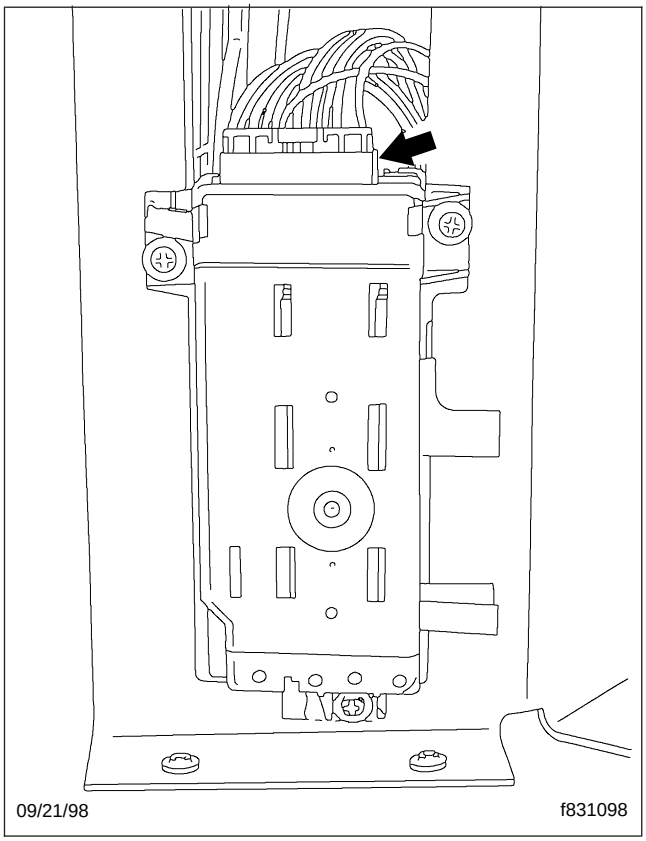

Fig. 3, Auxiliary Air Conditioning Control Module Electrical Connector

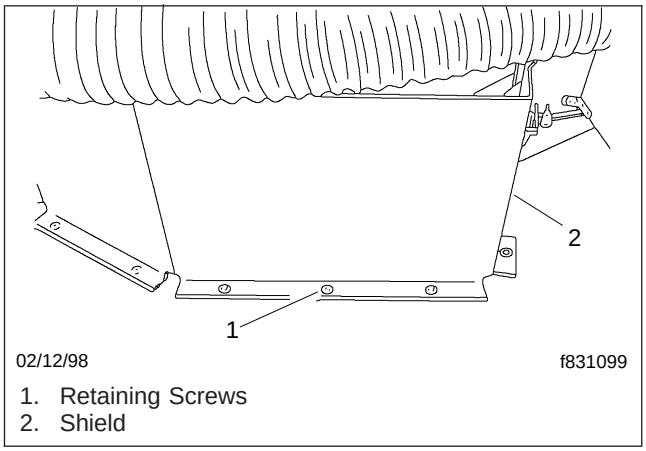

1. Retaining Screws
2. Shield

Fig. 4, Auxiliary Air Conditioning and Heating Assembly Shield

Auxiliary Heater Jumper Hose Replacement

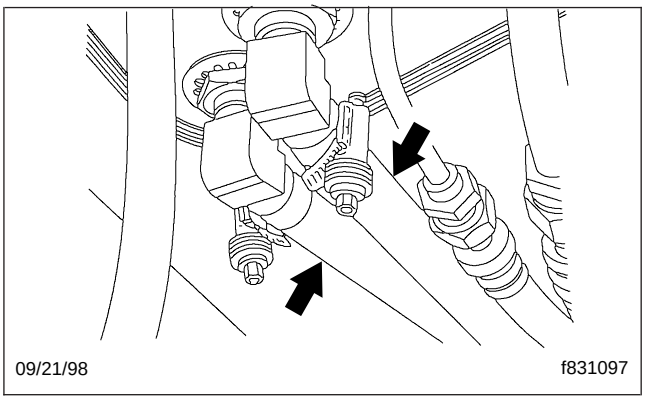

Fig. 5, Auxiliary Heater Hoses

WARNING

The engine must be off and fully cool, and the cooling system fully depressurized before attempting to disconnect any heater hoses. Failure to comply with these warnings can result in serious injury and burns from hot liquid escaping from the engine cooling system.

7. Disconnect the auxiliary heater jumper hoses from the bulkhead elbows.
8. Remove the auxiliary heater jumper hose retaining clamps. See **Fig. 6**.

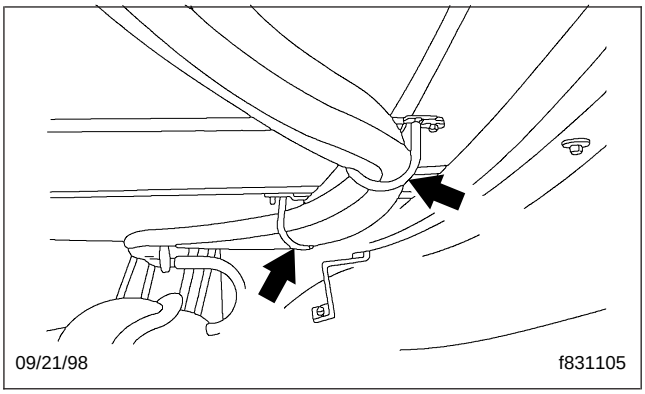

Fig. 6, Auxiliary Heater Jumper Hose Retaining Clamps

9. Remove the body side trim, under the passenger door.
10. Remove the auxiliary heater jumper hoses. See **Fig. 7**.

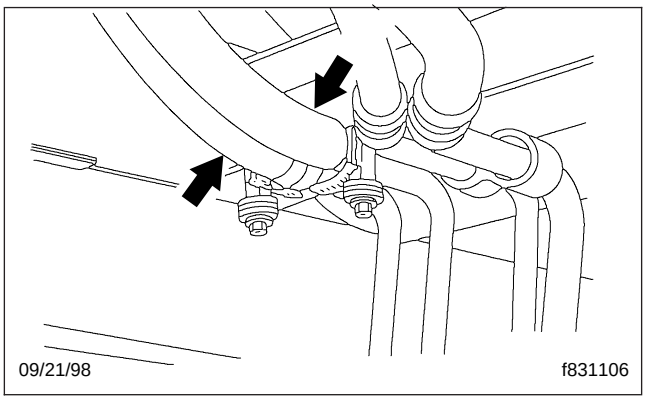

Fig. 7, Auxiliary Heater Jumper Hoses

11. Install the auxiliary heater jumper hoses. See **Fig. 7**.
12. Install the body side trim, under the passenger door.
13. Install the auxiliary heater jumper hose retaining clamps. See **Fig. 6**.
14. Connect the auxiliary heater jumper hoses to the bulkhead elbows.
15. Remove clamps from the auxiliary heater hoses. See **Fig. 5**.
16. Install the auxiliary air conditioning and heating assembly shield, then install the retaining screws. See **Fig. 4**.
17. Connect the auxiliary air conditioning control module electrical connector. See **Fig. 3**.
18. Open the return water control valve. See **Fig. 2**.
19. Open the supply heater water control valve. See **Fig. 1**.

CAUTION

Make certain that the auxiliary heater jumper hose connections are installed correctly and that the auxiliary heater jumper hoses cannot come in contact with any part of the exhaust system, or cannot become pinched.

20. Refill and bleed the cooling system. For instructions, refer to **Group 20**.

Auxiliary Heater Jumper Hose Replacement

Front Hose Replacement

NOTE: The following procedure is a typical procedure and may vary slightly depending on the engine and transmission application.

1. Close the heater water control supply valve. See **Fig. 1**.
2. Close the heater water control return valve. See **Fig. 2**.
3. Position a drain pan below the vehicle to catch any coolant which may escape.
4. Clamp off the auxiliary rear heater coolant jumper line. See **Fig. 8**.

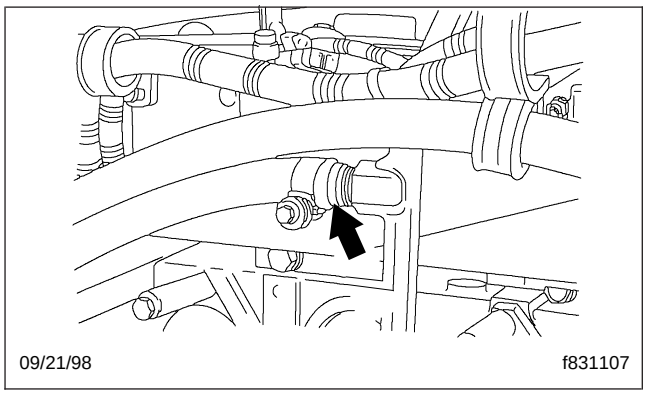

Fig. 8, Auxiliary Rear Heater Coolant Jumper Line

⚠ WARNING

The engine must be off and fully cool, and the cooling system fully depressurized before attempting to disconnect any heater hoses. Failure to comply with these warnings can result in serious injury and burns from hot liquid escaping from the engine cooling system.

5. Disconnect the heater supply hose and retainers from the heater water control supply valve line.
6. Disconnect the heater return hose and retainers from the heater water control return valve line. See **Fig. 9**.
7. Remove the front auxiliary heater jumper hoses. See **Fig. 10**.
8. Install the front auxiliary heater jumper hoses. See **Fig. 10**.

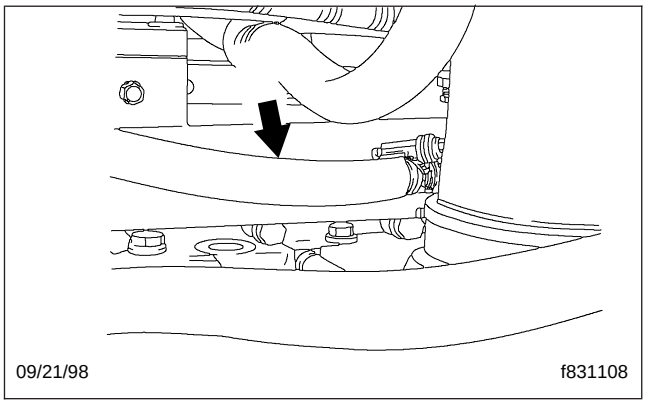

Fig. 9, Heater Return Hose and Retainers

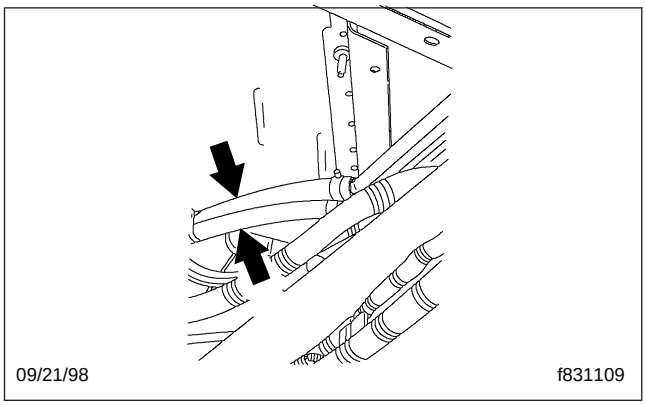

Fig. 10, Front Auxiliary Heater Jumper Hoses

9. Connect the heater return hose and retainers from the heater water control return valve line. See **Fig. 9**.
10. Connect the heater supply hose and retainers to the heater water control supply valve line.
11. Remove clamp from the auxiliary rear heater coolant jumper line. See **Fig. 8**.
12. Open the heater water control return valve. See **Fig. 2**.
13. Open the heater water control supply valve. See **Fig. 1**.

⚠ CAUTION

Make certain that the auxiliary heater jumper hose connections are installed correctly and that the auxiliary heater jumper hoses cannot come in contact with any part of the exhaust system, or cannot become pinched.

Auxiliary Heater Jumper Hose Replacement

14. Refill and bleed the cooling system. For instructions, refer to **Group 20**.

Replacement

1. Disconnect the flexible duct. See **Fig. 1**.

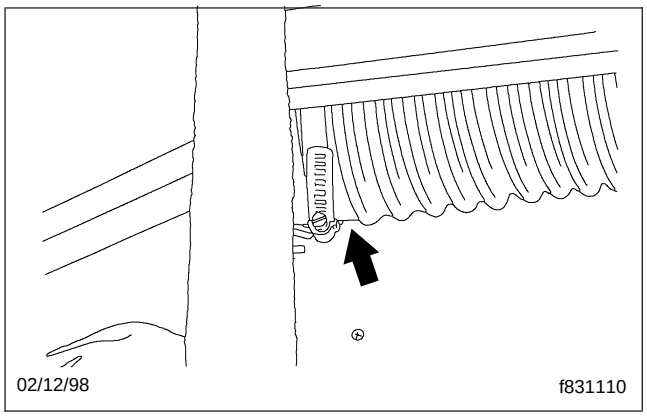

Fig. 1, Flexible Duct

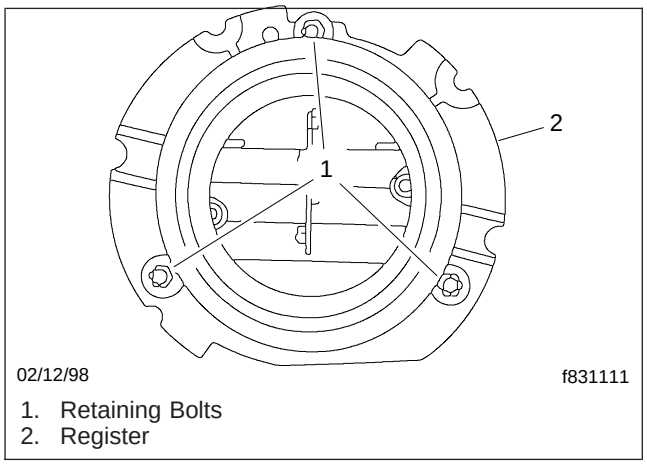
2. Remove the lower register retaining bolts, then remove the lower register. See **Fig. 2**.



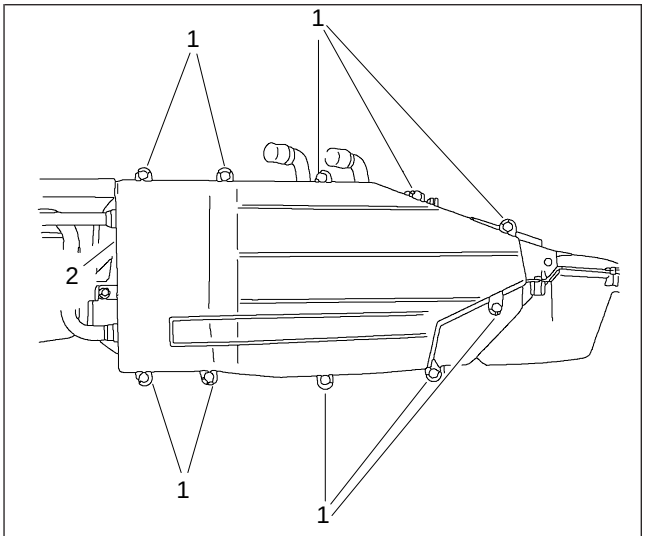
1. Retaining Bolts
2. Register

Fig. 2, Lower Register

3. Install the lower register, then install the lower register retaining bolts. See **Fig. 2**.
4. Connect the flexible duct. See **Fig. 1**.

Replacement

1. Remove the auxiliary air conditioning and heating assembly.
2. Remove the heater/evaporator core cover retaining screws, then remove the cover. See **Fig. 1**.



1. Retaining Screws
2. Cover

Fig. 1, Heater/Evaporator Core Cover

3. Remove the heater core. See **Fig. 2**.

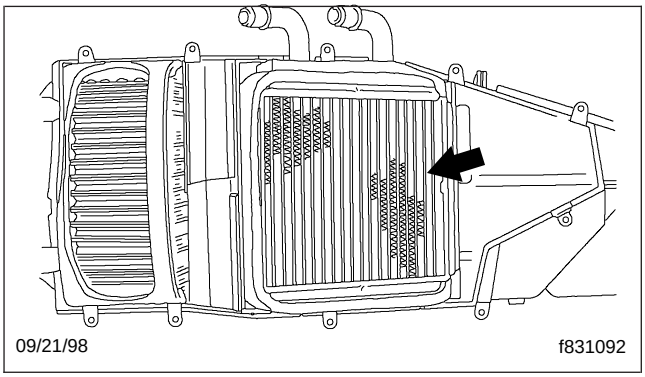


Fig. 2, Heater Core

4. Install the heater core. See **Fig. 2**.
5. Install the heater/evaporator core cover, then install the retaining screws. See **Fig. 1**.
6. Install the auxiliary air conditioning and heating assembly.

Auxiliary Air Conditioning Jumper Line Replacement

Replacement

NOTE: The following procedure is typical and may vary with engine and transmission application.

1. Recover the air conditioning refrigerant from the system. For instructions, refer to **Section 83.00**.
2. Disconnect the battery ground cable.
3. Disconnect the auxiliary air conditioning jumper lines from the bulkhead elbows. See **Fig. 1**.

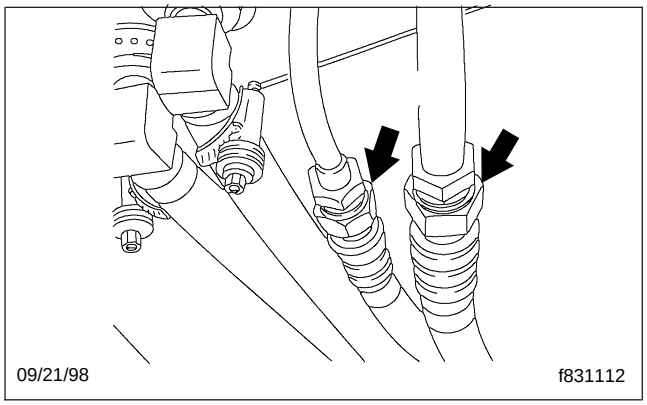

Fig. 1, Auxiliary Air Conditioning Jumper Lines

4. Disconnect the auxiliary air conditioning jumper suction line and the hose retainer from the evaporator-to-compressor line. See **Fig. 2**.
5. Disconnect the auxiliary air conditioning jumper liquid line and all the retainers from the condenser-to-evaporator line. See **Fig. 3**.
6. Remove the auxiliary air conditioning jumper lines.
7. Install the auxiliary air conditioning jumper lines.
8. Connect the auxiliary air conditioning jumper liquid line and all the retainers to the condenser-to-evaporator line. See **Fig. 3**.
9. Connect the auxiliary air conditioning jumper suction line and the hose retainer to the evaporator-to-compressor line. See **Fig. 2**.
10. Connect the auxiliary air conditioning jumper lines to the bulkhead elbows. See **Fig. 1**.
11. Connect the battery ground cable.

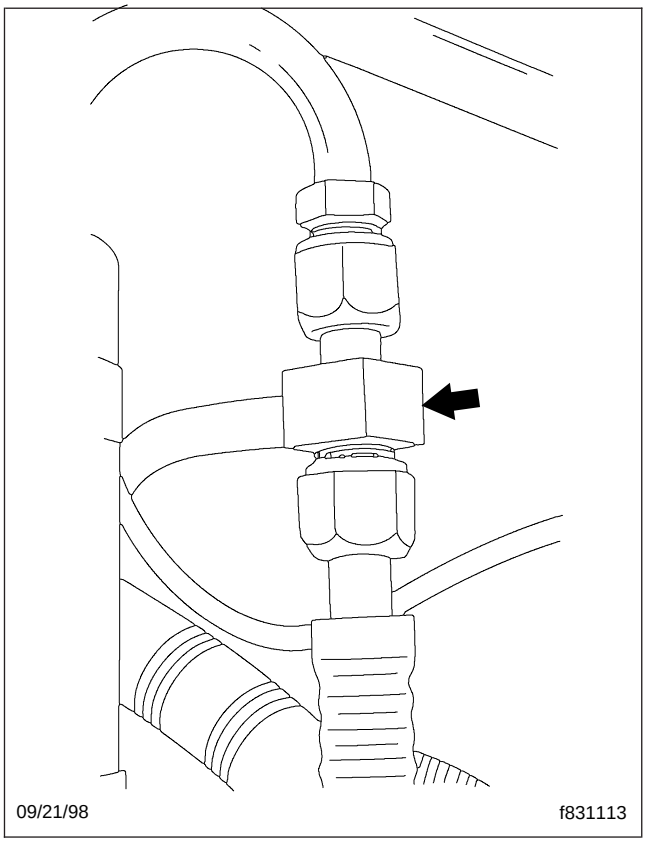

Fig. 2, Auxiliary Air Conditioning Jumper Suction Line

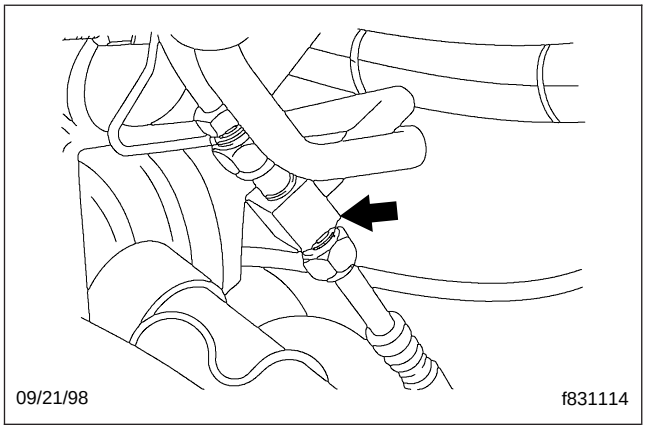

Fig. 3, Auxiliary Air Conditioning Jumper Liquid Line

12. Evacuate, charge and leak-test the air conditioning system. For instructions, refer to **Section 83.00**.

Evaporator Core Expansion Valve Replacement

Replacement

1. Recover the air conditioning refrigerant from the system. For instructions, refer to **Section 83.00**.
2. Disconnect the battery ground cable.
3. Disconnect the auxiliary air conditioning control module electrical connector. See **Fig. 1**.

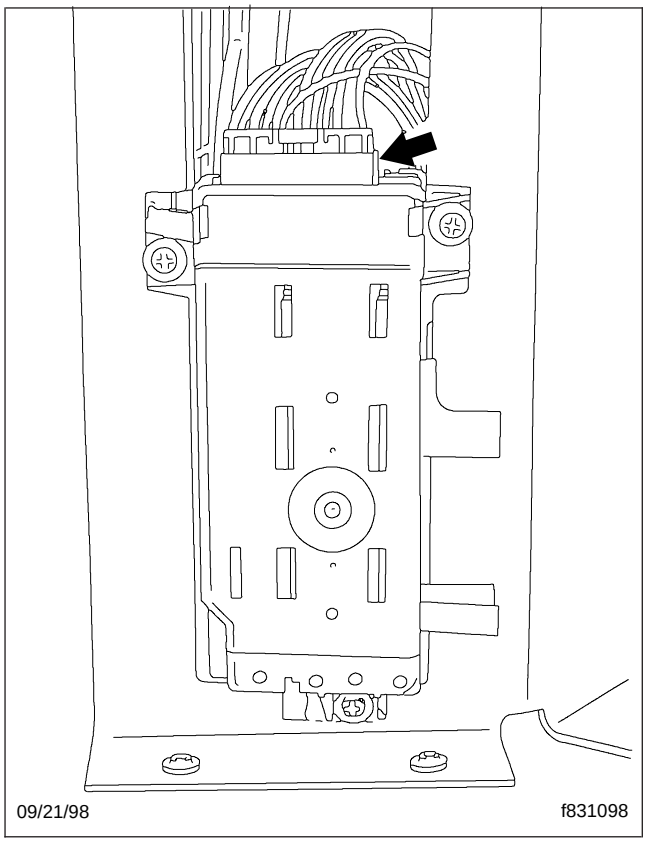

Fig. 1, Auxiliary Air Conditioning Control Module Electrical Connector

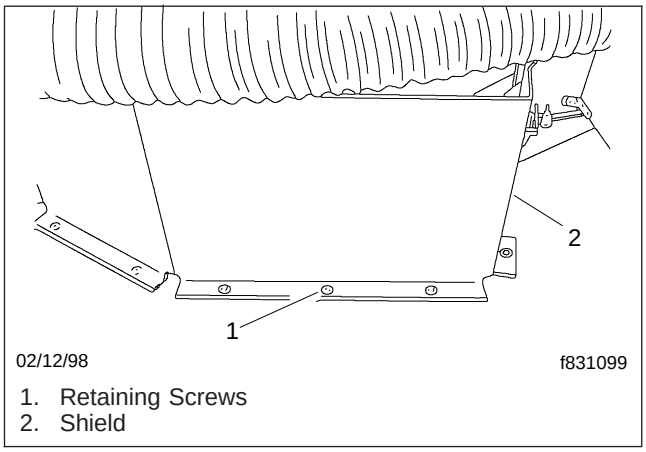
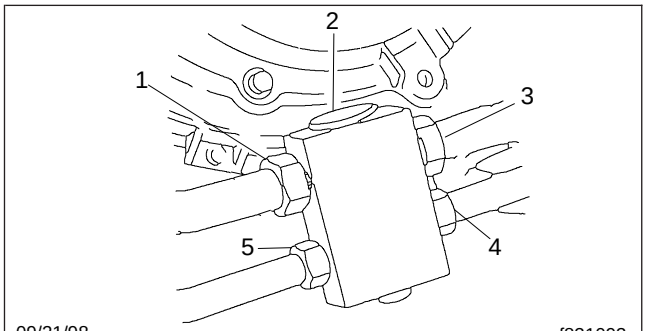
4. Remove the auxiliary air conditioning and heating assembly shield. See **Fig. 2**.
   - 4.1 Remove the retaining screws.
   - 4.2 Remove the auxiliary air conditioning and heating assembly shield.
5. Remove the floor pan opening plate.
6. Remove the thermal expansion valve. See **Fig. 3**.



1. Retaining Screws
2. Shield

Fig. 2, Auxiliary Air Conditioning and Heating Assembly Shield



1. Evaporator Inlet
2. Valve
3. Evaporator Outlet
4. Evaporator Core Inlet
5. Evaporator Core Outlet

Fig. 3, Thermal Expansion Valve

   - 6.1 Disconnect the floor pan opening plate evaporator inlet and outlet tube assemblies from the thermal expansion valve.
   - 6.2 Disconnect the evaporator core from the thermal expansion valve.
   - 6.3 Remove the thermal expansion valve.
7. Install the thermal expansion valve. See **Fig. 3**.
   - 7.1 Install the thermal expansion valve.
   - 7.2 Connect the evaporator core to the thermal expansion valve.

Evaporator Core Expansion Valve Replacement

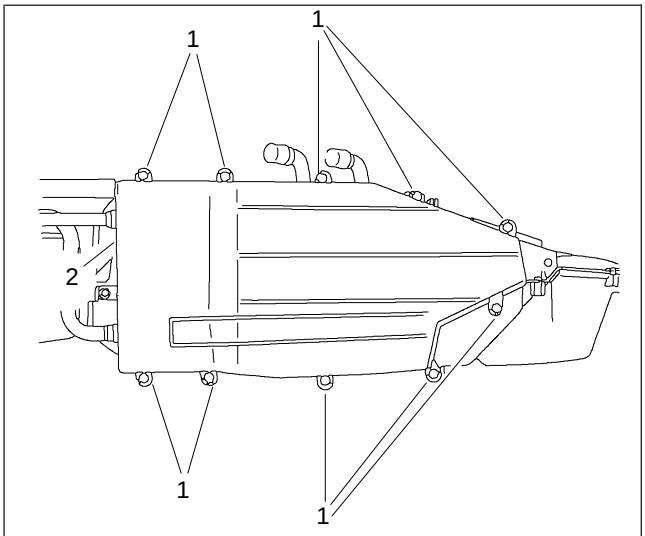
7.3 Connect the floor pan opening plate evaporator inlet and outlet tube assemblies to the thermal expansion valve.

8. Install the floor pan opening plate.
9. Install the auxiliary air conditioning and heating assembly shield. See **Fig. 2**.
   - 9.1 Install the auxiliary air conditioning and heating assembly shield.
   - 9.2 Install the retaining screws.
10. Connect the auxiliary air conditioning control module electrical connector. See **Fig. 1**.
11. Connect the battery ground cable.
12. Evacuate, charge and leak-test the air conditioning system. For instructions, refer to **Section 83.00**.

Auxiliary Air Conditioning Temperature Blend Door Removal and Installation

Removal

1. Remove the auxiliary air conditioning and heating assembly.
2. Remove the auxiliary air conditioning temperature blend door actuator.
3. Remove the heater/evaporator core cover retaining screws, then remove the cover. See **Fig. 1**.



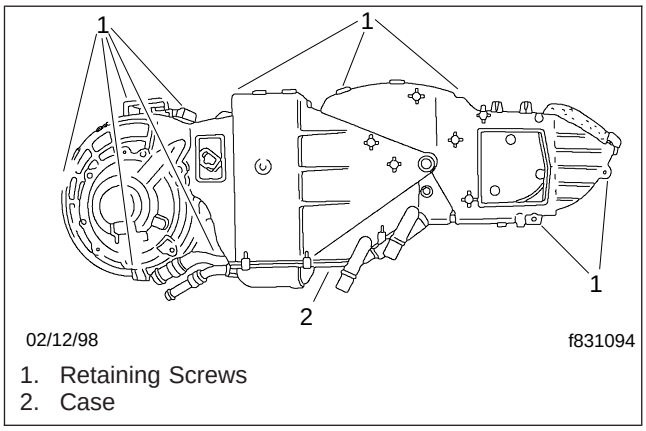
1. Retaining Screws
2. Cover

Fig. 1, Heater/Evaporator Core Cover

4. Remove the retaining screws, then separate the auxiliary air conditioning and heating assembly case halves. See **Fig. 2**.
5. Remove the auxiliary air conditioning temperature blend door. See **Fig. 3**.

Installation

1. Install the auxiliary air conditioning temperature blend door. See **Fig. 3**.
2. Assemble the auxiliary air conditioning and heating assembly case halves, then install the retaining screws. See **Fig. 2**.
3. Install the heater/evaporator core cover, then install the retaining screws. See **Fig. 1**.



1. Retaining Screws
2. Case

Fig. 2, Auxiliary Air Conditioning and Heating Assembly Case

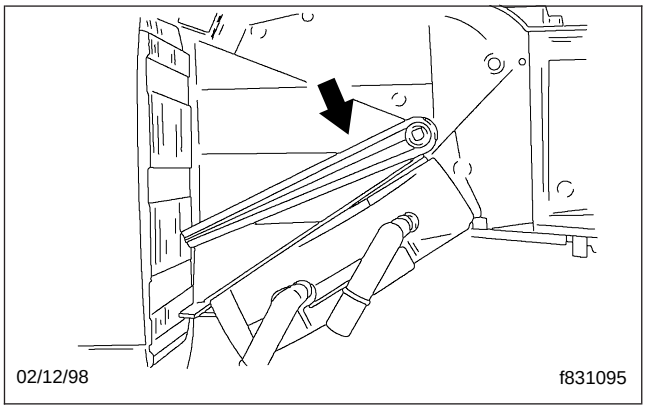


Fig. 3, Auxiliary Air Conditioning Temperature Blend Door

4. Install the auxiliary air conditioning temperature blend door actuator.
5. Install the auxiliary air conditioning and heating assembly.

Auxiliary Air Conditioning Temperature Blend Door Actuator Removal and Installation

Removal

1. Disconnect the battery ground cable.
2. Raise the lower bunk.
3. Disconnect the auxiliary air conditioning control module electrical connector. See **Fig. 1**.

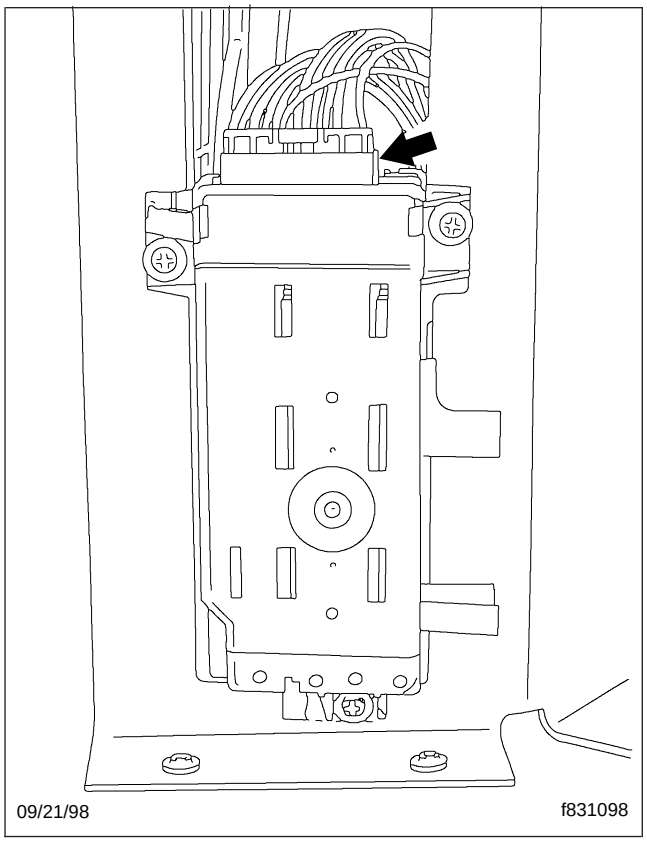

Fig. 1, Auxiliary Air Conditioning Control Module Electrical Connector

4. Remove the retaining screws, then remove the auxiliary air conditioning and heating assembly shield. See **Fig. 2**.
5. Disconnect the right-hand side air distribution duct.
6. Disconnect the auxiliary air conditioning temperature blend door actuator electrical connector.
7. Remove the retaining screws, then remove the auxiliary air conditioning temperature blend door actuator. See **Fig. 3**.

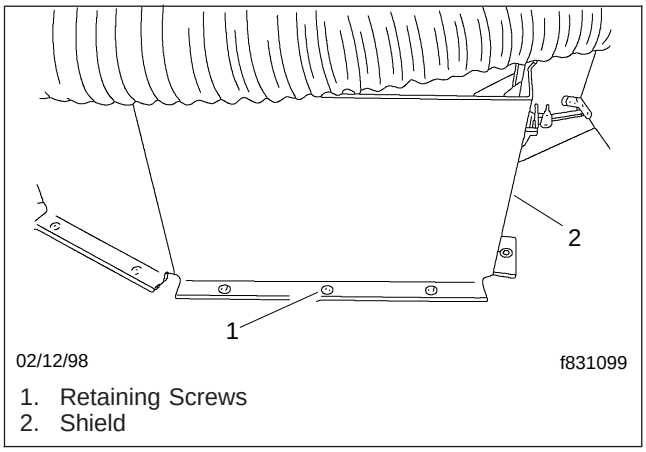

Fig. 2, Auxiliary Air Conditioning and Heating Assembly Shield

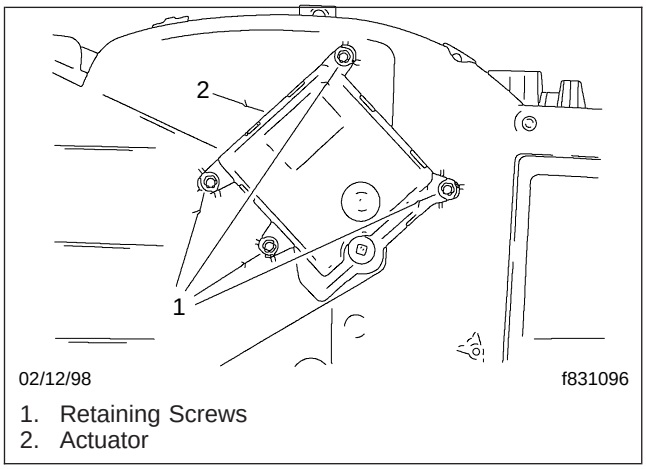

Fig. 3, Temperature Blend Door Actuator

Installation

NOTE: Make sure that the auxiliary air conditioning temperature blend door actuator is properly engaged with the auxiliary air conditioning temperature blend door.

1. Install the auxiliary air conditioning temperature blend door actuator, then install the retaining screws. See **Fig. 3**.
2. Connect the auxiliary air conditioning temperature blend door actuator electrical connector.
3. Connect the right-hand side air distribution duct.

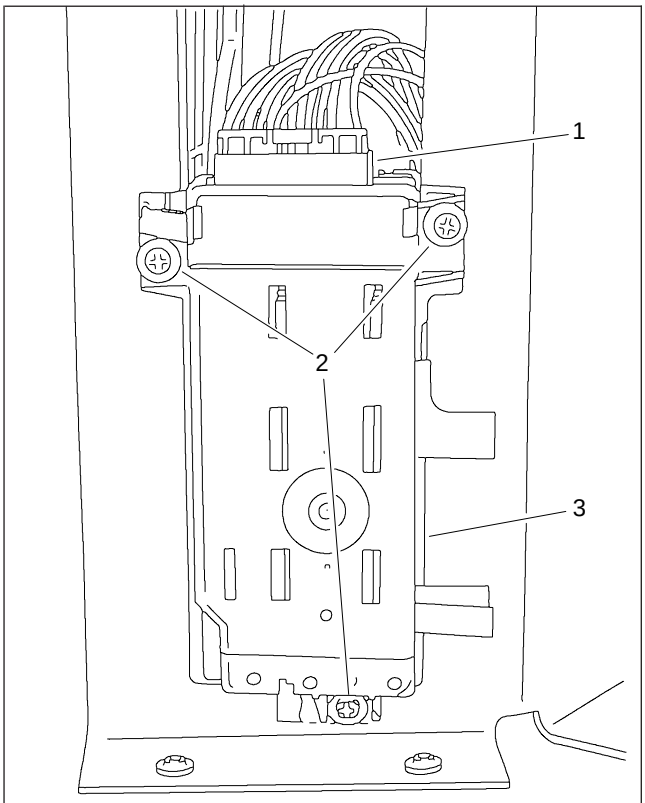
Auxiliary Air Conditioning Temperature Blend Door Actuator Removal and Installation

4. Install the auxiliary air conditioning and heating assembly shield, then install the retaining screws. See **Fig. 2**.
5. Connect the auxiliary air conditioning control module electrical connector. See **Fig. 1**.
6. Lower the lower bunk.
7. Connect the battery ground cable.

Auxiliary Air Conditioning Control Module Replacement

Replacement

1. Disconnect the auxiliary air conditioning control module electrical connector.
2. Remove the auxiliary air conditioning control module retaining bolts.
3. Remove the auxiliary air conditioning control module. See **Fig. 1**.



1. Electrical Connector
2. Retaining Screws
3. Module

Fig. 1, Auxiliary Air Conditioning Control Module

4. Install the auxiliary air conditioning control module. See **Fig. 1**.
5. Install the auxiliary air conditioning control module retaining bolts.
6. Connect the auxiliary air conditioning control module electrical connector.

Air Conditioning

Inspection and Verification

⚠ WARNING

Never attempt to remove the radiator cap while the vehicle is warm and the cooling system is under pressure. Severe burns and injury can occur.

Carbon monoxide is a colorless, odorless and dangerous gas. If it is necessary to operate the engine with the vehicle in a closed area such as a garage, always use an exhaust collector to vent the exhaust gases outside of the closed area.

Do not stand in line with, or near, the fan blade when the engine is running.

The inlet and outlet water hose will become too hot to handle if the system is working properly. Serious burns and injury can occur if caution is not used.

NOTE: Before doing any testing on the auxiliary air conditioning system, make sure that the front air conditioning and heating system and the engine cooling system are functioning properly. Refer to **Group 20** for diagnosis and testing of the engine cooling system.

Diagnosis and testing of the auxiliary air conditioning and heating evaporator core and heater core is the same as the front air conditioning and heating evaporator core and heater core.

1. Verify the owner's original concern by operating the system to duplicate the concern.
2. Visually inspect the system for obvious signs of mechanical or electrical damage. See **Table 1**.

Visual Inspection Chart	
Mechanical	**Electrical**
Damaged evaporator core	Open fuse: sleeper fuse junction panel Fuse 11 (30 A) or Fuse 12 (4 A)
Damaged heater core	Damaged blower motor relay
Kinked, bent or damaged A/C lines	Damaged circuitry
Kinked, bent or damaged heater hoses	Damaged connector(s)
Damaged blower motor housing	Loose or corroded connectors
Damaged ductwork	Damaged control panel components
Damaged air conditioning and heating assembly	
Coolant leak	
Refrigerant leak	

Table 1, Visual Inspection Chart

3. If the concern is not visually evident, determine the problem and proceed to the troubleshooting tables.

Troubleshooting

Problem—Insufficient, Erratic, or No Heat, Auxiliary SilverStar System

Problem—Insufficient, Erratic, or No Heat, Auxiliary SilverStar System	
Possible Cause	**Remedy**
Low engine coolant level	Check for proper engine coolant level. Turn the ignition switch to the "Off" position. Check the engine coolant level. If the engine coolant is not at the proper level, check the coolant system including the radiator cap for leaks. Turn the ignition switch to the "Off" position. Fill the engine coolant system to the specified level. Refer to **Group 20**. NOTE: It is not necessary to check each of the engine coolant system components separately at this time. Perform a pressure check on the engine coolant system. Refer to **Group 20**. If the engine cooling system, including the radiator cap, does not hold pressure, repair the engine cooling system. Refer to **Group 20**. Test the system for normal operation. If the engine cooling system, including the radiator cap, holds pressure, check for hot water to the heater core inlet hose. Start the engine and bring it to the normal operating temperature. Lightly touch the inlet heater water hose. If the inlet heater water hose is not hot, go to **Group 20**. If the inlet heater water hose is hot, check the heater core outlet hose for hot water. Run the engine until it reaches normal operating temperature. Lightly touch the outlet heater water hose. If the outlet heater water hose is cool or cold, repair or replace the heater core. Test the system for normal operation. If the outlet heater water hose is not cool or cold, refer to the "Problem—Auxiliary Controls are Operational With the Function Selector Off" chart in this subject.
Engine overheating	
Plugged or partially plugged heater core	
Damaged/inoperative auxiliary A/C temperature blend door actuator or A/C control module	

Problem—Insufficient A/C Cooling, Auxiliary SilverStar System

Problem—Insufficient A/C Cooling, Auxiliary SilverStar System	
Possible Cause	**Remedy**
Incorrect front A/C-heater function selector switch setting	Check the front climate control system. Check the front climate control panel A/C-heater function selector switch setting. If the front climate control panel A/C-heater function selector switch is not set to MAX A/C or NORM A/C, set the front climate control panel A/C-heater function selector switch to MAX A/C or NORM A/C. Test the system for normal operation. If the front climate control panel A/C-heater function selector switch is set to MAX A/C or NORM A/C, check the refrigerant system. Perform the refrigerant system tests. If the refrigerant system does not test OK, repair the refrigerant system as necessary. Test the system for normal operation. If the refrigerant system tests OK, refer to the "Problem—Temperature Control Does Not Operate Using the Rear Auxiliary Climate Control" chart in this subject.
Low refrigerant level	
Damaged/inoperative thermal expansion valve	
Damaged/inoperative auxiliary A/C temperature blend door actuator or A/C control module	

Problem—Blower Motor Does Not Operate Properly, Auxiliary SilverStar System

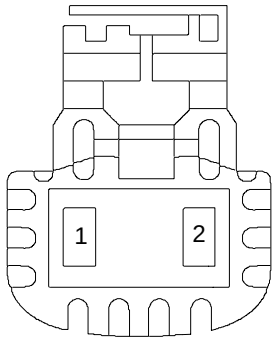
Problem—Blower Motor Does Not Operate Properly, Auxiliary SilverStar System	
Possible Cause	**Remedy**
Damaged/inoperative auxiliary blower motor resistor	Check the auxiliary blower motor resistor. Perform the "SilverStar Auxiliary Blower Motor Resistor" test. Refer to "Component Tests" in this subject. If the auxiliary blower motor resistor is not OK, replace the auxiliary blower motor resistor. Test the system for normal operation. If the auxiliary blower motor resistor is OK, check the auxiliary blower motor switch. Perform the "SilverStar Auxiliary Blower Motor Switch" test. Refer to "Component Tests" in this subject. If the auxiliary blower motor switch is not OK, replace the auxiliary blower motor switch. Test the system for normal operation. If the auxiliary blower motor switch is OK, check the auxiliary blower motor operation.
Damaged circuitry	Turn the ignition switch to the "On" position. Rotate the auxiliary blower motor switch through all speed positions. If the auxiliary blower motor operates at all speeds, wiggle the wires and check for intermittent operation. Repair as necessary. Test the system for normal operation. If the auxiliary blower motor does not operate at LO, MED-LO or MED-HI speed, refer to the "Problem—No Operation in Lower Speeds, Auxiliary SilverStar System" chart in this subject. If the auxiliary blower motor does not operate at HI speed, refer to the "Problem—No Operation in High Blower Setting, Auxiliary SilverStar System" chart in this subject.

Problem—Blower Motor Operates Continuously in High Speed, Auxiliary SilverStar System

Problem—Blower Motor Operates Continuously in High Speed, Auxiliary SilverStar System (See Fig. 1)	
Possible Cause	**Remedy**
Damaged/inoperative auxiliary blower motor switch	Check the auxiliary blower motor switch. Turn the ignition switch to the "Off" position. Disconnect the auxiliary blower motor switch C758 harness connector. Turn the ignition switch to the "On" position. Check the blower motor operation. If the blower motor still does not operate continuously in high speed, replace the blower motor switch. Test the system for normal operation. If the blower motor still operates continuously in high speed, check Circuit 515 (O) for short to ground. Turn the ignition switch to the "Off" position. Disconnect the auxiliary blower motor C743 harness connector. Disconnect the auxiliary A/C control module C746 harness connector. Disconnect the auxiliary blower motor resistor C742 harness connector. Measure the resistance of Circuit 515 (O) between the auxiliary blower motor connector C743 and chassis ground. If the resistance is more than 5 ohms, replace the auxiliary blower motor. Test the system for normal operation. If the resistance is less than 5 ohms, repair the short to ground in Circuit 515 (O). Test the system for normal operation.
Damaged circuitry	
Damaged/inoperative auxiliary blower motor	

Troubleshooting

Problem—No Operation in High Blower Setting, Auxiliary SilverStar System

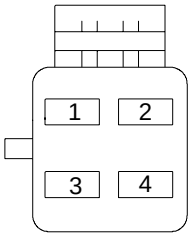


10/14/98 f830959

Fig. 1, Auxiliary Blower Motor Connector Pin Identification

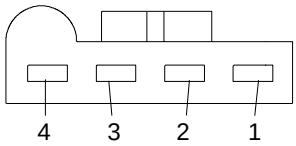
Problem—No Operation in High Blower Setting, Auxiliary SilverStar System (See Fig. 1, Fig. 2 and Fig. 3)	
Possible Cause	**Remedy**
Damaged/inoperative auxiliary blower motor switch	Check the auxiliary blower motor switch. Perform the "SilverStar Auxiliary Blower Motor Switch" test. Refer to "Component Tests" in this subject. If the auxiliary blower motor switch is not OK, replace the auxiliary blower motor switch. Test the system for normal operation.
Damaged circuitry	Check Circuit 277 (GN) for an open. Turn the ignition switch to the "Off" position. Disconnect the auxiliary blower motor switch C758 harness connector. Disconnect the auxiliary A/C-heater function selector switch C760 harness connector. Disconnect the auxiliary blower motor resistor C742 harness connector. Measure the resistance of Circuit 277 (GN) between the auxiliary blower motor switch connector C758 and the auxiliary A/C-heater function selector switch connector C760. If the resistance is more than 5 ohms, repair the open in Circuit 277 (GN). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 515 (O) for an open. Disconnect the auxiliary blower motor C743 harness connector. Disconnect the auxiliary A/C control module C746 harness connector. Measure the resistance of Circuit 515 (O) between the auxiliary blower motor switch connector C758 and the auxiliary blower motor connector C743. If the resistance is less than 5 ohms, wiggle the wires and check for intermittent operation. Repair as necessary. Test the system for normal operation. If the resistance is more than 5 ohms, repair the open in Circuit 515 (O). Test the system for normal operation.

Problem—No Operation in Lower Speeds, Auxiliary SilverStar System



10/14/98 f830961

Fig. 2, Auxiliary Blower Motor Switch Connector Pin Identification



10/14/98 f830933

Fig. 3, Auxiliary Function Selector Switch Connector Pin Identification

Problem—No Operation in Lower Speeds, Auxiliary SilverStar System (See Fig. 2 and Fig. 4)	
Possible Cause	**Remedy**
Damaged/inoperative auxiliary blower motor resistor	Check the auxiliary blower motor resistor. Perform the "SilverStar Auxiliary Blower Motor Resistor" test. Refer to "Component Tests" in this subject. If the auxiliary blower motor resistor is not OK, replace the auxiliary blower motor resistor. Test the system for normal operation.
Damaged/inoperative auxiliary blower motor switch	Perform the "SilverStar Auxiliary Blower Motor Switch" test. Refer to "Component Tests" in this subject. If the auxiliary blower motor switch is not OK, replace the auxiliary blower motor switch. Test the system for normal operation. If the auxiliary blower motor switch is OK, check the auxiliary blower motor operation. Turn the ignition switch to the "On" position. Rotate the auxiliary blower motor switch through all speed positions. If the auxiliary blower motor operates at all speeds, wiggle the wires and check for intermittent operation. Repair as necessary. Test the system for normal operation.

Troubleshooting

Problem—No Operation in Lower Speeds, Auxiliary SilverStar System (See Fig. 2 and Fig. 4)	
Possible Cause	**Remedy**
Damaged circuitry	If the auxiliary blower motor does not operate at LO speed, MED-LO speed, or at MED-HI speed, check Circuit 277 (GN) for an open. Turn the ignition switch to the "Off" position. Disconnect the auxiliary A/C-heater function selector switch C760 harness connector. Disconnect the auxiliary blower motor switch C758 harness connector. Disconnect the auxiliary blower motor resistor C742 harness connector. Measure the resistance of Circuit 277 (GN) between the auxiliary blower motor switch connector C758 and the auxiliary blower motor resistor connector C742. If the resistance is less than 5 ohms, wiggle the wires and check for intermittent operation. Repair as necessary. Test the system for normal operation. If the resistance is more than 5 ohms, repair the open in Circuit 277 (GN). Test the system for normal operation. Check Circuit 260 (R/BK) for an open. Turn the ignition switch to the "Off" position. Disconnect the auxiliary blower motor switch C758 harness connector. Disconnect the auxiliary blower motor resistor C742 harness connector. Measure the resistance of Circuit 260 (R/BK) between the auxiliary blower motor switch connector C758 and the auxiliary blower motor resistor connector C742. If the resistance is less than 5 ohms, wiggle the wires and check for intermittent operation. Repair as necessary. Test the system for normal operation. If the resistance is more than 5 ohms, repair the open in Circuit 260 (R/BK). Test the system for normal operation. Check Circuit 269 (BL/R) for an open. Turn the ignition switch to the "Off" position. Disconnect the auxiliary blower motor switch C758 harness connector. Disconnect the auxiliary blower motor resistor C742 harness connector. Measure the resistance of Circuit 269 (BL/R) between the auxiliary blower motor switch connector C758 and the auxiliary blower motor resistor connector C742. If the resistance is less than 5 ohms, wiggle the wires and check for intermittent operation. Repair as necessary. Test the system for normal operation. If the resistance is more than 5 ohms, repair the open in Circuit 269 (BL/R). Test the system for normal operation.

Problem—Auxiliary Blower Motor Does Not Operate

Problem—Auxiliary Blower Motor Does Not Operate (See Fig. 1, Fig. 2, Fig. 3 and Fig. 5)	
Possible Cause	**Remedy**
Open Fuse 11 (30 A) or Fuse 12 (4 A) Damaged/inoperative blower motor relay Damaged/inoperative auxiliary blower motor switch Damaged/inoperative auxiliary blower motor	Check the auxiliary blower motor. Perform the "Blower Motor" component test. Refer to "Component Tests" in **Section 83.00, Subject 300**. If the blower motor is not OK, replace the auxiliary blower motor. Test the system for normal operation. If the blower motor is OK, check Circuit 371 (R) for power. Turn the ignition switch to the "Off" position. Disconnect the auxiliary blower motor C743. Turn the ignition switch to the "On" position. Measure the voltage of Circuit 371 (R) between the auxiliary blower motor connector C743 and chassis ground. If the voltage is less than 10 volts, check the blower motor relay. Perform the "Blower Motor Relay" test. Refer to "Component Tests" in this subject. If the blower motor relay is not OK, replace the blower motor relay. Test the system for normal operation. If the blower motor relay is OK, check the blower motor relay Circuit 57 (BK) for an open. Turn the ignition switch to the "Off" position. Remove the sleeper fuse junction panel blower motor relay. Measure the resistance of Circuit 57 (BK) between the sleeper fuse junction relay panel blower motor relay connector C768, Pin 85 and chassis ground. If the resistance is more than 5 ohms, repair the open in Circuit 57 (BK). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 150 (R) for power. Remove the sleeper fuse junction panel Fuse 11 (30 A). Turn the ignition switch to the "On" position. Measure the voltage of Circuit 150 (R) between the sleeper fuse junction panel input side of Fuse 11 (30 A) and chassis ground. If the voltage is less than 10 volts, repair the open in Circuit 150 (R). Test the system for normal operation. If the voltage is more than 10 volts, check Circuit 16 (R/GN) for power at relay connector. Reinstall the sleeper fuse junction panel Fuse 11 (30 A). Measure the voltage of Circuit 16 (R/GN) between the sleeper fuse junction relay panel blower motor relay connector C768, Pin 86 and chassis ground. If the voltage is less than 10 volts, repair the open in Circuit 16 (R/GN). Test the system for normal operation. If the voltage is more than 10 volts, check Circuit 371 (R) for an open. Turn the ignition switch to the "Off" position. Disconnect the auxiliary blower motor C743. Measure the resistance of Circuit 371 (R) between the sleeper fuse junction relay panel blower motor relay connector C768, Pin 87 and the auxiliary blower motor connector C743. If the resistance is more than 5 ohms, repair the open in Circuit 371 (R). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 50 (GN/W) for power. Turn the ignition switch to the "On" position. Measure the voltage of Circuit 50 (GN/W) between the sleeper fuse junction relay panel blower motor relay connector C768, Pin 30 and chassis ground. If the voltage is less than 10 volts, check Circuit 16 (R/GN) for power. Remove the sleeper fuse junction panel Fuse 12 (4 A). Measure the voltage of Circuit 16 (R/GN) between the sleeper fuse junction panel input side of Fuse 12 (4 A) and chassis ground. If the voltage is less than 10 volts, repair the open in Circuit 16 (R/GN). Test the system for normal operation. If the voltage is greater than 10 volts, check Circuit 50 (GN/W) for an open. Turn the ignition switch to the "Off" position. Reinstall the sleeper fuse junction panel Fuse 12 (4 A). Remove the sleeper fuse junction panel Fuse 11 (30 A). Measure the resistance of Circuit 50 (GN/W) between the sleeper fuse junction relay panel output side of Fuse 11 and the sleeper fuse junction relay panel blower motor relay connector C768, Pin 30. If the resistance is less than 5 ohms, wiggle the wires and Check for intermittent operation. Repair as necessary. Test the system for normal operation. If the resistance is greater than 5 ohms, repair the open in Circuit 50 (GN/W). Test the system for normal operation.

Troubleshooting

Problem—Auxiliary Blower Motor Does Not Operate	
Possible Cause	**Remedy**
Damaged circuitry	Check Circuit 277 (GN) for power. Reinstall the sleeper fuse junction panel Fuse 11 (4 A). Reinstall the sleeper fuse junction panel blower motor relay. Disconnect the auxiliary A/C-heater function selector switch C760. Turn the ignition switch to the "On" position. Measure the voltage of Circuit 277 (GN) between the auxiliary A/C-heater function selector switch connector C760 and chassis ground. If the voltage is greater than 10 volts, check the auxiliary A/C-heater function selector switch. Perform the "Auxiliary A/C-Heater Function Selector Switch" test. Refer to "Component Tests" in this subject. If the auxiliary A/C-heater function selector switch is not OK, replace the auxiliary A/C-heater function selector switch. Test the system for normal operation. If the auxiliary A/C-heater function selector switch is not OK, check the auxiliary A/C-heater function selector switch Circuit 57 (BK) for an open. Turn the ignition switch to the "On" position. Measure the resistance of Circuit 57 (BK) between the auxiliary A/C-heater function selector switch connector C760 and chassis ground. If the resistance is less than 5 ohms, wiggle the wires and check for intermittent operation. Repair as necessary. Test the system for normal operation. If the resistance is more than 5 ohms, repair the open in Circuit 57 (BK). Test the system for normal operation.
Damaged/inoperative auxiliary A/C-heater function selector switch	Check Circuit 277 (GN) for an open. Disconnect the auxiliary blower motor switch C758 harness connector. Measure the resistance of Circuit 277 (GN) between the auxiliary A/C-heater function selector switch connector C760 and the auxiliary blower motor switch connector C758. If the resistance is not less than 5 ohms, repair the open in Circuit 277 (GN). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 515 (O) for power. Turn the ignition switch to the "On" position. Measure the voltage of Circuit 515 (O) between the auxiliary blower motor switch connector C758 and chassis ground. If the voltage is greater than 10 volts, check Circuit 515 (O) for an open. Turn the ignition switch to the "Off" position. Measure the resistance of Circuit 515 (O) between the auxiliary blower motor connector C743 and the auxiliary blower motor switch connector C758. If the resistance is more than 5 ohms, repair the open in Circuit 515 (O). Test the system for normal operation. If the resistance is less than 5 ohms, check auxiliary blower motor switch. Perform the "Auxiliary Blower Motor Switch" test. Refer to "Component Tests" in this subject. If the auxiliary blower motor switch is OK, wiggle the wires and check for intermittent operation. Repair as necessary. Test the system for normal operation. If the auxiliary blower motor switch is not OK, replace the auxiliary blower motor switch. Test the system for normal operation.

Problem—Temperature Control Does Not Operate Using the Rear Auxiliary Climate Control

Problem—Temperature Control Does Not Operate Using the Rear Auxiliary Climate Control (See Fig. 6, Fig. 7 and Fig. 8)	
Possible Cause	**Remedy**
Damaged/inoperative auxiliary temperature potentiometer switch	Check the auxiliary temperature potentiometer switch. Perform the "SilverStar Auxiliary Temperature Potentiometer Switch " test. Refer to "Component Tests" in this subject. If the auxiliary temperature potentiometer switch is not OK, replace the auxiliary A/C-heater function selector switch. Test the system for normal operation. If the auxiliary temperature potentiometer switch is OK, check Circuit 182 (BR/W) for an open. Turn the ignition switch to the "Off" position. Disconnect the auxiliary temperature potentiometer C759 from the harness connector. Disconnect the auxiliary A/C control module C746 from the harness connector. Measure the resistance of Circuit 182 (BR/W) between the auxiliary temperature potentiometer connector C759 and the auxiliary A/C control module connector C746, Pin 9. If the resistance is more than 5 ohms, repair the open in Circuit 182 (BR/W). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 184 (R) for an open.
Damaged/inoperative return air temperature sensor	Measure the resistance of Circuit 184 (R) between the auxiliary temperature potentiometer connector C759 and the auxiliary A/C control module connector C746, Pin 10. If the resistance is more than 5 ohms, repair the open in Circuit 184 (R). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 185 (BK) for an open. Measure the resistance of Circuit 185 (BK) between the auxiliary temperature potentiometer connector C759 and the auxiliary A/C control module connector C746, Pin 2. If the resistance is more than 5 ohms, repair the open in Circuit 185 (BK). Test the system for normal operation. If the resistance is less than 5 ohms, check the auxiliary A/C temperature blend door actuator drive.
Damaged/inoperative auxiliary A/C temperature blend door actuator	Turn the ignition switch to the "On" position. Jumper Pin 5, Circuit 883 (O) to Pin 3, Circuit 884 (Y) and Pin 4, Circuit 882 (W) to Pin 1, Circuit 57 (BK) on the auxiliary A/C control module connector C746. Jumper Pin 4, Circuit 882 (W) to Pin 3, Circuit 884 (Y) and Pin 5, Circuit 883 (O) to Pin 1, Circuit 57 (BK) on the auxiliary A/C control module connector C746. If the auxiliary A/C temperature blend door actuator drives in both directions, check auxiliary A/C temperature blend door actuator resistance. Drive the auxiliary A/C temperature blend door actuator to the full heat position.
Damaged/inoperative auxiliary A/C control module	Turn the ignition switch to the "Off" position. Measure the resistance between Pin 7, Circuit 827 (Y/R) and Pin 6, Circuit 828 (BR/GN) of the auxiliary A/C control module connector C746. Measure the resistance between Pin 8, Circuit 830 (GN/W) and Pin 7, Circuit 827 (Y/R) of the auxiliary A/C control module connector C746. Measure the resistance between Pin 8, Circuit 830 (GN/W) and Pin 6, Circuit 828 (BR/GN) of the auxiliary A/C control module connector C746. If the resistance value of the first measurement is 250 to 1500 ohms, the second measurement 3500 to 6000 ohms and the third measurement 5000 to 7000 ohms, replace the auxiliary A/C control module. Test the system for normal operation. If the resistance value of the first measurement is not 250 to 1500 ohms, the second measurement 3500 to 6000 ohms and the third measurement 5000 to 7000 ohms, check Circuit 830 (GN/W) for an open.

Troubleshooting

Problem—Temperature Control Does Not Operate Using the Rear Auxiliary Climate Control	
Possible Cause	**Remedy**
Damaged/inoperative auxiliary temperature potentiometer switch	Disconnect the auxiliary A/C temperature blend door actuator C744 harness connector. Measure the resistance of Circuit 830 (GN/W) between Pin 8 of the auxiliary A/C control module connector C746 and Pin 8 of the auxiliary A/C temperature blend door actuator connector C744. If the resistance is more than 5 ohms, repair the open in Circuit 830 (GN/W). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 827 (Y/R) for an open.
Damaged/inoperative return air temperature sensor	Measure the resistance of Circuit 827 (Y/R) between Pin 7 of the auxiliary A/C control module connector C746 and Pin 4 of the auxiliary A/C temperature blend door actuator connector C744. If the resistance is more than 5 ohms, repair the open in Circuit 827 (Y/R). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 828 (BR/GN) for an open.
Damaged/inoperative auxiliary A/C temperature blend door actuator	Measure the resistance of Circuit 828 (BR/GN) between Pin 6 of the auxiliary A/C control module connector C746 and Pin 7 of the auxiliary A/C temperature blend door actuator connector C744. If the resistance is more than 5 ohms, repair the open in Circuit 828 (BR/GN). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 883 (O) for an open.
	Measure the resistance of Circuit 883 (O) between Pin 5 of the auxiliary A/C control module connector C746 and Pin 6 of the auxiliary A/C temperature blend door actuator connector C744. If the resistance is more than 5 ohms, repair the open in Circuit 883 (O). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 882 (W) for an open.
Damaged/inoperative auxiliary A/C control module	Measure the resistance of Circuit 88R (W) between Pin 4 of the auxiliary A/C control module connector C746 and Pin 5 of the auxiliary A/C temperature blend door actuator connector C744. If the resistance is less than 5 ohms, replace the auxiliary A/C control module. Test the system for normal operation. If the resistance is more than 5 ohms, repair the open in Circuit 882 (W). Test the system for normal operation.

Problem—Auxiliary Controls are Operational With the Function Selector Off

Problem—Auxiliary Controls are Operational With the Function Selector Off (See Fig. 2, Fig. 3 and Fig. 4)	
Possible Cause	**Remedy**
Damaged/inoperative auxiliary A/C-heater function selector switch	Check the auxiliary A/C-heater function selector switch. Perform the "A/C-Heater Function Selector Switch" test. Refer to "Component Tests" in this subject. If the auxiliary A/C-heater function selector switch is not OK, replace the auxiliary A/C-heater function selector switch. Test the system for normal operation. If the auxiliary A/C-heater function selector switch is OK, check Circuit 277 (GN) for short to ground. Disconnect the harness connector. Disconnect the auxiliary blower motor resistor C742 harness connector. Disconnect the auxiliary blower motor switch C758 harness connector. Disconnect the auxiliary A/C-heater function selector switch C760 harness connector. Measure the resistance of Circuit 277 (GN) between the auxiliary A/C-heater function selector switch connector C760 and chassis ground. If the resistance is less than 5 ohms, repair the short to ground in Circuit 277 (GN). Test the system for normal operation. If the resistance is more than 5 ohms, check Circuit 269 (BL/R) for short to ground. Measure the resistance of Circuit 269 (BL/R) between the auxiliary blower motor switch connector C758 and chassis ground. If the resistance is less than 5 ohms, repair the short to ground in Circuit 269 (BL/R). Test the system for normal operation. If the resistance is more than 5 ohms, check Circuit 260 (R/BK) for short to ground.
Damaged circuitry	Measure the resistance of Circuit 260 (R/BK) between the auxiliary blower motor switch connector C758 and chassis ground. If the resistance is less than 5 ohms, repair the short to ground in Circuit 260 (R/BK). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 515 (O) for short to ground. Disconnect the auxiliary blower motor C743 harness connector. Disconnect the auxiliary A/C control module C746 harness connector. Measure the resistance of Circuit 515 (O) between the auxiliary blower motor switch connector C758 and chassis ground. If the resistance is less than 5 ohms, repair the short to ground in Circuit 515 (O). Test the system for normal operation. If the resistance is more than 5 ohms, wiggle the wires and check for intermittent operation. Repair as necessary. Test the system for normal operation.

Troubleshooting

Problem—Rear Auxiliary Blower Motor Switch Operates Only in High

Problem—Rear Auxiliary Blower Motor Switch Operates Only in High	
Possible Cause	**Remedy**
Damaged/inoperative auxiliary blower motor switch	Check the auxiliary blower motor resistor. Perform the "SilverStar Auxiliary Blower Motor Resistor" test. Refer to "Component Tests" in this subject. If the auxiliary blower motor resistor is not OK, replace the auxiliary blower motor resistor. Test the system for normal operation. If the auxiliary blower motor resistor is OK, check the auxiliary blower motor switch. Perform the "SilverStar Auxiliary Blower Motor Switch" test. Refer to "Component Tests" in this subject. If the auxiliary blower motor switch is not OK, replace the auxiliary blower motor switch. Test the system for normal operation. If the auxiliary blower motor switch is OK, check Circuit 269 (BL/R) for an open.
Damaged/inoperative auxiliary blower motor resistor	Disconnect the auxiliary blower motor switch C758 and the auxiliary blower motor resistor C742. Measure the resistance of Circuit 269 (BL/R) between the auxiliary blower motor switch connector C758 and the auxiliary blower motor resistor connector C742. If the resistance is more than 5 ohms, repair the open in Circuit 269 (BL/R). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 260 (R/BK) for an open. Measure the resistance of Circuit 260 (R/BK) between the auxiliary blower motor switch connector C758 and the auxiliary blower motor resistor connector C742. If the resistance is more than 5 ohms, repair the open in Circuit 260 (R/BK). Test the system for normal operation. If the resistance is less than 5 ohms, check Circuit 277 (GN) for an open.
Damaged circuitry	Measure the resistance of Circuit 277 (GN) between the auxiliary blower motor switch connector C758 and the auxiliary blower motor resistor connector C742. If the resistance is less than 5 ohms, wiggle the wires and check for intermittent operation. Repair as necessary. Test the system for normal operation. If the resistance is more than 5 ohms, repair the open in Circuit 277 (GN). Test the system for normal operation.

Component Tests

SilverStar Auxiliary Blower Motor Resistor (See Fig. 9)

Resistance Check		
To Test	**Measure Resistance Between**	**Resistance Should Be**
MED-HI Speed	Terminal 3 and Terminal 1	0.25 ohms ± 10%
MED-LO Speed	Terminal 3 and Terminal 4	0.80 ohms ± 10%
LO Speed	Terminal 3 and Terminal 2	2.70 ohms ± 10%

Table 2, Resistance Check

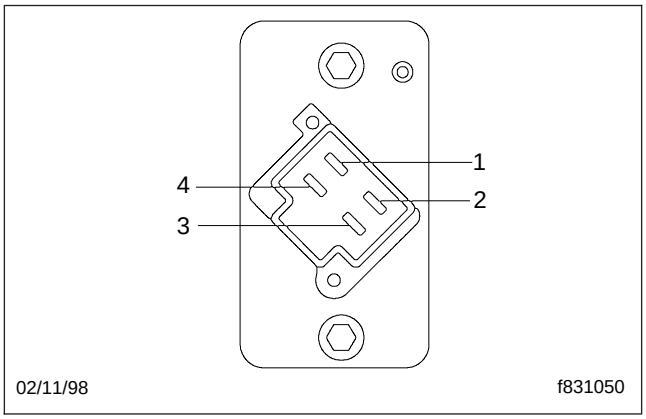


Fig. 9, SilverStar Auxiliary Blower Motor Resistor Pin Identification

A/C-Heater Function Selector Switch (See Fig. 10)

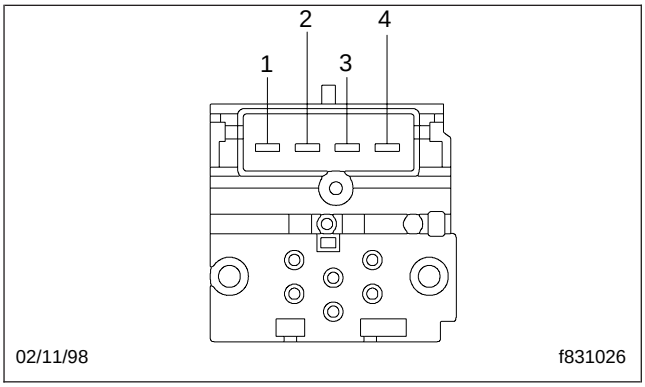

Fig. 10, A/C-Heater Function Selector Switch Pin Identification

Resistance Check			
To Test	**Measure Resistance Between**	**Set The Switch Position To**	**Resistance Should Be**
Blower Motor Circuit	Terminal 3, Circuit 277 (GN) and Terminal (1, Circuit 57 (BK)	"Off"	Greater than 10,000 ohms
		"On"	Less than 5 ohms

Table 3, Resistance Check

SilverStar Auxiliary Blower Motor Switch (See Fig. 11)

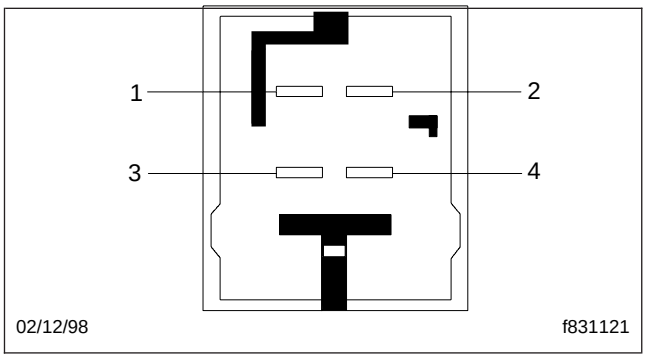

Fig. 11, SilverStar Auxiliary Blower Motor Switch Pin Identification

Resistance Check			
To Test	**Measure Resistance Between**	**Set The Switch Position To**	**Resistance Should Be**
HI Speed	Terminal 1, Circuit 515 (O) and Terminal 2, Circuit 277 (GN)	LO	Greater than 10,000 ohms
		MED-LO	Greater than 10,000 ohms
		MED-HI	Greater than 10,000 ohms
		HI	Less than 5 ohms
MED-HI Speed	Terminal 3, Circuit 269 (BL/R) and Terminal 2, Circuit 277 (GN)	LO	Greater than 10,000 ohms
		MED-LO	Greater than 10,000 ohms
		MED-HI	Less than 5 ohms
		HI	Greater than 10,000 ohms
MED-LO Speed	Terminal 4, Circuit 260 (R/BK) and Terminal 2, Circuit 277 (GN)	LO	Greater than 10,000 ohms
		MED-LO	Less than 5 ohms
		MED-HI	Greater than 10,000 ohms
		HI	Greater than 10,000 ohms

Item	**Specifications**
Calibration Procedure	Start the engine and allow it to reach normal operating temperature.
	Rotate the temperature control to the full WARM position for two minutes.
	Rotate the temperature control to the full COOL position for two minutes.

Table 1, General Specifications

Thermodynamic Principles

Air conditioning is the cooling or refrigeration of the air in the passenger compartment. Refrigeration is accomplished by making practical use of three thermodynamic principles. These principles and their practical application are described below.

Heat Transfer

If two objects of different temperatures are placed near each other, the heat in the warmer object will always travel to the cooler object until both are of equal temperature.

For example, a block of ice in a refrigerator does not transfer its coldness to a nearby carton of milk. Rather, the heat in the warm milk automatically flows to the ice.

The British Thermal Unit (BTU) is used to determine the amount of heat transferred from one object to another. One BTU is the amount of heat required to raise the temperature of 1 pound (0.45 kg) of water 1°F (0.55°C).

For example, to raise the temperature of 1 pound (0.45 kg) of water from 32°F to 212°F (0°C to 100°C), one BTU of heat must be added for 1°F (0.55°C) rise in temperature or a total of 180 BTUs of heat. Conversely, in order to lower the temperature of 1 pound (0.45 kg) of water from 212°F to 32°F (100°C to 0°C), 180 BTUs of heat must be removed from the water.

Latent Heat of Vaporization

When a liquid boils, it absorbs heat without raising the temperature of the resulting gas. When the gas condenses (changes back to a liquid), it gives off heat without lowering the temperature of the resulting liquid.

For example, when 1 pound (0.45 kg) of water at 32°F (0°C) is placed in a container over a flame, the temperature of the water rises 1°F (0.55°C) with each BTU of heat that the water absorbs from the flame. Thus, after it has absorbed 180 BTUs of heat, the water reaches a temperature of 212°F (100°C).

Even though the flame continues to give its heat to the water, the temperature of the water remains at 212°F (100°C). The water however starts to boil or change from a liquid to a gaseous state. It continues to boil until the water has passed off into the atmosphere as vapor. If this vapor were checked with a thermometer, it also would show a temperature of 212°F (100°C).

In other words, there was a rise of only 180°F (from 32°F to 212°F or 0°C to 100°C) in the water and vapor temperature even though the flame applied many more than 180 BTUs of heat. In this case, the heat is absorbed by the liquid in the process of boiling and disappears in the vapor. If the vapor were brought in contact with cool air, the hidden heat would flow into the cooler air and the vapor condensed back to water. Scientists refer to this principle as the latent (hidden) heat of vaporization.

Water has a latent heat of vaporization of 970 BTUs and a boiling point of 212°F (100°C). This means that 1 pound (0.45 kg) of water at 212°F (100°C), will absorb 970 BTUs of heat when changing to vapor at 212°F (100°C). Conversely, the vapor will give off 970 BTUs of heat when condensing back to water at 212°F (100°C).

This heat transfer, occurring when a liquid boils or a vapor condenses, forms the basic principle of all conventional refrigerant systems.

For a liquid to be a refrigerant, it must also have a low boiling point. That is, the temperature at which it boils must be lower than the substance to be cooled.

R–134a is a non-CFC refrigerant. Its temperature/pressure relationship makes it suitable for mobile air conditioning systems.

Effect of Pressure on Boiling or Condensation

As refrigerant passes through an air conditioning system, it flows under high-pressure conditions, first as a high-pressure vapor between the refrigerant compressor and the condenser, then as a high-pressure liquid between the condenser and the evaporator orifice. It expands to a low-pressure vapor between the evaporator orifice and the refrigerant return port in the refrigerant compressor. As pressures in the closed refrigerant circuit vary, temperatures will also vary. As pressure increases, temperatures also increase; as the pressure decreases, temperatures also decrease. The refrigerant flow diagram highlights the changes that take place. See **Fig. 1**.

Fig. 1, Refrigerant Flow

General Information

The heater and air conditioner assembly is mounted behind the passenger dash panels and on the engine side of the frontwall. The heater and air conditioner assembly contains the following major components:

- accumulator
- blower motor
- climate control panel
- condenser
- electric actuators
- evaporator
- heater core
- orifice tube
- refrigerant compressor
- refrigerant compressor cycling switch

The heating, air conditioning, and ventilating functions of the cab heater and air conditioner system are controlled by the cab climate control panel mounted on the dashboard. Refer to the *L-Line and A-Line Driver's Manual* for operating instructions.

Description of Components

Accumulator

When entering the inlet of the accumulator, the refrigerant contacts the liquid diverter dome and flows to the bottom of the housing. The refrigerant completes vaporization and passes into the suction inlet. A small, screened bleed hole in the bottom allows oil to be sucked into the suction tube to return to the compressor.

A desiccant bag inside the accumulator absorbs any moisture that may be in the system. A fitting on the accumulator is used to mount the refrigerant compressor cycling switch. The fitting prevents refrigerant loss when the cycling switch is removed.

Blower Motor

The blower motor forces air through the HVAC assembly and through the duct work.

Climate Control Panel

The fan switch, temperature control switch, and air selection switch are mounted on the climate control panel, which is also called the control head. The fan switch is used to control the rate of airflow through the outlets. The temperature control switch is used to select the desired temperature. The air selection switch is used to select the direction of warm or cool air through the air outlets.

Condenser

A condenser turns hot refrigerant gas coming from the refrigerant compressor into liquid. The condenser is mounted in front of the radiator. Because of its location, the condenser transfers heat to air that is drawn in by the engine fan and by air that is forced into the engine compartment as the vehicle moves forward.

Electric Actuator

The electric actuator is a combined motor and gearbox that is used to control the position of the doors within the HVAC assembly. The position of the doors is controlled by the settings on the climate control panel. There are five electric actuators on the HVAC assembly:

- the temperature/blend air actuator

- the defrost/panel actuator
- the right-side panel/demist actuator
- fresh air/recirculation actuator
- panel/floor actuator

Evaporator

The evaporator is located in the evaporator housing on the engine side of the frontwall. Because the evaporator is an area of low pressure in the refrigerant system, the boiling point of refrigerant lowers, which causes it to absorb heat from the tubing walls and fins. As it absorbs heat, liquid refrigerant quickly boils and turns into a gas.

As heat is absorbed from the outside surfaces of the evaporator, air passing over the unit loses its heat to these cooler surfaces. Moisture in the air condenses on the outside of the evaporator and drains off as water; the air becomes dehumidified.

Heater Core

When the engine is on, coolant flows through the heater core tubes heating the tubes and fins. The heat is absorbed by air that is forced through the heater core by the blower motor.

Orifice Tube

The orifice tube separates the high- and low-pressure sides of the HVAC system and meters the flow of refrigerant into the evaporator. The orifice tube is located in the inlet tube to the evaporator. The orifice tube has screens on the inlet and outlet ends of the tube. The inlet screen is a strainer for the liquid refrigerant flowing through the opening. The outlet screen reduces the noise of the refrigerant flowing through the orifice tube. O-rings on the orifice tube prevent the high pressure liquid refrigerant from bypassing the orifice tube. The orifice tube cannot be adjusted or repaired; it must be replaced.

Refrigerant Compressor

Heat in the low-pressure gas of the evaporator is not heat that can be noticed by touch because liquid refrigerant boils at a temperature much lower than the temperature at which water turns to ice. By touch, the heated gas in the evaporator is very cold. As a result, there is the problem of how to remove heat from cool gas using outside air that may be higher than 100°F (38°C).

With a refrigerant compressor, low-pressure gas from the evaporator can be squeezed into a much smaller space. When the gas is compressed, the heat it contains becomes concentrated. In this way, the gas is made hotter than the outside air without adding heat. Another function of the compressor is to move refrigerant through the system.

Refrigerant Compressor Cycling Switch

The refrigerant compressor cycling switch is mounted on the accumulator. The electrical contacts within the cycling switch are normally open below an operating pressure of about 23 psi (159 kPa). The electrical contacts close to allow compressor operation when internal pressure rises above approximately 40 to 47 psi (275 to 324 kPa). Lower ambient air temperatures (below 50°F or 10°C) during cold seasons will also open the contacts due to the pressure/temperature relationship of the refrigerant in the system.

The electrical contacts control the circuit to the compressor clutch field coil. When the contacts are closed, the compressor clutch field is energized and the clutch engages to drive the compressor. When the contacts are open, the compressor clutch field coil is de-energized and the compressor does not operate. The cycling switch, when operating properly, will control the refrigerant pressure within the evaporator at a point when the plate/fin surface of the evaporator will be maintained slightly above freezing to prevent icing and blockage of airflow.

Definition of Terms

Refer to the following terms for a better understanding of the HVAC system.

Accumulator A combination desiccant, filter, and storage container for liquid refrigerant.

Air Conditioner A system used to control the temperature, humidity, and movement of air in the cab.

Ambient Air Temperature The temperature of air around an object or the outside temperature.

Binary Switch See high-pressure switch and low-pressure switch.

General Information

Blower Motor A blower motor forces air through the HVAC assembly and through the duct work.

Blower Resistor Block Assembly Inline resistors that control the amount of voltage going to the blower motor. By controlling the voltage, you can control the fan speed.

Boiling Point The temperature at which a liquid changes to a gas. The boiling point varies with pressure.

Bulk Charging Use of large containers of refrigerant for charging a refrigerant system. Normally used for charging empty systems.

Charge A specific amount of refrigerant or oil by volume or weight. Also, the act of placing an amount of refrigerant or oil in the air conditioning system.

Clutch Cycling Switch Engages or disengages the refrigerant compressor depending on changes in system pressure on the low side. Same as low-pressure switch.

Condensate Water taken from the air, which forms on the outer surface of the evaporator.

Condenser A heat exchanger that is used to remove heat from the refrigerant, changing it from a high-pressure hot gas to a high-pressure warm liquid. Typically the condenser is mounted in front of the radiator.

Condensing Pressure Pressure as read from the gauge at the discharge service valve. Pressure from the discharge side of the compressor into the condenser.

Contaminants Anything other than refrigerant or refrigerant oil in the system. Usually means water, dirt, or air in the system.

Cycling Clutch System A system that controls compressor clutch operation in order to raise or lower the temperature in the cab.

Dehumidify To remove water from the air at the evaporator.

Dehydrate To remove all traces of moisture from the refrigerant system. This process occurs during evacuation.

Desiccant A drying agent used in the accumulator to remove water and create an extremely dry condition.

Discharge Line Connects the refrigerant compressor outlet to the condenser inlet.

Discharge Pressure High-side pressure or condensing pressure being discharged from the compressor.

Drive Pulley A pulley attached to the front of the engine crankshaft. It drives the compressor clutch pulley with a belt.

Duct A passageway for the transfer of air from one point to another.

Electric Actuator The actuator is a combined motor and gearbox used to drive the doors within the HVAC assembly.

Evacuate To place a high vacuum in the refrigerant system to remove air and dehydrate or remove traces of moisture.

Evaporate To change state from a liquid to a gas.

Evaporator A component in which liquid refrigerant changes to a gas after it absorbs heat from the air. It also removes some moisture from the air.

Expansion Valve A device that causes a pressure drop of the refrigerant and also regulates its flow.

Flooding A normal condition in the evaporator of an orifice tube system. The evaporator operates flooded and evaporates only the liquid closest to the outlet.

Flushing A process of passing liquid refrigerant through an air-conditioner component to remove dirt and water from the part. Liquid refrigerant removes heavy contamination, such as gritty dirt and large dirt buildup.

Freeze-Up Failure of a unit to operate properly because of ice forming at the expansion valve orifice or on the evaporator.

Heater Core A part of the heating system in which hot engine coolant flows to provide heat to the cab or to adjust the temperature produced by the air conditioner.

High-Side Service Valve A device located on the liquid line before the expansion device. It allows high-side pressure to be checked and other service operations to be performed.

High-Pressure Switch Located on the discharge side of the refrigerant compressor, the high-pressure switch signals the fan on and the refrigerant compressor off in the event of a high pressure condition.

Humidity The amount of water vapor in the air.

Hydraulic Lock The return of liquid refrigerant to the compressor, which could destroy the unit.

Leak Detector Any device used to detect refrigerant leaks in a refrigerant system.

Liquid Pressure Pressure of refrigerant in the liquid line from the condenser to the expansion device.

Low-Pressure Switch Located on the suction side of the refrigerant compressor, the low pressure switch signals the clutch to cycle or shut down in extremely cold temperatures, or if there is a loss of charge.

Low Head Pressure High-side pressure that is lower than normal due to a system problem.

Low-Suction Pressure Low-side pressure that is lower than normal due to a system problem.

Magnetic Clutch An electrical coupling device used to engage or disengage the compressor.

Manifold A device to control refrigerant flow for system test purposes. It is used with manifold gauges.

Manifold Gauge A calibrated instrument used for measuring system pressures.

Manifold Gauge Set A manifold that is complete with gauges and charging hoses and is used to measure or test pressure.

Micron A metric unit of length equal to one-millionth of a meter. The unit of measure is used to measure vacuum drawn from a refrigerant system by a vacuum pump.

Nitrogen A colorless, odorless, dry, inert gas.

Opacity A condition that is used to describe contamination of refrigerant oil in the compressor. Fresh refrigerant oil is clear; when contaminated, it appears cloudy or may have fine particles held in suspension.

Orifice Tube Fixed expansion device located in the cab evaporator inlet that controls the amount of refrigerant that passes into the evaporator.

Overcharge Too much refrigerant or oil in the system.

Polyalkylene Glycol (PAG) Highly refined synthetic refrigerant oil that is used in R–134a air conditioning systems.

psia Pounds per square inch, absolute pressure. Pressure exerted by the air at sea level. Atmospheric pressure is usually measured with a mercury barometer.

psig Pounds per square inch, gauge pressure. Any pressure above normal atmospheric pressure (14.7 psi) is referred to as gauge pressure.

Recovery Removal of the refrigerant from the air conditioning system.

Recycling Removal of contaminants and moisture from R–134a using a recovery and recycling station.

Refrigerant–134a (R–134a) The cooling agent used in automotive air conditioning systems. The chemical name for R–134a is tetrafluoroethane.

Refrigerant Compressor A device used to draw low-pressure refrigerant gas from the evaporator and squeeze it into a high-temperature, high-pressure gas. A second purpose of the compressor is to move refrigerant through the system.

Refrigeration Cycle The complete circulation of refrigerant through an air conditioning system, accompanied by changes in temperature and pressure.

Relative Humidity The actual water content of the air in relation to the total water vapor the air can hold at a given temperature.

Resistor A voltage-dropping device, usually wire-wound, for controlling fan speed.

Suction Line The line connecting the accumulator outlet to the compressor inlet.

Suction Pressure Compressor inlet pressure or the system's low-side pressure.

Suction Service Valve A device located on the suction hose near the accumulator that allows low-side pressure to be checked and other service operations to be performed.

Suction Side The low-pressure area of the system extending from the expansion device to the compressor inlet.

Thermistor A vacuum pressure sensor that is used to measure, in microns of mercury, internal system vacuum levels after evacuation.

Thermostatic Vacuum Gauge A high-vacuum gauge sensitive to pressures ranging from atmospheric pressure to less than 1 micron of mercury with scales reading from 25,000 microns to 1 micron of mercury.

Undercharge A system low on refrigerant resulting in lack of cooling and possible compressor damage.

Vacuum Refers to pressure that is less than atmospheric pressure.

General Information

Vacuum Pump A mechanical device used to evacuate and place a high vacuum in the refrigerant system.

Vacuum Pump Oil Water soluble oil used in some vacuum pumps to absorb moisture from the refrigerant system.

Vapor The gaseous state of a material.

Safety Precautions

Whenever repairs are made to any air conditioner parts that hold R–134a refrigerant, you must recover, flush (if contaminated), evacuate, charge and leak test the system. In a good system, refrigerant lines are always under pressure and you should disconnect them only after the refrigerant charge has been recovered (discharged) at the service valves.

R–134a refrigerant is safe when used under the right conditions. Always wear safety goggles and non-leather gloves while recovering, evacuating, charging, and leak testing the system. Do not wear leather gloves. When refrigerant gas or liquid contacts leather, the leather will stick to your skin.

⚠ WARNING

Use care to prevent refrigerant from touching your skin or eyes because liquid refrigerant, when exposed to the air, quickly evaporates and will freeze skin or eye tissue. Serious injury or blindness could result if you come in contact with liquid refrigerant.

Refrigerant splashed in the eyes should be rinsed with lukewarm water, not hot or cold. Do not rub the eyes. Apply a light bandage and contact a physician right away.

Refrigerant splashed on the skin should be rinsed with lukewarm water, not hot or cold. Do not rub the skin. Apply a light coat of a nonmedicated ointment, such as petroleum jelly. Contact a physician right away.

R–134a refrigerant does not burn at ambient temperatures and atmospheric pressure. However, it can be combustible at pressures as low as 5.5 psig (38 kPa absolute) at 350°F (177°C) when mixed with air concentrations that are greater than 60 percent.

⚠ WARNING

R–134a air conditioning systems should not be pressure tested or leak tested with compressed air. Combustible mixtures of air and R–134a may form, resulting in a fire or explosion that could cause personal injury or property damage.

You must work in an area where there is a constant flow of fresh air when the system is recovered, evacuated, charged and leak tested. R–134a vapors have a slightly sweet odor that is difficult to detect. Frequent leak checks and air monitoring equipment are recommended to ensure a safe working environment.

IMPORTANT: When servicing an R–134a air conditioning system, use only service equipment certified to meet the requirements of SAE J2210 (R–134a recycling equipment). The equipment should be operated only by qualified personnel who are familiar with the recycling station manufacturer's instructions.

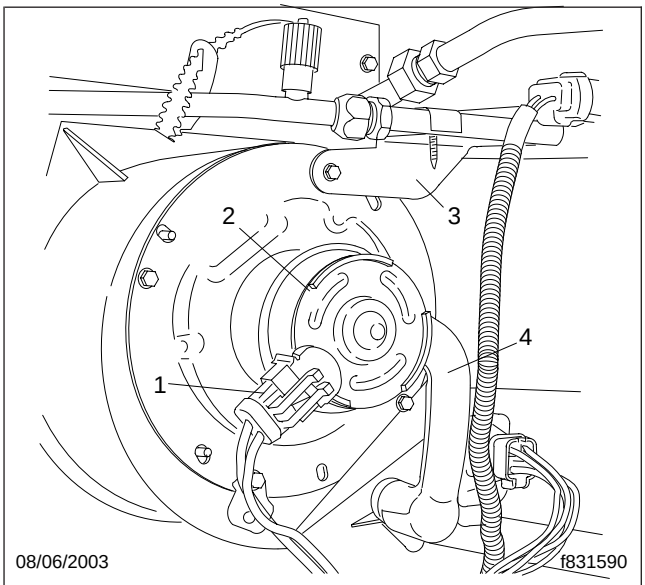
Because of its very low boiling point, refrigerant must be stored under pressure. To prevent the refrigerant containers from exploding, never expose them to temperatures higher than 125°F (52°C).

Polyalkylene glycol (PAG) refrigerant oil is the **only** refrigerant oil recommended for use in the refrigerant compressors. When handling refrigerant oil, observe the following:

- Keep the oil free of contaminants.
- Do not expose the air conditioning system or the oil container to air for long periods of time; refrigerant oil absorbs moisture quickly.
- Use care when handling: painted surfaces, plastic parts, and other components (drive belts) could be damaged if the oil is spilled on them.
- Never mix PAG oil with other types of refrigerant oil.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Disconnect the batteries.
4. Disconnect the electrical connector from the blower motor. See **Fig. 1**.



1. Electrical Connector
2. Blower Motor
3. Support Bracket
4. Blower Motor Tube

Fig. 1, Electrical Connector

5. Disconnect the blower motor tube from the blower motor.
6. Remove the screw that attaches the support bracket to the blower motor and remove the support bracket.
7. Remove the screws that secure the blower motor and remove the blower motor.
8. Remove and discard the retaining clip that secures the blower motor fan to the blower motor. See **Fig. 2**.

NOTE: The retaining clip that secures the blower motor fan to the blower motor is a single-use item. If the blower motor and blower motor fan are separated, a new retaining clip must be used.

9. Using a new retaining clip, install the blower motor fan.

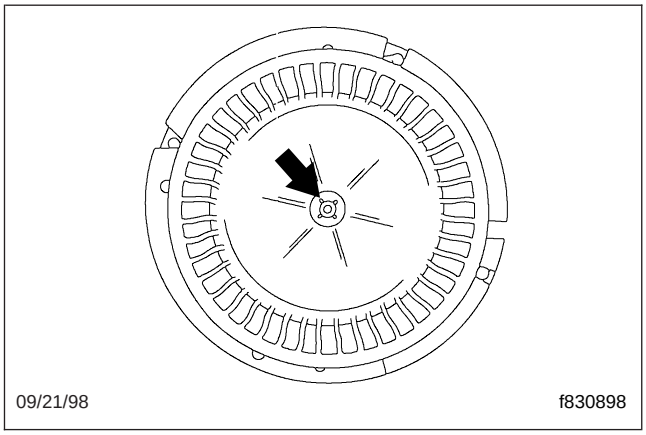


Fig. 2, Retaining Clip

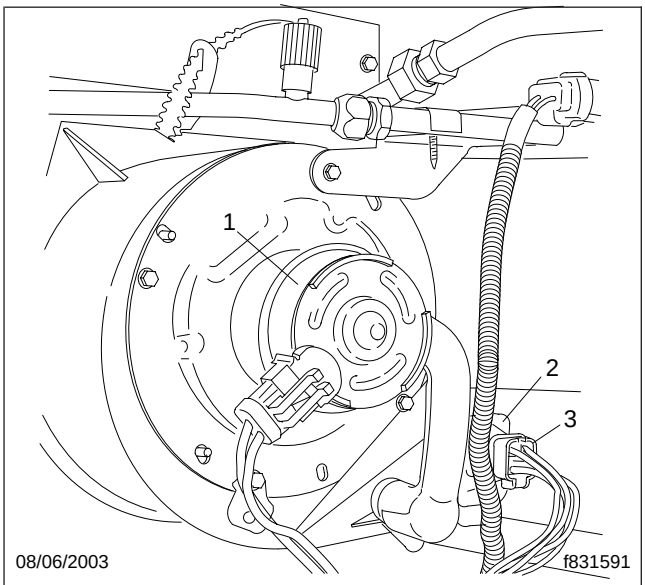
10. Using screws, install the blower motor.
11. Using a screw, install the support bracket on the blower motor.
12. Install the blower motor tube on the blower motor.
13. Connect the electrical connector to the blower motor.
14. Return the hood to the operating position.
15. Connect the batteries.
16. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Open the hood.
4. Disconnect the electrical connector from the resistor. See **Fig. 1**.



1. Blower Motor
2. Resistor
3. Electrical Connector

Fig. 1, Blower Motor Resistor

5. Remove the screws that secure the resistor, and remove the resistor.
6. Inspect the gasket on the blower motor resistor flange before installing the resistor. If the gasket is damaged, replace the resistor, or seal the resistor mounting flange using silicone rubber.
7. Using screws, install the resistor. Torque the screws 18 to 27 lbf·in (170 to 280 N·cm).
8. Connect the electrical connector to the resistor.
9. Connect the batteries.
10. Return the hood to the operating position.
11. Remove the chocks from the tires.

Required Equipment

You will need a machine, or machines, to identify the refrigerant and to recover, evacuate, flush, and charge the refrigerant system. Ideally, one machine can perform all the following functions:

- Identification–The machine must be able to verify the purity of the refrigerant in the refrigerant system and the presence of hydrocarbon-based refrigerants or other unapproved refrigerants.
- Recovery–The machine must be able to fully recover the refrigerant from the refrigerant system.
- Evacuation–Ideally, the machine should have a vacuum pump rated at 6 cfm and be maintenance free. A machine that requires maintenance is acceptable as long as it is properly maintained.
- Charging–The scale used in charging should be accurate to within ±1 ounce (30 mL).
- Flushing–Adaptors for the compressor(s), expansion device(s), and accumulator-drier should be purchased or fabricated to flush the system with refrigerant.

Refrigerant Identification

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

IMPORTANT: Identify the refrigerant in the refrigerant system if you suspect one of the following conditions:

- an excess noncondensable gas, such as nitrogen or air, is in the system
- an unapproved refrigerant is in the system
- the history of refrigerant system repairs is unknown

1. Using a high-quality refrigerant identifier and the manufacturer's instructions, attach the identifier to the vehicle and perform the test.
2. If the vehicle passed the test, it is safe to recover the refrigerant.
3. If the vehicle failed the test due to an excessive amount of noncondensable gas, recover the refrigerant system, then purge the recovery tank of the noncondensable gas.
4. If the vehicle failed the test due to the presence of a hydrocarbon-based refrigerant or a refrigerant other than R-134a, **do not recover the refrigerant into the general-use machine.** To recover the refrigerant system, recover the refrigerant into a separate container that contains refrigerant that must be recycled by a qualified recycling center. It is best to refer the customer to the place where the vehicle was last serviced.

Recovery

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

The recovery process removes most of the refrigerant charge in the system.

1. Turn off the engine, apply the parking brakes, chock the tires, and open the hood.
2. Remove the caps from the suction and discharge service valves.
3. If the history of refrigerant system repairs is unknown, or if you suspect that the system is charged with an unapproved refrigerant, identify the refrigerant using the "Refrigerant Identification" procedures.
4. Wearing protective goggles and nonleather gloves, attach the refrigerant recovery and charging machine hoses to the valves.

IMPORTANT: Push down firmly on the hose connectors until a clicking sound is heard. This will ensure that the coupler is locked.

5. Follow the refrigerant recovery and charging machine manufacturer's instructions and recover all of the refrigerant from the refrigerant system.

IMPORTANT: Always comply with all federal and local regulations regarding refrigerant recovery and disposal. You may be subject to substantial penalties for improper procedures.

6. Measure the oil recovered during the recovery process. The refrigerant system will have to be filled with the same quantity of new refrigerant oil. If the system is contaminated with moisture, all of the compressor oil must be replaced with clean oil. If the system is heavily contaminated with desiccant or grit, replace the compressor, expansion valve, and accumulator-drier, and flush the condenser and evaporator(s). After the system is charged, perform a performance check to ensure that the heat exchangers are not plugged.

Evacuating

The main purpose in evacuating the refrigerant system is to remove noncondensable gases (NCG), such as nitrogen and air. The secondary purpose is to boil off free water molecules.

In rare cases, water forms ice crystals at the expansion valve. Ice crystals retard or stop the flow of refrigerant, causing a reduction or complete loss of cooling. As the expansion valve warms due to the lack of refrigerant, the ice melts and passes through the expansion valve. Then refrigerant will flow again until the ice crystals re-form. The result is intermittent cooling.

Refrigerant oil has an extremely high moisture absorption capacity. Typically, the moisture picked up by the oil is passed on to the accumulator-drier. If excessive moisture exists in the system, the lubricating ability of the oil is reduced, which could damage the compressor and other components.

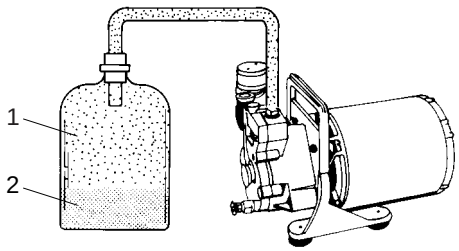
Effects of Pressure on the Boiling Point of Water

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

Water boils at 212°F (100°C) at an atmospheric pressure of 14.7 psi (101 kPa) at sea level. At higher elevations the atmospheric pressure is lower, which allows water to boil at lower temperatures. See **Table 1** for boiling temperatures of water at converted pressures.

Similarly you can boil and remove water from the air conditioning system by lowering the system pressure to a vacuum to cause the moisture to vaporize at normal ambient temperatures. A vacuum pump can reduce the pressure in the system. Since the pressure is lowest at the pump, NCG and water vapor are pulled out of the system. This process is called evacuation or dehydration. See **Fig. 1**.



11/14/95 f830489b

1. Vapor 2. Water

Fig. 1, Water to Vapor

Measuring Vacuum

Vacuum should be measured with an electronic thermistor vacuum gauge, which is designed for use with high vacuum pumps and can accurately read as low as 100 microns. This gauge can have an analog scale or a digital (LED or LCD) display.

The location of the vacuum gauge will affect the reading. The closer to the vacuum source, the lower the reading will be. Follow the manufacturer's instructions for proper use of the vacuum gauge.

If the pressure will not stabilize, it is an indication of a leak. If it does stabilize at a vacuum that is too high, for example 1500 microns Hg, it is an indication of moisture and more evacuation is required.

Boiling Temperatures of Water at Converted Pressures		
Boiling Temperature of Water: °F (°C)	**Absolute Pressure: psi (microns Hg)**	**Vacuum: inHg (mmHg)**
212 (100)	14.696 (759993.4)	0 (0)
205 (96)	12.770 (660400.0)	3.92 (99.6)
194 (90)	10.169 (523881.6)	9.22 (234.2)
176 (80)	6.8699 (355269.8)	15.93 (404.6)
158 (70)	4.5207 (233786.7)	20.72 (526.3)
140 (60)	2.8900 (149580.7)	24.04 (610.6)
122 (50)	1.7987 (92555.1)	26.28 (667.5)
104 (40)	1.0700 (55336.4)	27.74 (704.6)
89 (30)	0.61540 (31826.2)	28.67 (728.2)
86 (27)	0.57010 (26220.4)	28.89 (733.8)
76 (24)	0.44435 (22979.9)	29.02 (737.1)
72 (22)	0.38856 (20094.7)	29.13 (739.9)
69 (21)	0.35084 (18143.7)	29.21 (741.9)
64 (18)	0.29505 (15258.5)	29.32 (744.7)
59 (15)	0.24720 (12783.8)	29.42 (747.3)
53 (12)	0.19888 (10285.0)	29.52 (749.8)
45 (7)	0.14746 (7625.8)	29.62 (752.3)
32 (0)	0.08858 (4579.6)	29.74 (755.4)
21 (–6)	0.05293 (2738.1)	29.81 (757.2)
6 (–14)	0.02521 (1304.0)	29.87 (758.7)

Table 1, Boiling Temperatures of Water at Converted Pressures

Holding a vacuum is only an indication that there are not any leaks that are present under a vacuum. Other leaks may exist when the system is pressurized, so a proper leak test must be performed in conjunction with holding a vacuum.

Maintaining an Oil-Lubricated Vacuum Pump

Maintenance is important for a high-vacuum pump. The oil must be changed at regular intervals to prevent moisture buildup, which will cause decreased pump performance and eventual pump failure.

Pumping down for extremely wet air conditioning systems can completely saturate the pump oil, which will require the replacement of the vacuum pump oil.

⚠ CAUTION

Flush the vacuum pump every fourth time it is used, and before storing for long periods of time.

Acid will form and corrode the pump, if water-laden oil remains in the pump for an extended period.

Vacuum pump oil is water soluble. This aids the pump in reaching a high vacuum by absorbing water and sealing the pump.

Use only vacuum pump oil as a lubricant. Do not use any solvent or any other oil. Clean oil should be run through the pump until it runs out clear. Oil should be added to the fill level indicated on the pump. Check the oil level before each use.

Evacuation Procedure

1. The system must have been recovered and the refrigerant compressor filled with the correct amount of refrigerant oil. Replace the accumulator-drier if the system conditions require it.
2. Make sure the vacuum pump has been properly maintained.
3. Wearing protective goggles and nonleather gloves, attach the refrigerant recovery and charging machine hoses, or a vacuum pump, to the valves.

IMPORTANT: Push down firmly on the hose connectors until a clicking sound is heard. This will ensure that the coupler is locked.

4. Follow the refrigerant recovery and charging machine manufacturer's instructions and evacuate the refrigerant system.
5. A minimum of 10 minutes with a 6-cfm pump should be used to evacuate the system. Evacuate the system for a longer period of time if using a smaller pump. Make sure that the vacuum level reaches a point where water would boil and does not go back toward zero, then proceed with charging and leak testing the system.

Flushing

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

Flushing removes moisture-laden oil and some contamination, such as dirty oil and some particles. When a part is flushed, liquid refrigerant is forced through it. The liquid picks up the contaminants and flushes them out.

Whether to flush, or replace a part depends on how much contamination there is as previously described.

Normally the system always has pressure in it. Some loss of refrigerant from one season to the next is normal and does not mean that the system is dirty. If refrigerant parts show signs of internal corrosion and grit, the system is contaminated.

If the system is contaminated with moisture, flush all sections of the system. Then change the oil in the compressor and replace the accumulator-drier prior to evacuating and charging the system.

If the system is heavily contaminated or if desiccant has circulated through the system, replace the accumulator-drier, expansion valve(s), and inspect the compressor.

Do not flush the accumulator-drier or the compressor.

Flush the system in segments to lessen the chance of blowing deposits against a port.

Flush the system in the opposite direction of refrigerant flow. In other words, backflush the sections.

Flushing parts with refrigerant requires a refrigerant recovery and charging machine.

Flushing Procedure

Method 1

NOTE: Use this method when the recovery and charging machine is equipped with a flush cycle.

1. Recover the refrigerant from the air conditioning system.
2. Disconnect both ends of the line or part(s) being flushed. Tightly cap the lines to the rest of the system.

NOTE: You must remove the expansion device(s), accumulator-drier, and compressor(s) when flushing. These components must be removed and bypassed when performing a system flush.

3. Install the flushing adaptors and an inline filter and follow the instructions from the manufacturer of the recovery and charging machine to perform the flush. When flushing the entire system, use an adaptor that fits where the compressor was located and backflush.
4. Remove the adaptors and bypass devices and install the expansion device(s), the compressor, and a new accumulator-drier.
5. If installing the existing compressor, remove the oil in it and replace the oil with new oil. New compressors may or may not have a full charge of oil.
6. Charge the system with refrigerant and check the system performance.

Method 2

NOTE: Use this method when two recovery and charging machines are available.

1. Recover the refrigerant from the air conditioning system.
2. Disconnect both ends of the line or part(s) being flushed. Tightly cap the lines to the rest of the system.

NOTE: You must remove the expansion device(s), accumulator-drier, and compressor(s) when flushing. These components must be removed and bypassed when performing a system flush.

3. Install the flushing adaptors and an inline filter. When flushing the entire system, use an adaptor that fits where the compressor was located and backflush.
4. Charge the part with 2 pounds (0.9 kg) of refrigerant or the system with 5 pounds (2.3 kg) of refrigerant, then recover the refrigerant with a second machine. It is desirable to start the recovery slightly before the charge cycle is done since this helps to push fluid through the system. Repeat the process several times until you think that all the oil has been removed.
5. Remove the adaptors and bypass devices and install the expansion device(s), the compressor(s), and a new accumulator-drier.
6. If installing the existing compressor, remove the oil in it and replace the oil with new oil. New compressors may or may not have a full charge of oil.
7. Charge the system with refrigerant and check the system performance.

Charging

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

NOTE: Before charging, the system must be recovered and evacuated with the recovery and charging machine connected to the service and discharge port connections.

1. Obtain enough refrigerant to fully charge the system. To determine the amount of refrigerant needed to fully charge the system, read the Air Conditioner label on the vehicle or see **Specifications 400**.
2. Charge the system on the high side following the refrigerant recovery and charging machine manufacturer's instructions.
3. While the compressor is engaged, check the duct temperature and operating pressures at the suction and discharge ports. Compare the temperature and pressures to those in **Specifications 400**. If the operating pressures are not acceptable, see **Subject 300** for troubleshooting procedures.
4. Disconnect the hoses.
5. Shut down the engine.
6. Recover the refrigerant that is in the hoses.

Leak Testing Methods

General Information

⚠ WARNING

Before doing any of the work below, read the information under Safety Precautions 100. Failure to read the safety precautions, and to take precautions against the dangers involved when working with refrigerant, could lead to serious personal injury.

Refrigerant is nearly odorless. As a result, all of it may leak away and not be noticed until the system stops cooling. All vehicle refrigerant systems lose some refrigerant. Higher loss rates signal a need to locate and repair the leaks.

Leaks are most often found at the compressor hose connections and at the various fittings and joints in the system. If unapproved replacement hoses are installed, refrigerant can be lost through hose permeation.

There are two leak testing methods that can be used to detect leaks in the refrigerant system: UV (ultraviolet) dye leak detection and electronic leak detection. Daimler Trucks North America recommends using the UV dye leak detection method whenever possible, even though there are some limitations to using this method. A leak on the front seal of the compressor **must** be verified using a heated diode leak detector and the instructions in the workshop manual. Visible dye on the front of the compressor clutch **does not** verify that there is a repairable leak at the front seal. Evaporator leaks may not show up with dye, and must be checked using a heated diode leak detector if dye is not present at the condensate drain.

UV Dye Leak Detection

IMPORTANT: When using the UV dye leak detection method, always wear protective eyewear that blocks UV rays and enhances the appearance of the dye. Always wear nonleather gloves and protective eyewear when servicing the air conditioning system.

1. Inspect the refrigerant system for leaks using a UV lamp.
   - 1.1 Inspect the entire refrigerant system under low lighting using a UV lamp. Low lighting will increase the apparent brightness of the UV dye at leak sights.
   - 1.2 Move the UV lamp along the entire refrigerant system, looking for signs of damage or corrosion on the fittings, hose-to-line crimps, switch ports, service ports with caps installed (dye inside the port is not an indication of a leak), brazed or welded areas, and around all connections. Check for evaporator leaks by illuminating the condensate drain tube or hole using the UV lamp.
   - 1.3 Move the UV lamp along the refrigerant system following a continuous path so that no potential leak sites are missed. If a leak is found, continue to check the remainder of the system since other leaks may be present.
2. After repairing a leak, remove all UV dye residue remaining on the outside of the refrigerant system using the cleaner provided by the dye manufacturer, or a comparable cleaner. Use a spray bottle of cleaner, a toothbrush, and a spray bottle of clean water for hard-to-reach areas.

NOTE: Minor UV dye residue, or residue that is impossible to reach, will lose its fluorescence over time.

3. See **Table 2** for a list of products that have been tested and approved for use by Freightliner dealers.
4. Close the hood and remove the chocks from the tires.

Approved Products for UV Dye Leak Detection				
Type of Refrigerant Oil	**Product Description**	**Vendor Part Number**	**Freightliner Part Number**	**Website Address**
PAG	Tracerline BigEZ Kit—Can be injected without discharging the system. • Each kit includes one 4-oz (118-mL) cartridge and an injection tool.	TP-9741CS	ABP N83 327911	www.tracerline.com
	• A 4-oz (118-mL) replacement cartridge services 16 vehicles.	TP-9760-0004CS	ABP N83 327961	
	• An 8-oz (237-mL) replacement cartridge services 32 vehicles.	TP-9760-0108	ABP N83 327951

Table 2, Approved Products for UV Dye Leak Detection

Electronic Leak Detection

NOTE: Do not try to use a leak tester right after connecting or disconnecting service hoses. Traces of refrigerant at the fittings can falsely signal a leak. Always verify a leak by blowing shop air in to the area of the suspected leak and checking the area again.

When checking for leaks, move the probe all the way around the fitting or suspected leak.

Daimler Trucks North America recommends using only certain makes of the heated diode and infrared (IR) types of electronic leak detectors.

Recommended electronic heated diode type leak detectors are available from their manufacturers. See **Table 3**.

Another type of detector, the corona discharge type, is specifically **not recommended**.

Use the following procedures to locate refrigerant system refrigerant gas leaks using an electronic leak detector.

1. Operate the electronic leak detector in accordance with the manufacturer's instructions. Occasionally use a leak reference bottle of R-134a to ensure that the detector is working properly.
2. Leak test with the engine turned off.

Refrigerant Service Operations

Electronic Leak Detectors		
Designation	**Manufacturer**	**Comments**
D-TEK, D-Tek Select, and TekMate	Leybold Inficon 2 Technology Place East Syracuse NY 13057 (315) 434–1144	• Rechargeable battery • Hand-held design • Simple to operate
H–10 Professional	Bacharach Inc. c/o Yokogawa Corp. of America 2 Dart Road Newnan GA 30265 (800) 850–0044	• Rechargeable battery • Carrying case with strap • Calibration leak bottle • Manual sensitivity control • Most sensitive available
J 39400	SPX Kent-Moore 28635 Mound Road Warren MI 48092–3499 (800) 328–6657	• 12V DC or 120V AC • Carrying case with strap • Calibration leak bottle • Manual sensitivity control • Manual balance control

Table 3, Electronic Leak Detectors

3. Charge the air conditioning system with sufficient refrigerant to indicate a gauge pressure of at least 50 psi (345 kPa) with the system not operating. Typically, one-half pound (0.22 kg) of refrigerant is sufficient to create 50 psi (345 kPa) of pressure. It may not be possible to produce this amount of pressure and measure leakage if the ambient temperature is less than 59°F (15°C).
4. Be careful not to contaminate the detector probe tip if the part being tested is not clean. Wipe the part off with a dry shop towel or blow it off with shop air. Do not use cleaners or solvents as many detectors are sensitive to their chemical ingredients.
5. Visually inspect the entire refrigerant system. Look for air conditioning lubricant leakage and corrosion or damage to lines, hoses, and all other components. Inspect each questionable location carefully with the detector probe. Check all fittings, couplings, refrigerant controls, service ports (with caps installed), brazed or welded areas, and areas around attachment points and hold-downs.
6. Follow the path of the refrigerant system methodically so that no leaks are missed. If a leak is found, continue to test the rest of the system.
7. Inspect an area of possible leakage slowly and close to the part, moving completely around the part. Move the probe no faster than one to two inches (25 to 50 mm) per second and no farther away than 1/4 inch (6.4 mm) from the part.
8. If a large leak is present in either the system being serviced or the service equipment, the surrounding air will be saturated with refrigerant gas. In this situation the leak detector operates erratically and will indicate leakage without being near a possible leak source. Place a large fan so that a light breeze blows through the work area. Verify a leak by blowing shop air into the area and repeating the inspection. Pinpoint a large leak by blowing out the area often.
9. You may test the evaporator core while it is in its housing. Turn on the blower motor for a minimum of 15 seconds. Shut off the blower and wait for refrigerant gas to accumulate in the housing. Follow the detector instructions for the specific length of time to wait for the gas to accumulate. Insert the detector probe into the blower resistor

block, or condensate drain tube if no water is present. If this is not possible insert the probe into the closest opening to the evaporator, such as a heater or vent duct.

NOTE: The presence of water in the condensate drain tube can be determined by inserting the eraser end of a pencil in the drain tube. Inserting the pencil will break the surface tension of any water near the opening of the drain tube and allow the water to drain out before inserting the probe tip. It is only necessary to break the plane of the drain tube with the probe tip. It does not need to be inserted far into the tube.

10. Leak test the front seal area of the compressor. Blow shop air into the cavities in and around the clutch for at least 15 seconds. Let the compressor stand for one minute and then test for leakage. Inspect axial-type compressors (Sanden or Sel-Tec) by placing the probe near the holes at the front of the clutch. See **Fig. 2**. Inspect two-cylinder reciprocating type compressors (Climate Control) by placing the probe between the clutch coil and the compressor. See **Fig. 3**.

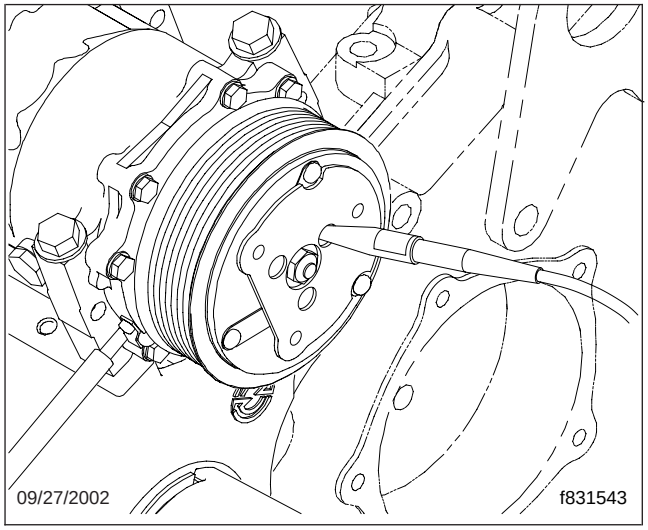

Fig. 2, Axial Type Compressor

IMPORTANT: Be careful not to damage the clutch bearing seal with high pressure shop air.

11. Leak test repaired areas of the system after repairs have been performed. Leak test the service ports (with caps installed) after any service which disturbs the refrigerant system.

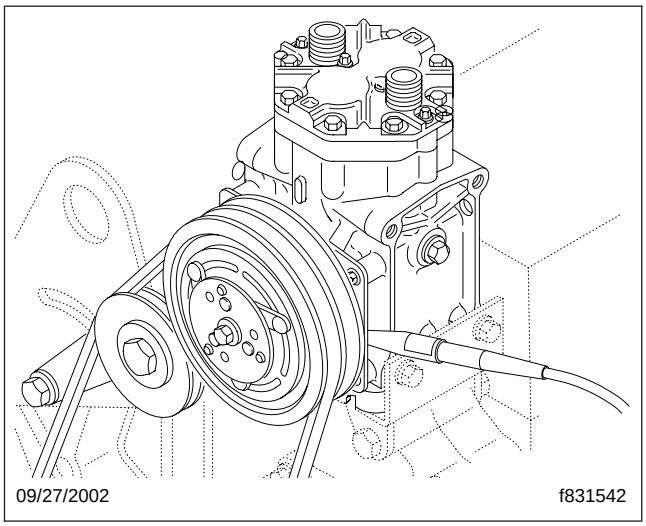

Fig. 3, Two-Cylinder Reciprocating Compressor

Evaporator Housing Removal and Installation

Removal

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Disconnect the batteries.
4. If equipped with air conditioning, recover the refrigerant from the air conditioning system. For instructions, see **Subject 130**.

WARNING

The engine must be off and fully cooled, and the cooling system fully depressurized before disconnecting any heater water hoses. Failure to comply with these warnings can result in serious personal injury from hot liquid escaping from the engine cooling system.

5. If necessary, remove the blower motor. For instructions, see **Subject 110**.
6. From inside the vehicle, remove the bolts and nuts that attach the dash panel support brace to the vehicle, and remove the support brace. See **Fig. 1**.
7. Remove the nuts that attach the evaporator housing to the dash panel.
8. Disconnect all electrical connectors from the blower motor and resistor.
9. Remove the nut that attaches the evaporator housing to the frontwall.
10. Remove the capscrews that attach the evaporator bracket to the frontwall. See **Fig. 2**.
11. Remove the evaporator housing. See **Fig. 3**.

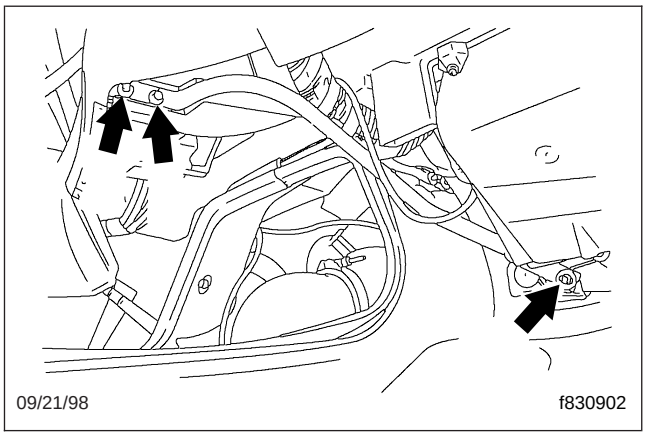

Fig. 1, Support Brace Fasteners

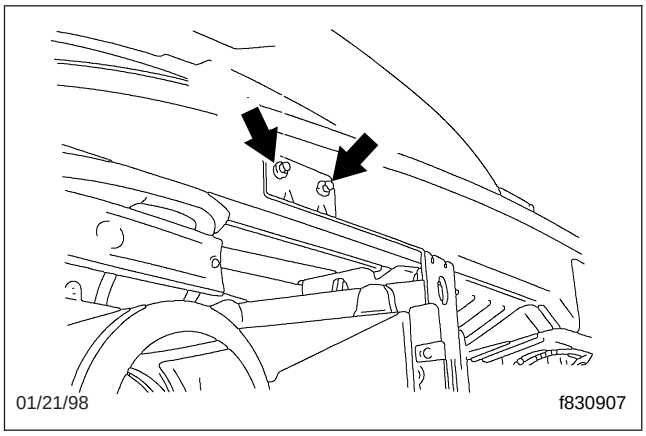

Fig. 2, Evaporator Bracket Capscrews

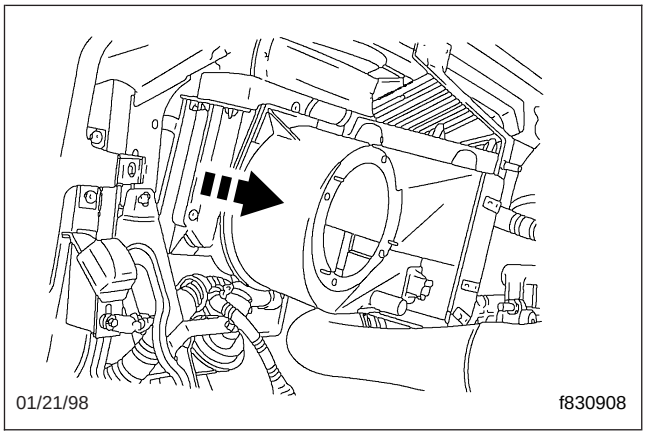

Fig. 3, Evaporator Housing

Evaporator Housing Removal and Installation

Installation

NOTE: If a new evaporator housing is to be installed, the blower motor and wheel, blower motor tube, blower motor resistor, evaporator bracket, fresh air filter, and evaporator must be transferred to the new evaporator housing. To ease installation, install these components prior to installing the evaporator housing.

1. Install the evaporator housing.
2. Install the capscrews that attach the evaporator bracket to the frontwall.
3. Install the nut that attaches the evaporator housing to the frontwall.
4. Connect the electrical connectors to the blower motor and resistor.
5. Install the nuts that attach the evaporator housing to the dash panel.
6. Using bolts and nuts, attach the dash panel support brace to the vehicle.
7. If the blower motor was removed, install the blower motor. For instructions, see **Subject 110**.
8. If equipped with an air conditioner, charge the air conditioning system. For instructions, see **Subject 130**.
9. Connect the batteries.
10. Close the hood.
11. Remove the chocks from the tires.

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

Replacement

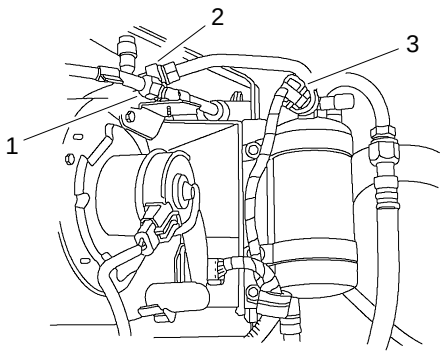
WARNING

The engine must be off and fully cooled, and the cooling system fully depressurized before disconnecting any heater water hoses. Failure to comply with these warnings can result in serious personal injury from hot liquid escaping from the engine cooling system.

1. Recover the refrigerant from the air conditioning system. For instructions, see Subject 130.

IMPORTANT: Under no circumstances should the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

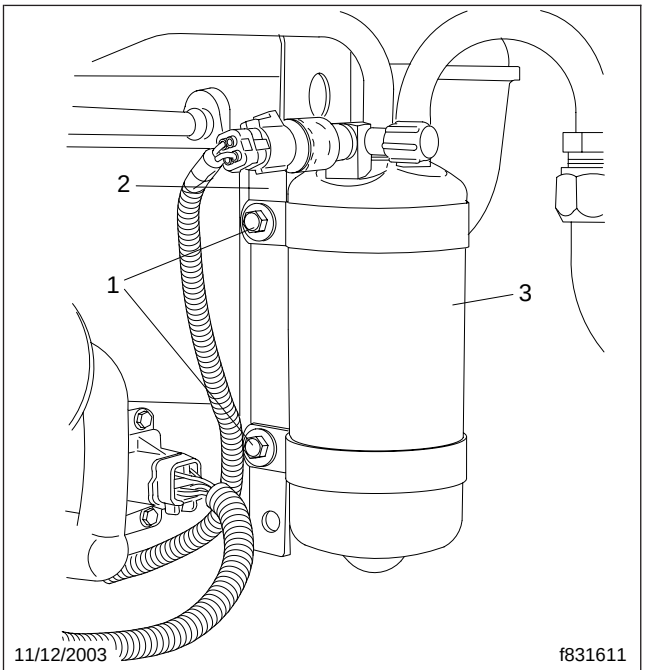
2. Disconnect the refrigerant lines from the evaporator. See Fig. 1.



1. Refrigerant Inlet Line
2. Refrigerant Outlet Line
3. Electrical Connector

Fig. 1, Disconnect the Refrigerant Lines

3. Disconnect the electrical connector from the refrigerant compressor cycling switch on the accumulator.
4. Remove the screws that attach the accumulator to the bracket, and remove the accumulator. See Fig. 2.

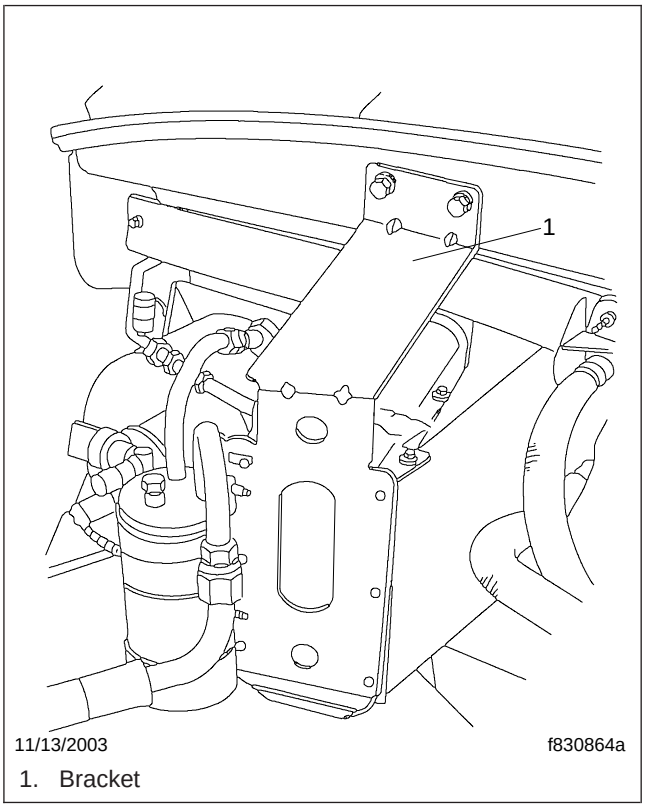


1. Screw
2. Bracket
3. Accumulator

Fig. 2, Accumulator

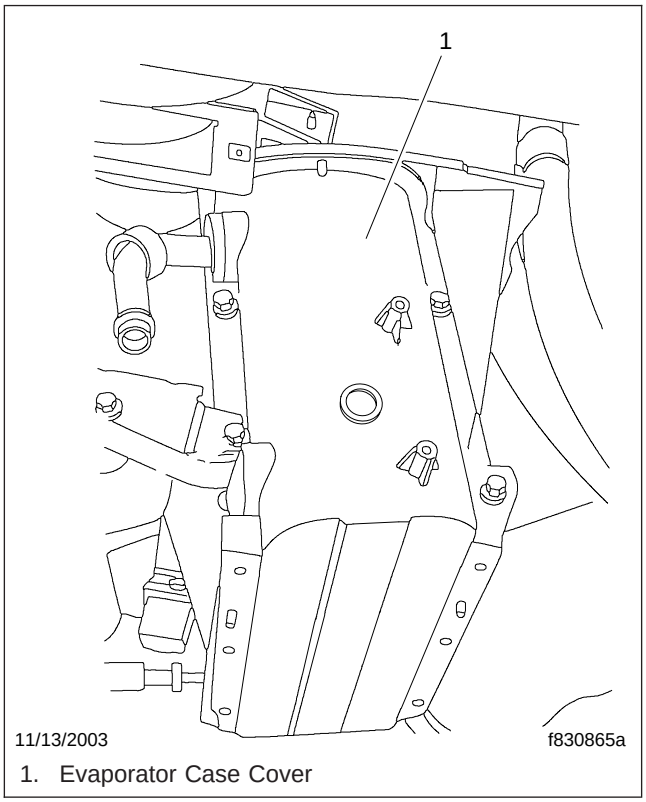
5. Remove the screws that attach the bracket to the evaporator case cover and the frontwall, and remove the bracket. See Fig. 3.
6. Remove the screws on top of the evaporator case cover and remove the case cover. See Fig. 4.
7. Remove the evaporator and O-rings.
8. Install a new evaporator and new O-rings. Lubricate the O-rings with mineral oil before installing.
9. Using screws, install the evaporator case cover.
10. Using screws, attach the accumulator and bracket to the evaporator case cover.
11. Connect the refrigerant lines to the evaporator.

Evaporator Replacement



1. Bracket

Fig. 3, Bracket



1. Evaporator Case Cover

Fig. 4, Evaporator Case Cover

12. Connect the electrical connector to the refrigerant compressor cycling switch on the accumulator.
13. Evacuate, leak check, and charge the air conditioning system. For instructions, see **Subject 130**.

⚠ WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Recover the refrigerant from the air conditioning system. For instructions, see **Subject 130**.

IMPORTANT: Under no circumstances should the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through the refrigerant lines since shop air is wet (humid).

3. Disconnect the refrigerant line at the orifice tube fitting. See **Fig. 1**.

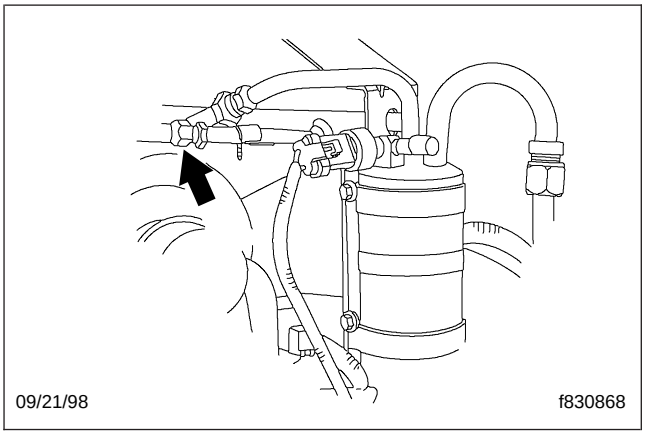


Fig. 1, Orifice Tube Fitting

4. Remove the orifice tube.
5. Install a new orifice tube.
6. Replace the O-ring in the fitting. Lubricate the O-ring with mineral oil before installing the O-ring.
7. Connect the refrigerant line to the orifice tube fitting. Torque the fitting 15 to 20 lbf·ft (20 to 27 N·m).
8. Evacuate and charge the air conditioning system. For instructions, see **Subject 130**.
9. Leak check the orifice tube fitting.
10. Remove the chocks from the tires.

Accumulator Replacement

Replacement Guidelines

NOTE: The accumulator/drier contains a desiccant bag to absorb any moisture that may be in the system. It is important to protect the accumulator/drier by capping any open lines when performing service work on the refrigerant system. Replacement of the accumulator/drier is necessary anytime a major component of the refrigerant system is replaced. Major components include the condenser, the refrigerant compressor, the evaporator, or a refrigerant hose or line. An orifice tube or an O-ring is not considered a major component. However, the orifice tube must be replaced whenever the compressor is replaced.

In addition, the accumulator/drier must be replaced if:

- The accumulator/drier is leaking;
- There has been a complete loss of charge in the refrigerant system;
- There is evidence of moisture in the system, such as internal corrosion of metal refrigerant lines or the refrigerant oil is thick and dark.

NOTE: When replacing the accumulator/drier, this procedure must be followed to make sure that the total oil charge in the system is correct after the new accumulator/drier is installed.

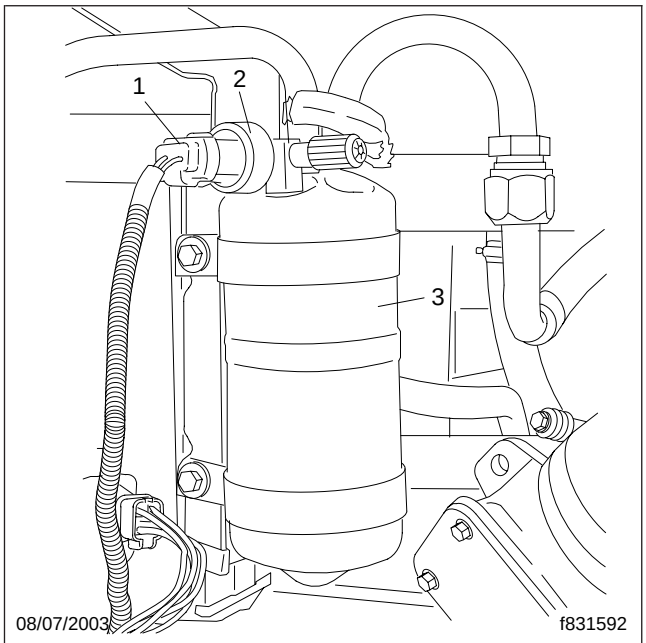
1. Drain the oil from the removed accumulator/drier into a measuring container. It may be necessary to drill one or two 1/2-inch (12.7-mm) holes in the bottom of the accumulator/drier to make sure all the oil has been drained out.
2. Add the same amount of new, clean refrigerant oil, plus the amount of oil that was removed from the system during refrigerant recovery, to the new accumulator/drier. Use only the oil specified for the specific vehicle being serviced.

Replacement

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Recover the refrigerant from the air conditioning system. For instructions, see **Subject 130**.
4. Disconnect the electrical connector and the refrigerant compressor cycling switch from the accumulator. See **Fig. 1**.



1. Electrical Connector
2. Refrigerant Compressor Cycling Switch
3. Accumulator

Fig. 1, Accumulator

5. Disconnect the refrigerant lines from the accumulator. Quickly cap the refrigerant lines.

IMPORTANT: Under no circumstances should the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

6. Remove the capscrews that attach the accumulator to the mounting bracket and remove the accumulator.

Accumulator Replacement

7. Drain the refrigerant oil from the accumulator.
   - 7.1 Drill one or two 1/2-inch (13-mm) holes in the bottom of the accumulator that was just removed.
   - 7.2 Drain the refrigerant oil from the accumulator into a calibrated container. Record the amount of oil recovered and properly dispose of the recovered oil.
8. Add the same amount of clean refrigerant oil that was drained from the accumulator, plus the amount of oil that was removed from the system during refrigerant recovery, to the new accumulator.
9. Using capscrews, install the new accumulator to the mounting bracket.
10. Uncap the refrigerant lines.
11. Replace the O-rings on the refrigerant lines. Lubricate the O-rings with mineral oil before installing.
12. Connect the refrigerant lines to the accumulator. Torque the fittings on the refrigerant lines 25 to 30 lbf·ft (34 to 41 N·m).
13. Connect the refrigerant compressor cycling switch and the electrical connector to the accumulator. Tighten the cycling switch by hand only.
14. Evacuate and charge the air conditioning system with refrigerant. For instructions, see **Subject 130**.
15. Return the hood to the operating position.
16. Remove the chocks from the tires.

Removal

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Recover the refrigerant from the air conditioning system. For instructions, see **Subject 130**.
4. Disconnect the refrigerant lines from the condenser. Quickly cap the condenser inlet and outlet ports if the condenser will be reinstalled, and cap the refrigerant lines.

IMPORTANT: Under no circumstances should the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

5. Remove the fasteners that attach the condenser to the radiator, and remove the condenser.

Installation

1. Using fasteners, install the condenser on the radiator. Torque the fasteners 26 to 34 lbf·ft (35 to 46 N·m).
2. Uncap the inlet and outlet ports on the condenser and uncap the refrigerant lines.
3. On refrigerant line connections that have a Mini Stat-O-Seal assembly, replace the Mini Stat-O-Seals. **Do not** lubricate Mini Stat-O-Seals prior to installation. Use **only** a Mini Stat-O-Seal on a Mini Stat-O-Seal assembly.

   On refrigerant line connections that have threaded fittings, replace the O-rings in the fittings. Lubricate the O-rings with mineral oil before installing.
4. Connect the refrigerant lines to the condenser.

   On refrigerant lines that have a Mini Stat-O-Seal assembly, torque the bolt on the retaining plate 11 to 15 lbf·ft (15 to 20 N·m).

   On refrigerant lines that have threaded fittings, torque the fittings 10 to 15 lbf·ft (14 to 20 N·m).
5. Evacuate, leak test, and charge the air conditioning system with refrigerant. For instructions, see **Subject 130**.
6. Return the hood to the operating position.
7. Remove the chocks from tires.

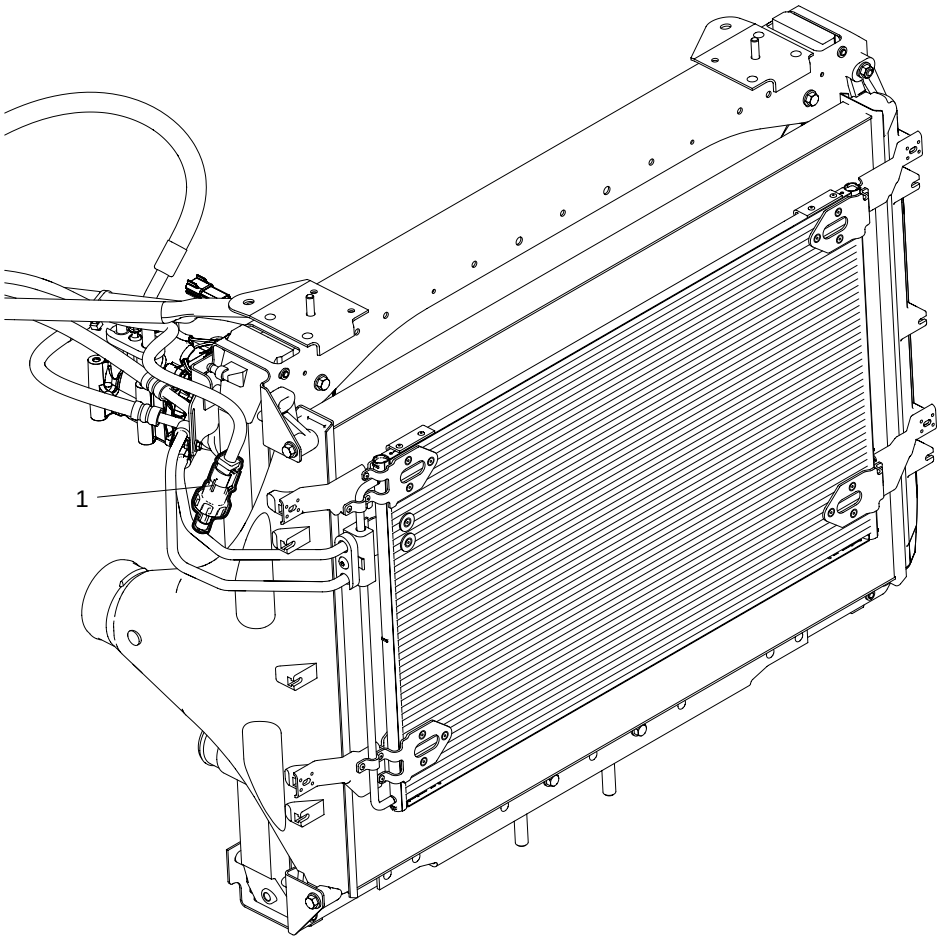
Replacement

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Disconnect the electrical connector from the engine fan cycling switch. See **Fig. 1**.
4. Remove the cycling switch.
5. Check the condition of the O-ring before installing the cycling switch. If necessary, replace the O-ring. Lubricate the O-ring with mineral oil before installing.
6. Install a new engine fan cycling switch. Tighten the switch by hand only.
7. Connect the electrical connector to the cycling switch.
8. Return the hood to the operating position.
9. Remove the chocks from the tires.

Engine Fan Cycling Switch Replacement



1. Engine Fan Cycling Switch

Fig. 1, Engine Fan Cycling Switch

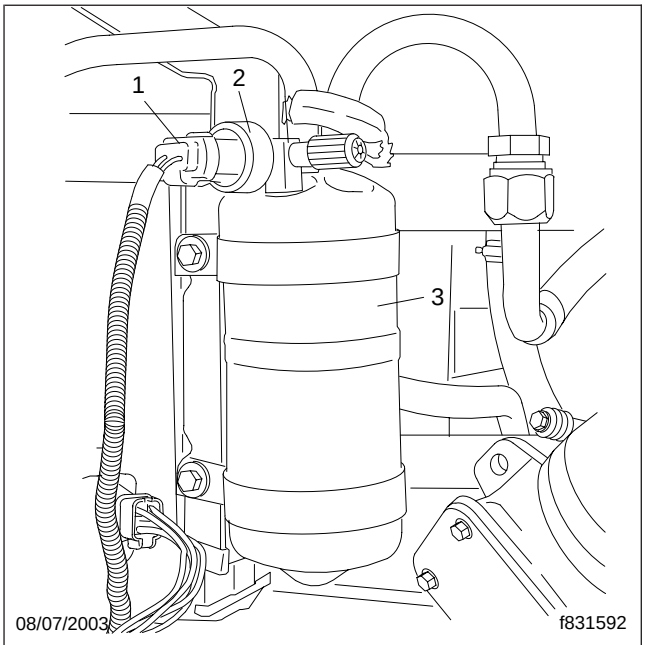
Refrigerant Compressor Cycling Switch Replacement

Replacement

WARNING

Before doing any of the work below, read the information in Safety Precautions 100. Failure to read and understand the safety precautions, and to take necessary precautions against the dangers involved when working with refrigerant could lead to serious personal injury.

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.
3. Disconnect the electrical connector from the refrigerant compressor cycling switch. See **Fig. 1**.
4. Remove the cycling switch.



1. Electrical Connector
2. Refrigerant Compressor Cycling Switch
3. Accumulator

Fig. 1, Refrigerant Compressor Cycling Switch

5. Check the condition of the O-ring before installing the cycling switch. If necessary, replace the O-ring. Lubricate the O-ring with mineral oil before installing.
6. Install a new cycling switch. Tighten the switch by hand only.
7. Connect the electrical connector to the cycling switch.
8. Return the hood to the operating position.
9. Remove the chocks from the tires.

Removal

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the auxiliary finish panel. For instructions, see **Group 60**.
4. Remove the screws that attach the climate control panel to the dash panel.
5. Pull the climate control panel away from the dash panel and disconnect the electrical connectors.
6. Remove the climate control panel.

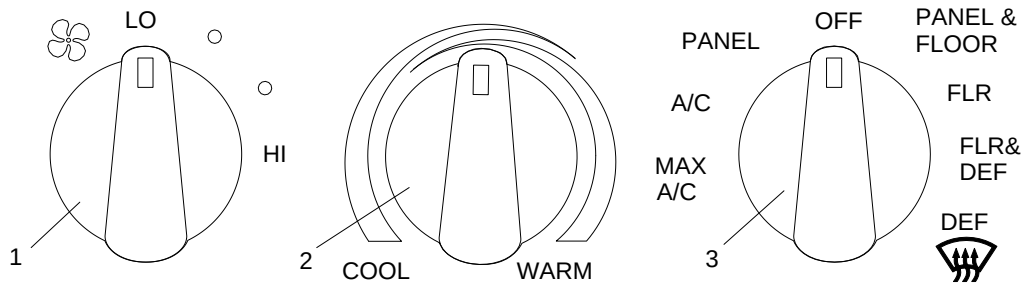
Installation

1. Connect the electrical connectors to the climate control panel.
2. Using screws, attach the climate control panel to the dash panel.
3. Install the auxiliary finish panel. For instructions, see **Group 60**.
4. Connect the batteries.
5. Remove the chocks from the tires.

Fan, Temperature Control, and Air Selection Switches Replacement

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the fan switch, temperature control switch, or air selection switch knob by pulling it off the climate control panel. See **Fig. 1**.
4. Remove the climate control panel. For instructions, see **Subject 210**.
5. Remove the screw that attaches the switch to the climate control panel. Rotate and remove the switch.
6. Using a screw, install a new switch on the climate control panel.
7. Install the climate control panel. For instructions, see **Subject 210**.
8. Install the fan switch, temperature control switch, or air selection switch knob by pushing it on the switch.
9. Connect the batteries.
10. Remove the chocks from the tires.



1. Fan Switch Knob
2. Temperature Control Switch Knob
3. Air Selection Switch Knob

Fig. 1, Climate Control Panel

Temperature/Blend Air Actuator Replacement

NOTE: The temperature/blend air actuator is referred to as the blend door actuator on the wiring schematic, drawing number D06-39579.

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the screws that attach the heater core cover to the heater core housing, and remove the cover. See **Fig. 1**.
4. Disconnect the electrical connector from the temperature/blend air actuator. See **Fig. 2**.
5. Remove the screws that attach the temperature/blend air actuator to the HVAC assembly, and remove the actuator.
6. Using screws, install a new temperature/blend air actuator on the HVAC assembly.
7. Connect the electrical connector to the actuator.
8. Using screws, attach the heater core cover to the heater core housing.
9. Connect the batteries.
10. Remove the chocks from the tires.

Defrost/Panel Actuator Replacement

NOTE: The defrost/panel actuator is referred to as mode #3 module on the wiring schematic, drawing number D06-39579.

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the actuator trim cover from the instrument panel. See **Fig. 3**.
4. Disconnect the control arms from the defrost/panel actuator.
5. Disconnect the electrical connector from the actuator.
6. Remove the screws that attach the defrost/panel actuator to the HVAC assembly, and remove the actuator. See **Fig. 1**.
7. Connect the electrical connector to a new defrost/panel actuator and position the actuator where it is to be installed on the HVAC assembly.
8. Connect the control arms to the actuator.
9. Using screws, attach the actuator to the HVAC assembly.
10. Install the actuator trim cover on the instrument panel.
11. Connect the batteries.
12. Remove the chocks from the tires.

Fresh Air/Recirculation Actuator Replacement

NOTE: The fresh air/recirculation actuator is referred to as re-circ on the wiring schematic, drawing number D06-39579.

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the screws that attach the heater core cover to the heater core housing, and remove the cover. See **Fig. 1**.
4. Disconnect the control arms from the fresh air/recirculation actuator.
5. Disconnect the electrical connector from the actuator.
6. Remove the screws that attach the fresh air/recirculation actuator to the HVAC assembly, and remove the actuator. See **Fig. 1**.
7. Connect the electrical connector to a new fresh air/recirculation actuator and position the actuator where it is to be installed on the HVAC assembly.
8. Connect the control arms to the actuator.
9. Using screws, attach the actuator to the HVAC assembly.
10. Using screws, attach the heater core cover to the heater core housing.
11. Connect the batteries.

Actuator Replacement

1. Power Distribution Module Cover
2. Actuator Trim Cover
3. Louvers and Louver Housing

Fig. 3, Instrument Panel

12. Remove the chocks from the tires.

Panel/Floor Actuator Replacement

NOTE: The panel/floor actuator is referred to as mode #2 module on the wiring schematic, drawing number D06-39579.

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the power distribution module cover from the instrument panel. See **Fig. 3**.
4. Remove the screws that attach the power distribution module separator to the instrument panel, and remove the separator.
5. Remove the screws that attach the power distribution module to the instrument panel, and move the module to the cab floor.
6. Disconnect the electrical connector from the panel/floor actuator. See **Fig. 1**.
7. Remove the screws that attach the panel/floor actuator to the HVAC assembly, and remove the actuator.
8. Using screws, install a new panel/floor actuator on the HVAC assembly.
9. Connect the electrical connector to the actuator.
10. Using screws, install the power distribution module.
11. Using screws, install the power distribution module separator.
12. Install the power distribution module cover on the instrument panel.
13. Connect the batteries.
14. Remove the chocks from the tires.

Right-Side Panel/Demist Actuator Replacement

NOTE: The right-side panel/demist actuator is referred to as mode #1 module on the wiring schematic, drawing number D06-39579.

NOTE: The right-side panel/demist actuator can be removed by removing the right-side louvers and the louver housing, or by removing the power distribution module cover.

Louver Removal Method

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Access the tabs on the lower portion of the louver housing by moving the bottom of the louvers back. Use a screwdriver to release the tabs and pull the louvers and louver housing out of the dash panel. See **Fig. 3**.
4. Remove the screws that attach the actuator to the HVAC assembly, and remove the actuator. See **Fig. 1**.
5. Disconnect the electrical connector from the right-side panel/demist actuator.
6. Connect the electrical connector to the new actuator.
7. Using screws, install a right-side panel/demist actuator on the HVAC assembly.
8. Install the louvers and louver housing in the instrument panel.
9. Connect the batteries.
10. Remove the chocks from the tires.

Power Distribution Module Cover Removal Method

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Disconnect the batteries.
3. Remove the power distribution module cover from the instrument panel. See **Fig. 3**.
4. Disconnect the electrical connector from the right-side panel/demist actuator. See **Fig. 1**.
5. Remove the screws that attach the actuator to the HVAC assembly, and remove the actuator.
6. Using screws, install a new right-side panel/demist actuator on the HVAC assembly.
7. Connect the electrical connector to the actuator.

Actuator Replacement

8. Install the power distribution module cover on the instrument panel.
9. Connect the batteries.
10. Remove the chocks from the tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.

WARNING

The engine must be off and fully cooled, and the cooling system fully depressurized before disconnecting any heater water hoses. Failure to comply with these warnings can result in serious personal injury from hot liquid escaping from the engine cooling system.

3. Drain the coolant from the cooling system. For instructions, see **Group 20**.
4. Loosen the hose clamps on the heater hoses.
5. Remove the heater hose.

CAUTION

Install the heater hoses so that they are not pinched and do not contact any part of the exhaust system. Doing so will prevent the hoses from being damaged.

NOTE: Cut a new hose of the same diameter to the same length as the old hose.

6. Install the heater hose.
7. Tighten the hose clamps on the heater hoses.
8. Fill the cooling system with coolant. For instructions, see **Group 20**.
9. Return the hood to the operating position.
10. Remove the chocks from the rear tires.

Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.

WARNING

The engine must be off and fully cooled, and the cooling system fully depressurized before disconnecting any heater water hoses. Failure to comply with these warnings can result in serious personal injury from hot liquid escaping from the engine cooling system.

3. Drain the coolant from the cooling system. For instructions, see **Group 20**.

NOTE: There are two heater core shutoff valves on the vehicle.

4. Loosen the heater hose clamp and remove the heater hose from the heater core shutoff valve.
5. Remove and discard the shutoff valve.
6. Apply pipe sealant with Teflon® (D8AZ-19554-A or equivalent) to the threads on the new shutoff valve.
7. Install the heater hose on the shutoff valve.
8. Tighten the hose clamp on the heater hose.
9. Fill the cooling system with coolant. For instructions, see **Group 20**.
10. Return the hood to the operating position.
11. Remove the chocks from the tires.

Replacement

1. Remove the heater core. For instructions, see **Subject 270**.
2. Remove the evaporator housing. For instructions, see **Subject 140**.
3. Disconnect the electrical connector.
4. Remove the nuts that attach the heater core housing to the firewall, and remove the heater core housing. See **Fig. 1** and **Fig. 2**.

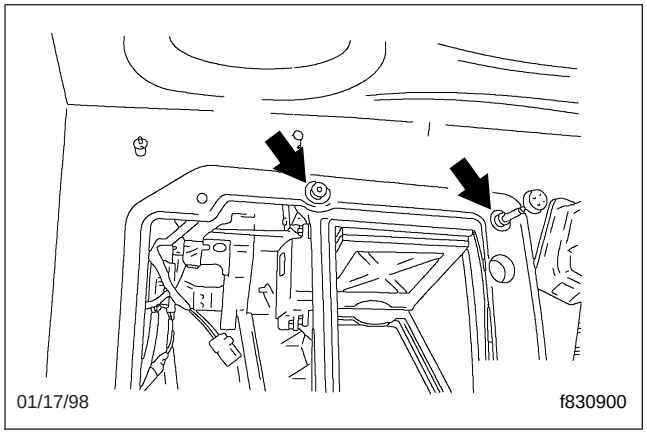

Fig. 1, Heater Core Housing Nuts

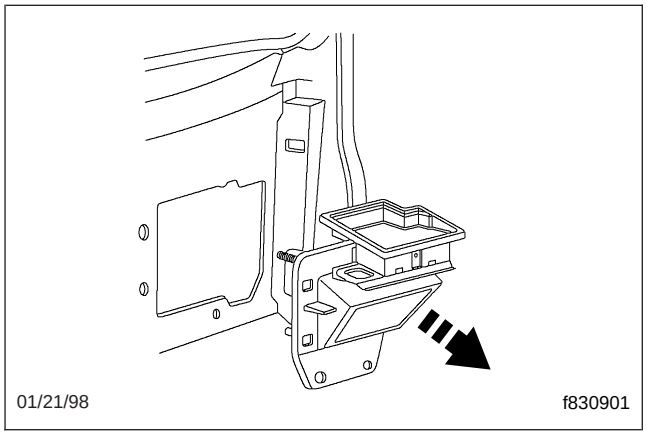

Fig. 2, Heater Core Housing

5. Using nuts, install a new heater core housing on the firewall.
6. Connect the electrical connector.
7. Install the evaporator housing. For instructions, see **Subject 140**.
8. Install the heater core. For instructions, see **Subject 270**.

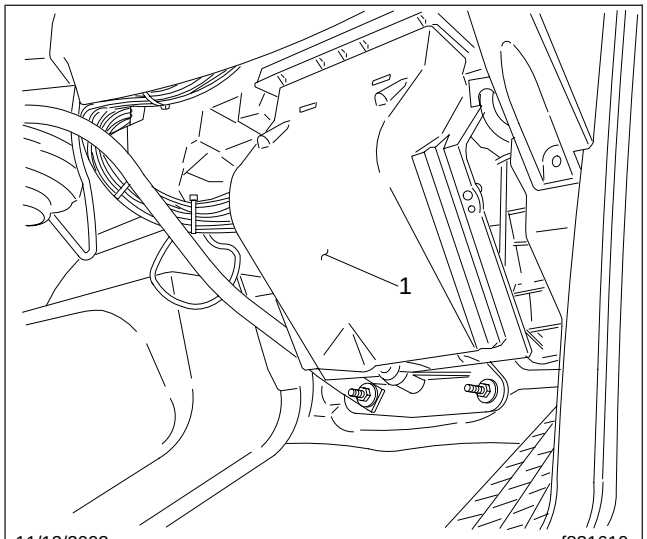
Replacement

1. Turn off the engine, apply the parking brakes, and chock the tires.
2. Open the hood.

⚠ WARNING

The engine must be off and fully cooled, and the cooling system fully depressurized before disconnecting any heater water hoses. Failure to comply with these warnings can result in serious personal injury from hot liquid escaping from the engine cooling system.

3. Close the heater core shutoff valves or clamp the heater hoses.
4. Loosen the heater hose clamps and remove the heater hoses from the heater core.
5. Remove the screws that attach the heater core cover to the heater core housing, and remove the cover. See **Fig. 1**.

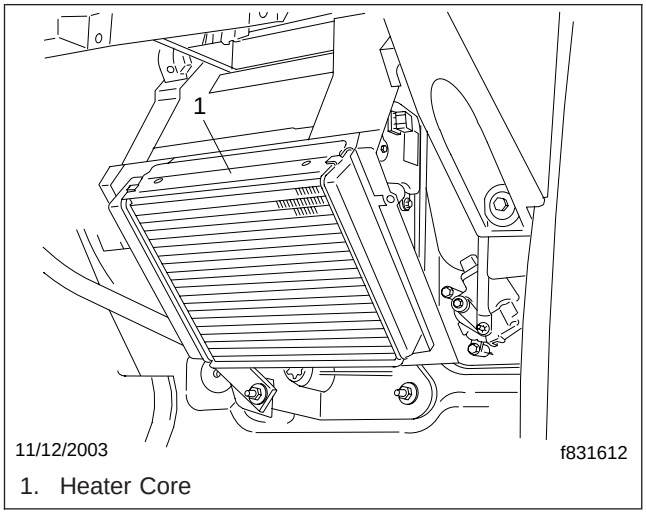


1. Heater Core Cover

Fig. 1, Heater Core Cover

IMPORTANT: A small amount of antifreeze may be present in the heater core. Protect the interior of the vehicle to prevent any damage from an antifreeze spill.

6. Wearing protective gloves, remove the heater core and drain any remaining coolant from the heater core. See **Fig. 2**.



1. Heater Core

Fig. 2, Heater Core

7. Apply rubber suspension insulator lube or its equivalent to the heater core tubes and to the frontwall seals to allow the heater core tubes to pass easily through the frontwall during installation.
8. Wearing protective gloves, install a new heater core in the heater core housing.
9. Using screws, attach the heater core cover to the heater core housing.
10. Attach the heater hoses to the heater core and tighten the hose clamps.
11. Open the heater core shutoff valves or remove the clamps from the heater hoses.
12. Add coolant to the cooling system to replace the amount that was lost during the replacement procedure. For instructions, see **Group 20**.
13. Return the hood to the operating position.
14. Remove the chocks from the tires.

General Information

The cab heating, ventilating, and air conditioning (HVAC) system is an electrically-controlled blend air system. This type of system began being installed on vehicles in July 2000.

On vehicles equipped with air conditioning, all airflow is routed through the evaporator. A blend air door is used to control the amount of air that is routed through the heater core. The amount of air directed through the heater core is dependent on the temperature control switch setting. Electric actuators control the position of the four mode doors, and thus the airflow, within the HVAC system. The actuators are controlled by the control panel module located on the back of the climate control panel. The speed of the blower motor is controlled by reducing the current through a resistor block.

The cab heater and air conditioner consists of a blower motor, evaporator, heater core, and five electric actuators that control the temperature control doors, the air selection mode doors, and the recirculation door. All electric actuators, except the temperature/blend air actuator, are controlled by the control panel module. The temperature/blend air actuator is controlled by a potentiometer on the climate control panel.

- The temperature/blend air actuator controls temperature by controlling the airflow through the heater core.
- The fresh air/recirculation actuator allows fresh air into the cab or allows the air in the cab to be recirculated.
- The panel/floor actuator controls the airflow to the floor outlets and to the instrument panel outlets, with the exception of the right-side instrument panel outlet.
- The right-side panel/demist actuator controls the airflow to the right-side instrument panel outlet and demist outlet.
- The defrost/panel actuator controls the airflow to the defrost outlets and to the instrument panel outlets, with the exception of the right-side instrument panel outlet.

See **Table 1** for the location of the air selection switch positions.

Air Selection Switch Positions

Figure	Switch Position	HVAC Option		
		Heater (–000)	A/C (–001)	Max A/C (–002)
 05/14/2004 f544451	A	Not Available	MAX A/C	MAX A/C
	B	PANEL	A/C	MAX A/C
	C	PANEL & FLOOR	PANEL	PANEL
	D	OFF	OFF	OFF

	G	DEF	FLR & DEF	FLR & DEF
	H	Not Available	DEF	DEF

Table 1, Air Selection Switch Positions

HVAC System Troubleshooting Tables

See **Table 2** to determine which troubleshooting table to refer to for the problem area of the HVAC system.

Troubleshooting the HVAC System

General Diagnosis	
General Problem Area	**Action**
Air Distribution	See **Table 6**.
Blower	See **Table 9** and **Table 10**.
Little or No Cooling	See **Table 3**.
Little or No Heating	See **Table 4**.
Fresh Air/Recirculation	See **Table 12**.
Backlighting	See **Table 5**.
A/C Clutch Not Engaging	See **Table 16**.
CHECK A/C Indicator Illuminated*	See **Table 17**.

* Only vehicles built with pre-2004 engines have a CHECK A/C indicator.

Table 2, General Diagnosis

Little or No Cooling Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Does A/C clutch engage?	Yes	**Go to test no. 2.**
		No	See **Table 16** for diagnosis.
2	Temporarily pinch off the hoses going to the heater core. Is the outlet temperature now acceptable?	Yes	See **Table 7** for diagnosis of temperature/ blend air actuator.
		No	See **Subject 310** for the Refrigerant System Diagnosis procedures.

Table 3, Little or No Cooling Diagnosis

Little or No Heating Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Check engine coolant level.	OK	**Go to test no. 2.**
		Not OK	Check for coolant leaks. Repair as necessary. If vehicle still has a heating problem, **go to test no. 2.**
2	Check heater hose temperatures entering and exiting the heater core: • Set the temperature control switch to full hot. • Set the blower speed to HI. • Set the mode control to PANEL. • Bring engine to operating temperature. Feel both heater hoses going in to and out of the heater core.	Both hot	Check for possible blend door malfunction. See **Table 7** for diagnosis of temperature/ blend air actuator.
		One hot, one cool	Possible plugged heater core. Flush or replace as necessary.
		Both cool to lukewarm	Check engine thermostat for proper operation. Check for closed heater hose valves, if equipped.

Table 4, Little or No Heating Diagnosis

Backlighting Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Check power and ground to control panel: • Gain access to back of control panel. • Remove the AC2 connector. See **Subject 400** for wiring diagrams. • Turn headlight switch ON. Measure voltage across pins 1 and 2 of the AC2 connector.	Approx. 12V	Replace bulb(s). If backlightling still does not work, replace the control panel.
		0V	Check backlighting circuit 29A and ground for open.

Table 5, Backlighting Diagnosis

Air Distribution Diagnosis	
Symptom	**Action**
No air flow from defrost outlets	Does air come out of floor outlets in defrost mode? Yes—**go to Table 14** for diagnosis. No—**go to Table 13** for diagnosis.
No airflow from floor outlets	**Go to Table 14** for diagnosis.
No airflow from panel outlets, except right-side outlet	Does air come out of the floor outlets in PANEL mode? Yes—**go to Table 14** for diagnosis. No—**go to Table 13** for diagnosis.
No airflow from right-side outlet	**Go to Table 15** for diagnosis.
Airflow from floor outlets in all mode positions	**Go to Table 14** for diagnosis.
Airflow from defrost and panel outlets in all mode positions, except floor	**Go to Table 13** for diagnosis.
No recirc or fresh air	**Go to Table 12** for diagnosis.

Table 6, Air Distribution Diagnosis

Temperature/Blend Air Actuator Electrical Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Check fuse/circuit breaker no. 18.	OK	**Go to test no. 2**.
		Not OK	Check circuit 220 for short to ground. Repair as necessary. If OK, replace actuator.

Troubleshooting the HVAC System

Temperature/Blend Air Actuator Electrical Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
2	Disconnect the temperature potentiometer connector AC3. • Turn ignition ON. Measure voltage across pins 1 and 3 of the temperature potentiometer connector (harness side). NOTE: Connect electrical connector when test is complete. Leave connector accessible. It may require removal in later tests.	Approx. 10V	**Go to test no. 4**.
		Much less than 10V	**Go to test no. 3**.
3	Disconnect the connector to the temperature/blend air actuator. See **Fig. 7**. • Turn ignition ON. Measure voltage across pins 1 and 2 at the actuator connector (harness side). NOTE: Connect electrical connector when test is complete.	Approx. 12V	Check circuits 98K1 and 98K2 for open. Repair as necessary. See **Subject 400** for wiring diagrams. If circuits are okay, replace actuator.
		Much less than 12V	Check circuit 220 and actuator ground circuit for open. Repair as necessary. See **Subject 400** for wiring diagrams.
4	Disconnect the temperature potentiometer connector AC3. • Turn ignition OFF. Measure resistance across pins 1 and 2 of the temperature potentiometer connector (harness side). NOTE: Connect electrical connector when test is complete. Leave connector accessible. It may require removal in later tests.	Approx. 195k ohms	**Go to test no. 6**.
		Much greater than 195k ohms	**Go to test no. 5**.
5	Remove the temperature/blend air actuator. See **Fig. 7**. Measure resistance across pins 5 and 6 at the actuator connector (actuator side).	Approx. 195k ohms	Check circuits 98K2 and 98K3 for open. Repair as necessary. See **Fig. 1**. See **Subject 400** for wiring diagrams.
		Much greater than 195k ohms	Replace actuator.
6	Disconnect the temperature potentiometer connector AC3. • Turn ignition OFF. Measure resistance between harness side of pin 1 and a known good ground. NOTE: Connect electrical connector when test is complete. Leave connector accessible. It may require removal in later tests.	Less than 1 ohm	**Go to test no. 7**.
		More than 1 ohm	Check actuator ground circuit. Repair as necessary. See **Subject 400** for wiring diagrams.

Temperature/Blend Air Actuator Electrical Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
7	Temperature potentiometer resistance check: • Disconnect the temperature control potentiometer connector AC3 (back of HVAC control panel). Measure resistance at the potentiometer as follows. See **Fig. 1**. • Across pins 1 and 3: should be approx. 5000 ohms • Across pins 1 and 2: should be approx. 80 ohms (cold) and approx. 5150 ohms (hot).	OK	**Go to test no. 8**.
		Not OK	Replace temperature potentiometer.
8	Remove the temperature/blend air actuator. See **Fig. 7**. Move the temperature door arm and check for obstruction or mechanical problem, such as binding.	OK	Replace actuator.
		Not OK	Mechanical problem. Repair as necessary.

Table 7, Temperature/Blend Air Actuator Electrical Diagnosis

Actuator Function Logic						
Air Selection Switch Setting*	**Actuator†**				**A/C 001 and 002 only**	**Blower**
	No. 1 Right-Side Panel/Demist	**No. 2 Panel/Floor**	**No. 3 Defrost/Panel**	**No. 4 Fresh Air/ Recirc‡**		
MAX A/C	CW	CCW	CCW	CW	X	On
A/C	CW	CCW	CCW	CCW§	X	On
PANEL	CW	CCW	CCW	CCW	§	On
OFF	Middle§	Middle§	CCW	CW§		Off§
PANEL & FLOOR	Middle	Middle	CCW	CCW§	X§	On§
FLR	CCW§	CW§	CW§	CCW	§	On
FLR & DEF	CCW	Middle§	CW	CCW	X§	On
DEF	CCW	CCW§	CW	CCW	X	On

* Use this table by starting with the switch at MAX A/C and moving through the settings as listed in the column.
† See **Fig. 7**.
‡ With the ignition off, the fresh air/recirc actuator drives recirc clockwise from any mode.
§ A change in state has occurred.

Table 8, Actuator Function Logic

Troubleshooting the HVAC System

Blower Motor Diagnosis—Blower Does Not Operate at Any Speed			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Before proceeding, perform test in **Table 18**. If this does not correct the problem, return to this table, step 2.		
2	Check if blower relay is switching on: • Disconnect the blower motor connector. • Set the blower speed switch to any speed. • Set the mode control switch to any position except OFF. • Turn ignition ON. Measure voltage between pin 1 (circuit 98FA) of the blower motor connector (harness side) and a known good ground. See **Subject 400** for wiring diagrams.	Approx. 12V	**Go to test no. 8**.
		Less than 1V	**Go to test no. 3**.
3	Check voltage to the coil side of the blower motor relay: • Remove blower motor relay (relay 8). • Turn ignition ON. Measure voltage between the relay cavity in the PDM that mates with pin 1 of the relay and a known good ground.	Approx. 12V	**Go to test no. 4**.
		Less than 1V	Check circuit breaker 18 in cab PDM. Check circuit 220 (305 on vehicles with a 2004 engine) for open or short. Repair as necessary. See **Subject 400** for wiring diagrams.
4	Check if the control panel is providing ground to switch the blower motor relay on: • Turn ignition ON. Measure voltage between relay cavities in the PDM that mate to pins 1 and 2 of the blower motor relay. Check for the following: • When the mode control switch is in the OFF position, the voltage reading should be approx. 6V. • When the mode control switch is in any position except OFF, the voltage reading should be approx. 12V.	OK	**Go to test no. 5**.
		Not OK	Check circuit 98Z for open, check power and ground circuits to HVAC control panel. Repair as necessary. See **Subject 400** for wiring diagrams. If circuits are okay, replace the control panel.

Blower Motor Diagnosis—Blower Does Not Operate at Any Speed			
Test No.	**Test Procedure**	**Test Result**	**Action**
5	Check relay coil resistance. Check resistance across pins 1 and 2 of the blower motor relay. NOTE: If the resistance is approximately 680 ohms, the relay coil is open. If the resistance is approximately 70 ohms, the surge suppression resistor is open. In either case the relay should be replaced.	Approx. 62 to 64 ohms	**Go to test no. 6**.
		Greater than 64 ohms	Replace the relay.
6	Check for voltage at the high side of the blower motor relay. Measure voltage between the relay cavity in the PDM that mates to pin 3 of the blower motor relay (relay 8) and a known good ground.	Approx. 12V	**Go to test no. 7**.
		Less than 1V	Check circuit breaker G in the engine compartment PDM. Check for open/short in circuit 210G that supplies power to the high side of the blower motor relay. Repair as necessary. See **Subject 400** for wiring diagrams.
7	Check continuity in circuit 98FA between blower motor relay and blower motor: • Disconnect blower motor connector. Check continuity between relay cavity in the PDM that mates to pin 5 of the blower motor relay, and pin 1 of the blower motor connector.	Continuity	Check for stuck relay contacts. If OK, check same circuit 98FA using a voltage drop test to confirm circuit. Voltage drop should be less than 1V. Repair as necessary.
		No continuity	Circuit 98FA is open. Repair as necessary.
8	Check voltage drop across blower motor: • Install blower motor relay (relay 8). • Connect blower motor connector. • Turn ignition ON. • Turn fan to HI. • Set mode control switch to any position except OFF. Measure the voltage drop across the blower motor connector (leave connector plugged in) by backprobing the two pins.	More than 10V	Replace blower motor.
		Less than 10V	Check circuit 98FA using a voltage drop test to confirm circuit between blower motor relay and the blower motor. Voltage drop should be less than 1V. If circuit 98FA is OK, perform same check on ground circuit between the blower motor and splice S2. Repair as necessary. See **Subject 400** for wiring diagrams.

Table 9, Blower Motor Diagnosis—Blower Does Not Operate at Any Speed

Blower Motor Diagnosis—Blower Does Not Work in One or Multiple Speed Settings			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Does the blower motor work in one or more speed settings?	Yes	**Go to test no. 2**.
		No	See **Table 9**, Blower Motor Diagnosis—Blower Does Not Operate at Any Speed.

Troubleshooting the HVAC System

Blower Motor Diagnosis—Blower Does Not Work in One or Multiple Speed Settings			
Test No.	**Test Procedure**	**Test Result**	**Action**
2	Does the blower operate in LO speed?	Yes	**Go to test no. 6**.
		No	**Go to test no. 3**.
3	Check the blower resistor block: • Unplug resistor block. Measure resistance across the following pins. See **Fig. 2**. Pins 1 and 3: approx. 0.4 ohm Pins 3 and 4: approx. 1 ohm Pins 2 and 3: approx. 3 ohms If any of the readings are significantly higher than the values shown (meter reads OL), or if any of the readings are zero, then the result is not OK. NOTE: Plug connector back into resistor block when test is complete.	OK	**Go to test no. 4**.
		Not OK	Replace blower resistor block.
4	Check circuit 98F between blower motor and resistor block: • Turn ignition ON. • Set blower speed to MED-HI. • Set mode control switch to any position except OFF. Measure voltage drop between pin 2 (circuit 98F) of the blower motor connector and pin 3 (circuit 98F) of the resistor block by backprobing the connectors. NOTE: Connectors must be plugged in when performing this test.	Less than 0.25V	**Go to test no. 5**.
		More than 0.25V	Repair circuit 98F between blower motor and resistor block.
5	Check resistor block ground circuit: • Turn ignition ON. • Set blower speed to LO. • Set mode control switch to any position except OFF. Measure voltage drop between pin 2 of the resistor block (by backprobing) and the battery negative terminal. NOTE: Connectors must be plugged in when performing this test.	Less than 0.25V	No problem found. Repeat tests.
		More than 0.25V	Locate open or source of high resistance in resistor block ground circuit. Repair as necessary.

Blower Motor Diagnosis—Blower Does Not Work in One or Multiple Speed Settings			
Test No.	**Test Procedure**	**Test Result**	**Action**
6	Check blower motor switch: • Remove blower motor switch connector from the control panel. Check continuity of the switch as follows. See **Fig. 3**. LO: pin 1 to pins 2 through 4—No continuity MED-LO: pin 1 to pin 3—Continuity MED-HI: pin 1 to pin 4—Continuity HI: pin 1 to pin 2—Continuity NOTE: Connect blower switch connector when test is complete.	OK	**Go to test no. 7**.
		Not OK	Replace blower speed switch.
7	Check blower speed switch ground circuit: • Turn ignition ON. • Set blower speed to HI. • Set mode control switch to any position except OFF. Measure voltage drop between pin 1 (GND) of the blower switch (by backprobing) and the battery negative terminal. NOTE: Connectors must be plugged in when performing this test.	Less than 0.25V	Depending on which speed does not work, check the following circuits: For MED-LO: 98A For MED-HI: 98B For HI: 98F between splice S2 and blower switch
		More than 0.25V	Repair blower switch ground circuit.

Table 10, Blower Motor Diagnosis—Blower Does Not Work in One or Multiple Speed Settings

HVAC Control Panel Pinout		
Pin	**Description**	**Circuit**
1	Not used	—
2	Mode no. 1 and no. 2 actuator position sensor ground	GND1
3	Mode no. 2 actuator position sensor feedback	338F2
4	Recirc actuator–open	338E
5	Mode no. 3 actuator–open	338C–
6	Mode no. 2 actuator–CW	338B–
7	Mode no. 1 actuator–CW	338A–
8	Blower motor relay control	98Z
9	Ground	GND2
10	+12V battery	97A
11	Mode no. 2 actuator position sensor +5V reference	338H

Troubleshooting the HVAC System

HVAC Control Panel Pinout		
Pin	**Description**	**Circuit**
12	Mode no. 1 actuator position sensor +5V reference	338G
13	Mode no. 1 actuator position sensor feedback	338F1

Table 11, HVAC Control Panel Pinout

Fresh Air/Recirculation Actuator No. 4 Circuit Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Check for signal from control panel: • Disconnect the fresh air/recirc actuator connector. See **Fig. 7**. • Turn ignition ON. Set DMM to read voltage, then place meter leads in harness side of actuator connector as follows: • (+) lead in pin 4 (circuit 338D) • (–) lead in pin 2 (circuit 338E) Start with the mode control switch in the OFF position. Then set the mode switch as follows and observe the voltage readings: MAX A/C: –10.5V± then 0V A/C: +10.5V± then 0V PANEL: +10.5V± then 0V OFF: –10.5V± then 0V PANEL & FLOOR: +10.5V± then 0V FLR: 0V FLR & DEF: 0V DEF: 0V If working correctly, the voltages listed should be present for a few seconds, then go to zero. For example, when the mode is switched to MAX A/C, the voltage should be approximately –10.5 V for a few seconds, then it will go to zero. NOTE: The voltage readings listed may range from approximately ±9 to 11V.	OK	Check for mechanical problem, such as binding. Repair as necessary If no mechanical problem is present, replace the fresh air/recirc actuator.
		Not OK	Check circuits 338D and 338E between control panel and recirc actuator for open or short circuit. Repair as necessary. If circuits 338D and 338E are OK, replace the control panel. NOTE: Assumes control panel is getting power/ground.

Table 12, Fresh Air/Recirculation Actuator No. 4 Circuit Diagnosis

Troubleshooting the HVAC System

Defrost/Panel Actuator No. 3 Circuit Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Check for signal from control panel: • Disconnect the defrost/panel actuator connector. See **Fig. 7**. • Turn ignition ON. Set DMM to read voltage, then place meter leads in actuator connector as follows: • (+) lead in pin 4 (circuit 338C+) • (–) lead in pin 2 (circuit 338C–) Start with the mode control switch in the OFF position. Then set the mode switch as follows and observe the voltage readings: MAX A/C: 0V A/C: 0V PANEL: 0V OFF: 0V PANEL & FLOOR: 0V FLR: –10.5V± then 0V FLR & DEF: 0V DEF: 0V OFF: +10.5V± then 0V If working correctly, the voltages listed should be present for a few seconds, then go to zero. For example, when the mode is switched to FLOOR, the voltage should be approximately –10.5 V for a few seconds, then it will go to zero. NOTE: The voltage readings listed may range from approximately ±9 to 11V.	OK	Check for mechanical problem, such as binding. Repair as necessary If no mechanical problem is present, replace the defrost/panel actuator.
		Not OK	Check circuits 338C+ and 338C– between control panel and defrost/panel actuator no. 3 for open or short circuit. Repair as necessary. If circuits 338C+ and 338C– are OK, replace the control panel. NOTE: Assumes control panel is getting power/ground.

Table 13, Defrost/Panel Actuator No. 3 Circuit Diagnosis

Panel/Floor Actuator (Mode No. 2) Circuit Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Check for actuator position sensor reference voltage and ground: • Disconnect the electrical connector at the actuator. See **Fig. 7**. • Turn ignition ON. Measure voltage across pins 2 and 3 of the actuator connector. See **Fig. 4**.	Approx. 5V	**Go to test no. 2**.
		Approx. 0V	Check circuit 338H (5V ref.) and actuator sensor ground circuit for open or short. Repair as necessary. If the circuits are OK, check power and ground circuits to control panel. If these are also OK, replace the control panel.
2	Check for actuator drive signal from the control panel: • Disconnect the electrical connector at the actuator. See **Fig. 7**. • Turn mode control switch to OFF. • Turn ignition ON. Measure voltage across pins 1 and 6 as follows. See **Fig. 4**. • (–) lead on pin 1 • (+) lead on pin 6 Observe the voltage. The voltage should briefly read approximately 10 to 12V, then go to zero. This repeats approximately every 10 seconds. If the meter observation is as listed, then the signal is OK.	OK	**Go to test no. 4**.
		Not OK	**Go to test no. 3**.
3	Check actuator drive circuit: • Turn ignition OFF. • Gain access to the back of the control panel and disconnect the electrical connector. • Disconnect the actuator connector. See **Fig. 7**. Check continuity in circuit 338B+ between control panel connector pin 16 and the actuator connector pin 6. See **Fig. 4** and **Fig. 5**. Check continuity in circuit 338B– between control panel connector pin 6 and the actuator connector pin 1.	OK	Check power and ground circuits to control panel. Repair as necessary. If the power and ground circuits are OK, replace the control panel.
		Not OK	Repair circuit 338B+ or 338B– as necessary.

Troubleshooting the HVAC System

Panel/Floor Actuator (Mode No. 2) Circuit Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
4	Check actuator position sensor feedback voltage: • Make sure actuator and mode module connectors are plugged in. • Turn ignition ON. Measure voltage between mode module connector pin 3 (by backprobing) and a known good ground. The voltage should be approx. between 0.5V and 4.5V. See **Fig. 5**.	OK	**Go to test no. 5**.
		Not OK	Check circuit 338F2 for open or short. Repair as necessary. If circuit 338F2 is OK, replace the actuator.
5	Check actuator drive motor resistance: • Remove actuator. See **Fig. 7**. Measure resistance across pins 1 and 6 of the actuator. See **Fig. 4**.	Approx. 96 ohms	**Go to test no. 6**.
		Approx. 0 ohm or meter reads OL	Replace actuator.
6	Check for mechanical problem: • Remove actuator. See **Fig. 7**. Attempt to turn the panel/floor door by hand. Check for binding or obstruction.	OK	Replace actuator.
		Not OK	Repair mechanical problem as necessary.

Table 14, Panel/Floor Actuator (Mode No. 2) Circuit Diagnosis

Right-Side Panel/Demist Actuator (Mode No. 1) Circuit Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Check for actuator position sensor reference voltage and ground: • Disconnect the electrical connector at the actuator. See **Fig. 7**. • Turn ignition ON. Measure voltage across pins 2 and 3 of the actuator connector. See **Fig. 6**.	Approx. 5V	**Go to test no. 2**.
		Approx. 0V	Check circuit 338G (5V ref.) and actuator sensor ground circuit for open or short. Repair as necessary. If the circuits are okay, check power and ground circuits to control panel. If these are also okay, replace the control panel.

Right-Side Panel/Demist Actuator (Mode No. 1) Circuit Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
2	Check for actuator drive signal mode module: • Disconnect the electrical connector at the actuator. See **Fig. 7**. • Turn mode control switch to OFF. • Turn ignition ON. Measure voltage across pins 1 and 6 as follows. See **Fig. 6**. • (–) lead on pin 1 • (+) lead on pin 6 Observe the voltage. The voltage should briefly read between approximately –10 to –12V, then go to zero. This repeats approx. every 10 seconds. If the meter observation is as listed, then the signal is okay.	OK	**Go to test no. 4**.
		Not OK	**Go to test no. 3**.
3	Check actuator drive circuit: • Turn ignition OFF. • Gain access to the back of the control panel and disconnect the electrical connector. • Disconnect the actuator connector. See **Fig. 7**. Check for continuity in circuit 338A+ between control panel connector pin 17 and the actuator connector pin 6. Check for continuity in circuit 338A– between control panel connector pin 7 and the actuator connector pin 1.	OK	Check power and ground circuits to control panel. Repair as necessary. If the power and ground circuits are OK, replace the control panel.
		Not OK	Repair circuit 338A+ or 338A– as necessary.
4	Check actuator position sensor feedback voltage: • Make sure actuator and control panel connectors are plugged in. • Turn ignition ON. Measure voltage between control panel connector pin 13 (by backprobing) and a known good ground. The voltage should be approx. between 0.5V and 4.5V.	OK	**Go to test no. 5**.
		Not OK	Check circuit 338F1 for open or short. Repair as necessary. If circuit 338F1 is okay, replace the actuator.

Troubleshooting the HVAC System

Right-Side Panel/Demist Actuator (Mode No. 1) Circuit Diagnosis			
Test No.	**Test Procedure**	**Test Result**	**Action**
5	Check actuator drive motor resistance: • Remove actuator. See **Fig. 7**. Measure resistance across pins 1 and 6 of the actuator. See **Fig. 6**.	Approx. 96 ohms	**Go to test no. 6**.
		Approx. 0 ohm or meter reads OL	Replace actuator.
6	Check for mechanical problem: • Remove actuator. See **Fig. 7**. Attempt to turn the right-side panel/demist door by hand. Check for binding or obstruction.	OK	Replace actuator.
		Not OK	Repair mechanical problem as necessary.

Table 15, Right-Side Panel/Demist Actuator (Mode No. 1) Circuit Diagnosis

A/C Compressor Clutch Circuit Diagnosis (clutch does not engage)			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Does the blower also not work?	Yes	See **Table 18**. If this does not correct the problem, return to this table, step no. 2, or to **Table 9**.
		No	**Go to test no. 2**.
2	Check for voltage to A/C compressor clutch: • Disconnect the A/C clutch 2-pin electrical connector. • Turn ignition ON. • Set the mode control switch to MAX A/C. Measure voltage across the two A/C clutch connector pins (harness side).	Approx. 12V	**Go to test no. 3**.
		0V	**Go to test no. 4**.
3	Check voltage drop at A/C clutch: • Connect the A/C clutch 2-pin connector. • Turn ignition ON. • Set the mode control switch to MAX A/C. Measure voltage across the two A/C clutch connector pins by backprobing.	10.5V or more	Replace A/C compressor
		Less than 10.5V	Check entire circuit between A/C clutch and A/C relay and A/C clutch ground circuit for source of high resistance. Use voltage drop measurements to isolate problem. Repair as necessary. See **Subject 400** for wiring diagrams.

A/C Compressor Clutch Circuit Diagnosis (clutch does not engage)			
Test No.	**Test Procedure**	**Test Result**	**Action**
4	Check for voltage to A/C compressor upstream of thermal switch: • Disconnect 4-pin connector near A/C compressor. • Turn ignition ON. • Set the mode control switch to MAX A/C. Measure voltage across pins 1 and 4 of the 4-pin connector (harness side). NOTE: Connect 4-pin connector when test is complete.	Approx. 12V	Thermal switch or wiring between 4-pin and 2-pin connector is open. Replace compressor.
		0V	**Go to test no. 5**.
5	Check for voltage on 97C at A/C clutch: • Disconnect the A/C clutch 2-pin connector. • Turn ignition ON. • Set mode control switch to MAX A/C. Measure voltage between pin B (circuit 97C) and a known good ground.	Approx. 12V	Check ground circuit to A/C clutch. Repair as necessary.
		0V	**Go to test no. 6**.
6	Check continuity across the low pressure (clutch cycling) switch: • Disconnect low pressure switch. See **Fig. 8**. Measure continuity across low pressure switch terminals. NOTE: See **Subject 400** for A/C Clutch Cycling Pressure Switch Specifications.	Continuity	**Go to test no. 7**.
		No continuity	Check refrigerant temperature/pressure relationship. If pressure is low, check refrigerant charge and repair as necessary. If temperature/pressure relationship is okay and pressure is above 42 psi (290 kPa), replace the low pressure switch (clutch cycling switch).
7	Check voltage to low pressure (clutch cycling) switch: • Disconnect low pressure switch. See **Fig. 8**. • Turn ignition on. • Set mode control switch to MAX A/C. Measure voltage between low pressure switch connector pin 2 (circuit 97F) and a known good ground.	Approx. 12V	**Go to test no. 8**.
		0V	**Go to test no. 9**.

Troubleshooting the HVAC System

A/C Compressor Clutch Circuit Diagnosis (clutch does not engage)			
Test No.	**Test Procedure**	**Test Result**	**Action**
8	Check continuity across the high pressure switch: • Disconnect high pressure switch. See **Fig. 9**. Measure continuity across high pressure switch terminals. NOTE: See **Subject 400** for High Pressure Cutout and Fan Cycling Pressure Switch Specifications.	Continuity	Check circuits 97C and 97E between the low pressure switch and A/C clutch for open. Repair as necessary. See **Subject 400** for wiring diagrams.
		No continuity	Replace high pressure switch.
9	Check for control voltage to A/C clutch relay: • Disconnect the A/C clutch relay. • Turn ignition ON. • Set mode control switch to MAX A/C. Measure voltage across the connector pins that correspond to relay pins 1 and 2 (circuits 220 and 97).	Approx. 12V	**Go to test no. 11**.
		0V	**Go to test no. 10**.
10	Check for ignition supply voltage to control side of A/C clutch relay: • Disconnect the A/C clutch relay. • Turn ignition ON. Measure voltage between connector pin that corresponds to relay pin 1 and a known good ground.	Approx. 12V	Check circuit 97 between relay and control panel. Repair as necessary. If circuit 97 is okay, replace the control panel. See **Subject 400** for wiring diagrams.
		0V	Check circuit 220 (ignition supply) for open. Repair as necessary. See **Subject 400** for wiring diagrams.
11	Check voltage to common pin of relay: • Disconnect the A/C clutch relay. Measure voltage between connector pin that corresponds to relay pin 3 (circuit 97A) and a known good ground.	Approx. 12V	**Go to test no. 12**.
		0V	Check circuit 97A and fuse. Repair as necessary. See **Subject 400** for wiring diagrams.
12	Bypass relay: • Disconnect the A/C clutch relay. Insert a jumper wire between connector pins that correspond to pins 3 and 5 of the relay (circuits 97A and 97F).	Clutch engages	Replace relay.
		Clutch does not engage	Check connections and wiring between relay and low pressure switch for open or high resistance. Repair as necessary. See **Subject 400** for wiring diagrams.

Table 16, A/C Compressor Clutch Circuit Diagnosis (clutch does not engage)

CHECK A/C Indicator Illuminated*			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	Does the CHECK A/C indicator come on intermittently, or does it stay on all the time?	Stays on all the time	Check compressor clutch ground circuit for open or poor connections. Repair as necessary. If OK, thermal switch is probably stuck open. If thermal switch is stuck open, replace the compressor. See **Subject 400** for wiring diagrams.
		Comes on intermittently	System is probably low on refrigerant, thus causing thermal switch to open intermittently. Check refrigerant charge. If low, repair all leaks. NOTE: See **Subject 400** for Compressor Thermal Protection Switch Specifications.

* Vehicles with 2004 engines do not have a CHECK A/C indicator.

Table 17, CHECK A/C Indicator Illuminated

Troubleshooting Control Panel Software Lockup

On vehicles built from July 2000 through May 2004 the software for the HVAC control panel may lock up. This is most likely to occur when the battery voltage is low and the weather is cold. When the software locks up, the blower motor will not run and the refrigerant compressor clutch will not engage. Beginning June 1, 2004, production made a change to the HVAC control panel to protect it from the effects of a low-voltage start up.

The following control panel part numbers are known to be prone to software lockup:

- A22-51035-000 through -002
- A22-52746-000 through -002
- A22-57400 through -002

Use the test procedure in **Table 18** to determine if the control panel software is locked up. If software lockup is confirmed, replace the control panel with the latest version available.

Troubleshooting the HVAC System

Checking for Control Panel Software Lockup			
NOTE: Control panels may exhibit software lockup which results in the following symptoms: blower is inoperable, and, if equipped with A/C, the A/C compressor clutch will not engage.			
Test No.	**Test Procedure**	**Test Result**	**Action**
1	If blower does not work at all, and the A/C compressor clutch does not engage (if equipped with A/C), do the following: Turn ignition OFF. Remove the fuse that supplies constant battery power to the control panel for at least 5 seconds, then install it. NOTE: For fuse location, see **Table 19**. Turn ignition ON. Start engine only if equipped with A/C. Does the blower now work and the A/C clutch engage (if equipped with A/C)?	Yes	Replace the existing control panel with the most current version available. For instructions, see **Subject 210**.
		No	For blower not working, see **Table 9**. For blower not working **and** A/C clutch not engaging, see **Table 9** and **Table 16** for diagnosis.

Table 18, Checking for Control Panel Software Lockup

Fuse Location–Constant Battery Supply to Control Panel			
Model	**Build Date**	**Fuse ID**	**Fuse Location**

General Information

Before testing the A/C system performance, check the following conditions and correct any problems before proceeding with performance testing:

- A/C compressor drive belt worn or slipping
- A/C clutch slipping

Connect pressure gauges to the service ports and insert a thermometer into the center dash outlet. Operate the A/C system until the engine is warm and the temperature on the thermometer stabilizes. Then compare the test data with the temperature pressure specifications in the appropriate table in **Subject 400**.

When performance testing the refrigerant system, be sure the test conditions are the same as those that were used when the temperature pressure specifications were developed. The test conditions are stated at the bottom of the temperature pressure specifications tables.

If the dash outlet temperature or service port pressures do not agree with the specified values, do the following:

- For a vehicle with a Visteon scroll compressor, see **Table 1** for possible cause and correction.
- For a vehicle with a Sanden compressor, see **Table 2** for possible cause and correction.

Refrigerant System Troubleshooting Tables

Refrigerant System Diagnosis for a Vehicle With a Visteon Scroll Compressor			
Test Result	**Possible Symptoms**	**Probable Cause(s)**	**Correction**
High side pressure abnormally high	Line to condenser is excessively hot	Restricted refrigerant flow (restricted discharge line or condenser)	Locate and remove the restriction.
		Air in the system	Recover, evacuate, and charge the system.
		Engine overheating	Check engine cooling system and repair as necessary.
		Reduced airflow across condenser	Clear or clean cause of restriction.
		Engine fan not operating correctly	Check engine cooling fan and repair as necessary.
High pressure side abnormally low	Evaporator outlet not cold and low pressure gauge indicates vacuum	Faulty orifice tube	Replace orifice tube.
	None	Moisture in the system	Recover, evacuate, and charge the system.
	Clutch cycles off rapidly after engagement	Low refrigerant charge	Recover system. If amount of refrigerant recovered indicates low charge, leak check entire system and repair leaks. Then evacuate and charge.
	High side pressure is lower than normal	Faulty A/C compressor	Replace the compressor.

Troubleshooting the Refrigerant System

Refrigerant System Diagnosis for a Vehicle With a Visteon Scroll Compressor			
Test Result	**Possible Symptoms**	**Probable Cause(s)**	**Correction**
Low side pressure abnormally low	Suction line not cold, and low pressure gauge indicates vacuum	Frozen orifice tube (moisture in system)	Recover, evacuate, and charge the system.
	None	Cycling switch low cutout is too low or switch is sticking	Check cycling switch and replace as necessary.
	Discharge temperature is cool, but airflow is less than normal	Frozen evaporator core	Run fan with A/C off to thaw the evaporator. Check cycling switch operation.
	Accumulator outlet is cool, inlet is warm during operation. Both should be cool when operating.	Clogged or restricted accumulator	Replace the accumulator.
High and low side pressures abnormally high	Low side pressure drops when condenser is cooled by water spray	System overcharged	Recover, evacuate, and charge the system.
Rapid compressor cycling		System undercharged	Recover system. If amount of refrigerant recovered indicates low charge, leak check entire system and repair leaks. Then evacuate and charge the system.
Refrigerant leaks	Compressor clutch is dirty	Compressor shaft seal leak	Replace the compressor.
	Compressor seam is wet with oil	Compressor gasket leak	

Table 1, Refrigerant System Diagnosis for a Vehicle With a Visteon Scroll Compressor

Refrigerant System Diagnosis for a Vehicle With a Sanden Compressor				
High Side Pressure	**Low Side Pressure**	**Possible Symptoms**	**Probable Cause(s)**	**Correction**
High	High	Compressor running continuously	Inadequate airflow across condenser	Check engine fan operation, and repair as necessary.
			Restricted airflow across condenser	Clean or remove debris from condenser.
High	Normal to High	Compressor running continuously	Engine overheating	Check engine cooling system and repair as necessary.
Normal to High	Normal	Compressor running continuously	Air in refrigerant	Recover, evacuate, and charge the system.
			High ambient temperature or humidity	Not a problem.
Normal	High	Compressor running continuously	Missing orifice tube	Replace the orifice tube.
		Compressor cycling, excessive on and off time	A/C clutch cycling switch cut in pressure too high	Check A/C clutch cycling switch and replace as necessary.

Troubleshooting the Refrigerant System

Refrigerant System Diagnosis for a Vehicle With a Sanden Compressor				
High Side Pressure	**Low Side Pressure**	**Possible Symptoms**	**Probable Cause(s)**	**Correction**
Normal to Low	High	Compressor running continuously	Low compressor performance	Replace the compressor.
Normal	Low	Compressor cycling, excessive on and off time	A/C clutch switch cutout pressure too low	Check A/C clutch cycling switch and replace as necessary.
Normal to Low	Normal to High	Compressor running continuously	Restriction between evaporator and compressor inlet (lines or accumulator)	Locate restriction and replace as necessary.
Normal to Low	Normal	Compressor cycling on and off quickly, shorter than normal run time	Low airflow across evaporator	Check evaporator for debris accumulation, frozen core, or faulty blower motor. Repair as necessary.
			Restriction	Locate restriction and repair as necessary.
		Compressor cycling on and off quickly, shorter than normal run and off time	Low refrigerant charge	Recover system. If amount of refrigerant recovered indicates low charge, leak check entire system and repair leaks. Then evacuate and charge the system.
		Compressor cycling on and off quickly, longer than normal off time	Restricted or plugged evaporator core	Locate restriction and repair as necessary.
Normal to Low	Low	Compressor running continuously	Restriction between evaporator and compressor inlet (lines or accumulator)	Locate restriction and repair as necessary.
			A/C clutch cycling switch sticking closed	Check A/C clutch cycling switch and repair as necessary.
Low	Normal	Compressor cycling on and off quickly, shorter than normal run and off time	A/C clutch cycling switch cut in cutout pressure range too close	Check A/C clutch cycling switch and replace as necessary.
Normal	Normal	Compressor running continuously or run time excessively long if cycling	Moisture in system	Recover, evacuate, and charge the system.
			Excessive refrigerant oil in the system	Flush system with refrigerant to remove oil. Add proper quantity of oil, evacuate and charge the system.
		Compressor cycling on and off quickly, shorter than normal run and off time	A/C clutch cycling switch cut in cutout pressure range too close	Check A/C clutch cycling switch and replace as necessary.

Table 2, Refrigerant System Diagnosis for a Vehicle With a Sanden Compressor

Specifications

⚠ WARNING

R–134a is the only refrigerant that is approved for use on Sterling vehicles. Several companies offer less expensive, hydrocarbon-based refrigerant, such as propane and methane. Use of these refrigerants will void the warranty on the air conditioning system, cause damage to the air conditioning system, and possibly result in personal injury or property damage. Leaking air conditioning systems charged with hydrocarbon-based refrigerants pose a serious risk of fire or explosion under the hood, or inside the passenger compartment. No vehicle built by Sterling Trucks can be safely charged with hydrocarbon-based refrigerants, regardless of what the refrigerant supplier states.

When servicing an air conditioning system, be sure to use a refrigerant identifier to ensure that the system has not been charged with something other than R–134a. This should be standard practice since there is no way to tell what services have been previously performed. Identification by service technicians will help to avoid the risk of explosion and guard against contamination of equipment when refrigerant is recovered and recycled.

Refrigerant recover/charge stations can be purchased from:

SPX Kent-Moore
28635 Mound Road
Warren, Michigan 48092-3499
(800) 328-6657

See **Fig. 1** for a partial view of the heater and air conditioner system wiring diagram. See **Fig. 2**, **Fig. 3** and **Fig. 4** for details of the heater and air conditioner system wiring diagram.

See **Fig. 5** for a partial view of the heater and air conditioner system wiring diagram. See **Fig. 6** and **Fig. 7** for details of the heater and air conditioner system wiring diagram.

See **Fig. 8** for a partial view of the heater and air conditioner system wiring diagram. See **Fig. 9** and **Fig. 10** for details of the heater and air conditioner system wiring diagram.

The amount of refrigerant needed to fully charge the air conditioning system is printed on the "Air Conditioner" label on the air intake plenum located under the hood. See **Fig. 11**.

See **Fig. 12** for an illustration of the Behr and Modine condensers.

A/C Clutch Cycling Pressure Switch Specifications*				
Color	**Type of A/C Compressor**	**Part No.**	**Contacts Open Pressure psi (kPa)**	**Contacts Close Pressure psi (kPa)**
White	Sanden and Visteon Scroll	VST95BW19E561AA	36 to 42 (248 to 290)	21 to 23 (145 to 159)

* Some early production vehicles with 2004 engines were equipped with a blue, YC2H 19D561 AA pressure switch. If the vehicle has this switch and is having a problem with A/C performance, replace it with a VST95BW19E561AA pressure switch.

Table 1, A/C Clutch Cycling Pressure Switch Specifications

High Pressure Cut Out and Fan Cycling Pressure Switch Specifications

1. Behr Condenser
2. Modine Condenser

Fig. 12, Behr and Modine Condensers

General Information

The primary purpose of the refrigerant compressor is to draw refrigerant gas from the evaporator and compress it into high-pressure gas. High pressure raises the condensation point of refrigerant gas, which allows the condenser to change it to a liquid so that it can be used for cooling again. The secondary purpose of the compressor is to move refrigerant through the air conditioning system.

Safety Precautions

Whenever repairs are made to any air conditioner components that hold R–134a refrigerant, you must recover, purge or flush (if contaminated), evacuate, charge, and leak test the system. In a good system refrigerant lines are always under pressure and you should disconnect them only after the refrigerant charge has been recovered (discharged) at the service valves.

Refrigerant R–134a is safe when used under the right conditions. Always wear safety goggles and non-leather gloves while recovering, evacuating, charging, and leak testing the system. Do not wear leather gloves. When refrigerant gas or liquid contacts leather, the leather will stick to your skin.

⚠ WARNING

Use care to prevent refrigerant from touching your skin or eyes because liquid refrigerant, when exposed to the air, quickly evaporates and will freeze skin or eye tissue. Serious injury or blindness could result if you come into contact with liquid refrigerant.

Refrigerant splashed in the eyes should be rinsed with lukewarm water, not hot or cold. Do not rub the eyes. Apply a light bandage and contact a physician right away.

Refrigerant splashed on the skin should be rinsed with lukewarm water, not hot or cold. Do not rub the skin. Apply a light coat of a nonmedicated ointment, such as petroleum jelly. Contact a physician right away.

R–134a refrigerant does not burn at ambient temperatures and atmospheric pressure. However, it can be combustible at pressures as low as 5.5 psig (38 kPa absolute) at 350°F (177°C) when mixed with air concentrations that are greater than 60 percent.

⚠ WARNING

R–134a air conditioning systems should not be pressure tested or leak tested with compressed air. Combustible mixtures of air and R–134a may form, resulting in a fire or explosion that could cause personal injury or property damage.

Always work in an area where there is a constant flow of fresh air when the system is recovered, evacuated, charged, and leak tested. R–134a vapors have a slightly sweet odor that is difficult to detect. Frequent leak checks and air monitoring equipment are recommended to ensure a safe working environment.

IMPORTANT: When servicing an R–134a air conditioning system, use only service equipment certified to meet the requirements of SAE J2210 (R–134a recycling equipment). The equipment should be operated only by qualified personnel who are familiar with the recycling station manufacturer's instructions.

Because of its very low boiling point, refrigerant must be stored under pressure. To prevent the refrigerant containers from exploding, never expose them to temperatures higher than 125°F (52°C).

On R–134a refrigerant systems, polyalkylene glycol (PAG) oil is used in the compressor. When handling PAG oil, observe the following guidelines:

- Keep the oil free of contaminants.
- Do not expose the air conditioning system or the PAG oil container to air for more than five minutes. PAG oil has a high moisture absorption capacity and the oil container should be immediately sealed after each use.
- Use care when handling. Spilled oil could damage painted surfaces, plastic parts, and drive belts.
- Never mix PAG oil with other types of refrigerant oil.

Pre-Service Checks |

⚠ WARNING

Before doing any work, read the information in Safety Precautions 100. Failure to read the safety precautions and to be aware of the dangers involved when working with refrigerant could lead to serious personal injury.

Compressor problems usually show in one of four ways:

- abnormal noise
- seizure
- leakage
- low suction and discharge pressures

Resonant compressor noises are not causes for alarm. Irregular noise or rattles are likely to be caused by broken parts. To check for seizure, de-energize the magnetic clutch with the engine shut off and see if the drive plate can be turned. If it cannot be turned, the compressor has seized.

Do the following checks whenever the air conditioner system is not cooling enough and the causes are unknown.

1. Check the drive belt and mounting.
   - 1.1 On the drive belt look for wear, damage, or oil. If worn, oil-soaked, or damaged, remove it and install a new one. See **Section 01.03**, Subject 100, for instructions.
   - 1.2 Check the compressor mounting components for loose fasteners, cracks, or other damage. Tighten loose fasteners to the correct torque specification. Repair or replace cracked or damaged brackets.
2. Check the wiring and connections to the compressor clutch. Replace damaged wiring and tighten loose connections.
3. Check for road debris buildup on the condenser coil fins. Using air pressure and a whisk broom or a solution of soap and water, carefully clean the condenser. Be careful not to bend the fins.
4. Check the refrigerant charge in the air conditioner system. For instructions, see **Section 83.05**, Subject 130.

Refrigerant Compressor Removal and Installation

Removal

WARNING

Before doing any work, read the information in Safety Precautions 100. Failure to read the safety precautions and to be aware of the dangers involved when working with refrigerant could lead to serious personal injury.

1. Turn off the engine, apply the brakes, and chock the tires.
2. Recover the refrigerant from the air conditioning system. For instructions, see **Section 83.05, Subject 130**.
3. Remove the serpentine belt. Do not pry or roll the belt off the pulleys.
4. Disconnect the wiring harness from the compressor.
5. Disconnect the discharge and suction lines from the compressor. Quickly cap the discharge and suction ports and the refrigerant lines.

IMPORTANT: Under no circumstances should the ports on the compressor or the refrigerant lines remain uncapped for longer than five minutes. Water and dirt can damage the refrigerant system. Do not blow shop air through refrigerant lines since shop air is wet (humid).

6. Being careful not to spill any refrigerant oil, remove the capscrews and washers that attach the refrigerant compressor to the engine and remove the compressor.

Installation

1. If installing a new compressor, adjust the refrigerant oil level in the new compressor. For instructions see, **Subject 130**.
2. Using capscrews and washers, install the compressor on the mounting bracket. Torque the capscrews 15 to 19 lbf·ft (20 to 26 N·m).
3. Uncap the discharge and suction ports and the refrigerant lines. Check the refrigerant lines and the discharge and suction ports. They must be clean and free of nicks, gasket residue, and other foreign material.
4. Replace the O-rings on the refrigerant lines. Lubricate the O-rings with mineral oil prior to installation.
5. Connect the refrigerant lines to the compressor. Torque the retaining plate 11 to 15 lbf·ft (15 to 20 N·m).
6. Connect the wiring harness to the compressor.
7. Install the serpentine belt.
8. If installing a new compressor or if the system was without any refrigerant pressure before repairs were started, replace the accumulator. For instructions, see **Section 83.05, Subject 170**.
9. Evacuate, charge, and leak test the refrigerant system. For instructions, see **Section 83.05, Subject 130**.
10. Turn the compressor shaft several times by hand to distribute the refrigerant oil that has settled.
11. Lower the hood.
12. Run the air conditioning system for several minutes to circulate the refrigerant oil.
13. Check the performance of the air conditioning system by turning on the air conditioning and checking the temperature at the air outlets in the cab. See **Section 83.05, Subject 400** for the correct temperatures. If the temperatures are not correct, see **Section 83.05, Subject 300** for troubleshooting procedures.
14. Remove the chocks from the tires.

Adjustment

If the compressor is being replaced, drain the refrigerant oil from the old compressor to determine the amount of oil to add to the new compressor.

1. Remove the caps (if present) from the suction and discharge ports.
2. Drain the refrigerant oil from the suction and discharge ports into a suitable container while turning the shaft clockwise with a socket wrench on the compressor clutch retaining nut.
3. Measure and record the amount of refrigerant oil drained from the compressor.
4. Inspect the refrigerant oil for signs of contamination such as discoloration or foreign material. If there is contamination, flush the system using the instructions in **Section 83.05, Subject 130**.
5. Add Visteon polyalkylene glycol (PAG) refrigerant oil to the refrigerant compressor.
   - 5.1 If the amount of oil drained from the refrigerant compressor is less than 3 ounces (0.10 mL), add an additional 3 ounces (0.10 mL) to the amount of oil that was recovered during refrigerant recovery.
   - 5.2 If the amount of oil drained from the refrigerant compressor is between 3 to 5 ounces (0.10 to 0.17 mL), add the same amount of oil that was drained in addition to the amount recovered during refrigerant recovery.
   - 5.3 If the amount of oil drained from the refrigerant compressor is more than 5 ounces (0.17 mL), add only 5 ounces (0.17 mL) in addition to the amount recovered during refrigerant recovery.
   - 5.4 If the system was flushed, add 7 ounces (0.24 mL) of oil to the new accumulator, and 7 ounces (0.24 mL) of refrigerant oil to the refrigerant compressor.
6. To determine the amounts of refrigerant oil to add to the refrigerant compressor when other components have been replaced, follow the replacement instructions in this subject.

Adding Oil After Suction Accumulator/Drier Replacement

1. Drill a hole in the bottom of the old suction accumulator/drier.
2. Drain the refrigerant oil into a suitable oil measuring container.
3. Using the type of refrigerant oil recommended by the refrigerant compressor manufacturer, pour the same amount of new refrigerant oil plus 2 oz (60 ml) into the suction accumulator/drier.

Adding Oil After Component Replacement

NOTE: If a refrigerant line or component bursts with a fully charged system, the addition of refrigerant oil may be necessary, with the amount determined by the technician.

Using the type of refrigerant oil recommended by the refrigerant compressor manufacturer, pour new oil into the component in the following amounts:

- Evaporator: add 3 oz (90 ml)
- Condenser: add 1 oz (30 ml)
- Evaporator orifice: add 2 oz (59 ml)
- Refrigerant lines: add 2 oz (59 ml)

Adding Oil After Refrigerant Compressor Replacement

IMPORTANT: If the refrigerant compressor is being replaced due to failure, the suction accumulator/drier must be replaced at the same time. For instructions for a Sanden compressor, see **Section 83.02, Subject 150**. For instructions for a Visteon compressor, see **Section 83.06, Subject 130**.

Specifications

Use only Visteon polyalkylene glycol (PAG) refrigerant oil, part number EXM 920029, in the Visteon refrigerant compressor.

General Information

Hood

The hood is molded using the SMC process. SMC, which stands for sheet molding compound, is a fiberglass and thermosetting polyester material. SMC hoods are easily recognized by their smooth inner surface. To make each part, SMC sheets are first placed between matching mold halves. Heat and pressure are applied to the mold in order to cure (solidify) the SMC resin. At the end of the process, an in-mold coating is injected onto the part to prepare it for priming and topcoating.

Hood Mounting and Components

The hood assembly is hinged at the front mounts. Depending on the vehicle configuration, the hinges are located on a crossbar at the bottom of the grille opening, or at the sides of the grille opening. The hood pivots work in conjunction with the tilt-assist and tilt-limiting mechanisms to allow a forward hood tilt of approximately 65 degrees for vehicle service. Some hoods are equipped with butterfly, or transverse access openings for ease of service.

In the closed position, the rear of the hood is supported by hood mounting brackets, which are attached to the cab. The rear brackets hold the hood in the correct position for operation. The hood is held in place with elastomeric latches; one on each side.

The hood hinge brackets are adjustable fore-and-aft, and depending on the hood configuration, side-to-side and/or up-and-down. The rear hood mounting brackets are adjustable side-to-side and up-and-down.

The hood is equipped with headlight assemblies, which feature a headlight and turn signal/parking light combination on each fender.

Grille

The grille is mounted to the hood or the radiator, depending on the vehicle configuration and options. Hood-mounted grilles are chrome-plated or painted plastic. Radiator-mounted grilles, of aluminum, are bright anodized or painted silver metallic.

Hood Removal and Installation, Vehicles With an Engine Manufactured Through 2006

Procedures under these headings apply to the following vehicles, with engines manufactured through 2006, as specified:

- 101-inch BBC vehicles
- 111-inch BBC vehicles
- 113-inch and 122-inch BBC vehicles

CAUTION

On vehicles using aluminum cab construction, use only original equipment manufacturer replacement parts, including fasteners. This must be strictly adhered to in order to reduce the possibility of galvanic corrosion.

101-Inch BBC Vehicles

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Open the hood.
3. Place a support between the floor and the front of the hood. The support should be as wide and as long as the front of the hood, and should be the same height as the lowest edge of the hood. Pad the support and the front bumper.
4. Disconnect the front lamps electrical connector; see **Fig. 1**.
5. Have an assistant close the hood one-fourth of the way, and support it in that position from the front. Disconnect the hood check cable by removing the retainer spring and the clevis pin from the hood support bracket; see **Fig. 2**.

CAUTION

Do not support the hood by the grille or the headlamp surface; this could cause damage to the grille or the headlamp surface.

6. Tilt the hood fully open, and rest it on the support so that most of the weight is on the hood structure.
7. On each side of the vehicle, pull the hood hinge retainer spring out of the clevis pin. See **Fig. 3**.
8. With two assistants holding the hood, one per side, push out both hood hinge clevis pins.

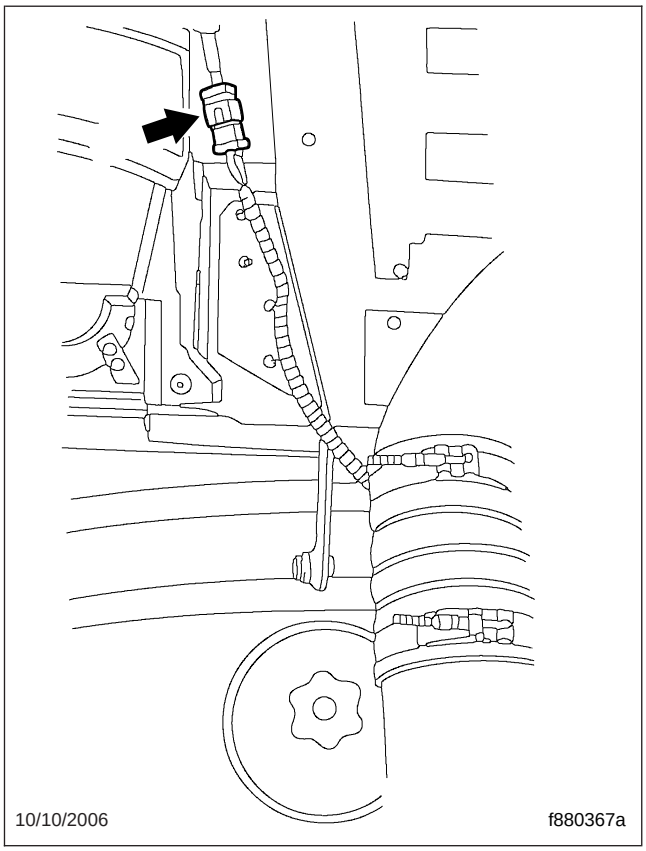

Fig. 1, Front Lamp Electrical Connector (101-inch, 113-inch, and 122-inch BBC vehicles)

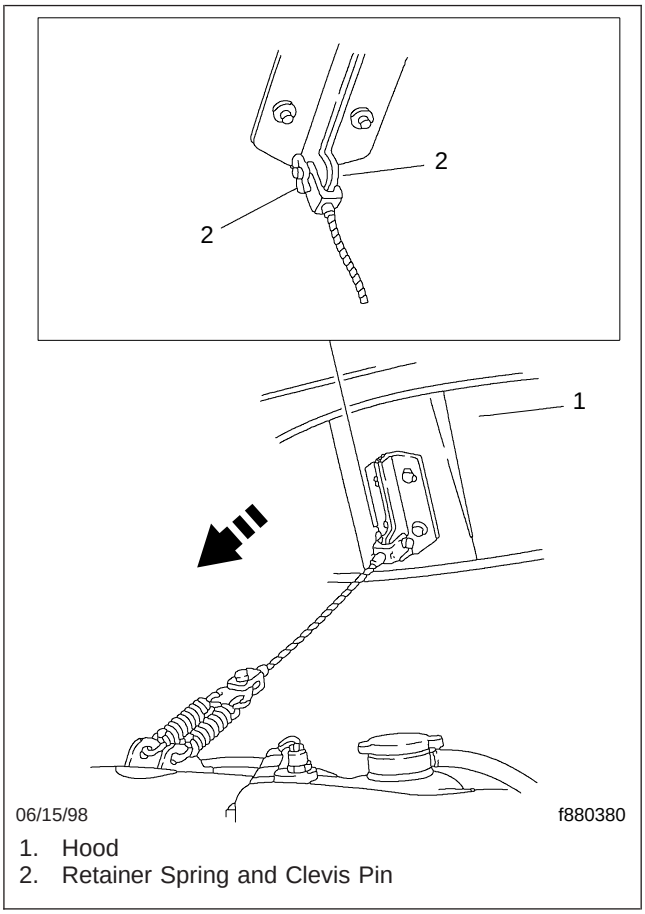
9. Position the hood carefully on the support.

Installation

1. With the tires chocked, and two assistants holding the hood, one per side, install the hood hinge clevis pins; see **Fig. 3**.
2. Install new retainer springs in the clevis pins on both sides of the vehicle.
3. Have an assistant close the hood one-fourth of the way, and support it in that position from the front. Attach the hood check cable to the hood with the clevis pin and retainer spring; see **Fig. 2**.
4. Connect the front lamps electrical connector; see **Fig. 1**.
5. Close and latch the hood.

Hood Removal and Installation, Vehicles With an Engine Manufactured Through 2006



1. Hood
2. Retainer Spring and Clevis Pin

Fig. 2, Hood Check Cable (101-inch and 111-inch BBC vehicles)

6. Align the hood, if necessary; see "Hood Alignment" below. For hood alignment clearances, see **Specifications 400**.
7. Remove the chocks.

Hood Alignment

NOTE: The frame-mounted portion of the hood hinge assembly, hidden behind the front bumper, provides adjustment along three axes, fore-and-aft, up-and-down, and side-to-side. See **Fig. 3**. The cab-mounted hood stabilizers provide up-and-down adjustment and side-to-side adjustment at the rear of the hood. See **Fig. 4**. To correct a misaligned hood, measure the clearances between the panels to determine in which directions, and how far, to move the hood.

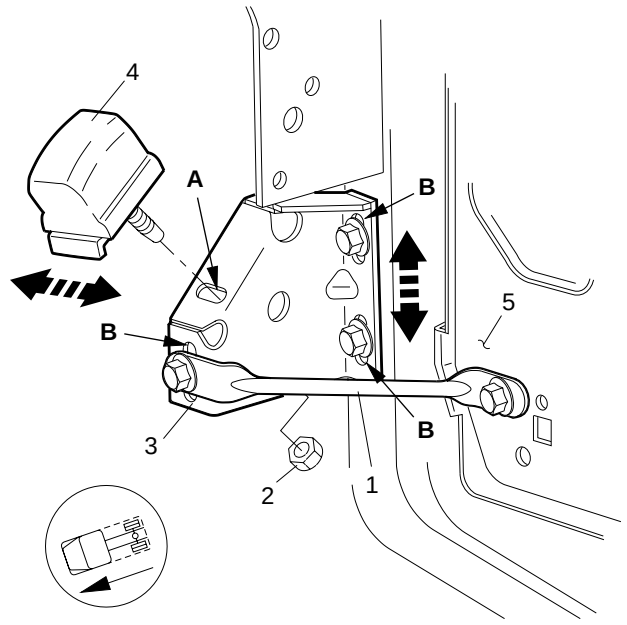
5. Nut with Conical Washer
6. Hinge Mounting Bracket
7. Retainer Spring
8. Washer
9. Pivot Bracket
10. Clevis Pin

Fig. 3, Hood Hinge Assembly (101-inch BBC vehicles)

For hood alignment clearances, see **Specifications 400**.

1. Drive the vehicle back and forth to settle the frame and suspension. Park the vehicle on a flat, level surface. Shut down the engine, apply the parking brakes, and chock the tires.
2. For hood adjustment at the rear of the hood, loosen the hood stabilizer bracket bolts and slide the bracket up-and-down, or loosen the isolator and slide it side-to-side. See **Fig. 4**.
3. Lubricate the top face of the hood stabilizer isolator with fluorinated grease.
4. If further hood adjustments are necessary, remove the front bumper (except extended frame or extended bumper); see **Section 31.00**.

Hood Removal and Installation, Vehicles With an Engine Manufactured Through 2006



09/12/2006 f880738

B. Slots for Up-and-Down Adjustment

1. Hood Stabilizer Brace
2. Nut
3. Hood Stabilizer Bracket
4. Isolator
5. Cab Front Wall

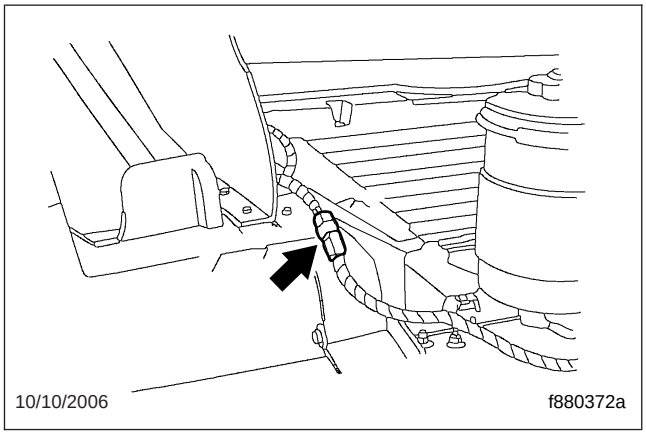
Fig. 4, Hood Alignment at Cab-Mounted Hood Stabilizer

5. Loosen the bolts (item 4 in **Fig. 3**) on the two hinge mounting brackets, move the hood up-and-down as far as required, then tighten the bolts.
6. Loosen the two nuts (item 5 in **Fig. 3**) that secure the hood hinge mounting brackets to the hinge assembly, move the hood side-to-side or front-and-back as far as required, then tighten the nuts.
7. If the hood cannot be adjusted to the specified clearances, the hood hinges may be damaged. Inspect the hood hinge assembly and the pivot brackets, and replace any damaged components.
8. Remove the chocks.

111-Inch BBC Vehicles

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Open the hood.
3. Place a support between the floor and the front of the hood. The support should be as wide and as long as the front of the hood, and should be the same height as the lowest edge of the hood. Pad the support and the front bumper.
4. Disconnect the front lamps electrical connector; see **Fig. 5**.



10/10/2006 f880372a

Fig. 5, Front Lamps Electrical Connector (111-inch BBC vehicles)

5. Have an assistant close the hood one-fourth of the way, and support it in that position from the front. Disconnect the hood check cable by removing the retainer spring and the clevis pin from the hood support bracket; see **Fig. 2**.

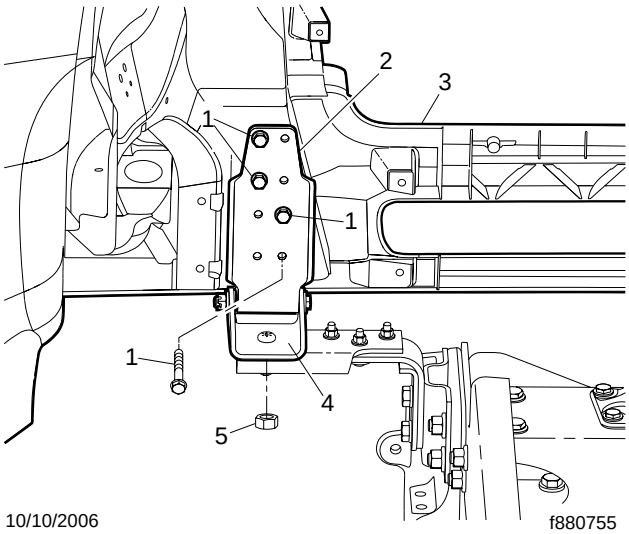
CAUTION

Do not support the hood by the grille or the headlamp surface; this could cause damage to the grille or the headlamp surface.

6. Tilt the hood fully open, and rest it on the support so that most of the weight is on the hood structure.
7. With two assistants holding the hood, one per side, remove the capscrews (item 1 in **Fig. 6**)

Hood Removal and Installation, Vehicles With an Engine Manufactured Through 2006

that attach the hood hinge assembly to the hood on both sides of the vehicle.



NOTE: Left side shown.

1. Capscrew
2. Hood-Mounted Hinge Bracket
3. Hood
4. Frame-Mounted Hinge Bracket
5. Nut

Fig. 6, Hood Hinge (111-inch BBC vehicles)

8. Position the hood carefully on the support.

Installation

1. With the tires chocked, and two assistants holding the hood, one per side, position the hood against the hinge brackets, and install the capscrews that attach the brackets to the hood; see **Fig. 6**.
2. Have an assistant close the hood one-fourth of the way, and support it in that position from the front. Attach the hood check cable to the hood with the clevis pin and retainer spring; see **Fig. 2**.
3. Close and latch the hood.
4. Connect the front lamps electrical connector; see **Fig. 5**.
5. Align the hood, if necessary; see "Hood Alignment" below. For hood alignment clearances, see **Specifications 400**.
6. Remove the chocks.

Hood Alignment

NOTE: The hood hinges provide fore-and-aft adjustment and side-to-side adjustment. The nut at both hinges must be loosened for adjustment. See **Fig. 6**. The cab-mounted hood stabilizers provide up-and-down adjustment and side-to-side adjustment at the rear of the hood. See **Fig. 4**. To correct a misaligned hood, measure the clearances between the panels to determine in which directions and how far to move the hood.

For hood alignment clearances, see **Specifications 400**.

1. Drive the vehicle back and forth to settle the frame and suspension. Park the vehicle on a flat, level surface. Shut down the engine, apply the parking brakes, and chock the tires.
2. For hood adjustment at the rear of the hood, loosen the hood stabilizer bracket bolts and slide the bracket up-and-down, or loosen the isolator and slide it side-to-side. See **Fig. 4**.
3. Lubricate the top face of the hood stabilizer isolator with fluorinated grease.
4. Loosen the nut (item 5 in **Fig. 6**) that secures the hood hinge bracket on each side of the vehicle, move the hood front-and-back or side-to-side as required, then tighten the nuts.
5. If the hood cannot be adjusted to the specified clearances, the hood hinges may be damaged. Inspect the hood hinges and replace, if required.
6. Remove the chocks.

113-Inch and 122-Inch BBC Vehicles

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Remove the bumper; see **Section 31.00, Subject 100**.

Hood Removal and Installation, Vehicles With an Engine Manufactured Through 2006

WARNING

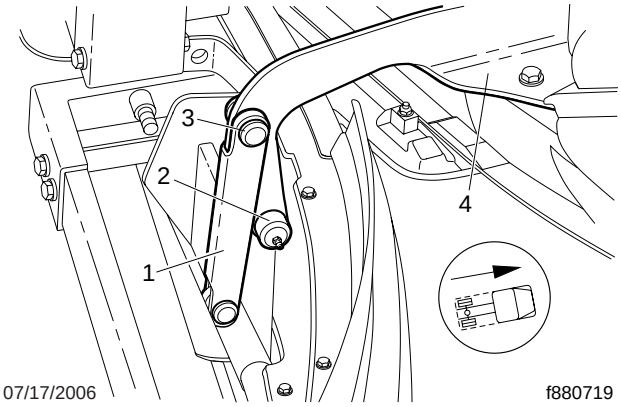
Do not attempt to lift the hood; it weighs about 150 lb (68 kg). Lifting the hood could result in personal injury or damage to the hood assembly and other components.

3. Open the hood.
4. Remove the grille; see **Subject 150**.
5. Place a support between the floor and the front of the hood. The support should be as wide and as long as the front of the hood, and should be the same height as the lowest edge of the hood. Place cardboard, carpet, rags, or other padding on top of the support to protect the hood.
6. Disconnect the front lamps electrical connector; see **Fig. 1**.
7. On vehicles built before December 2003, while an assistant is supporting the hood closed one-fourth of the way, disconnect the hood hinge links from the hood hinge mounting plate assemblies, as follows. See **Fig. 7**.
   - 7.1 Remove the left hood hinge link retaining spring.
   - 7.2 Remove the left hood hinge link pin.
   - 7.3 Remove the right hood hinge link retaining spring.
   - 7.4 Remove the right hood hinge link pin.

CAUTION

Do not support the weight of the hood with the grille support bracket or the chrome headlamp bezels. The weight of the hood will damage these components.

8. With an assistant supporting the hood closed one-fourth of the way, disconnect the hood-check cables by removing the nuts and bolts that attach the cables to the left and right mounting brackets. See **Fig. 8**. Lower the hood onto the support.
9. On each side of the vehicle, remove the spring clip and the washer from the hood hinge clevis pin. See **Fig. 9**.
10. On each side of the vehicle, push out and remove the hood hinge clevis pin.



1. Hood Hinge Link
2. Hood Hinge Pivot Pin
3. Hood Hinge Link Pin
4. Hood Mounting Plate Assembly

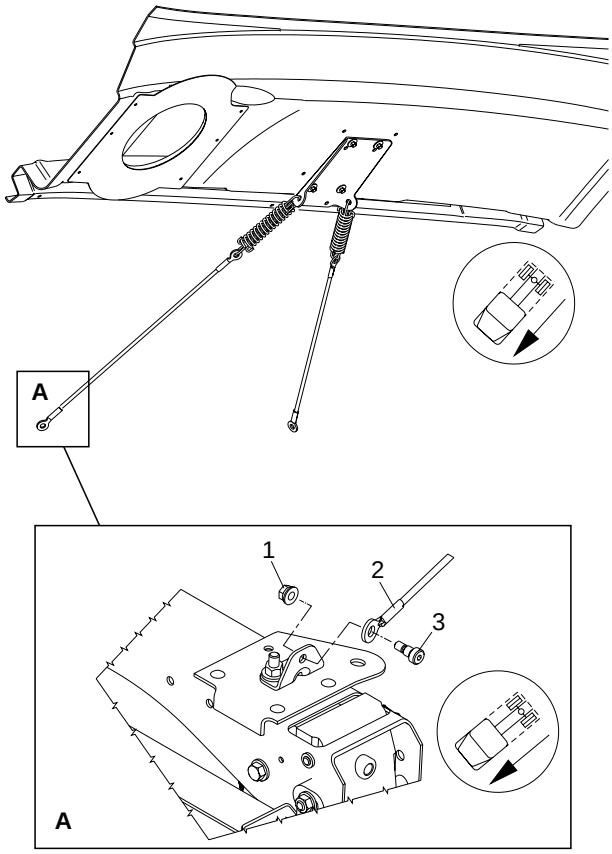
Fig. 7, Hood Hinge Link (113-inch and 122-inch BBC vehicles built before December 2003)

11. Position the hood carefully on the support.

Installation

1. With the tires chocked, install the hood hinge clevis pins on each side of the vehicle. See **Fig. 9**.
2. Install a washer and spring clip on each hood hinge clevis pin.
3. On vehicles built before December 2003, while an assistant is supporting the hood closed one-fourth of the way, connect the hood hinge links to the hood hinge mounting plate assemblies, as follows. See **Fig. 7**.
   - 3.1 Install the right hood hinge link pin.
   - 3.2 Install the right hood hinge link retaining spring.
   - 3.3 Install the left hood hinge link pin.
   - 3.4 Install the left hood hinge link retaining spring.
4. With an assistant supporting the hood closed one-fourth of the way, position the hood-check cables on the left and right mounting brackets, and install the nuts and bolts. Tighten the nuts securely. See **Fig. 8**.
5. Connect the front lamps electrical connector; see **Fig. 1**.

Hood Removal and Installation, Vehicles With an Engine Manufactured Through 2006



03/14/2005 f880687

A. Disconnect the hood-check cable.

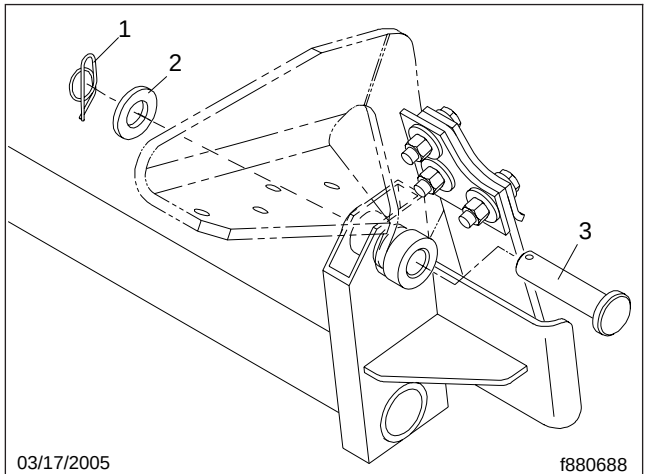
1. Nut
2. Hood-Check Cable
3. Bolt

Fig. 8, Hood-Check Cable Assembly (113-inch and 122-inch BBC vehicles)

6. Install the grille; see **Subject 150**.
7. Close and latch the hood.
8. Install the bumper; see **Section 31.00, Subject 100**.
9. Align the hood, if necessary; see "Hood Alignment" below. For hood alignment clearances, see **Specifications 400**.
10. Remove the chocks.

Hood Alignment

NOTE: The frame-mounted portion of the hood hinge assembly, hidden behind the front



03/17/2005 f880688

NOTE: Left side shown.

1. Spring Clip
2. Washer
3. Hood Hinge Clevis Pin

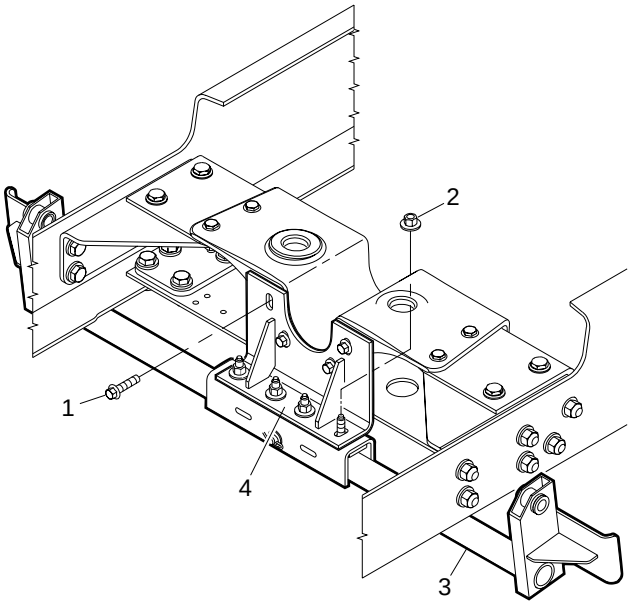
bumper, provides adjustment along three axes: fore-and-aft, up-and-down, and side-to-side. See **Fig. 10**. The cab-mounted hood stabilizers provide side-to-side and up-and-down adjustment at the rear of the hood. See **Fig. 4**. To correct a misaligned hood, measure the clearances between the panels to determine which directions, and how far, to move the hood.

For hood alignment clearances, see **Specifications 400**.

1. Drive the vehicle back and forth to settle the frame and suspension. Park the vehicle on a flat, level surface. Shut down the engine, apply the parking brakes, and chock the tires.
2. For hood adjustment at the rear of the hood, loosen the hood stabilizer bracket bolts and slide the bracket up-and-down, or loosen the isolator and slide it side-to-side. See **Fig. 4**.
3. Lubricate the top face of the hood stabilizer isolator with fluorinated grease.
4. If further adjustments are necessary, remove the front bumper (except extended frame or extended bumper); see **Section 31.00**.
5. Loosen the bolts in the front face of the hood hinge center mounting brackets, and move the

Hood Removal and Installation, Vehicles With an Engine Manufactured Through 2006



1. Bolt
2. Nut
3. Torsion Bar
4. Pivot Bracket

Fig. 10, Hood Alignment at Hood Hinge (113-inch and 122-inch BBC vehicles)

hood up-and-down as required, then tighten the bolts. See **Fig. 10**.

6. Loosen the nuts that retain the hood hinge to the center mounting bracket, and move the hood side-to-side or fore-and-aft as required, then tighten the nuts.
7. If the hood cannot be adjusted to the specified clearances, the hood hinge may be damaged. Inspect the hood hinge crosstube and arms that attach to the hood, and replace any damaged components.
8. Remove the chocks.

Hood Removal and Installation, Vehicles With an EPA07 Engine

Procedures under these headings apply to the following vehicles, with EPA07 engines, as specified:

- 101-inch and 111-inch BBC vehicles
- 113-inch and 122-inch BBC vehicles

CAUTION

On vehicles using aluminum cab construction, use only original equipment manufacturer replacement parts, including fasteners. This must be strictly adhered to in order to reduce the possibility of galvanic corrosion.

101-Inch and 111-Inch BBC Vehicles

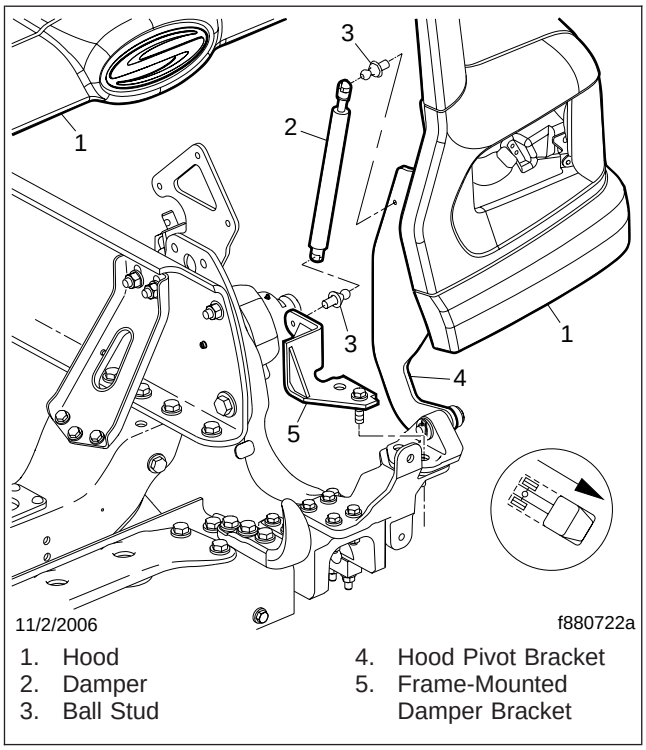
Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Open the hood.
3. Place a support between the floor and the front of the hood. The support should be as wide and as long as the front of the hood, and should be the same height as the lowest edge of the hood. Pad the support and the front bumper.
4. Disconnect the front lamps electrical connector, located next to the left-side hood hinge.
5. For a 101-inch BBC vehicle, disconnect the hood damper from the hood; see **Fig. 1**.

   For a 111-inch vehicle, disconnect the hood tilt-assist strut by removing the fasteners that attach the strut to the hood; see **Fig. 2**.
6. Disconnect the hood check cables, as follows.

   6.1 Have an assistant close the hood one-fourth of the way, and support it in that position from the front.

   6.2 With the assistant supporting the hood in position, remove the shoulder bolts and flange nuts that attach the check cables to the brackets on the radiator; see **Fig. 3**.



1. Hood
2. Damper
3. Ball Stud
4. Hood Pivot Bracket
5. Frame-Mounted Damper Bracket

Fig. 1, Hood Damper Installation

CAUTION

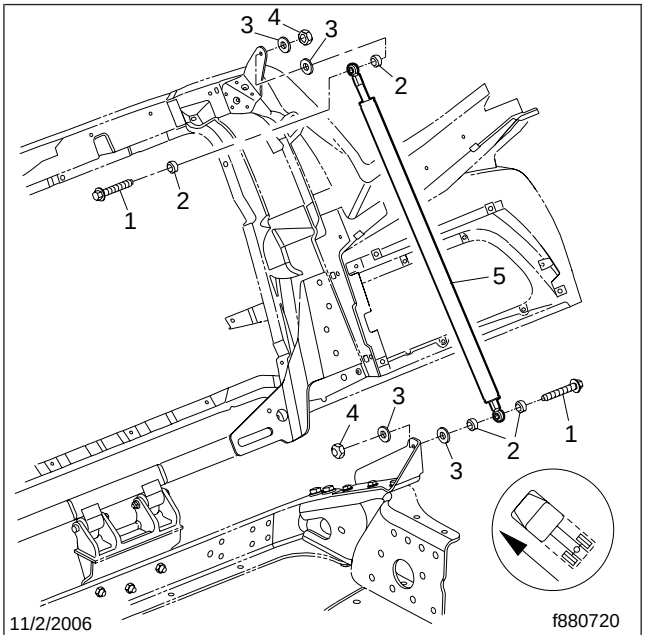
Do not support the hood by the grille or the headlamp surface; this could cause damage to the grille or the headlamp surface.

7. Tilt the hood fully open, and rest it on the support so that most of the weight is on the hood structure.
8. On each side of the hood, pull the retainer spring out of the clevis pin; see **Fig. 4**.
9. With two assistants holding the hood, one per side, remove both hood hinge clevis pins and washers.
10. Position the hood carefully on the support.

Installation

1. With the tires chocked, and two assistants holding the hood, one per side, install hood hinge clevis pins and washers; see **Fig. 4**.
2. Install new retainer springs in the clevis pins on both sides of the vehicle.

Hood Removal and Installation, Vehicles With an EPA07 Engine



NOTE: 113/122-inch BBC shown; 111-inch BBC similar.

1. Bolt
2. Spacer
3. Washer
4. Nut
5. Strut

Fig. 2, Hood Tilt-Assist Strut Installation

3. Connect the hood check cables, as follows.
   - 3.1 Have an assistant close the hood one-fourth of the way, and support it in that position from the front.
   - 3.2 With the assistant supporting the hood in position, attach the hood check cables to the brackets on the radiator with the shoulder bolts and flange nuts; see **Fig. 3**.
4. For a 101-inch BBC vehicle, connect the hood damper to the hood; see **Fig. 1**.

   For a 111-inch vehicle, connect the hood tilt-assist strut to the hood; see **Fig. 2**.
5. Connect the front lamps electrical connector.
6. Close and latch the hood.
7. Align the hood, if necessary. For hood alignment clearances, see **Specifications 400**. For hood alignment instructions, see "Hood Alignment" in this subject.
8. Remove the chocks.

Hood Alignment

NOTE: Hood alignment is adjusted at both hinges for fore-and-aft and side-to-side movements. The fasteners at both hinges must be loosened for adjustment; see **Fig. 5**. The cab-mounted hood stabilizers provide side-to-side adjustment at the rear of the hood only; see **Fig. 6**. To correct a misaligned hood, measure the clearances between the panels to determine in which directions and how far to move the hood.

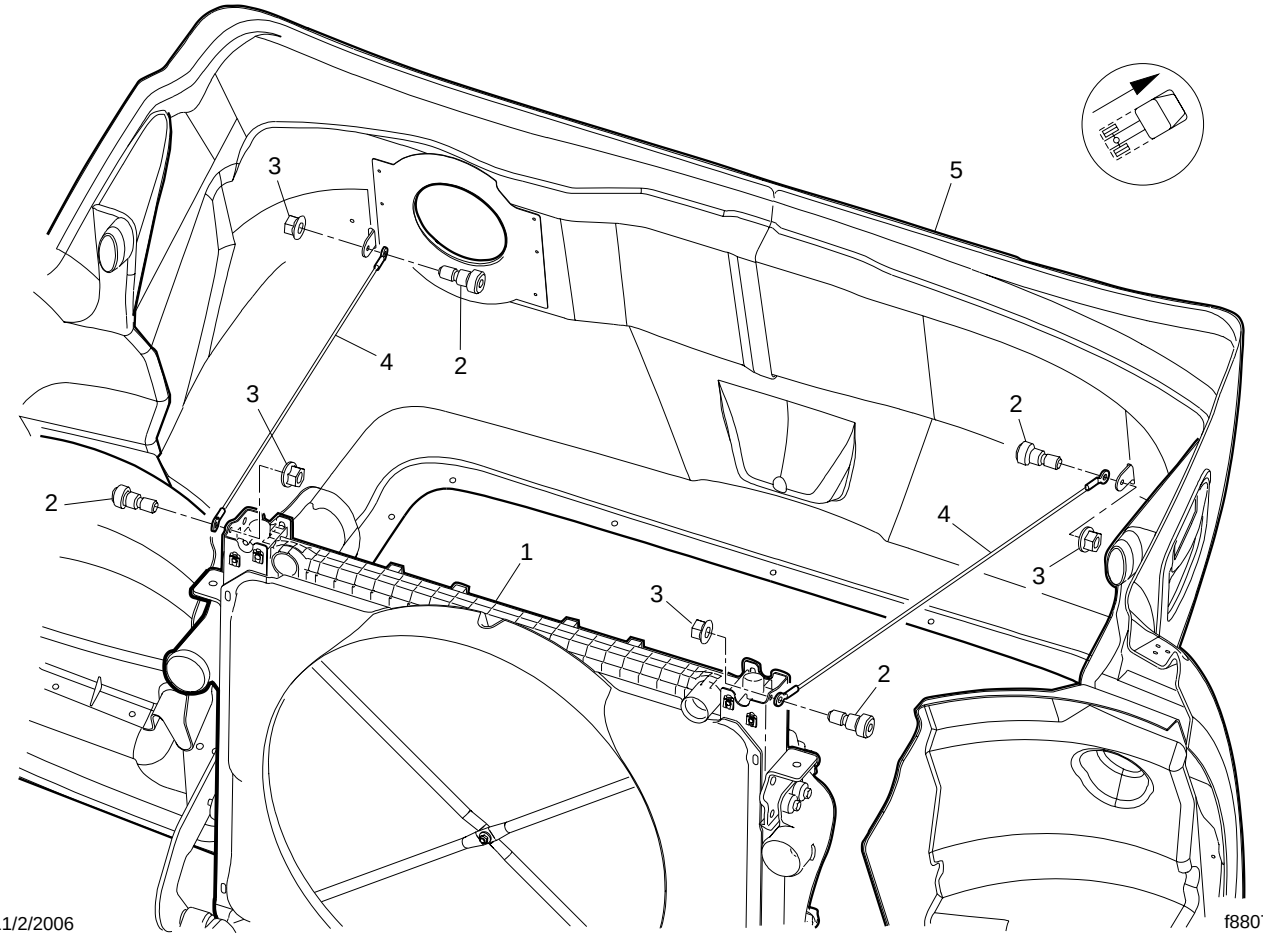
1. Drive the vehicle back and forth to settle the frame and suspension. Park the vehicle on a flat, level surface. Shut down the engine, apply the parking brakes, and chock the tires.
2. Loosen the stabilizer receptacle bracket bolts and slide the bracket up or down or side-to-side for hood adjustment at the rear of the hood only; see **Fig. 6**. For clearances, refer to **Specifications 400**.
3. Lubricate the hood stabilizer on the top face with fluorinated grease.
4. Loosen the bolts on the hood-mounted pivot bracket, move the hood up or down as far as required, and tighten the bolts. For clearances, refer to **Specifications 400**.
5. Loosen the bolts that secure the hinge brackets to the frame, move the hood left to right or front to back as far as required and tighten the nuts. For clearances, refer to **Specifications 400**.
6. If the hood cannot be adjusted to the specified clearances, the hood hinge may be damaged. Inspect the hood hinge brackets, and replace any damaged components.
7. Remove the chocks.

113-Inch and 122-Inch BBC Vehicles

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Open the hood.
3. Remove the grille; see **Subject 150**.

Hood Removal and Installation, Vehicles With an EPA07 Engine



NOTE: 101-inch BBC vehicle with a chassis-mounted radiator is shown. 111-inch BBC vehicles have springs attached to the cables at the hood end. For vehicles with an engine-mounted radiator, the cables attach to an intermediate bracket at the radiator end.

Cowl Panel Removal and Installation

Removal

CAUTION

On vehicles using aluminum cab construction, use only original equipment manufacturer replacement parts, including fasteners. This must be strictly adhered to in order to reduce the possibility of galvanic corrosion.

1. Open the hood.

IMPORTANT: Remove the bracket bolts from the A-pillar, since the bracket bolts to the cowl panel are thread-locked during assembly.

2. Remove the cowl panel upper inner door bolts. See **Fig. 1**.

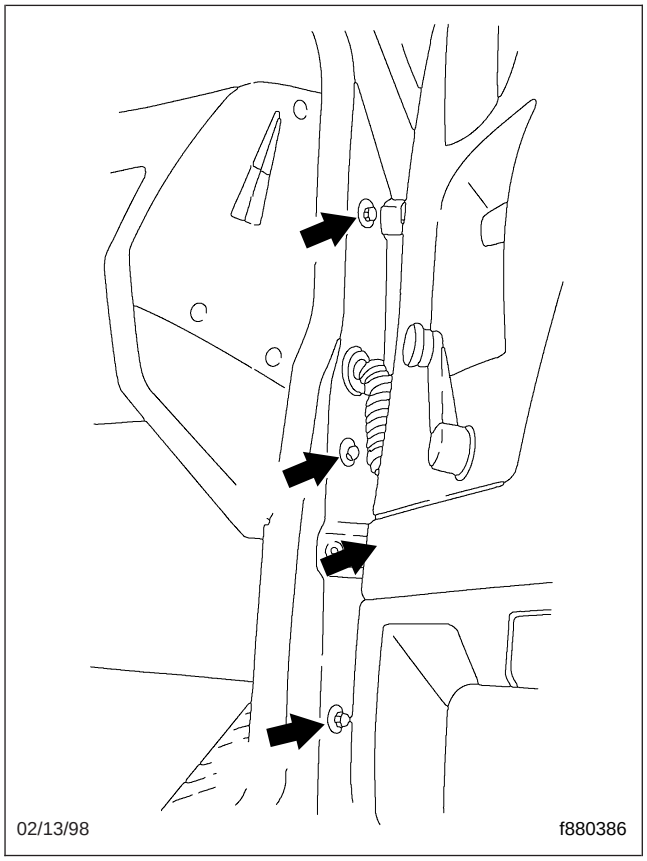

Fig. 1, Cowl Panel Upper Inner Door Bolts

3. Remove the cowl panel lower inner door bolts. See **Fig. 2**.
4. Remove the cowl front panel bolts. See **Fig. 3**.

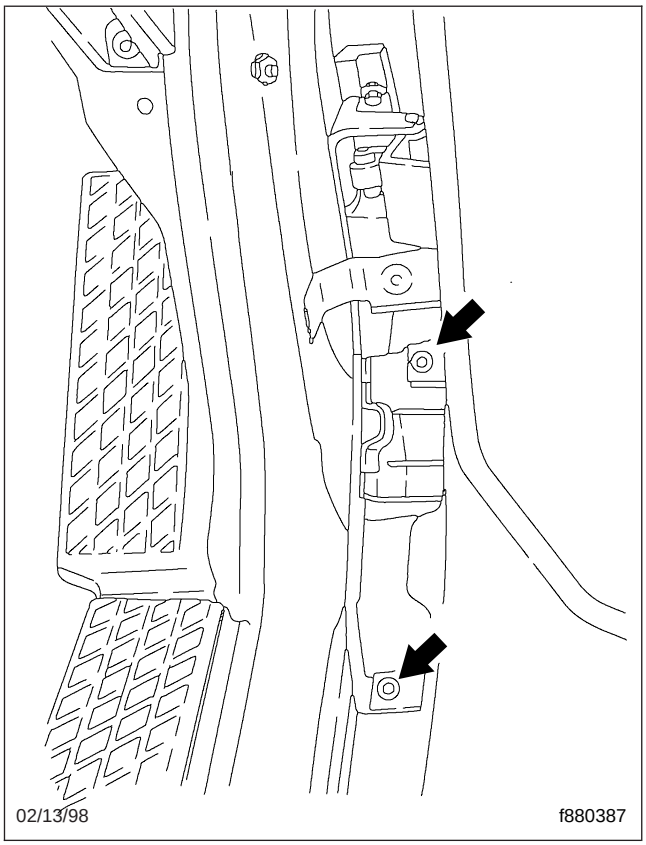

Fig. 2, Cowl Panel Lower Inner Door Bolts

5. Remove the hood latch bracket bolts. See **Fig. 4**.
6. Pull the cowl panel from the installed position.

Installation

1. Place the cowl panel into position.
2. Install the hood latch bracket bolts. See **Fig. 4**.
3. Install the cowl front panel bolts. See **Fig. 3**.
4. Install the cowl panel lower inner door bolts. See **Fig. 2**.
5. Install the cowl panel upper inner door bolts. See **Fig. 1**.
6. Close the hood.

Cowl Panel Removal and Installation

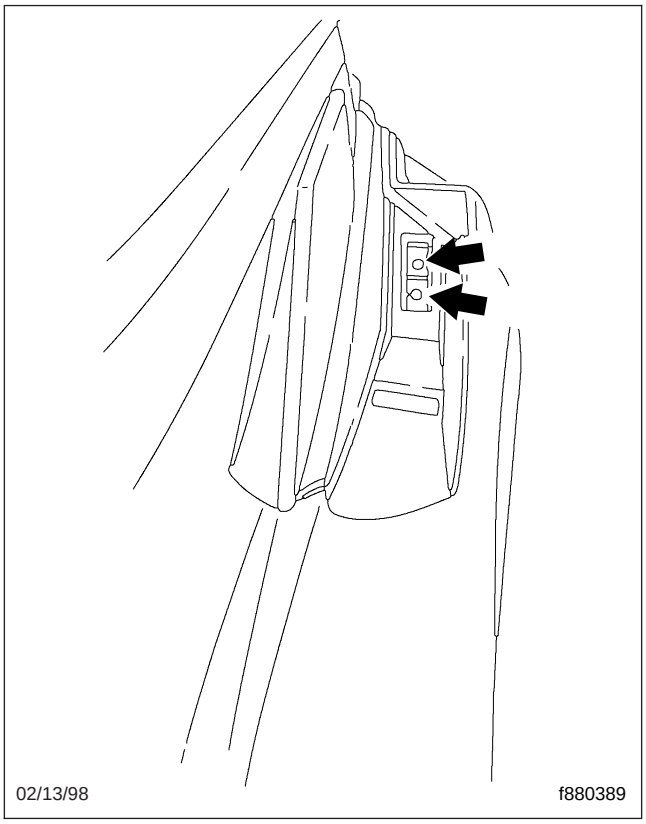

Fig. 4, Hood Latch Bracket Bolts

Fender Removal and Installation

Removal

CAUTION

On vehicles using aluminum cab construction, use only original equipment manufacturer replacement parts, including fasteners. This must be strictly adhered to in order to reduce the possibility of galvanic corrosion.

1. Open the hood.
2. Remove the cowl panel lower inner door bolts. See **Fig. 1**.

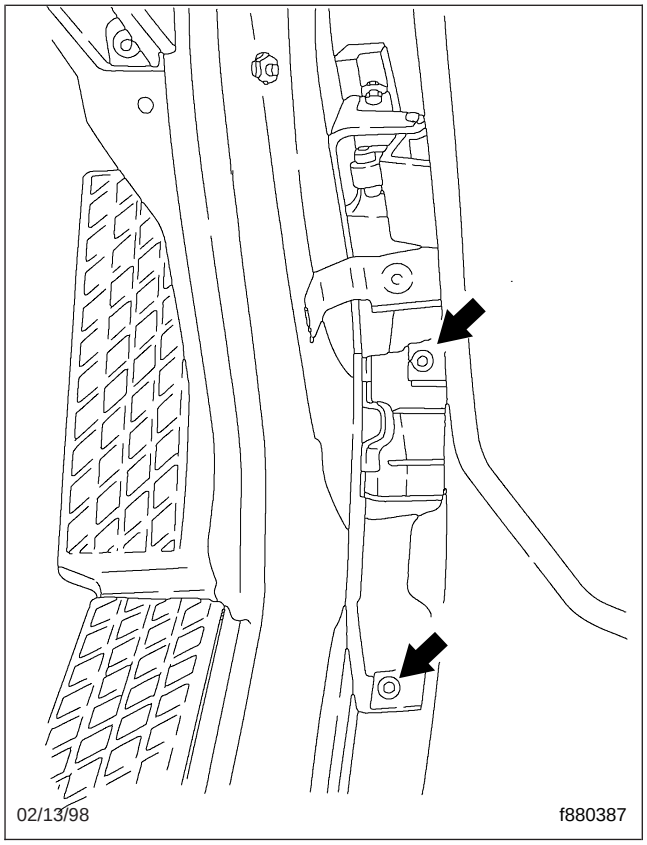

Fig. 1, Cowl Panel Lower Inner Door Bolts

3. Remove the hood latch bracket bolts. See **Fig. 2**.
4. Remove the upper fender bracket bolt. See **Fig. 3**.
5. Remove the inner fender bracket lower bolts. See **Fig. 4**.

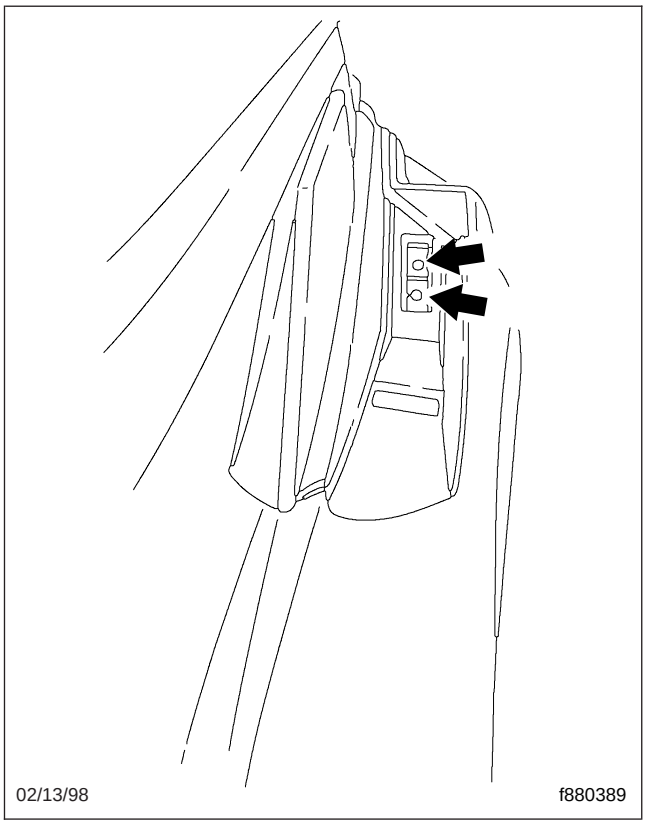

Fig. 2, Hood Latch Bracket Bolts

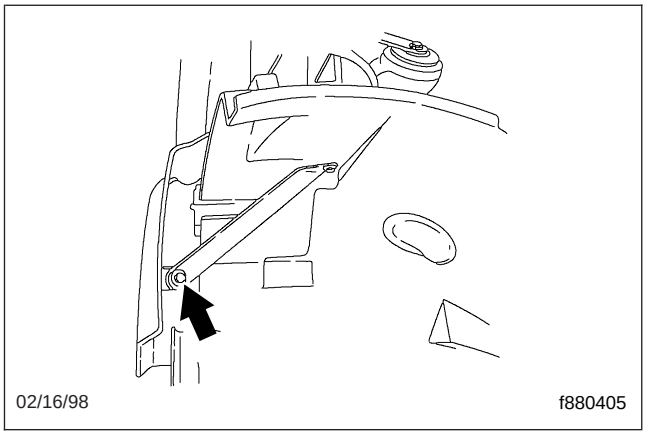

Fig. 3, Upper Fender Bracket Bolt

6. Remove the fender support bracket bolt. See **Fig. 5**.
7. Pull the fender towards the rear of the vehicle and remove.

Fender Removal and Installation

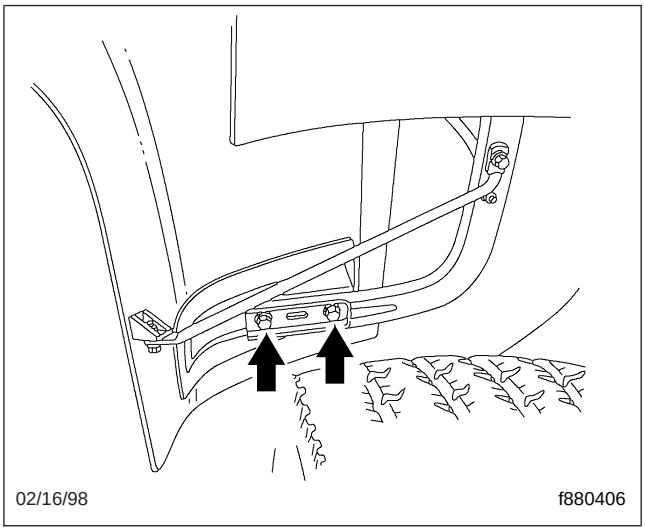

Fig. 4, Inner Fender Bracket Lower Bolts

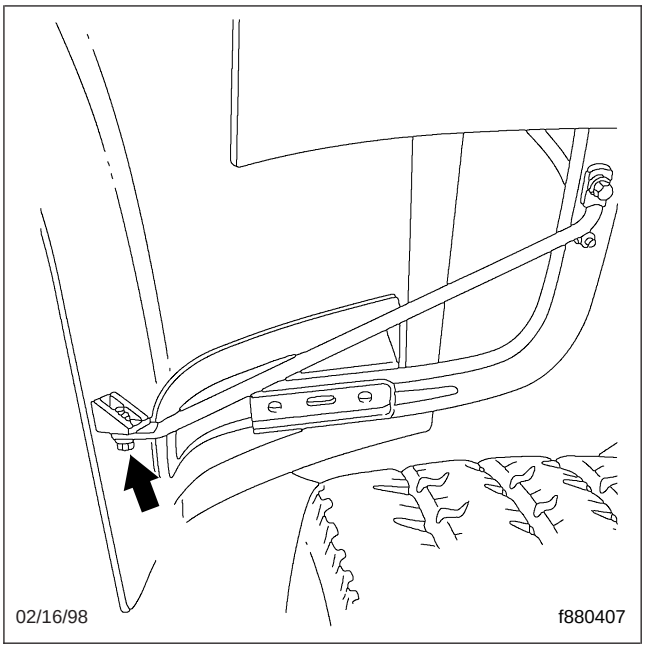

Fig. 5, Fender Support Bracket Bolt

8. Remove the cowl panel lower inner door bracket bolt and the bracket. See **Fig. 6**.

Installation

1. Position the fender on the vehicle.

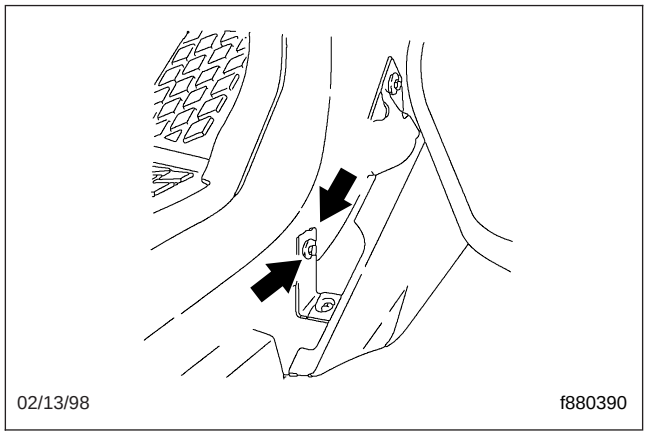

Fig. 6, Cowl Panel Lower Inner Door Bracket Bolt

2. Install the hood latch bracket and the bolts, but do not tighten the bolts. See **Fig. 2**.
3. Install the upper fender bracket bolt. See **Fig. 3**.
4. Install the fender support bracket bolt. See **Fig. 5**.
5. Install the inner fender bracket lower bolts. See **Fig. 4**.

CAUTION

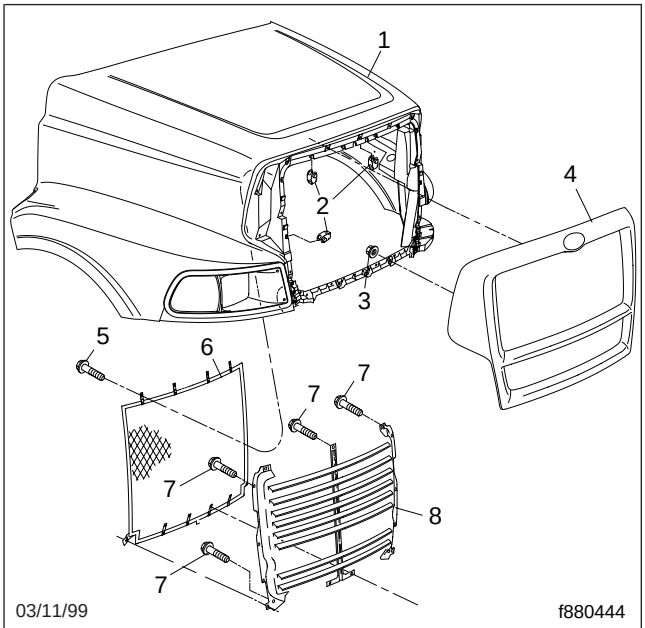
A clearance smaller than specified may result in door-to-fender contact and damage.

6. Align the fender, then tighten the hood latch bracket bolts. Refer to **Subject 170**. See **Fig. 2**.
7. Align the cowl panel lower inner door bracket and tighten the bolt. See **Fig. 6**.
8. Install the cowl panel lower inner door bolts. See **Fig. 1**.

Hood-Mounted One-Piece Grille

Removal

For a grille with a full bezel, see **Fig. 1**. For a grille without a bezel, see **Fig. 2**. For a grille with a partial bezel, see **Fig. 3**.



1. Hood
2. Grille Retaining Clips
3. Bezel Retaining Clips
4. Bezel
5. Screen Fasteners
6. Screen
7. Grille Fasteners
8. Grille

Fig. 1, Hood-Mounted One-Piece Grille With Bezel

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Open the hood.
3. From under the hood, remove the fasteners around the screen, if so equipped. Remove the screen.
4. Remove the fasteners from the grille. Remove the grille.
5. If the vehicle is equipped with a full bezel, remove the fasteners from the bezel. Remove the bezel.

   If the vehicle is equipped with a partial bezel, remove the fasteners from the hood molding. Remove the molding.

Installation

1. With the tires chocked, attach the bezel or hood molding (if so equipped) to the hood with the fasteners.
2. Attach the grille to the hood with the fasteners. Do not install the fasteners in the holes used to attach the screen to the grille.
3. Install the screen, if so equipped, and tighten the fasteners.
4. Close the hood.
5. Remove the chocks.

Radiator-Mounted One-Piece Grille

Removal

For a grille without a bezel, see **Fig. 4**. For a grille with a partial bezel, see **Fig. 5**.

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. If the vehicle is equipped with a screen, remove the fasteners around the screen. Remove the screen.
3. Open the hood.
4. If the vehicle is equipped with hood moldings, remove the fasteners from the moldings (upper and lower). Remove the moldings.
5. Remove the fasteners from the grille. Remove the grille.

Installation

1. With the tires chocked, attach the grille to the radiator with the fasteners.
2. Attach the hood moldings (if so equipped) to the hood with the fasteners.
3. Close the hood.
4. Install the screen, if so equipped, and tighten the fasteners.
5. Remove the chocks.

Grille Removal and Installation

2. Locknut
3. Screen
4. Screw and Washer
5. Grille
6. Nut and Washer
7. Stud

Fig. 2, Hood-Mounted One-Piece Grille Without Bezel

Hood-Mounted Two-Piece Grille

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Open the hood.
3. From under the hood, remove the fasteners around the screen, if so equipped; see **Fig. 6**. Remove the screen.

NOTE: Support the upper and lower grille so they do not fall.

4. From under the hood, remove the 10 fasteners and washers from the lower grille. Remove the lower grille.
5. From under the hood, remove the 12 fasteners and washers from the upper grille. Remove the upper grille.
6. Remove the fasteners from the bezel, and remove the bezel.

Installation

1. With the tires chocked, attach the bezel to the hood with the fasteners.
2. Position the upper grille under the hood. Align the 12 fasteners and washers with the holes, and tighten the fasteners.
3. Position the lower grille under the hood. Align the 10 fasteners and washers with the holes, and tighten the fasteners.
4. Install the screen, if so equipped, and tighten the fasteners.

Fig. 3, Hood-Mounted One-Piece Grille With Partial Bezel

5. Close the hood.
6. Remove the chocks.

Radiator-Mounted Grille with Surround, 113-Inch and 122-Inch BBC Vehicles

Removal

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Open the hood.
3. If the vehicle is equipped with a screen, remove the fasteners around the screen. Remove the screen; see **Fig. 7**.
4. Remove the fasteners around the nameplate. Remove the nameplate from the grille.
5. Remove the fasteners from the grille. Remove the grille from the radiator.
6. Remove the lower grille surrounds from the nameplate surrounds.
7. Remove the nameplate surrounds from the grille surround.

8. Remove the fasteners that attach the grille cutout to the grille surround. Remove the grille cutout; see **Fig. 8**.
9. Remove the fasteners that attach the grille surround to the hood. Remove the grille surround.

Installation

1. With the tires chocked, attach the grille surround to the hood.
2. Attach the grille cutout to the grille surround.
3. Attach the nameplate surround to the grille surround.

6. Attach the nameplate to the grille.
7. Install the screen, if so equipped, and tighten the fasteners.
8. Close the hood.
9. Remove the chocks.

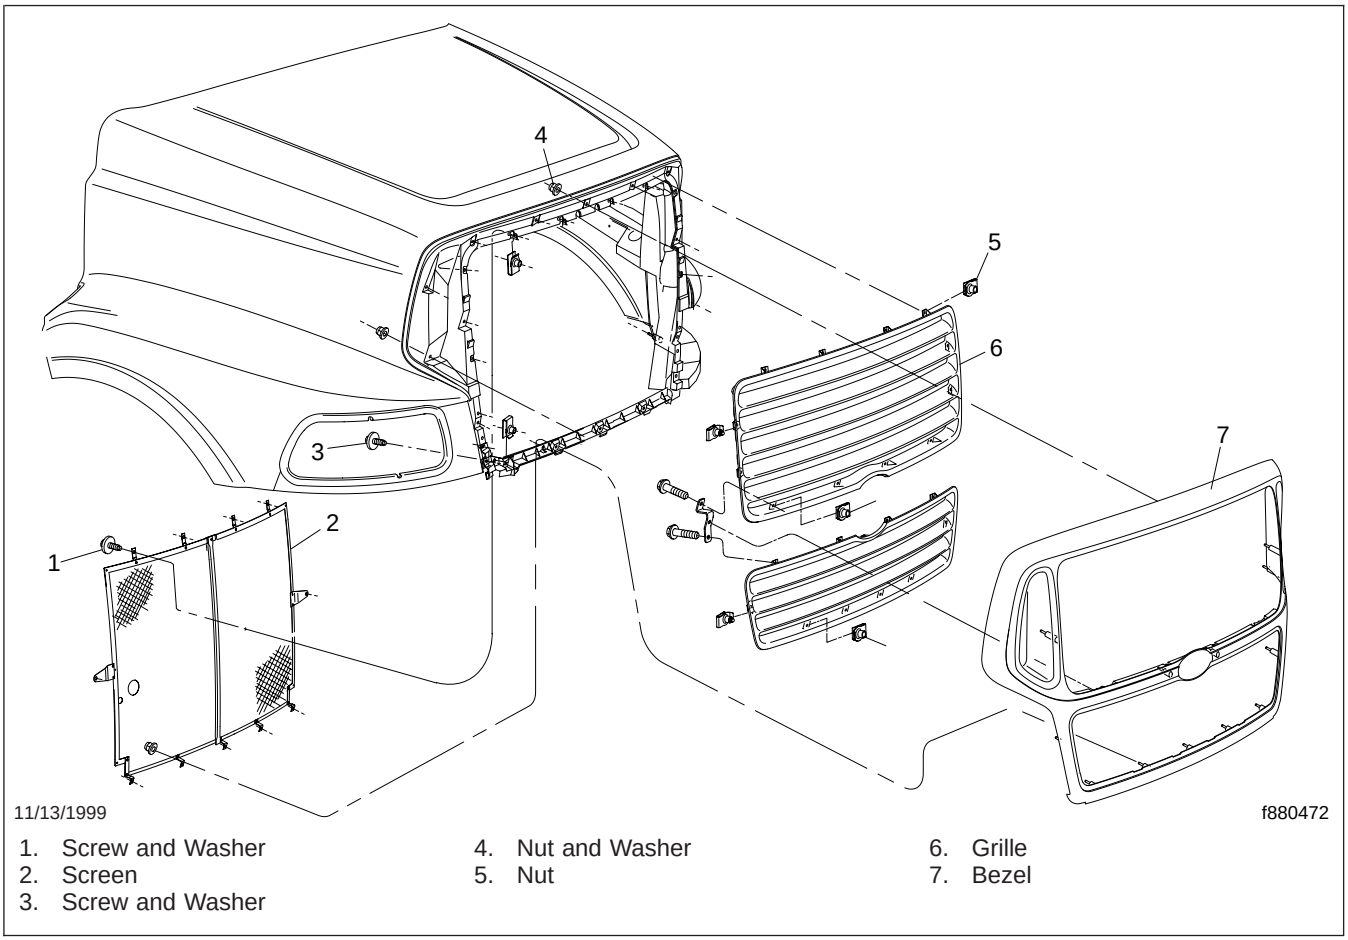
Radiator-Mounted Grille with Bezel, Built From April, 2007

Removal

For 101-inch and 111-inch vehicles without forward frame extension, see **Fig. 9**. For 101-inch and 111-inch BBC vehicles with forward frame extension, see **Fig. 10**.

1. With the vehicle parked, apply the parking brakes and chock the tires.
2. Remove the fasteners that attach the grille and the lower grille panel (if so equipped) to the radiator. Remove the grille.

Grille Removal and Installation



1. Screw and Washer
2. Screen
3. Screw and Washer

3. Open the hood.
4. Remove the capscrews that attach the bezel to the hood above the headlamp surrounds; see **Fig. 11**.
5. Pull the bezel up to disengage the clips from the hood. Remove the bezel.

Installation

1. With the tires chocked, lower the bezel into position on the hood, engaging the clips that attach it to the hood; see **Fig. 11**.
2. Using the capscrews, attach the bezel to the hood above the headlamp surrounds.
3. Close the hood.
4. Attach the grille and the lower grille panel (if so equipped) to the radiator with the fasteners.
5. Remove the chocks.

Replacement

WARNING

All air pressure must be relieved from the air reservoirs before disconnecting any pneumatic lines or hoses from the seating system. Failure to relieve air pressure could cause the lines to whip, resulting in personal injury.

1. Drain the vehicle air reservoirs.
2. Apply inward pressure on the quick release collar, and pull the air line out of the connector. See **Fig. 1**.

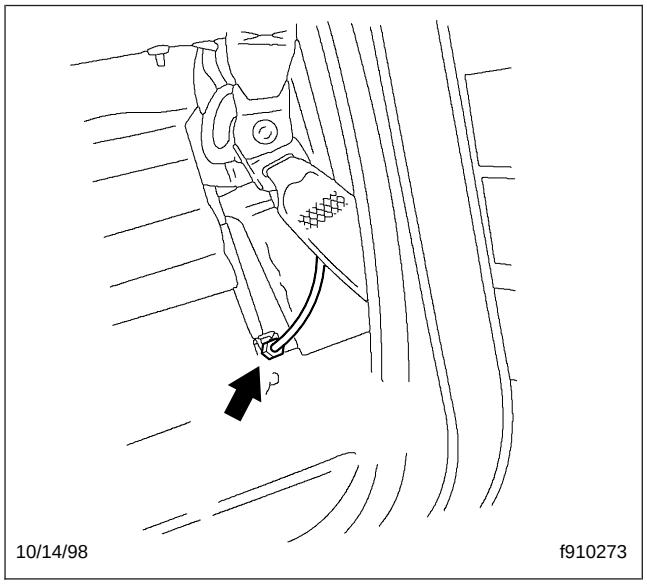

Fig. 1, Quick Release Collar

3. Compress the air switch retaining tabs, and push the air switch from the seat frame. See **Fig. 2**.
4. Remove the air lines from the air switch. See **Fig. 3**.
   - 4.1 Apply inward pressure on the quick release collar, and pull the air line out of the connector.
   - 4.2 Pull the air lines from the air switch fittings.
5. Install the air lines into the air switch.
6. Install the air switch into the seat frame.

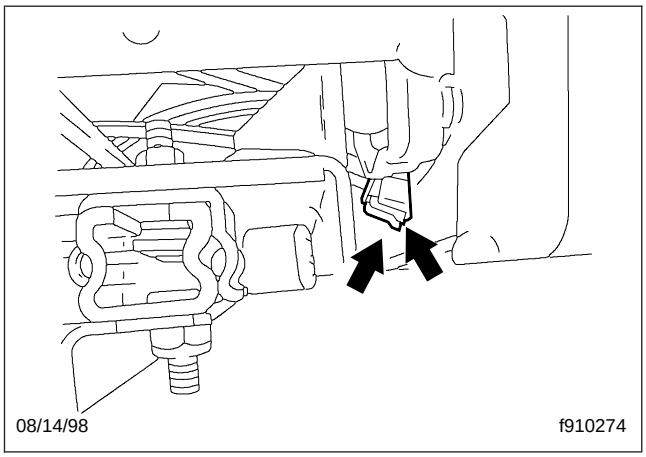

Fig. 2, Air Switch

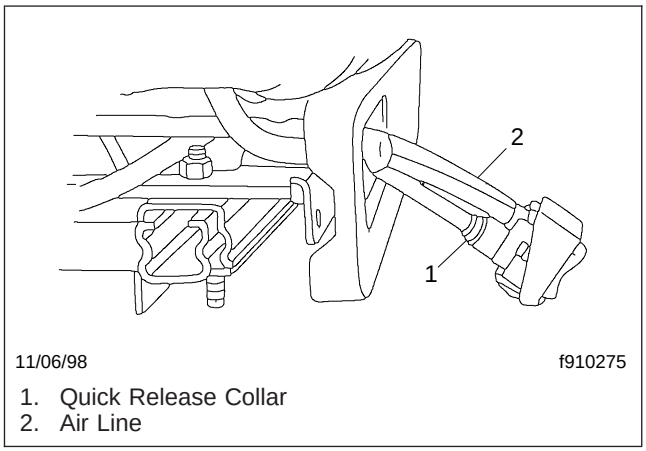


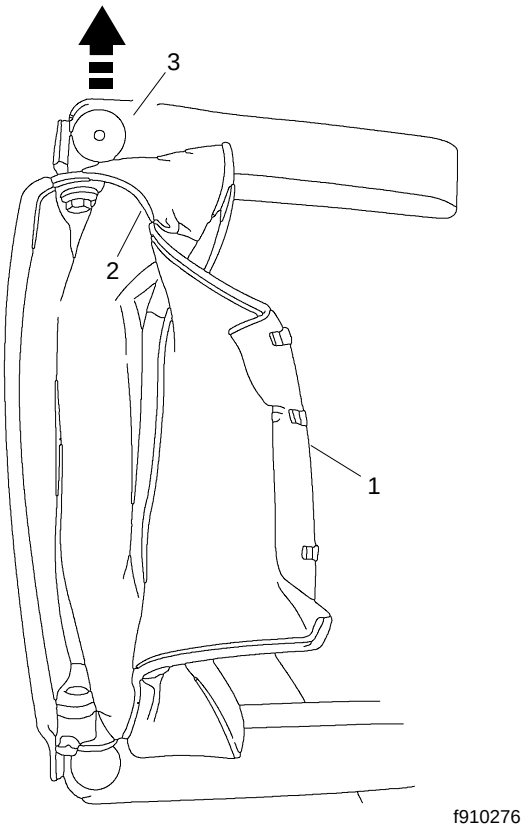
1. Quick Release Collar
2. Air Line

Fig. 3, Air Switch

7. Recharge the air reservoirs by starting the vehicle.

Replacement

1. Remove the seat back. Refer to **Subject 120**.
2. Remove the armrest. See **Fig. 1**.



1. Seat Back Cover
2. Armrest Tube Locking Button, Under Seat Cover
3. Armrest

Fig. 1, Armrest Removal

   2.1 Pull the seat back cover from the back of the seat back.

   2.2 Reach a hand in from the front of the seat back and press the armrest tube locking button.

   2.3 Pull the armrest from the seat back.

3. Position the armrest on the seat back.
4. Pull the seat back cover back into place.
5. Install the seat back. Refer to **Subject 120**.

Replacement

1. Remove the right-side bolt. See **Fig. 1**.

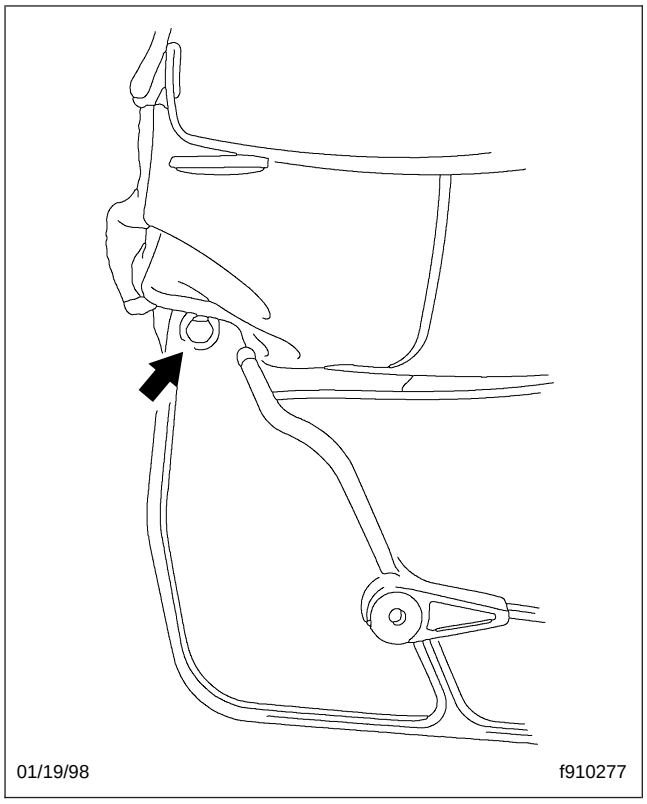


Fig. 1, Right-Side Bolt

2. Remove the left-side bolt. See **Fig. 2**.
3. Remove the recline limit bolt.
4. Remove the recline bolt. See **Fig. 3**.
5. Remove the nut and stud, and lift the seat back from the seat. See **Fig. 4**.

⚠ WARNING

All air pressure must be relieved from the air reservoirs before disconnecting any pneumatic lines or hoses from the seating system. Failure to relieve air pressure could cause the lines to whip, resulting in personal injury.

6. Remove the seat back air line from the air switch. See **Fig. 5**.
7. Install the seat back air line onto the air switch.

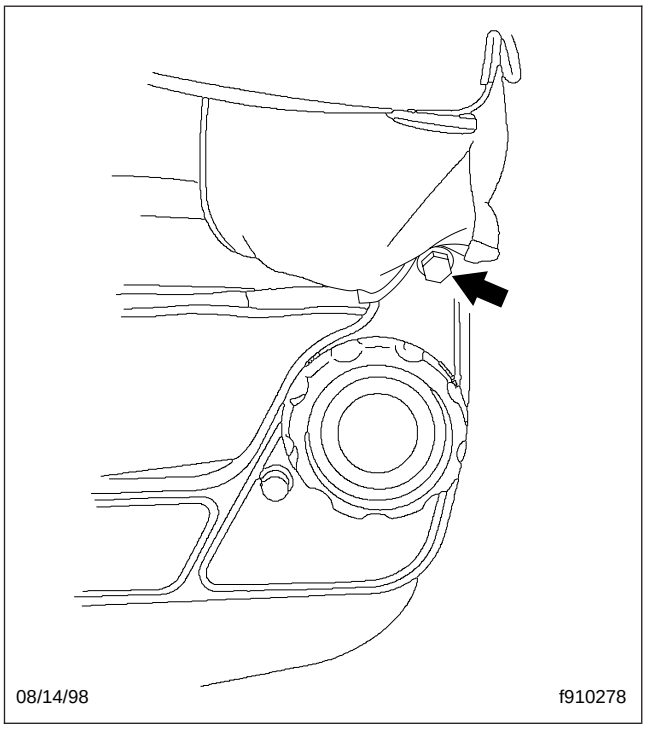

Fig. 2, Left-Side Bolt

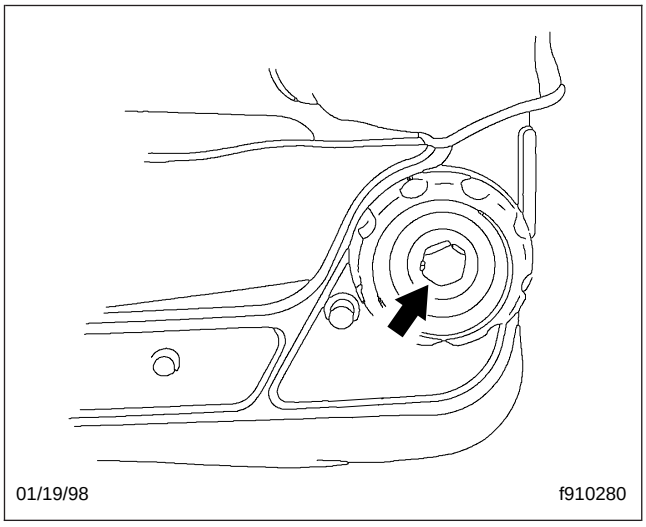

Fig. 3, Recline Bolt

8. Position the seat back on the seat, and install the stud and nut.
9. Install the recline bolt.
10. Install the recline limit bolt and tighten until firm.

Seat Back Replacement

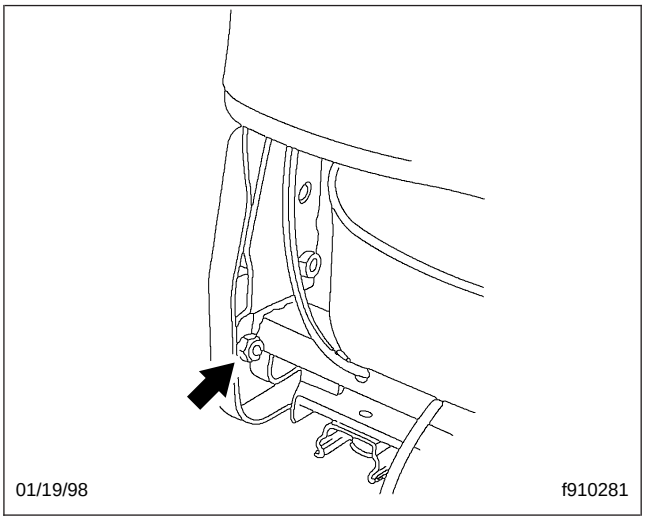

Fig. 4, Nut and Stud

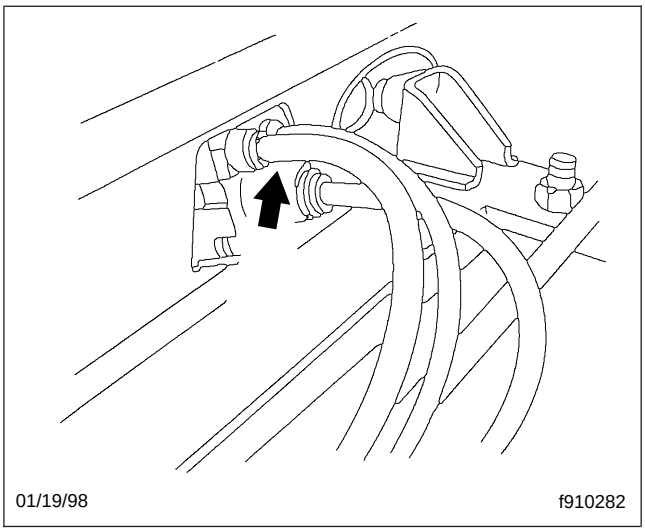

Fig. 5, Seat Back Air Line

11. Install the left-side bolt and tighten until firm.
12. Install the right-side bolt and tighten until firm.

Replacement

1. Remove the left-side nuts. See **Fig. 1**.

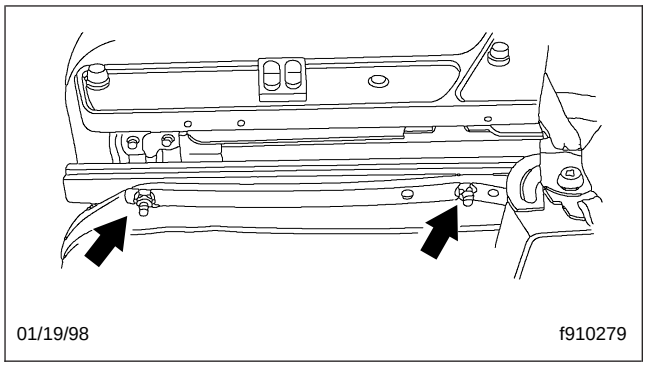

Fig. 1, Left-Side Nuts

2. Remove the right-side nuts. See **Fig. 2**.

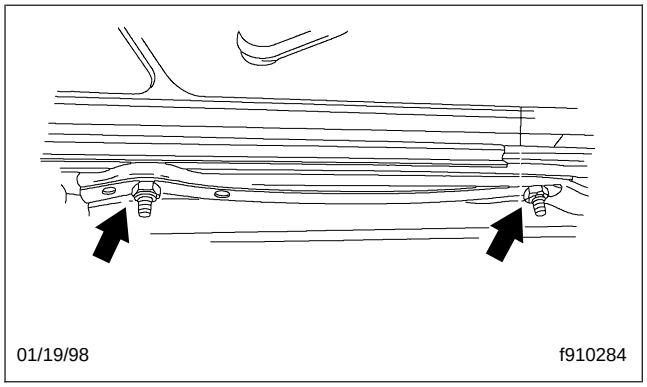

Fig. 2, Right-Side Nuts

WARNING

All air pressure must be relieved from the air reservoirs before disconnecting any pneumatic lines or hoses from the seating system. Failure to relieve air pressure could cause the lines to whip, resulting in personal injury.

3. Apply inward pressure on the quick release collar, and pull the airline out of the connector. See **Fig. 3**.
4. Remove the air spring air line from the air switch. See **Fig. 4**.
5. Remove the seat.
6. Install the new seat.

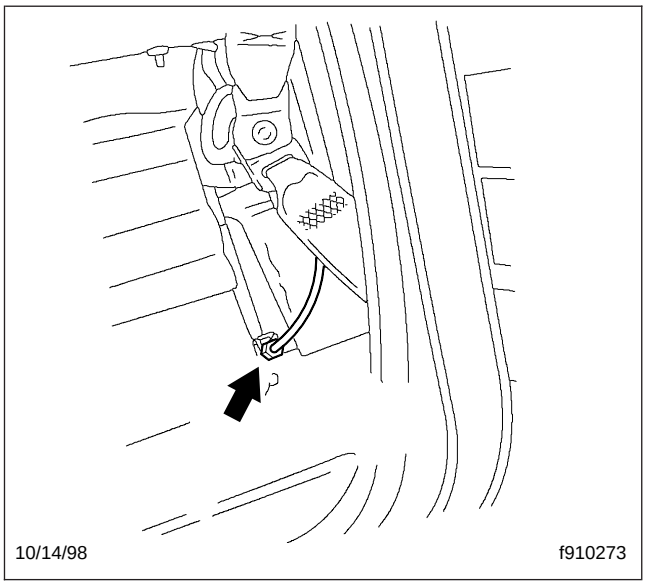

Fig. 3, Quick Release Collar

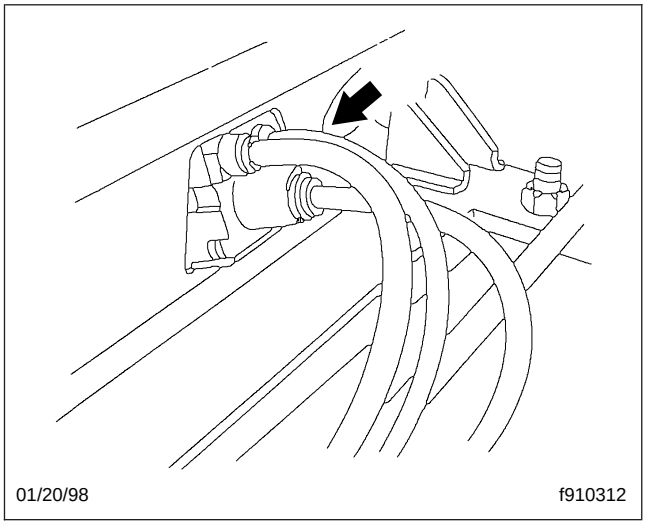

Fig. 4, Air Spring Air Line

7. Install the air spring air line from the air switch.
8. Install the right- and left-side nuts and tighten until firm.

Disassembly

WARNING

All air pressure must be relieved from the air reservoirs before disconnecting any pneumatic lines or hoses from the seating system. Failure to relieve air pressure could cause the lines to whip, resulting in personal injury.

1. Apply inward pressure on the quick release collar, and pull the airline out of the connector. See **Fig. 1**.

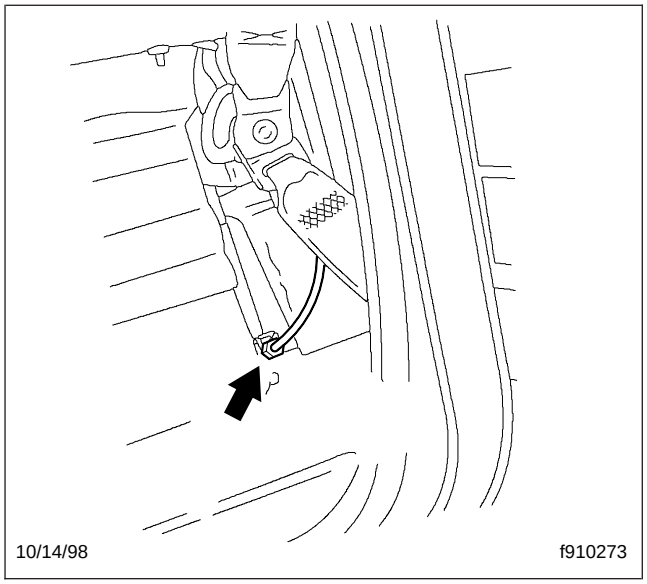

Fig. 1, Quick Release Collar

2. Remove the seat and base from the vehicle.
3. Remove the seat-to-base nuts. See **Fig. 2**.
4. Remove the air spring air line. See **Fig. 3**.
5. Support the base in the full up position with a suitable brace. See **Fig. 4**.
6. Remove the air spring retaining ring. See **Fig. 5**.
7. Push the air spring fitting through the seat base retaining hole. See **Fig. 6**.
8. Pull the air spring retaining clip from the air spring, and remove the air spring. See **Fig. 7**.
9. Remove the shock absorber top nut and bolt. See **Fig. 8**.

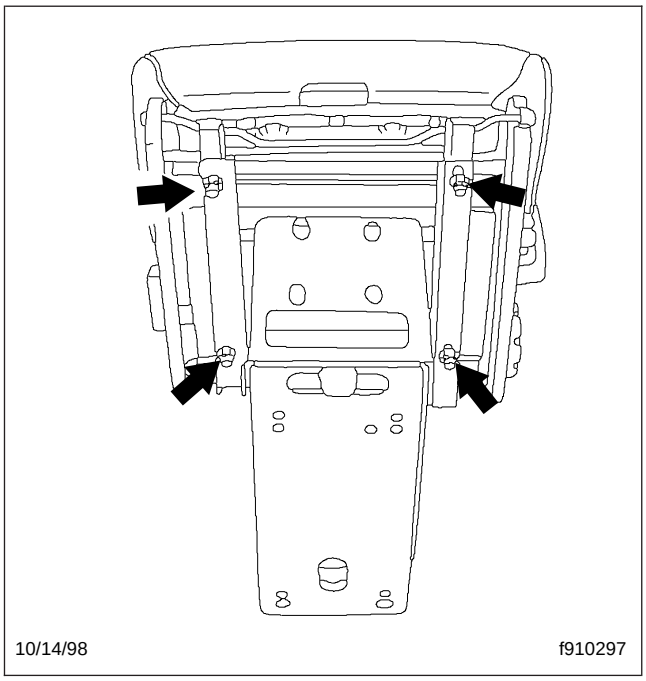

Fig. 2, Seat-to-Base Nuts

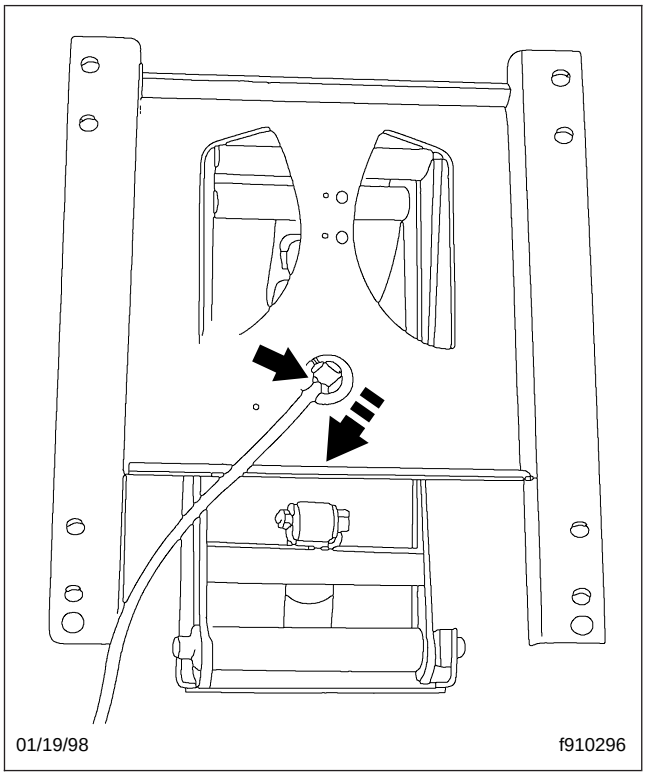

Fig. 3, Air Spring Air Line Remove/Install

Seat Base Disassembly and Assembly

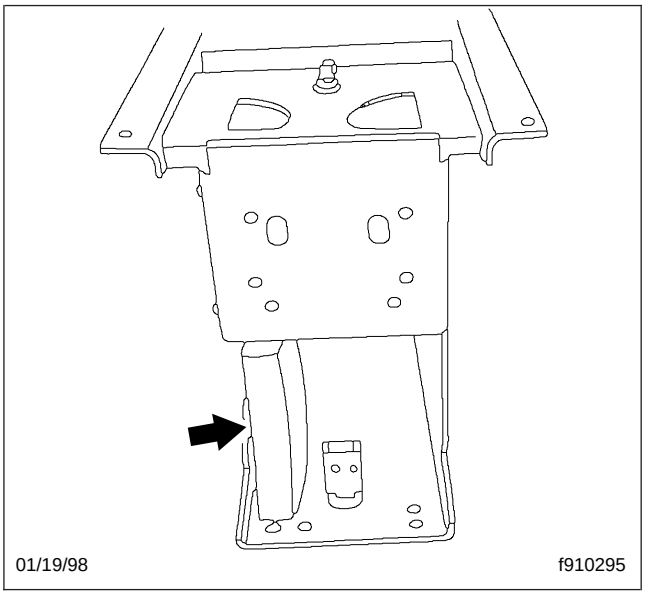

Fig. 4, Supporting the Base

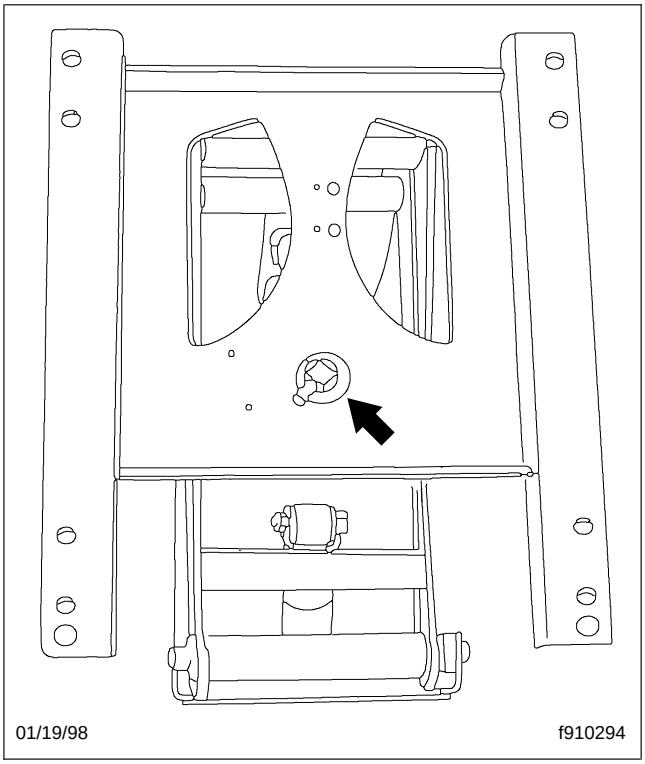

Fig. 5, Air Spring Retaining Ring Remove/Install

10. Remove the shock absorber bottom nut and bolt, and remove the shock absorber. See **Fig. 9**.

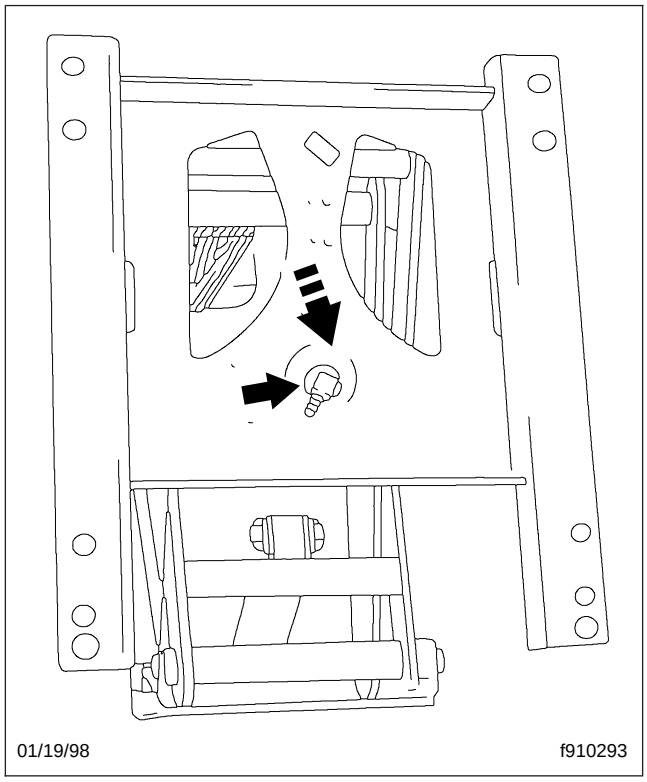

Fig. 6, Air Spring Fitting

11. Remove the snap rings. See **Fig. 10**.
12. Drive the shafts out of the base using a drift pin. The two shafts are connected at the opposite end. To prevent binding, drive the shafts out of the base evenly. See **Fig. 11**.
13. Remove the snap rings. See **Fig. 12**.
14. Drive the shafts out of the base using a drift pin. The two shafts are connected at the opposite end. To prevent binding, drive the shafts out of the base evenly. See **Fig. 13**.
15. Remove the shaft bushings with a drift pin. Repeat for the other side. See **Fig. 14**.

Assembly

Lubricate the shaft housings. Refer to **Specifications, 400**.

1. Install the shaft bushings with a drift pin. Repeat for the other side. See **Fig. 14**.

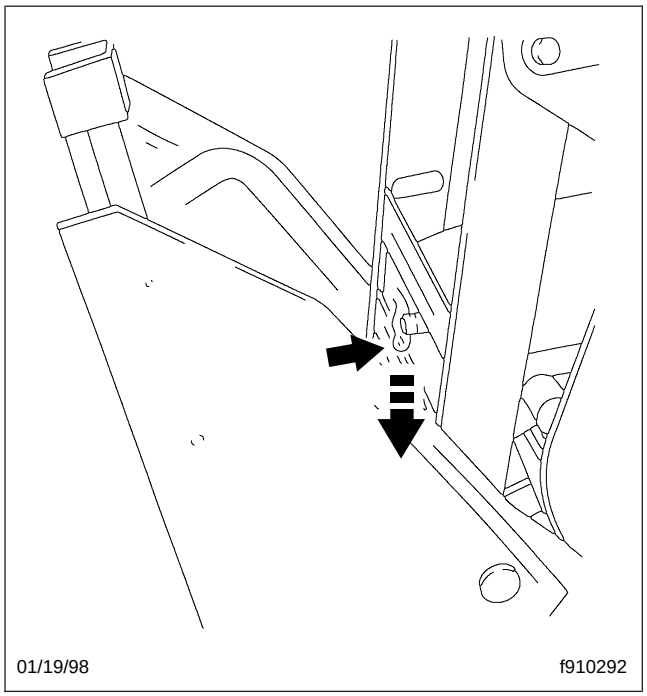

Fig. 7, Air Spring Retaining Clip Removal/Installation

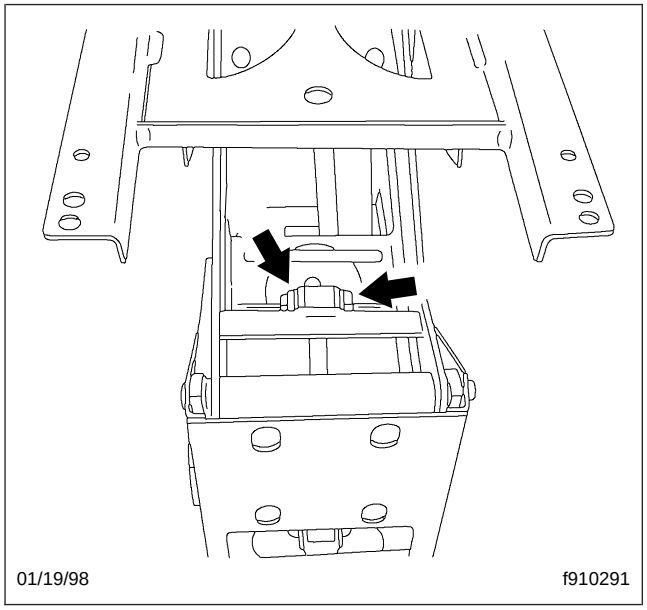

Fig. 8, Shock Absorber Nut and Bolt Removal/ Installation

2. Drive the shafts into the base using a drift pin. The two shafts are connected at the opposite end. To prevent binding, drive the shafts into the base evenly. See **Fig. 13**.
3. Install the snap rings. See **Fig. 12**.
4. Drive the shafts into the base using a drift pin. The two shafts are connected at the opposite end. To prevent binding, drive the shafts into the base evenly. See **Fig. 11**.
5. Install the snap rings. See **Fig. 10**.
6. Position the shock absorber and install the bottom bolt and nut. See **Fig. 9**.
7. Install the shock absorber top bolt and nut. See **Fig. 8**.

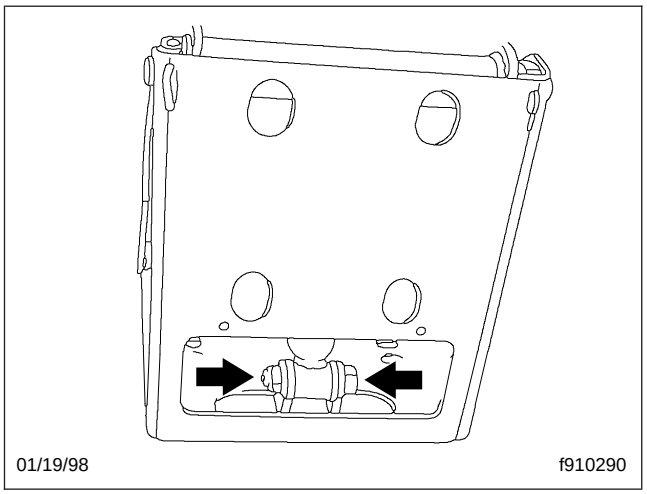

Fig. 9, Shock Absorber Bottom Nut and Bolt Removal/ Installation

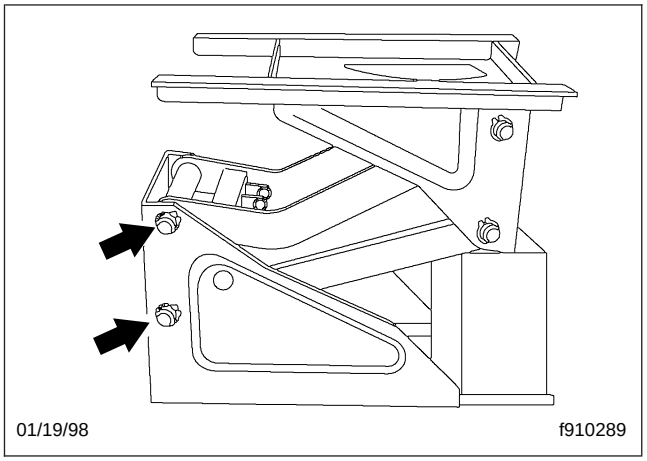

Fig. 10, Snap Rings Removal/Installation

Seat Base Disassembly and Assembly

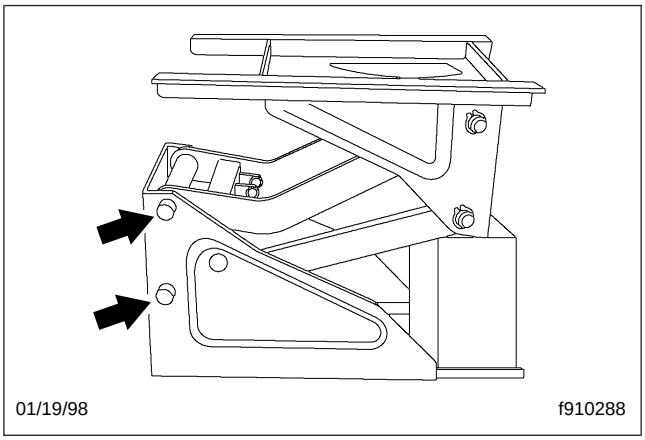

Fig. 11, Driving Out the Shafts

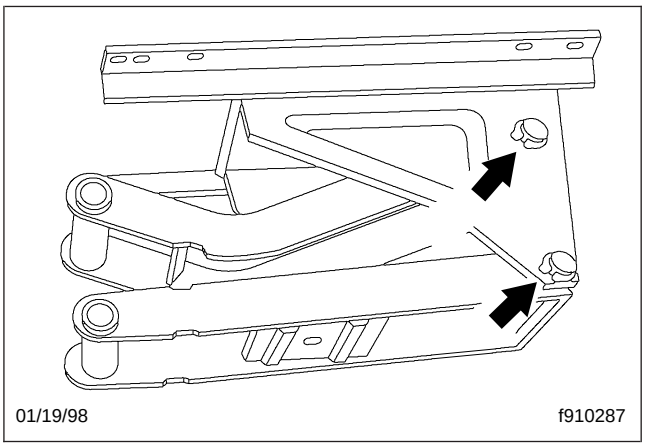

Fig. 12, Snap Rings Removal/Installation

8. Position the air spring, and install the air spring retaining clip. See **Fig. 7**.
9. Install the air spring air line. See **Fig. 3**.
10. Install the seat-to-base nuts. See **Fig. 2**.
11. Install the seat and base into the vehicle.
12. Install the airline into the quick connector. See **Fig. 1**.

Disassembly

1. Remove the seat back.
2. Remove the armrests.
3. Pull the seat back cover from the back of the seat back, and pull the seat back cover to the headrest region of the seat back. See **Fig. 1**.

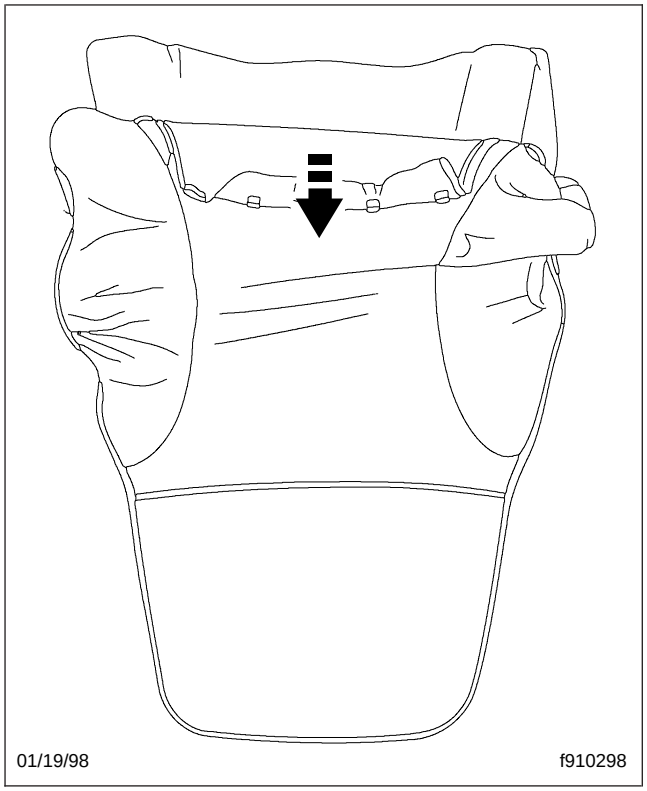

Fig. 1, Pull the Seat Back Cover from the Back of the Seat Back

4. Remove the clips, and pull the seat back cover from the seat back. See **Fig. 2**.
5. Slide the lumbar retainers out of the seat back, and remove the lumbar assembly. See **Fig. 3**.
6. Pull the seat back frame from the seat back cushion. See **Fig. 4**.

Assembly

1. Pull the seat back frame onto the seat back cushion. See **Fig. 4**.

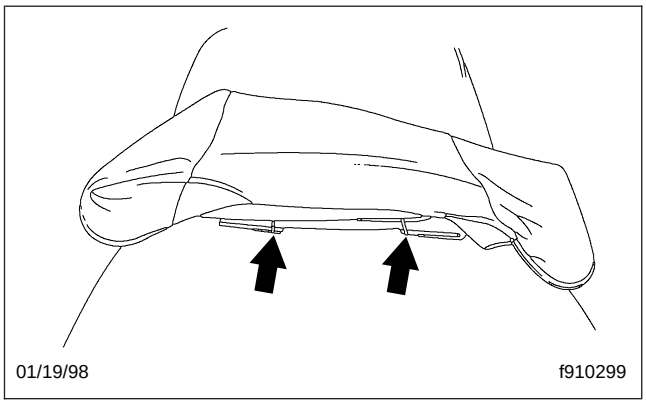

Fig. 2, Remove the Clips

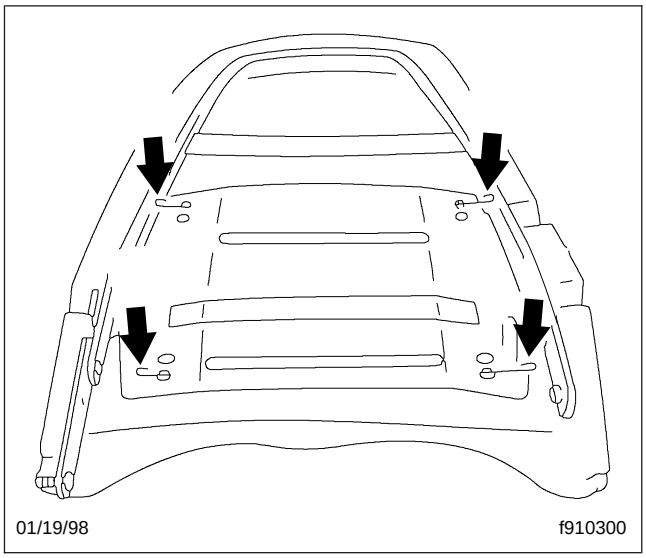

Fig. 3, Remove the Lumbar Assembly

2. Position the lumbar assembly and install the lumbar retainers into the seat back. See **Fig. 3**.
3. Pull the seat back cover onto the seat back and install the clips. See **Fig. 2**.
4. Pull the seat back cover onto the headrest region of the seat back. See **Fig. 1**.

Seat Back Disassembly and Assembly

1. Seat Back Frame
2. Seat Back Cushion

Fig. 4, Pull the Seat Back Frame from the Seat Back Cushion

Disassembly

1. Cut the tie strap. See **Fig. 1**.

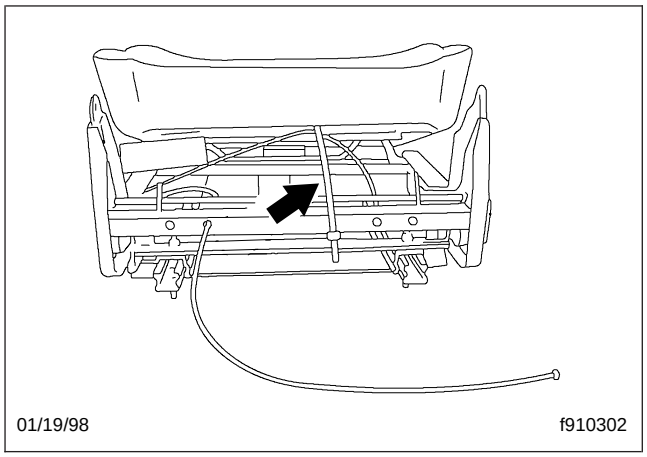

Fig. 1, Cut the Tie Strap

2. Remove the screws and brackets retaining the seat. See **Fig. 2**.

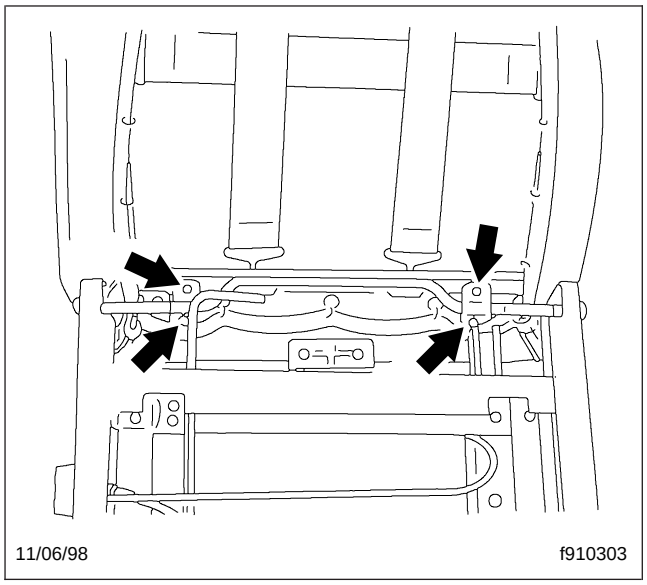

Fig. 2, Seat Retaining Screws and Brackets

3. Remove the seat cover screws. See **Fig. 3**.
4. Remove the seat cover. See **Fig. 4**.
   - 4.1 Remove the clips on the seat straps.

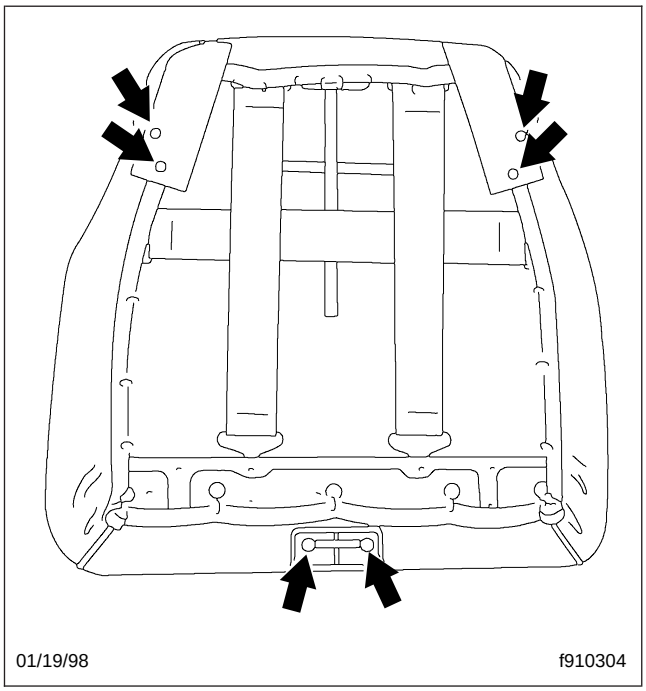

Fig. 3, Seat Cover Screws

   - 4.2 Remove the seat straps by pulling from the retaining holes.
   - 4.3 Remove the clips retaining the seat cover, and remove the seat cover.
5. Pull the seat frame from the seat cushion. See **Fig. 5**.

Assembly

NOTE: Seal the seat frame to the seat cushion.

1. Install the seat cover. See **Fig. 4**.
   - 1.1 Pull the seat straps through the retaining holes.
   - 1.2 Install the clips on the seat straps.
   - 1.3 Position the seat cover and install the retaining clips.
2. Install the seat cover screws and tighten until firm. See **Fig. 3**.
3. Install the brackets and screws retaining the seat and tighten until firm. See **Fig. 2**.
4. Install a new tie strap. See **Fig. 1**.

Seat Cushion Disassembly and Assembly

Disassembly

1. Remove the seat track retaining nuts, and remove the seat tracks. See **Fig. 1**.

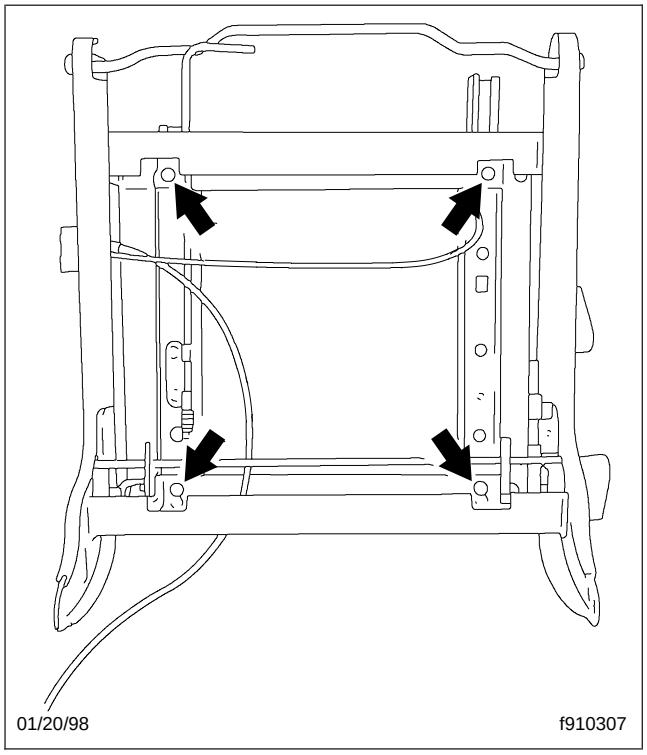

Fig. 1, Seat Track Retaining Nuts

2. Compress the air switch retaining tabs, and push the air switch from the seat frame. See **Fig. 2**.

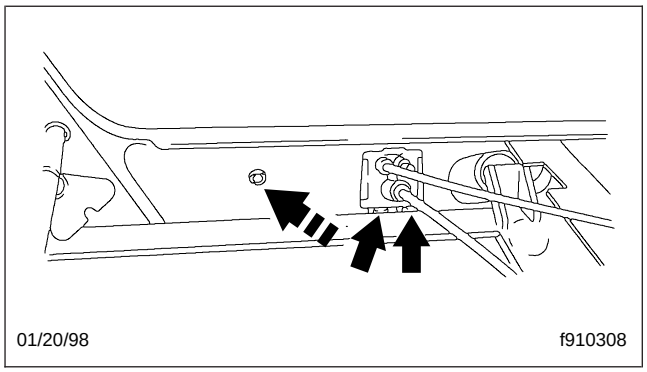

Fig. 2, Compress the Air Switch Retaining Tabs

3. Remove the seat chugger nuts, and carefully remove the right seat chugger assembly. See **Fig. 3**.

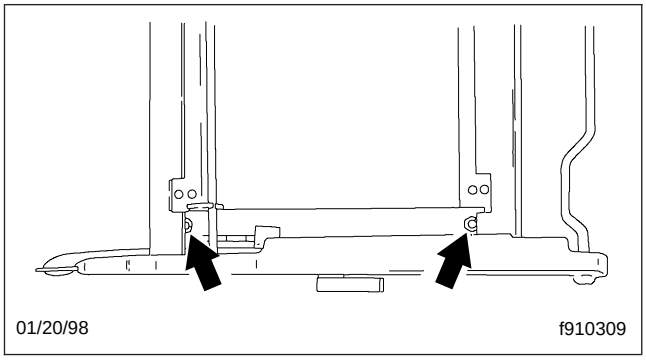

Fig. 3, Right-Side Chugger Assembly Removal/ Installation

4. Carefully pull the left seat chugger from the seat frame. See **Fig. 4**.

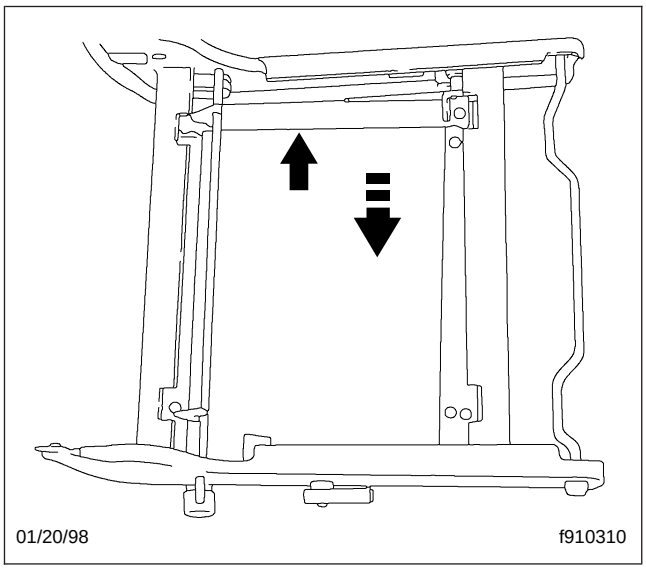

Fig. 4, Left-Side Chugger Assembly Removal/ Installation

5. Remove the nut, and remove the seat chugger latch assembly. See **Fig. 5**.

Assembly

NOTE: Lubricate the seat chugger bearings and the seat tracks. For approved lubricants, refer to **Specifications, 400**.

Seat Mid-Section Disassembly and Assembly

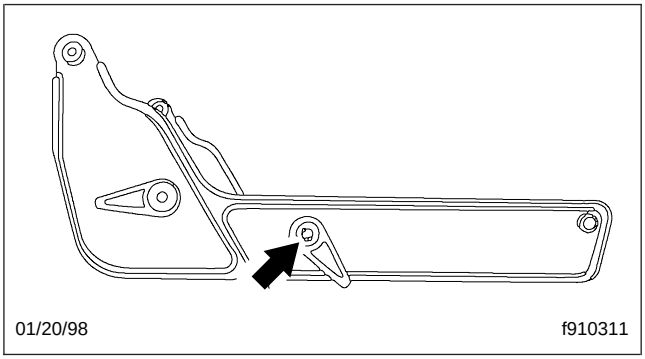

Fig. 5, Seat Chugger Latch Assembly Removal/ Installation

1. Position the seat chugger latch assembly and install the nut. See **Fig. 5**.
2. Install the left seat chugger. See **Fig. 4**.
3. Install the right seat chugger assembly. See **Fig. 3**.
4. Install the air switch. See **Fig. 2**.
5. Install the seat tracks. See **Fig. 1**.

Troubleshooting

INSPECTION AND VERIFICATION

Verify the customer's concern by operating the seat to duplicate the condition.

MECHANICAL AND PNEUMATIC SEAT MALFUNCTION CAUSES

Inspect the seat system to determine if one of the following mechanical or pneumatic concerns applies:

- seat track obstructions
- missing parts
- obvious breaks in parts
- operation of the shock absorber
- broken seat adjusting cable
- broken, disconnected or chafed air lines
- leaking valve and connections
- leaking or damaged air spring
- damage to the lumbar support system

Problem—Air Suspension Seat Will Not Move Vertically

Problem—Air Suspension Seat Will Not Move Vertically	
Possible Source	**Remedy**
Binding seat track(s)	Check for loose or broken parts. Replace or repair as necessary.
Disconnected pneumatic line	Reconnect the pneumatic line.
Leaking pneumatic line	Replace the pneumatic line.
Leaking air spring	Replace the air spring.
Damaged seat switch	Replace the seat switch.

Specifications

General Specifications	
Item	**Specification**
Silicone Rubber	ESB–M4G92–AESE–M4G195–A
Premium Long-Life Grease	ESA–M1C75–B

Table 1, General Specifications

Seats

L-Line and A-Line vehicles are available with Bostrom seating in both a mid-back and high-back configuration. Both of these seating systems are of an air suspension design.

Replacement

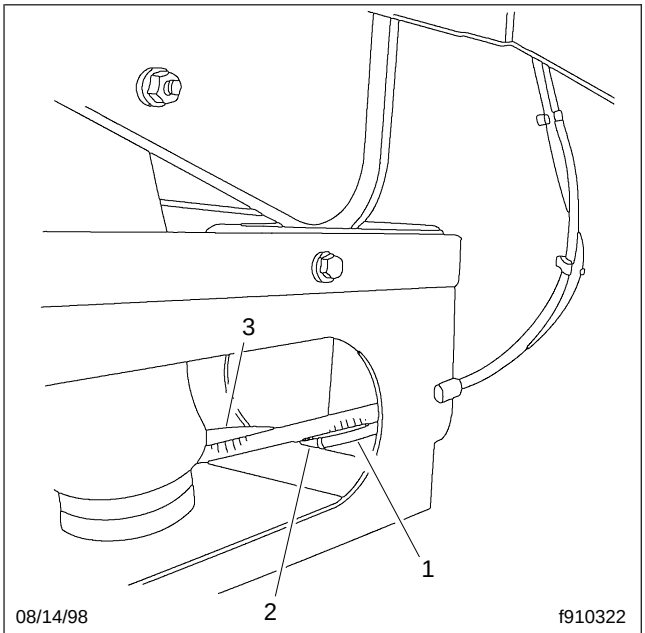
WARNING

All air pressure must be relieved from the air reservoirs before disconnecting any pneumatic lines or hoses from the seating system. Failure to relieve air pressure could cause the lines to whip, resulting in personal injury.

1. Drain the vehicle air reservoirs.

NOTE: The pneumatic lines are of the quick-release type.

2. Disconnect the pneumatic lines. See **Fig. 1**.



1. Quick-Release Pneumatic Line Connector
2. Quick-Release Collar Right-Side
3. Quick-Release Collar Left-Side

Fig. 1, Pneumatic Lines

2.1 Push the line toward the quick-release pneumatic line connector.

2.2 Apply inward pressure on the quick-release collar, and pull the line out of the connector.

2.3 Repeat for the second quick-release connector.

3. Cut the retaining clips. See **Fig. 2**.

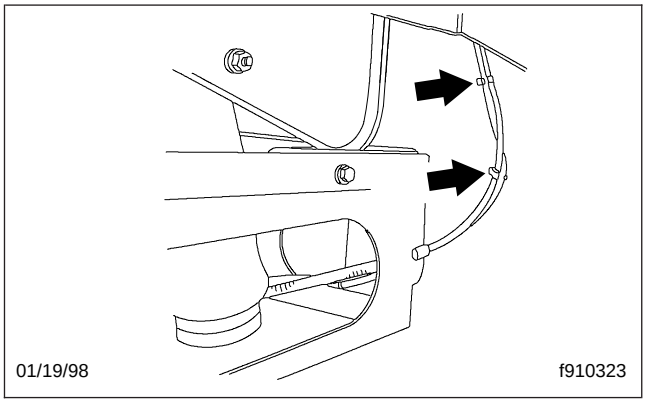


Fig. 2, Retaining Clips

4. Apply slight outward pressure on the switch retaining tabs, and slide the switch forward and off the seat.
5. Install the air switch.
6. Connect the pneumatic lines. See **Fig. 1**.
7. Install new retaining clips.
8. Recharge the air reservoirs by starting the vehicle.

Replacement

1. Remove the bolts that attach the seat to the seat base. See **Fig. 1**.

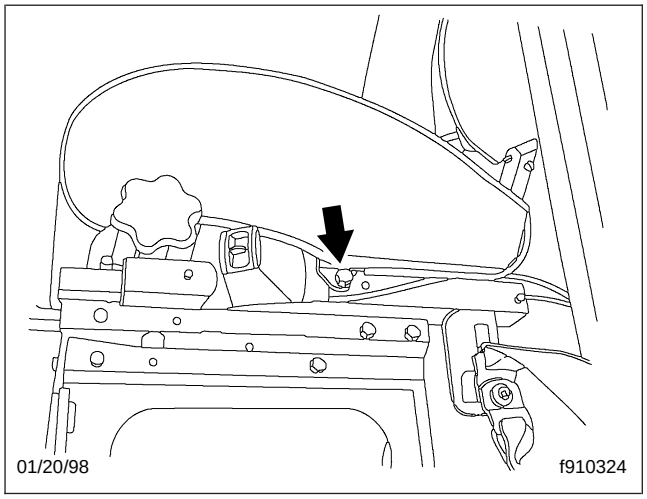

Fig. 1, Seat to Seat Base Bolt, Left-Side Shown

2. Move the seat to the rearmost position. Remove the nuts below the seat, and remove the seat.
3. Position the seat and install the nuts and bolts. Tighten the nuts 18 to 21 lbf·ft (25 to 29 N·m).

Replacement

1. Remove the switch.
2. Remove the bolts that retain the seat to the seat pedestal. See **Fig. 1**.

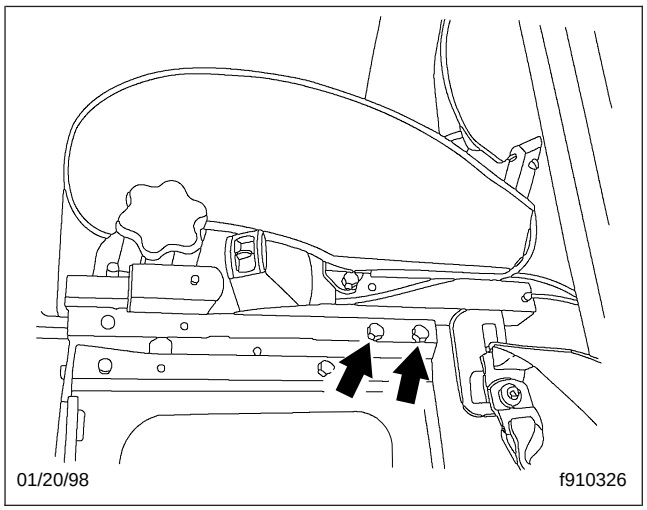

Fig. 1, Bolts Removal/Installation, Left-Side Shown

3. Remove the nuts, and remove the seat and pedestal. See **Fig. 2**.

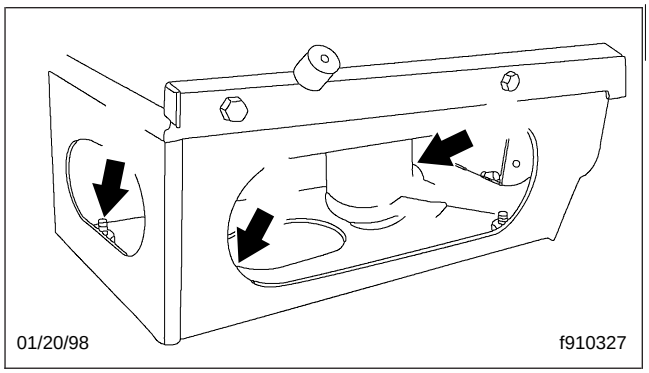

Fig. 2, Seat and Pedestal Removal/Installation

4. Position the seat and pedestal and install the nuts. See **Fig. 2**.
5. Install the bolts and tighten until firm. See **Fig. 1**.

Replacement

1. Remove the seat.
2. Remove the switch.
3. Remove the bolts that retain the seat to the seat pedestal. See **Fig. 1**.

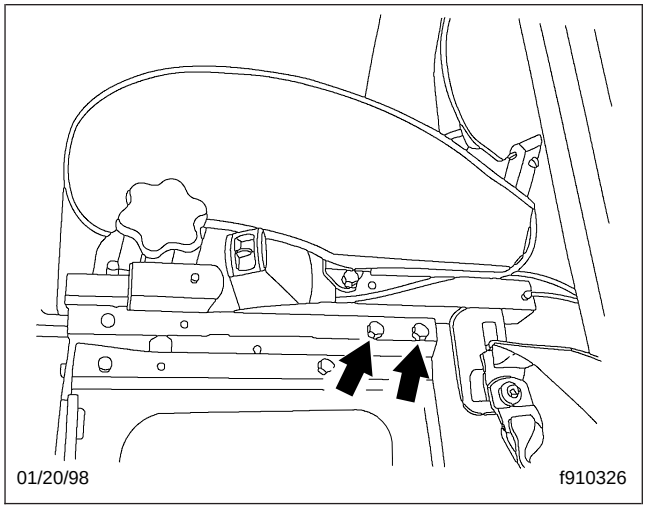

Fig. 1, Bolts Removal/Installation, Left-Side Shown

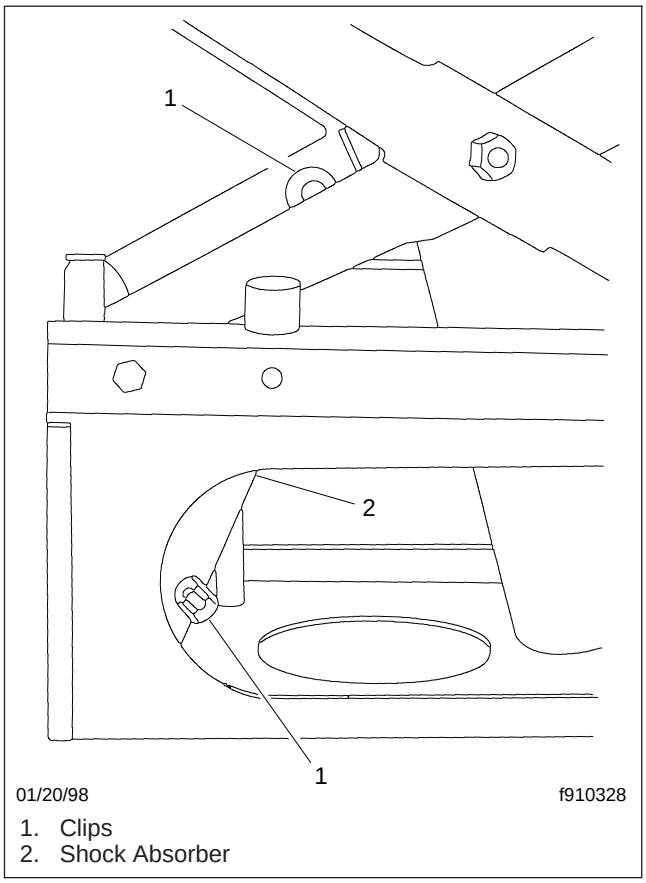
4. Remove the shock absorber. See **Fig. 2**.
   - 4.1 Remove the clips.
   - 4.2 Remove the shock absorber.
5. Remove the seat adjuster stop bolts, and remove the stop. See **Fig. 3**.

NOTE: The seat height adjuster must be fully extended to remove the seat adjuster.

6. Remove the seat adjuster. See **Fig. 4**.
   - 6.1 Remove the bolts.
   - 6.2 Fully extend the height adjuster, and remove the seat adjuster assembly.
7. Remove the front inner spring. See **Fig. 5**.
8. Remove the rear inner spring. See **Fig. 6**.
9. Remove the latch. See **Fig. 7**.
   - 9.1 Remove the spring.
   - 9.2 Remove the nut.
   - 9.3 Remove the bolt.



1. Clips
2. Shock Absorber

Fig. 2, Shock Absorber

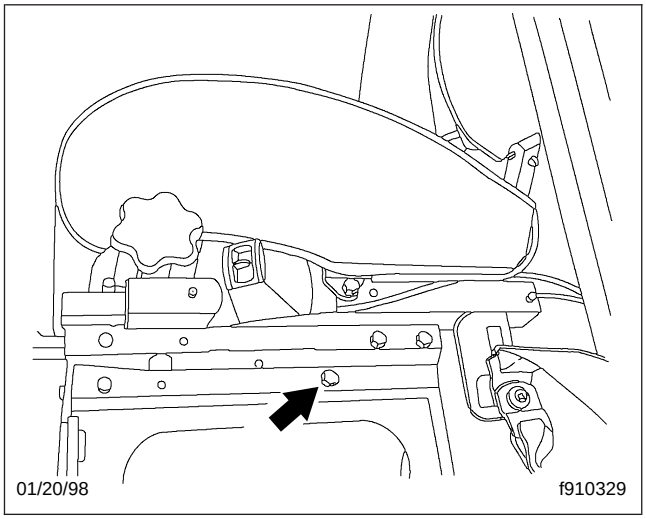


Fig. 3, Seat Adjuster Stop Bolt, Left-Side Shown

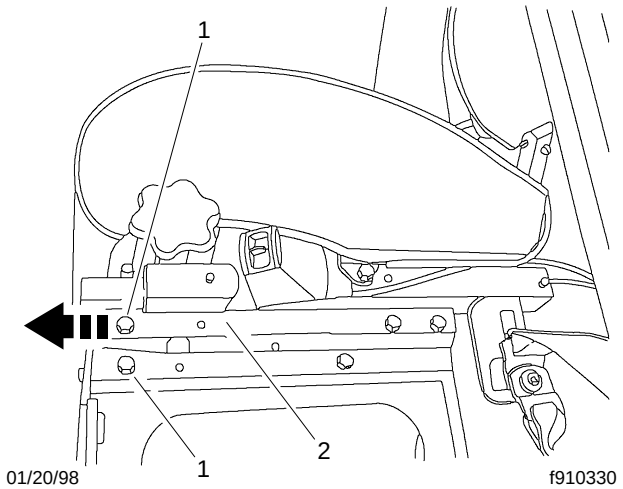
- 9.4 Remove the springs.

Latch Replacement



1. Bolts
2. Seat Adjuster Assembly

Fig. 4, Seat Adjuster

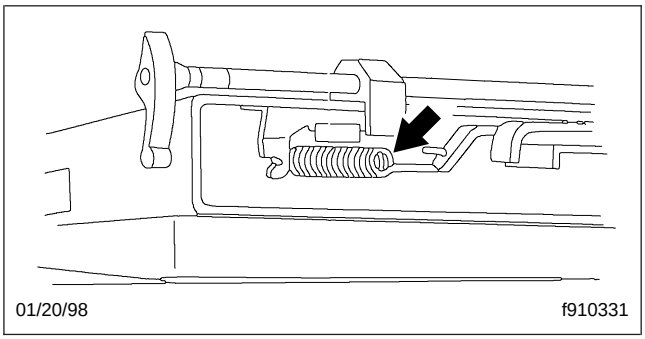


Fig. 5, Front Inner Spring

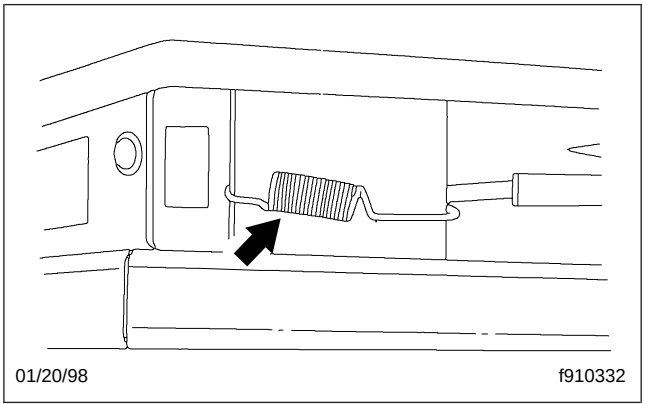

Fig. 6, Rear Inner Spring

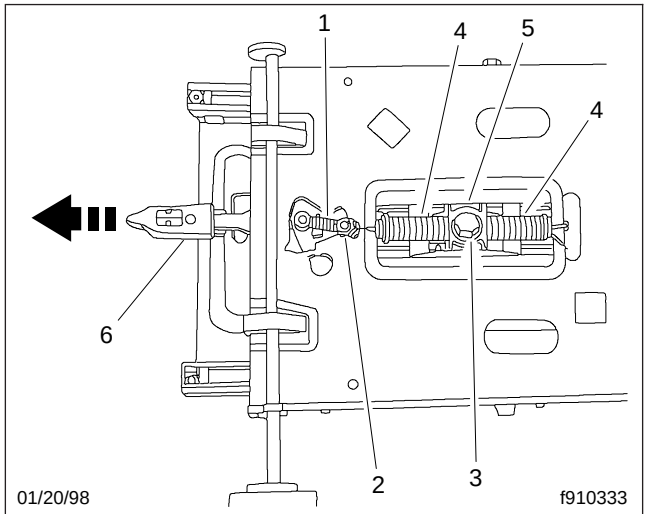
9.5 Remove the spring isolator.



1. Spring
2. Nut
3. Bolt
4. Springs
5. Spring Isolator
6. Latch

Fig. 7, Latch Removal/Installation

9.6 Remove the latch.

10. Install the latch.
    - 10.1 Position the latch.
    - 10.2 Install the spring isolator.
    - 10.3 Install the springs.
    - 10.4 Install the bolt.
    - 10.5 Install the nut.
    - 10.6 Install the spring.
11. Tighten the middle bolt 27 to 35 lbf·ft (36 to 47 N·m). Tighten the spring nut 12 to 15 lbf·ft (16 to 20 N·m). See **Fig. 1**.
12. Tighten the three bolts 22 to 27 lbf·ft (30 to 36 N·m). See **Fig. 3** and **Fig. 4**.

SilverStar Sleeper Non-Retractable Safety Belt Buckle Replacement

Replacement

1. Remove the lower bunk mattress.
2. Remove the safety belt buckle bunk anchor bolts, and remove the safety belt buckle assembly. See **Fig. 1**.

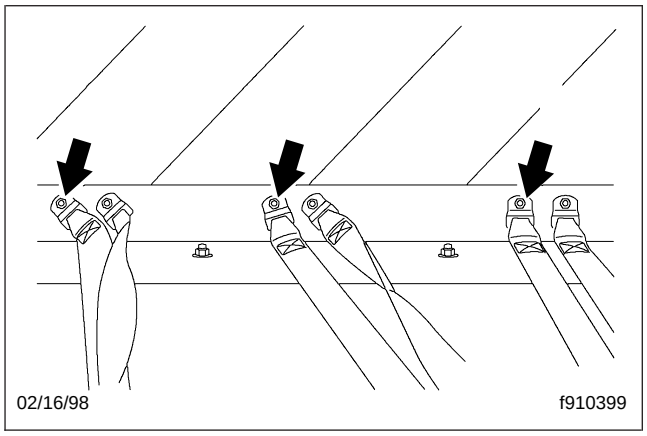


Fig. 1, Safety Belt Buckle Bunk Anchor Bolts

3. Position the safety belt buckle assembly and install the safety belt buckle bunk anchor bolts. Tighten 22 to 32 lbf·ft (30 to 43 N·m).
4. Install the lower bunk mattress.

Troubleshooting

INSPECTION AND VERIFICATION

Verify the customer's concern by operating the seat to duplicate the condition.

Mechanical and Pneumatic Seat Malfunction Causes

Inspect the seat system to determine if one of the following mechanical or pneumatic concerns applies:

- seat track obstructions
- missing parts
- obvious breaks in parts
- operation of the shock absorber
- broken seat adjusting cable
- broken, disconnected or chafed air lines
- leaking valve and connections
- leaking or damaged air spring
- damage to the lumbar support system

Problem—Air Suspension Seat Will Not Move Vertically

Problem—Air Suspension Seat Will Not Move Vertically	
Possible Cause	**Remedy**
Binding seat track(s)	Check for loose or broken parts. Replace or repair as necessary.
Disconnected pneumatic line	Reconnect the pneumatic line.
Leaking pneumatic line	Replace pneumatic line.
Leaking air spring	Replace the air spring.
Damaged seat switch	Replace the seat switch.

Specifications

Torque Specifications	
Description	**lbf·ft (N·m)**
Seat Mount Shoulder Bolt (M8)	18–21 (25–29)
Spring Mount Shoulder Bolt	27–35 (36–47)
Pivot Mount Nut (M8 x 1.25 Self-Locking)	12–15 (16–20)
Self Adjuster Bolt (M8)	22–27 (30–36)

Table 1, Torque Specifications

Occupant Restraint System

⚠ WARNING

Inspect and maintain seat belts. When any part of a seat belt system needs replacement, the entire seat belt must be replaced, both retractor and buckle side. Any time a vehicle is involved in an accident, and the seat belt system was in use, the entire vehicle seat belt system must be replaced before operating the vehicle. Do not attempt to modify the seat belt system; doing so could change the effectiveness of the system. Failure to replace worn or damaged seat belts, or making any modifications to the system, may result in personal injury or death.

Although the three-point seat belts installed in Sterling vehicles appear similar to the seat belts used in passenger cars, there are some important differences that can affect service life:

- A heavy truck can travel more miles in a year than a car might go in its lifetime.
- There is more movement in a truck seat belt system, especially with air ride seats.
- Trucks often operate in more severe environments than cars, such as gravel pits, cement plants and grain elevators, where the belts are exposed to abrasive dirt and dust.

Because of these factors, truck seat belt systems need to be inspected regularly to ensure that they are in proper condition.

The safety belts are factory installed. If the safety belts are removed for any reason, follow the "Removal and Installation" procedures in **Subject 100**. Sealer must be placed around all safety belt anchor bolt holes in the floorpan.

IMPORTANT: When any part of a seat-belt system needs replacement, the entire seat-belt system must be replaced—both the retractor side and the buckle side and, if equipped, both tether belts.

Safety Belt Buckle

The safety belt buckle ends are designed to lock onto the safety belt tongue and to serve as an anchor for both the lap and shoulder portions of the safety belt.

Lap Safety Belt

On some right-hand-drive vehicles, a lap safety belt with a retractor is fitted on the driver and passenger side seats. The inboard lap belt is retractable. To secure the safety belt, the belt tongue is inserted into an outboard, floor-anchored buckle assembly. See **Fig. 1**.

Lap/Shoulder Safety Belt

The outboard combination lap and shoulder belt is a continuous loop system which uses a common sliding tongue. To secure the safety belt, the tongue is inserted into an inboard buckle.

The shoulder harness retractor is designed to let the webbing move freely in or out at all times, except during a vehicle deceleration rate sufficient enough to activate a mechanically-actuated inertia sensor. When the inertia sensor is activated, it will cause the shoulder harness retractor to lock, preventing further extension of the shoulder harness.

On bench seat installations, the inboard belt with the buckle passes through the seat before being anchored to the floor. On air suspension bucket seats, it attaches to the bottom rear of the seat before being anchored to the floor. Attaching the tongue and buckle secures the occupant with both lower and upper restraints. This tongue and buckle attachment can be accomplished by a single continuous movement.

Center Safety Belt

The center safety belts (if equipped) do not have retractors. To lengthen the belt, tip the tongue until the ends can be joined over the lap.

To fasten the belt, insert the tongue into the open end of the buckle until a snap is heard. Shorten the belt, if necessary, by pulling on the loose end of the webbing.

Shoulder Strap Adjuster

The D-ring is the upper anchor point for the shoulder portion of the safety belt. An adjustable D-ring (if equipped) can be positioned at four different points to adapt to individual driver or passenger preferences. The D-ring is adjusted by pushing the release button down and sliding the D-ring to the desired po-

General Information

6. Retaining Bolt
7. Buckle Assembly Anchor
8. Seat

Fig. 1, Lap Safety Belts, Right-Hand-Drive Vehicles

sition. It is not necessary to use the release button to raise the D-ring.

Komfort® Latch

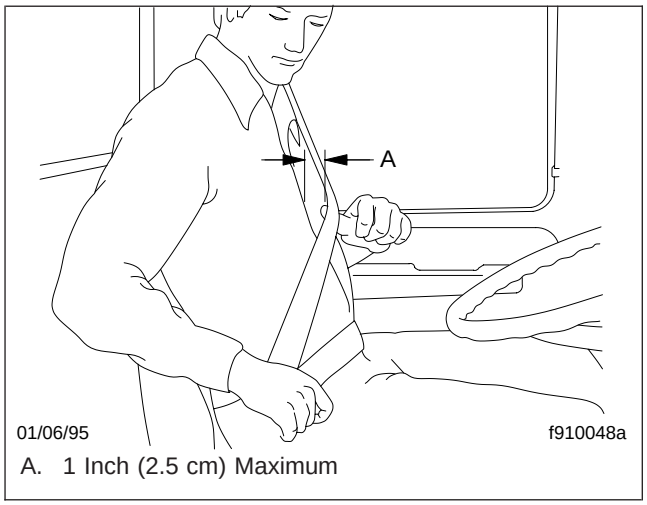
If the constant pressure of the engaged belt system causes discomfort, the driver or passenger can elect to engage the Komfort® latch as follows:

⚠ WARNING

Never adjust the Komfort® latch so that more than 1 inch (2.5 cm) of slack is apparent when measured from the chest to the belt. Failure to follow these precautions can increase the chance and severity of injury in an accident.

NOTE: If at any time when the Komfort® latch is latched and the driver or passenger is required to lean forward quickly, the Komfort® latch will automatically release.

1. Pull on the webbing of the safety belt shoulder strap, permitting only enough slack in the shoulder belt to allow slight pressure on the shoulder and chest. The maximum amount of slack must not exceed 1 inch (2.5 cm) when measured from the chest to the belt. See **Fig. 2**.
2. While holding the slack, lift the lever on the Komfort® latch upward, clamping the safety belt webbing in place. See **Fig. 3**.



A. 1 Inch (2.5 cm) Maximum

Fig. 2, Slack Amount

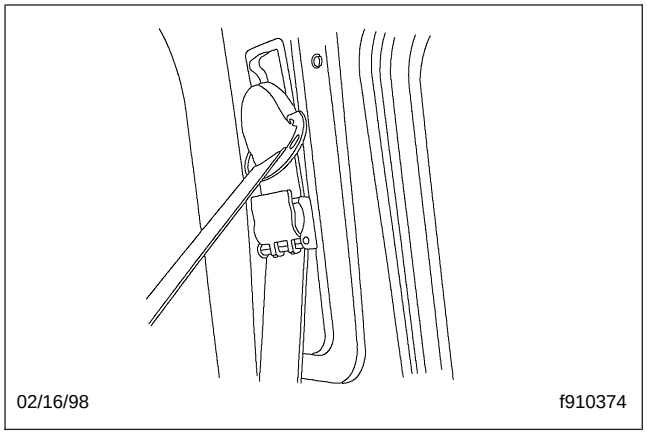


Fig. 3, Komfort® Latch Engaged

3. Push the release button on the safety belt buckle. This allows the tongue to unlatch from the buckle.
4. Give the shoulder strap a quick pull, which will release the Komfort® latch and allow the safety belt to retract into the retractor.

IMPORTANT: If an emergency release from the safety belt is needed, release the buckle by pushing the release button. In the event of an emergency, the Komfort® latch does not have to be released.

5. While the safety belt retracts, guide the tongue to its original position to prevent it from striking an individual or the vehicle.

Unfastening Safety Belts With Retractors

Push the release button in the buckle and allow the outboard belts to retract to the fully stowed position. After unbuckling the belt, it is recommended to guide the tongue during retraction to prevent it from causing injury or damage.

Safety Belt Extension Assembly

A safety belt assembly that is too short when fully extended over the lap of a vehicle occupant can be lengthened approximately 8 inches (20.3 cm) with a safety belt extension assembly. The safety belt extension assembly is only available with black webbing and a standard buckle and must be of the same manufacture as the belt to which it is attached.

Retractor Removal and Installation

Removal

IMPORTANT: When any part of a seat-belt system needs replacement, the entire seat-belt system must be replaced—both the retractor side and the buckle side and, if equipped, both tether belts.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. For vehicles with air suspension seats, remove the retractor-side safety belt seat anchor bolt. See **Fig. 1**.

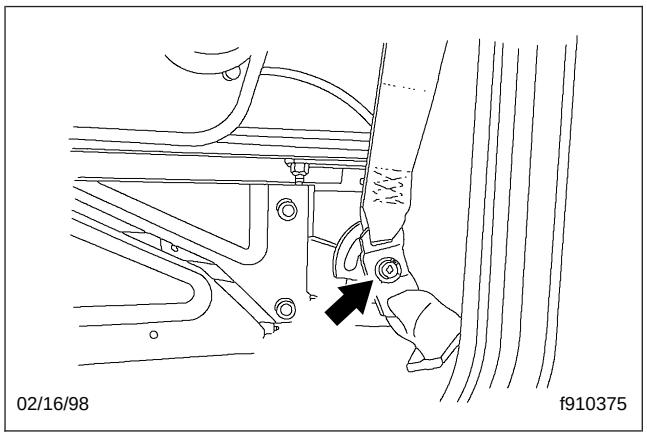

Fig. 1, Safety Belt Seat Anchor Bolt

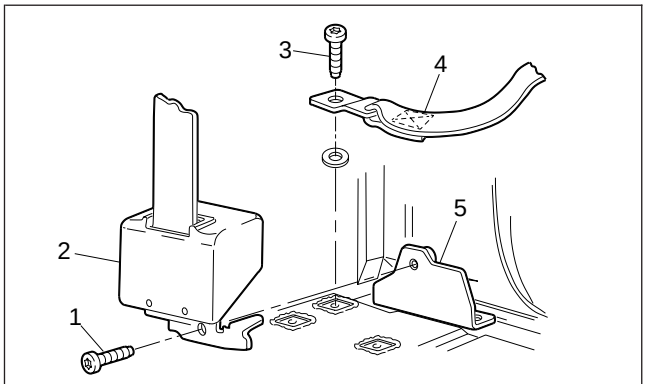
3. Remove the retractor-side floor anchor bolt. See **Fig. 2**. Remove the tether, if so equipped.
4. Remove the safety belt retractor bolt.
5. Remove the shoulder strap guide cover. See **Fig. 3**.
6. Remove the shoulder strap guide nut.
7. Remove the safety belt retractor assembly.

Installation

1. With the tires chocked, position the shoulder strap guide in place. Install the guide nut. See **Fig. 3**. Tighten the nut 22 to 32 lbf·ft (30 to 43 N·m).
2. Install the shoulder strap guide cover.



1. Retractor Bolt
2. Retractor
3. Floor Anchor Bolt
4. Safety Belt or Tether (if so equipped)
5. Retractor Mounting Bracket

Fig. 2, Safety Belt Retractor and Floor Anchor

2. Dust Cover
3. Shoulder Strap Guide
4. Guide Nut
5. Cover

Fig. 3, Shoulder Strap Guide Installation

3. Position the safety belt retractor in place, and install the bolt. See **Fig. 2**. Tighten the bolt 22 to 32 lbf·ft (30 to 43 N·m).
4. For vehicles with air suspension seats, attach the safety belt and tether to the seat with the seat anchor bolt. See **Fig. 1**. Tighten the bolt 22 to 32 lbf·ft (30 to 43 N·m).
5. Attach the safety belt or the tether (if so equipped) to the cab floor with the floor anchor

Retractor Removal and Installation

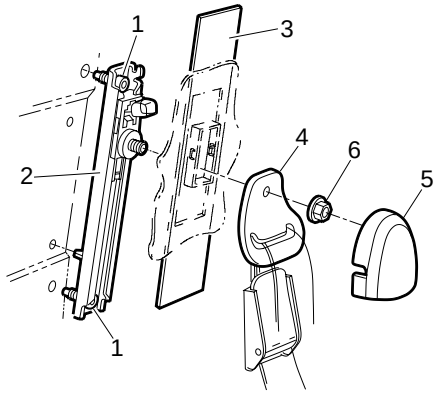
bolt. See **Fig. 2**. Tighten the bolt 22 to 32 lbf·ft (30 to 43 N·m).

Height Adjuster Removal and Installation

Removal

IMPORTANT: When any part of a seat-belt system needs replacement, the entire seat-belt system must be replaced—both the retractor side and the buckle side and, if equipped, both tether belts.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Remove the shoulder strap guide cover. See **Fig. 1**.



1. Height Adjuster Screw
2. Height Adjuster
3. Dust Cover
4. Shoulder Strap Guide
5. Cover
6. Guide Nut

Fig. 1, Height Adjuster Installation

3. Remove the shoulder strap guide nut.
4. Remove the height adjuster trim cover, if so equipped. See **Fig. 2**.
5. Remove the height adjuster dust cover. See **Fig. 1**.
6. Remove the height adjuster by removing the height adjuster screws.

Installation

1. With the tires chocked, position the height adjuster in place, and install the height adjuster screws. See **Fig. 1**. Tighten the screws 22 to 30 lbf·ft (30 to 40 N·m).

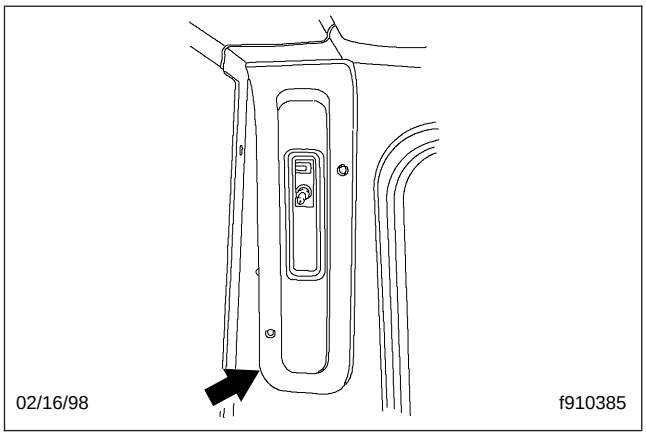


Fig. 2, Height Adjuster Trim Cover

2. Install the height adjuster dust cover.
3. Install the height adjuster trim cover. See **Fig. 2**.
4. Install the shoulder strap guide and nut. See **Fig. 1**. Tighten the nut 22 to 32 lbf·ft (30 to 43 N·m).
5. Install the shoulder strap guide cover.

Replacement

IMPORTANT: When any part of a seat-belt system needs replacement, the entire seat-belt system must be replaced—both the retractor side and the buckle side and, if equipped, both tether belts.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. If the vehicle is equipped with air suspension seats, remove the seat anchor bolt. See **Fig. 1**.
3. Remove the floor anchor bolt.
4. Remove the safety belt buckle, and if so equipped, the tether.
5. If the vehicle is equipped with air suspension seats, attach the new safety belt buckle and tether to the seat with the seat anchor bolt. Tighten the bolt 22 to 32 lbf·ft (30 to 43 N·m).
6. Attach the safety belt buckle or tether (if so equipped) to the cab floor with the floor anchor bolt. Tighten the bolt 22 to 32 lbf·ft (30 to 43 N·m).

Able Body Sleeper Non-Retractable Safety Belt Buckle Replacement

Replacement

IMPORTANT: When any part of a safety belt system needs replacement, the entire safety belt system must be replaced—both the retractor side and the buckle side and, if equipped, tether belts.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Remove the safety belt buckle floor anchor bolt located under the vehicle carpeting. See **Fig. 1**.

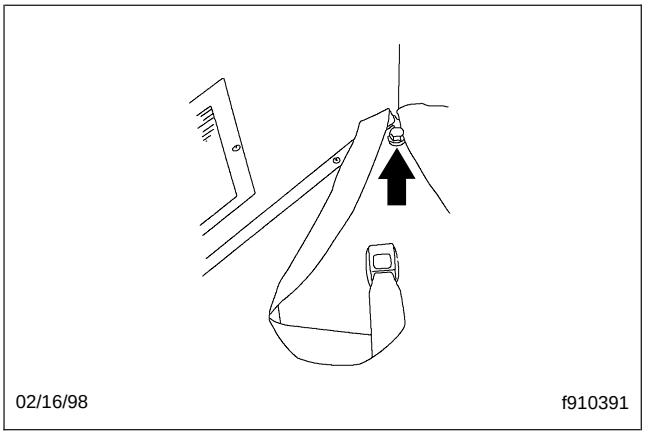

Fig. 1, Safety Belt Buckle Floor Anchor Bolt

3. Install the safety belt buckle floor anchor bolt. Tighten 22 to 32 lbf·ft (30 to 43 N·m). See **Fig. 1**.

SilverStar Sleeper Non-Retractable Safety Belt Buckle Replacement

Replacement

IMPORTANT: When any part of a safety belt system needs replacement, the entire safety belt system must be replaced—both the retractor side and the buckle side and, if equipped, tether belts.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Remove the lower bunk mattress.
3. Remove the safety belt buckle bunk anchor bolts, and remove the safety belt buckle assembly. See **Fig. 1**.

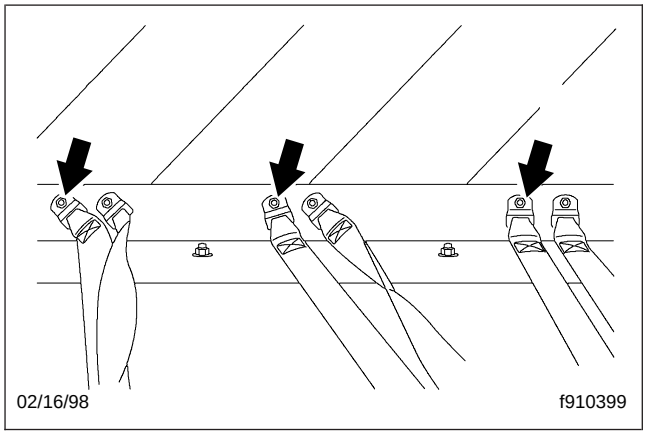

Fig. 1, Safety Belt Buckle Bunk Anchor Bolts

4. Position the safety belt buckle assembly and install the safety belt buckle bunk anchor bolts. Tighten 22 to 32 lbf·ft (30 to 43 N·m). See **Fig. 1**.
5. Install the lower bunk mattress.

Able Body Sleeper Non-Retractable Safety Belt Tongue Replacement

Replacement

IMPORTANT: When any part of a safety belt system needs replacement, the entire safety belt system must be replaced—both the retractor side and the buckle side and, if equipped, tether belts.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Remove the lower bunk mattress.
3. Drill out the rivets. See **Fig. 1**.

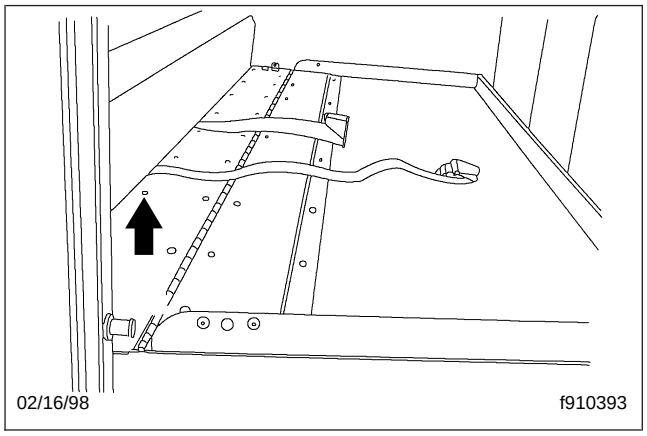

Fig. 1, Lower Bunk Rivets

4. Lift the lower bunk platform and support it in the "Up" position.
5. Disconnect the lower bunk center prop safety latch. See **Fig. 2**.
   - 5.1 Remove the nut and bolt.
   - 5.2 Swing the safety latch down from the bunk platform.

NOTE: Use care not to damage the vehicle interior during bunk platform removal.

6. Remove the lower bunk platform.
7. Drill out the lower bunk fore and aft beam rivets and remove the fore and aft beams.
8. Remove the screws retaining the storage compartment lights and disconnect the electrical connectors. See **Fig. 3**.
9. Disconnect the auxiliary A/C system. See **Fig. 4**.

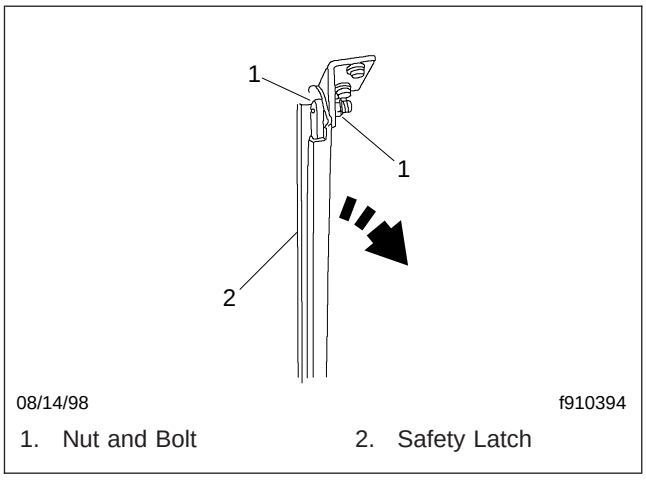

Fig. 2, Lower Bunk Center Prop Latch

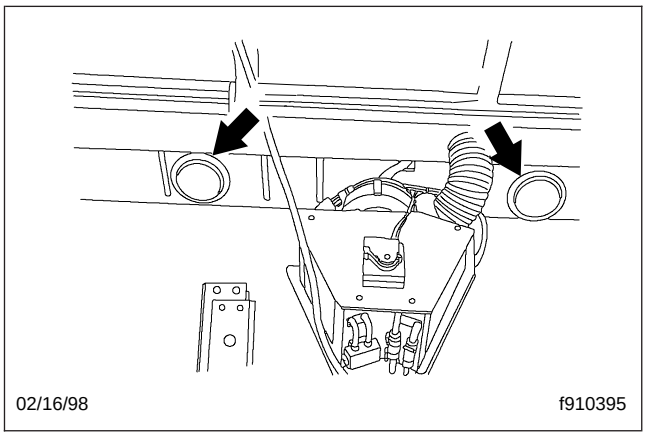

Fig. 3, Storage Compartment Lights

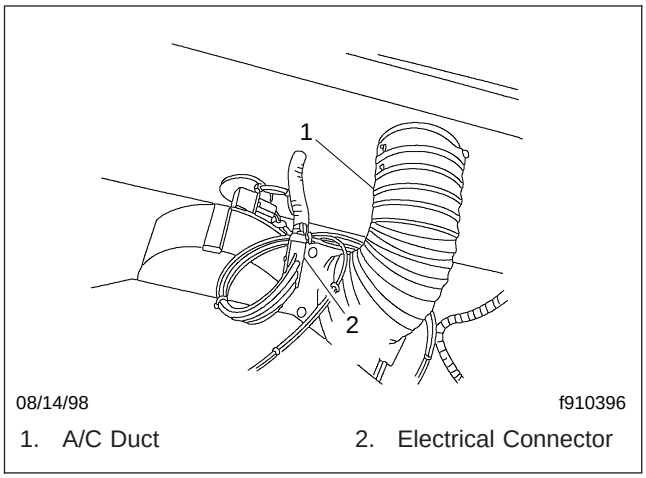

Fig. 4, Auxiliary A/C System

Able Body Sleeper Non-Retractable Safety Belt Tongue Replacement

9.1 Disconnect the A/C duct.

9.2 Disconnect the electrical connector.

10. Remove the mounting screws on the storage compartment rear trim panel.
11. Pull the storage compartment rear trim panel forward at the corners.
12. Disconnect the side A/C ducts located in the left-hand side and right-hand side corners.
13. Remove the storage compartment rear trim panel.
14. Relocate the rear panel insulation.

NOTE: The safety belt tongue nut is located on the vehicle underside.

15. Remove the safety belt tongue nut and bolt.
16. Install the safety belt tongue nut and bolt.
17. Position the rear panel insulation.
18. Install the storage compartment rear trim panel.
19. Connect the side A/C ducts located in the left-hand side and right-hand side corners.
20. Position the storage compartment rear trim panel.
21. Install the storage compartment rear trim panel mounting screws.
22. Connect the auxiliary A/C system.

    22.1 Connect the electrical connector.

    22.2 Connect the A/C duct.

23. Connect the storage compartment lights electrical connectors and install the screws.
24. Install the fore and aft beams with new rivets.

NOTE: Use care not to damage the vehicle interior during bunk platform installation.

25. Install the lower bunk platform.
26. Connect the lower bunk center prop safety latch.

    26.1 Swing the safety latch up towards the bunk platform.

    26.2 Install the nut and bolt.

27. Position the lower bunk platform and install new rivets.
28. Install the lower bunk mattress.

SilverStar Sleeper Non-Retractable Safety Belt Tongue Replacement

Replacement

IMPORTANT: When any part of a safety belt system needs replacement, the entire safety belt system must be replaced—both the retractor side and the buckle side and, if equipped, tether belts.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Remove the lower bunk mattress.
3. Remove the safety belt tongue bunk anchor bolts, and remove the safety belt assembly. See **Fig. 1**.

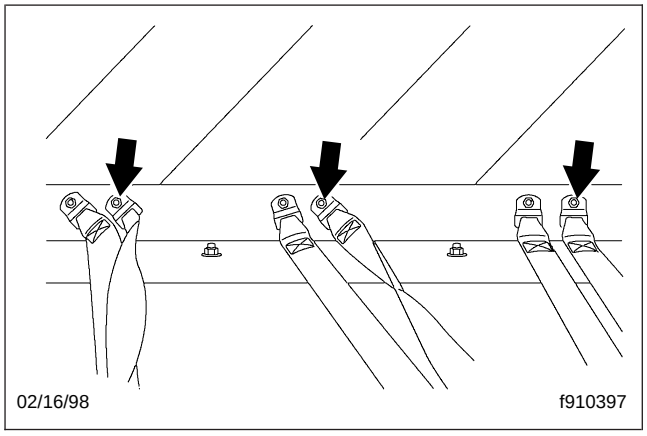

Fig. 1, Safety Belt Tongue Bunk Anchor Bolts

4. Position the safety belt tongue bunk and install the anchor bolts. Tighten 22 to 32 lbf·ft (30 to 43 N·m). See **Fig. 1**.

Safety Belt Webbing

The following procedure is recommended for the removal of spots and stains from safety belts. It is important that proper cleaning techniques and cleaning agents be used to prevent setting the stain or affecting the color or flame resistance of the safety belts. Avoid bleaching or redyeing the webbing as this can hinder the safety belt strength and performance.

NOTE: The following materials are needed to clean the safety belts:

- clean, undyed cotton fabric
- medium-hard bristle brush
- spot and stain remover or equivalent commercial product

NOTE: Prior to selecting a cleaning method, perform the following steps:

⚠ CAUTION

Do not bleach or dye the webbing. This can weaken the safety belt.

1. Remove excess staining material from the fabric by scraping or wiping with a clean cloth.
2. Identify the staining material, if possible.
3. Clean the fabric as described in the following Method A, B or C.

Spot Cleaning Method A

NOTE: Use this procedure for stains from grease, oil, tar, water spotting, crayon and lipstick.

⚠ CAUTION

Care must be used in the application of the spot lifter to prevent it from damaging the vinyl trim.

NOTE: Using other than recommended cleaners or procedures can affect the flammability or fabric appearance of the safety belt webbing.

1. Spray the stain with upholstery cleaner or equivalent commercial product from a distance of 8 to 10 inches (204 to 254 mm) as directed by the instructions on the can.
2. Allow the spot lifter to dry completely, until forming a white powder on the surface of the fabric.
3. Brush and vacuum the white powder from the fabric.
4. If the spot or stain is not removed from the fabric, repeat the procedure as necessary.
5. Wipe the cleaned area with a damp cloth to remove any residual cleaner.

General Cleaning Method B

NOTE: Use this procedure for stains such as grease, oil, tar, adhesive, crayon and lipstick.

1. If the stain is still visible after the spot cleaning procedure (Method A), blot the soiled area with a clean cotton cloth saturated with spot and stain remover or equivalent commercial product.
2. Rub in a circular motion while continuously exposing clean portions of the cloth.
3. Gradually widen the area of application onto the edges of the safety belt(s).
4. Repeat as necessary.
5. Wipe the cleaned area with a clean, damp cloth to remove any residual cleaner.

General Cleaning Method C

NOTE: Use this procedure for stains from soil, food, soda pop and coffee.

NOTE: Spot cleaning as described in Method A will be sufficient when the soiled area is not excessive. In the event of severe soiling or staining, clean the entire safety belt to avoid a cleaning ring condition.

1. Apply Rosenthal, Bissell or equivalent upholstery cleaner with a cloth or brush as directed by the instructions on the container.
2. Rub in a circular motion until the stain is removed.
3. Gradually widen the area of application to the edges of the safety belt(s).

Safety Belt Cleaning

4. Repeat the cleaning as necessary.
5. Rub the cleaned area with a clean, damp cloth to absorb any residual cleaner.
6. Allow the safety belt(s) to dry at room temperature.

Replacement

IMPORTANT: When any part of a safety belt system needs replacement, the entire safety belt system must be replaced—both the retractor side and the buckle side and, if equipped, tether belts.

Safety Belt Anchor Plate Without Thread Damage

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Remove the damaged anchor bolt from the anchor reinforcement and discard.
3. Install a new anchor bolt with the same part number as indicated in the "Parts Replacement" table in **Specifications 400**. Tighten the bolt to specification. Refer to "Torque Specifications" in **Specifications 400**.

Safety Belt Anchor Plate and Bolt With Thread Damage

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Remove the broken or stripped anchor bolt and discard.
3. Drill out the internal threads in the safety belt anchor plate with a 27/64-inch drill.
4. Rethread the anchor plate with a 1/2-13 tap.
5. Blow out any metal chips.
6. Install the attachment parts. Tighten the replacement bolt to specification. Refer to the "Torque Specifications" table in **Specifications 400**. Original parts are to be replaced with the repair parts indicated in the "Parts Replacement" table in **Specifications 400**. Unless specified, use original parts.

Shoulder Safety Belt Height Adjuster Replacement

Replacement

IMPORTANT: When any part of a seat-belt system needs replacement, the entire seat-belt system must be replaced—both the retractor side and the buckle side and, if equipped, both tether belts.

1. Park the vehicle on a level surface, shut down the engine, and set the parking brake. Chock the tires.
2. Remove the height adjuster. Refer to "Height Adjuster" in **Subject 110**.
3. Drill out the damaged threads in the upper B-pillar structure, using a 1/2-inch drill. See **Fig. 1**.

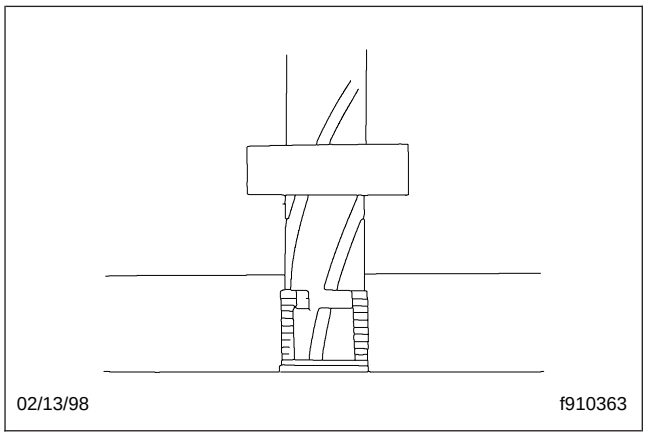

Fig. 1, Drilling Out Damaged Threads

NOTE: After each rotation, back the tap off slightly to remove new cuttings and make sure to blow out any chips.

4. Apply a suitable lubricant to the threads of an M14-1.5 tap and tap new threads.
5. Select thread insert N807170–190 and hand-screw it into the tapped hole until it is slightly below the surface of the hole. See **Fig. 2**.

NOTE: Drive "kees" on the insert will act as an automatic stop.

6. Using a 12-oz hammer, lightly tap the installation tool several times to drive down the insert "kees". See **Fig. 3**.

NOTE: If the height adjuster retaining bolts are stripped, replace the height adjuster and retaining bolts. Refer to "Height Adjuster" in **Subject 110**, and to the applicable "Parts Replacement" table in **Specifications 400**.

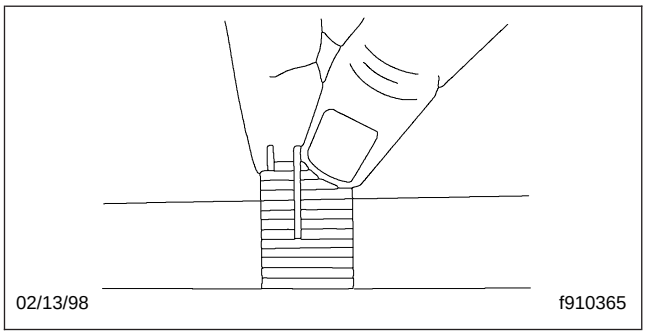

Fig. 2, Installing Thread Insert

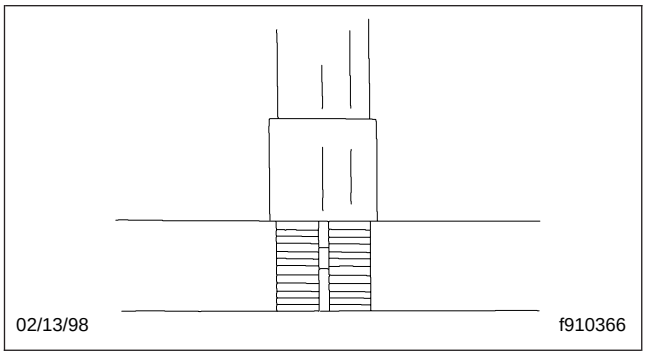

Fig. 3, Inserting the "Kees"

7. Install the height adjuster. Refer to "Height Adjuster" in **Subject 110**.

Safety Belt Procedure After a Collision

⚠ WARNING

Inspect and maintain seat belts. When any part of a seat belt system needs replacement, the entire seat belt must be replaced, both retractor and buckle side. Any time a vehicle is involved in an accident, and the seat belt system was in use, the entire vehicle seat belt system must be replaced before operating the vehicle. Do not attempt to modify the seat belt system; doing so could change the effectiveness of the system. Failure to replace worn or damaged seat belts, or making any modifications to the system, may result in personal injury or death.

1. Safety belt assemblies should be periodically inspected to make sure they have not become damaged and are in proper operating condition, particularly if subjected to severe stress.
2. Before installing a new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are damaged or distorted, the sheet metal must be worked back to its original shape and structural integrity.
3. Install the new safety belt(s). Refer to the appropriate subject in this section. Perform the "Component Function Test" in **Troubleshooting 300**.

Safety Belt Twisted at the Safety Belt Guide (See Fig. 1)

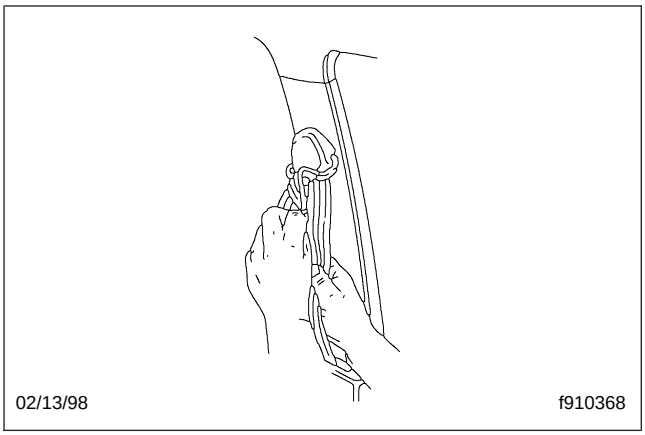

Fig. 1, Safety Belt Guide (D-Ring)

NOTE: These procedures apply to both wire-formed and stamped D-ring designs.

1. Grasp the safety belt webbing at the shoulder belt guide (D-ring).
2. Rotate and fold the belt webbing over itself to remove the twist.
3. Feed the folded portion of the safety belt webbing through the safety belt guide (D-ring).
4. When completed, the safety belt should look like the illustration.

Safety Belt Tongue Rotated on Belt

1. Grasp the safety belt tongue and pull down on the closest belt webbing to form a loop through the upper (narrower and longer) slot in the tongue. See **Fig. 1**.

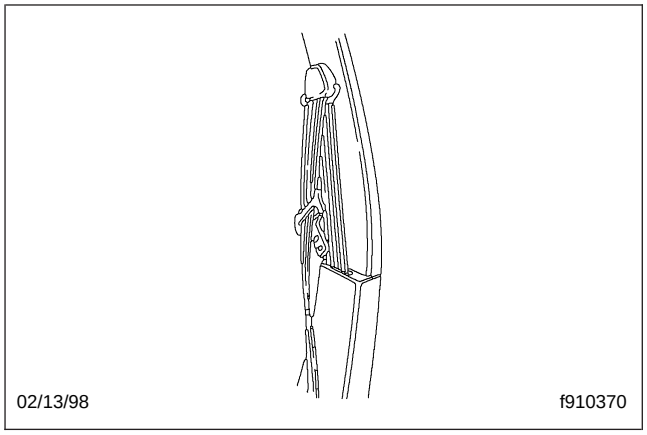

Fig. 1, Safety Belt Tongue

2. Working within the upper slot, rotate and fold the safety belt webbing over itself as required to remove the twist. See **Fig. 2**.

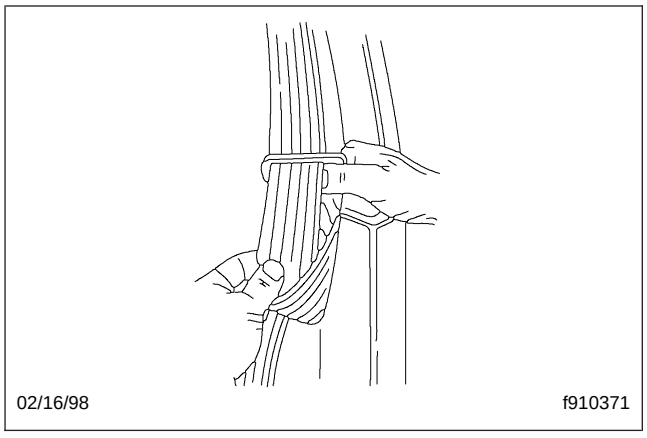

Fig. 2, Rotate to Remove Twist

3. Pull the excess safety belt webbing back through the upper slot in the tongue.
4. Repeat the previous steps to complete the removal of the twist at the lower (wider and larger) slot in the tongue. See **Fig. 3**.

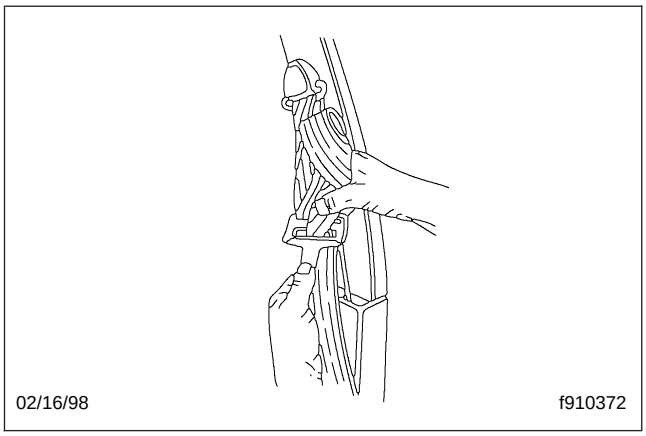

Fig. 3, Removing Twist

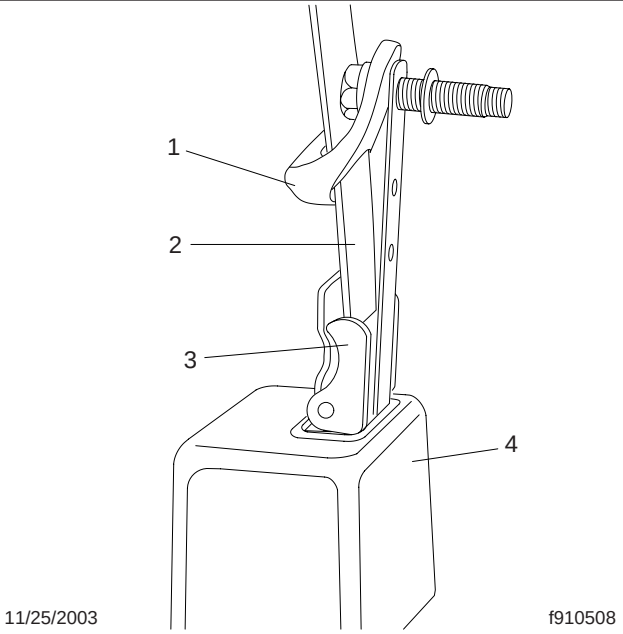
Unlocking an Installed Retractor

Seat belt retractors are locking up and preventing the webbing from being extracted. This condition is known as reverse lock-up and is caused by excessive webbing spooling into the retractor before installation in the vehicle.

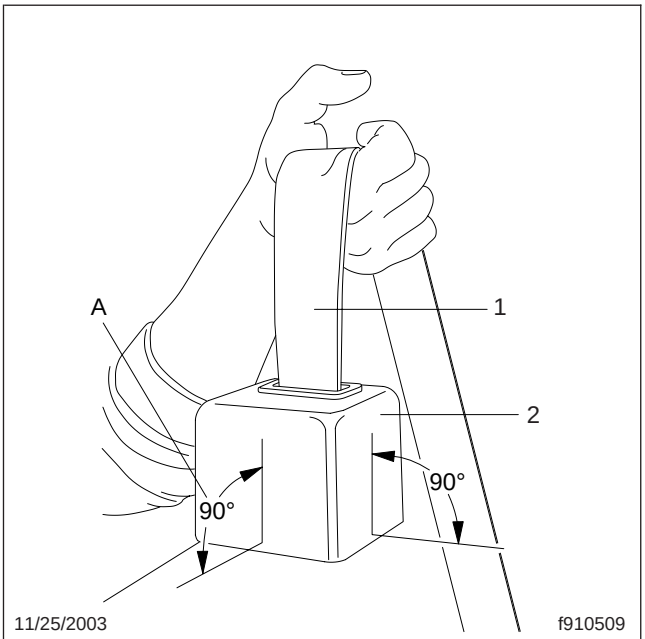
1. Park the vehicle, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Verify that the retractor is mounted in the 90-degree position. See **Fig. 1**.
3. Firmly grasp the web close to the retractor. See **Fig. 2**.



1. Web Guide Loop
2. Web
3. Komfort Latch®
4. Retractor Cover

Fig. 1, Retractor in the 90-Degree Position

4. Pull on the web with enough force to tighten the web onto the spool until the webbing locks back onto the retractor. The retractor should unlock when tension is released.
5. Remove the chocks from the tires.



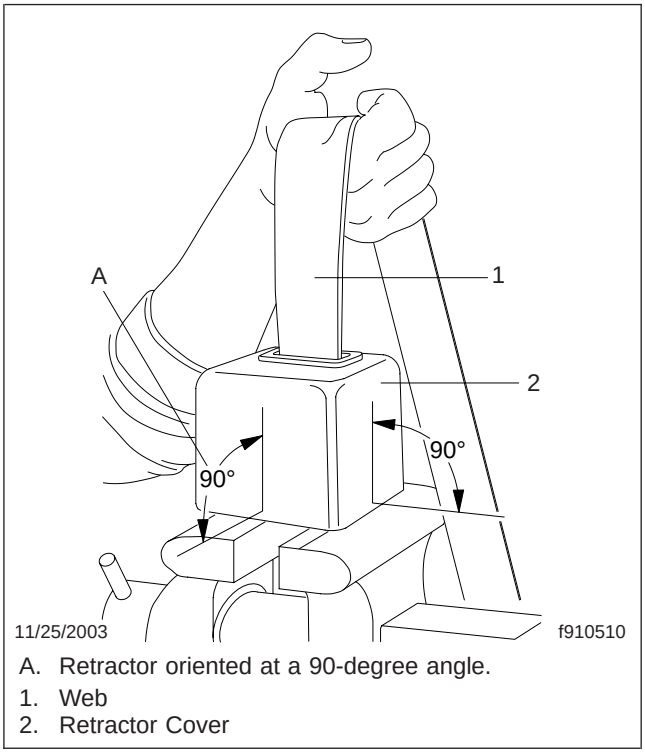
A. Orient the retractor at a 90-degree angle.
1. Web
2. Retractor Cover

Fig. 2, Firmly Grasp the Webbing

Unlocking an Uninstalled Retractor

1. Clamp the retractor in a vice at a 90-degree angle. See **Fig. 3**.
2. Pull on the web with enough force to tighten the web onto the spool.
3. Release the web. This allows 1/2-inch (12.7-mm) of the webbing to feed back into the retractor storage housing and unlock the retractor.
4. Pull all the webbing out of the retractor, and allow only 12 to 15 inches (304 to 381 mm) to retract. Lock the Komfort Latch on the web. See **Fig. 4**.

Seat Belt Retractor Unlocking



A. Retractor oriented at a 90-degree angle.

Inspection

⚠ WARNING

Inspect and maintain seat belts. When any part of a seat belt system needs replacement, the entire seat belt must be replaced, both retractor and buckle side. Any time a vehicle is involved in an accident, and the seat belt system was in use, the entire vehicle seat belt system must be replaced before operating the vehicle. Do not attempt to modify the seat belt system; doing so could change the effectiveness of the system. Failure to replace worn or damaged seat belts, or making any modifications to the system, may result in personal injury or death.

Seat belts and tether belts have a finite life which may be much shorter than the life of the vehicle. Regular inspections and replacement as needed are the only assurance of adequate seat belt security over the life of the vehicle.

1. Check the web for fraying, cuts, extreme dirt and dust, or for severe fading from exposure to sunlight, especially near the buckle latch plate and in the D-loop guide area.
2. Check operation of the buckle, latch, Komfort Latch or Sliding Komfort Latch (if equipped), web retractor, and upper seat belt mount on the door pillar. Check all visible components for wear or damage.
3. Check the seat belt and tether belt connection points, and tighten any that are loose.

Troubleshooting

Inspection and Verification

1. Verify the customer complaint by operating the safety belt. Refer to the "Component Function Test" in this subject.
2. Inspect the safety belts for obvious signs of wear or mechanical damage; see **Subject 240**.

Component Function Test

To prevent mistaking a full extension for a safety belt lockup, the safety belt must not be fully extended.

1. Buckle up and proceed to a safe test area. If the passenger safety belt must be tested, a passenger should be buckled into the passenger seat.

NOTE: The passenger safety belt can be tested by the driver, providing the driver has the ability to grasp the passenger shoulder belt and extend it approximately 26 inches (660 mm) with no compromise to safe driving. This method applies to the 5 mph (8 km/h) test only.

2. After reaching a safe area for performing sudden stops, the driver will attain a speed of approximately 5 mph (8 km/h). The driver should inform the passenger, if applicable, that he or she is preparing to make a severe brake application. At this time, both the driver and passenger should grasp their respective shoulder harnesses and prepare to lean slightly forward at the moment the brake application is made.

The driver and passenger must be prepared to brace themselves in the event the safety belt retractor does not lock.

The maximum brake application must be on dry concrete or an equivalent hard road surface, never on a wet or gravel road surface.

3. The driver will make a maximum brake application (approximately 32 ft/sec [9.7 m/sec]) without tire skid. The driver and passenger should lean forward slightly into the shoulder harness. At this instant, the safety belt(s) should lock up without webbing payout.
4. If there is a lockup of the shoulder strap(s), the safety belt assembly(s) is functioning properly. If either or both retractors fail to lock up at the 5 mph (8 km/h) speed, repeat the test at a constant 15 mph (24 km/h). This test must be performed with a passenger if the passenger belt is to be tested.

IMPORTANT: If the retractor of a new belt has been bolted into a damaged or distorted mounting area, the new retractor could warped and may not function. If this is the case, rework the sheet metal back to its original shape and structural integrity and install another new, complete safety belt assembly.

5. If either or both shoulder harnesses do not lock up at the 15 mph (24 km/h) test, the vehicle is to be returned for repair of the malfunctioning safety belt(s). Remove the retractor and rework the sheet metal in the area of the retractor mounting surface back to its original shape and structural integrity. Install the retractor assembly and test the safety belt assembly(s) as previously stated.

Problem—Excessive Pressure on Occupant During Normal Use; Webbing Cannot Be Extracted; Excessive Slack in Webbing Does Not Retract

Problem—Excessive Pressure on Occupant During Normal Use; Webbing Cannot Be Extracted; Excessive Slack in Webbing Does Not Retract	
Possible Cause	**Remedy**
Safety belt retractor	Check and replace, if necessary.

Troubleshooting

Problem—Safety Belt(s) Does Not Function Properly

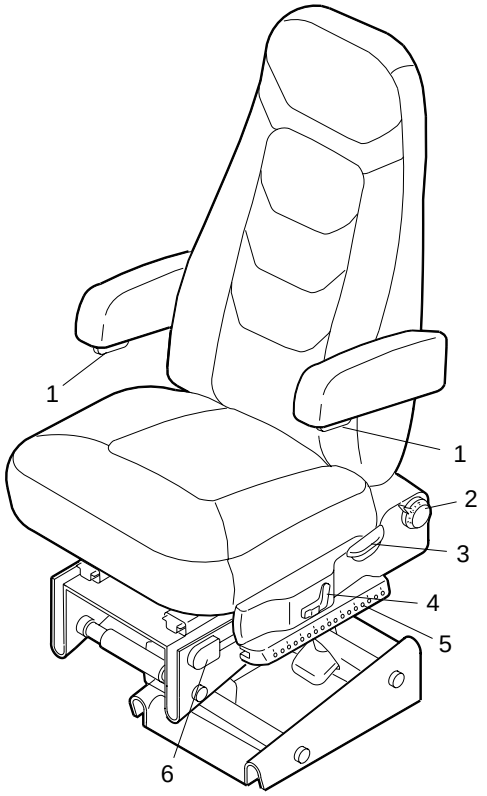
Torque Specifications	
Description	**lbf·ft (N·m)**
Height Adjuster Bolts	22–30 (30–40)
Safety Belt Floor Anchor Bolts	22–32 (30–43)
Safety Belt Retractor Bolts	22–32 (30–43)
Shoulder Strap Guide Nut	22–32 (30–43)
Safety Belt Seat Anchor Bolts	22–32 (30–43)
Safety Belt Buckle Floor Anchor Bolts	22–32 (30–43)
Safety Belt Buckle Seat Anchor Bolts	22–32 (30–43)
Safety Belt Buckle Bunk Anchor Bolts	22–33 (30–44)
Safety Belt Tongue Bunk Anchor Bolts	22–33 (30–44)

Table 3, Torque Specifications

General Information

EzyRider seats (see **Fig. 1**) offer adjustment features for height, fore and aft positioning, back cushion tilt, lumbar support, and seat cushion tilt. The air suspension and height-adjustment features are provided by an air spring that receives air pressure from the vehicle air system; pressure in the air spring is controlled by a switch attached to the seat frame. Each seat is equipped with a shock absorber to dampen unwanted up-and-down motion of the seat. An isolator reduces the amount of road shock by isolating the occupant from the motion of the vehicle. A lockout feature is used whenever the isolator is not desired.



06/24/2005 f910555

1. Armrest Adjustment Knob
2. Back Cushion Tilt Position Indicator (if so equipped)
3. Back Cushion Tilt Lever
4. Height Adjustment and Lumbar Support Lever
5. Fore/Aft Seat Position Indicator (if so equipped)
6. Isolator and Fore/Aft Seat Adjustment Lever

Fig. 1

The availability and configuration of the seat adjustment features may vary from those shown. For a complete description of, and operating instructions for, all seat adjustment features, refer to the *L-Line and A-Line Driver's Manual*.

Removal

1. Park the vehicle on a level surface, apply the parking brake, shut down the engine, and chock the front and rear tires.
2. Press the seat ride-height rocker switch until the seat is adjusted to its maximum height.
3. If so equipped, remove the seat suspension skirt. It is attached to the seat with 11 upholstery fasteners.

⚠ WARNING

Do not remove the seat without first draining the seat air spring and using a block to keep the seat suspension extended. If not securely blocked, the seat could lower unexpectedly, pinching a hand or finger between the suspension parts, resulting in personal injury.

4. Cut a wooden block to the length required to support the seat at its maximum height, and place the block between the air suspension seat base and the rear crosstube of the lower arm.
5. Drain the vehicle air reservoirs. Then press the seat-height adjustment switch until all the air is exhausted from the air spring.
6. Remove the seat heel guard. See **Fig. 1**.
   - 6.1 Remove the two screws and washers that hold the heel guard to the sides of the seat base.
   - 6.2 Remove the two T20 Torx® capscrews and washers that attach the heel guard to the cab deck. Remove the two spacers under the heel guard.
   - 6.3 Loosen the fasteners (two nuts in the front and two capscrews in the rear) that attach the seat base to the cab deck.
   - 6.4 Slide the heel guard forward to unseat the bottom flange from under the outer edges of the seat base. Remove the heel guard.
7. Disconnect the air valve air-supply hose at the quick-connect union behind the seat.
8. Remove the Torx capscrews that attach the seat-belt straps to the intermediate-connecting-point threaded rod.

7. Capscrews
8. Air Supply Quick-Connect Union
9. Heel Guard
10. Screw
11. Washer

Fig. 1, EzyRider Seat Installation

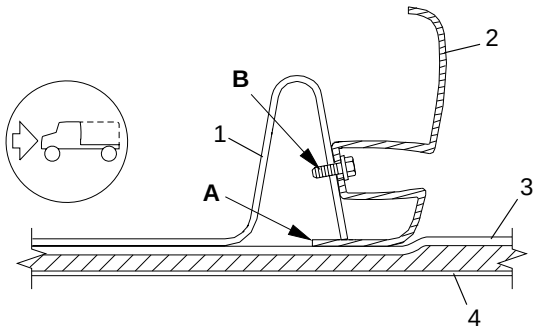
9. Remove the two capscrews and washers that attach the rear of the seat base to the cab deck, and the two nuts and washers that attach the front of the seat base to studs on the cab deck. Remove the seat from the cab.

Installation

1. Position the seat on the cab deck, with the two cab-deck studs inserted through the holes in the front of the seat base. Install the two nuts and washers on the studs. Insert the two capscrews and washers through the holes in the rear of the seat base (see **Fig. 1**). Do not tighten the nuts or the capscrews until the heel guard is installed.
2. Attach the brackets of the seat-belt straps and tether straps to the intermediate-connecting-point threaded rod. Tighten the Torx capscrews 35 to 45 lbf·ft (47 to 61 N·m).

Seat Removal and Installation

3. Connect the air valve air-supply hose by pressing the pneumatic tubing into the quick-connect union behind the seat.
4. Install the seat heel guard.
   4.1 Place the heel guard around the seat base, sliding it backward to seat the bottom flange under the outer edge of the seat base on both sides. See **Fig. 2**.



06/13/2005 f910559

A. Slide the bottom flange of the heel guard under the outer edge of the seat base.
B. Attach the heel guard to the seat base with the screws and washers.

1. Seat Base
2. Heel Guard
3. Floor Covering
4. Cab Deck

Fig. 2, Installing the Heel Guard

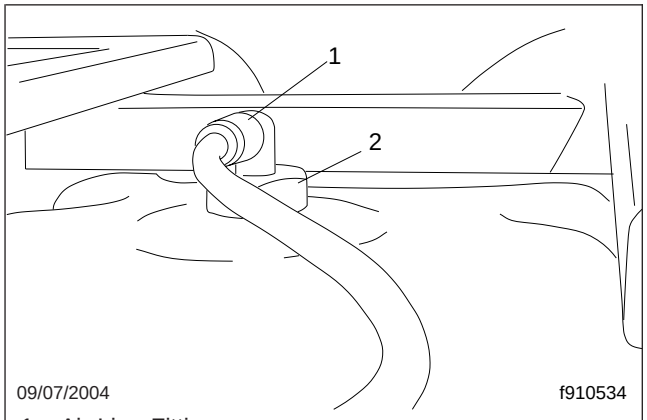
   4.2 Tighten the two capscrews and the two nuts that attach the seat to the cab deck 25 to 29 lbf·ft (34 to 39 N·m).
   4.3 Position the two spacers under the heel guard, then attach the front of the heel guard to the cab deck with the two T20 Torx capscrews and washers.
5. Start the engine and allow the air reservoirs to fill. Press the seat ride-height rocker switch until the seat is adjusted to its maximum height, then remove the wooden block that supports the seat suspension.
6. Install the seat suspension skirt.
7. Remove the chocks from the tires.

Air Spring Replacement

1. Park the vehicle, apply the parking brakes, shut down the engine, and chock the front and rear tires.
2. Inflate the seat suspension to the maximum height.
3. Pull the slide lever, and slide the seat to the forward position.
4. Lift the suspension skirt up and out of the way.
5. Cut a wooden block to the length required to support the seat at its maximum height, and place the block between the air suspension seat base and the rear crosstube of the lower arm.

NOTE: The seat must be secured with a block when replacing the air spring.

6. Drain the vehicle air reservoirs. Then push in on the bottom of the seat ride-height rocker switch until all air is exhausted from the air spring.
7. Remove the air line from the air spring. See **Fig. 1**.



1. Air Line Fitting
2. Spring Plate Mounting Nut

Fig. 1, Air Line and Fitting

8. Remove the air fitting from the top of the air spring.
9. Remove the nut that secures the air spring to the spring plate.
10. Use a 9/16-inch socket wrench to remove the lower air spring bolt.
11. Remove the air spring.
12. Install the new air spring.
13. Install the spring plate mounting nut and torque 130 lbf·in (1470 N·cm).
14. Install the air fitting and tighten securely. Make sure that the fitting is oriented forward.
15. Cut 1/4 inch (6 mm) off of the air line using a hose cutter.
16. Insert the air line into the air fitting.
17. Apply Loctite™ 454 to the bottom six threads of the mounting bolt. See **Fig. 2**.

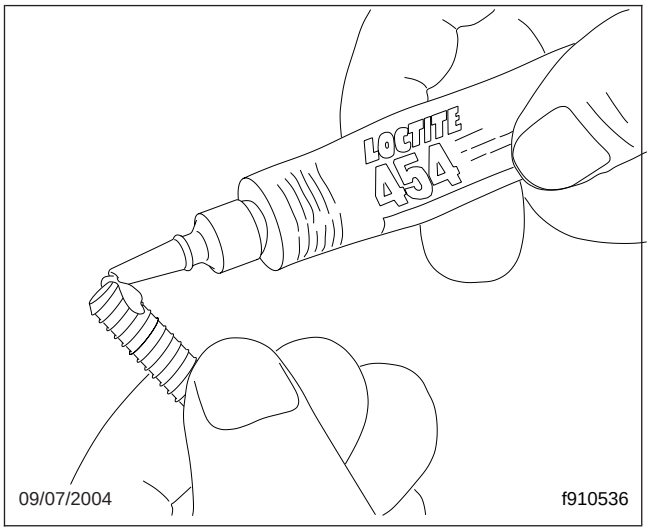


Fig. 2, Apply Loctite 454

18. Install the bolt through the bottom casting of the seat to the air spring and tighten the bolt 45 lbf·in (510 N·cm).
19. Start the engine and allow the air reservoirs to fill. Push in on the top of the seat ride-height rocker switch until the seat is adjusted to its maximum height, then remove the wooden block that supports the seat suspension.
20. Remove the chocks from the tires.

General Information

Sterling currently applies DuPont® single-stage Imron® 5000 or two-stage (base coat and clear coat) Imron 6000 high-solids polyurethane enamel on the vehicle cab at the factory.

Black Standard Urethane or Imron 5000 is used on the vehicle chassis. The chassis includes the frame, spoke spider, running gear, and any components attached to the frame. Aluminum fuel tanks are not painted.

To meet the federal air quality regulations imposed by the EPA and local jurisdictions, these products contain low levels of volatile organic compounds (VOCs) and are formulated free of lead and chrome.

The procedures in this section are for use with DuPont products. Unless otherwise noted, all products are manufactured by E. I. du Pont de Nemours and Company, Inc. Obtain approval from a Freightliner Regional Office for use of topcoats produced by other manufacturers.

Color-Matching

The recommended aftermarket paints for color-matching factory-applied paint are as follows:

- Cab—use Imron 5000 or Imron 6000
- Chassis—use only Imron 5000

To ensure proper gloss, durability, and color-matching of the enamel, use only Imron 5000 on panels that were previously painted with Imron 5000, and use only Imron 6000 on panels painted with Imron 6000.

To determine the correct paint number for color-matching any original finish on a vehicle, refer to the paint specification on the vehicle specification decal. Refer to the vehicle driver's manual for the location of this decal.

NOTE: The high-solids Standard Urethane applied to the chassis at the factory is sold to original equipment manufacturers (OEMs) only, and is not available for aftermarket sale. Use Imron 5000, N0001 Black, for repainting.

General Guidelines

This section provides instructions for preparing large panels or the entire cab for topcoating with DuPont® products. For spot repairs or touch-ups, see **Subject 120**.

Before topcoating, the surface must be thoroughly cleaned and sanded. Any bare areas must also be conditioned and primed.

1. Preparation materials specified for one type of surface should not be used for any other type of surface.
2. Limit intermediate coatings, such as primers, to the brand and type specified by the finish-coat manufacturer.

⚠ CAUTION

Only experienced, qualified persons using proper equipment should attempt repainting or touch-up painting. Incorrect application of chemicals or paint could damage the surface or impair the finish.

Preparation for Prime Coat

Use the cleaners and conditioners specified in each step to prepare the surface for priming. See **Specifications, 400** for a summary of the products used in this procedure.

⚠ WARNING

Do not use solvent-based cleaners on large areas of plastic or fiberglass, such as the hood or air fairing. Wiping down these large areas may cause a buildup of static electricity. The resulting spark could cause a flash fire, which could result in personal injury or property damage.

CAB AND HOOD PREPARATION

1. Wash and dry the entire vehicle with a mild detergent.

⚠ WARNING

Solvents are flammable. Keep them away from heat, sparks, and open flame. Keep the container closed. Use only with adequate ventilation. Avoid breathing the vapor, or headache, nausea, and impaired reaction time and coordination may result.

2. Wipe all surfaces to be painted with a clean cloth soaked with solvent or cleaner. Remove all traces of wax, polish, grease, and silicones.
   - Metal—use DuPont Prep-Sol 3919 S.
   - Plastic—use DuPont Plastic Prep 2319 S.
   - Fiberglass—use DuPont Prep-N-Solv.

   2.1 Work on small areas at a time, wetting the surface liberally.

   2.2 Quickly wipe the surface with a clean cloth before the solvent or cleaner has a chance to dry. Change cloths frequently.
3. Feather the edge of all repaired areas, chipped surfaces, and scratches.

   3.1 Cut down the edges of broken spots with no. 220 sandpaper.

   3.2 Feather the edges by hand, using a sanding block with no. 400 sandpaper.
4. Sand the entire area to be painted. Using a sanding block and no. 400 sandpaper, remove the gloss to improve adhesion of the primer.
5. Using a clean cloth soaked with cleaner, remove any sanding dust.
   - Metal or plastic—use DuPont 3939 S lacquer and enamel cleaner.
   - Fiberglass—use a solution of one part water and one part isopropyl alcohol (IPA).
6. Treat bare metal and rusted areas.
   - Steel—use DuPont 5717 S metal conditioner.
   - Aluminum—use DuPont 225 S aluminum cleaner.

   6.1 Mix one part of the cleaner with two parts of water in a plastic bucket.

6.2 Apply the cleaner with a cloth or sponge. If corrosion is present, work the surface with a stiff plastic brush or 3M Scotch-Brite® pad. Do not use any pads containing iron.

6.3 While the metal is still wet, wipe thoroughly with a clean, dry cloth. Allow the surface to dry before applying a conversion coating.

7. Apply a conversion coating to all bare metal.
   - Steel—use DuPont 5718 S metal conversion coating.
   - Zinc casings or galvanized surfaces (iron or steel)—use DuPont 5718 S metal conversion coating.
   - Aluminum—use DuPont 226 S aluminum conversion coating.

   7.1 Pour the conversion coating into a plastic container (do not dilute). Using a 3M Scotch-Brite or similar non-iron abrasive pad, apply the conversion coating to the metal surface. Work only as much area as can be coated and rinsed before the solution dries.

   7.2 Leave the coating on the surface for 2 to 5 minutes. Then, rinse off the solution with cold water, or mop with a sponge or cloth rinsed frequently in clean water.

   If the metal surface dries before rinsing, reapply the conversion coating, then repeat the previous substep.

   7.3 Wipe the surface dry with a clean cloth, or air dry.

8. With paper and tape, mask all areas that are not to be painted.

AIR FAIRING KIT PREPARATION

Before installing a new air fairing, prepare the surface for topcoating.

1. Wash the air fairing with a mild detergent. Dry with a clean, absorbent, lint-free cloth or paper towels.
2. Using a clean cloth soaked with DuPont Prep-N-Solv®, wipe the entire surface to remove any trace of grease or oil.
3. Scuff-sand the air fairing with no. 320 grit sandpaper.
4. Wipe the air fairing with a clean cloth soaked in a solution of one part water and one part isopropyl alcohol. Allow 10 to 15 minutes for the air fairing to dry.
5. With tape and paper, mask all areas that are not to be painted.

Prime Coat

Prime all bare and feathered areas before topcoating. The specified primers can be used on any surface.

1. Clean all cracks and surfaces with dry compressed air.
2. Using a tack cloth, wipe all surfaces to be painted.

⚠ WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C) when mixing or spraying primer, and until the work area has been exhausted of all vapor and spray mist. Breathing paint fumes can cause serious personal injury.

3. Prime all bare metal and feathered areas with DuPont primer.
   - Steel and aluminum—use Corlar 824 S epoxy primer.
   - Fiberglass—use Corlar 825 S epoxy primer.

   3.1 Stir the primer thoroughly.

   3.2 Mix two parts Corlar epoxy primer with one part DuPont 826 S activator.

   3.3 Reduce three parts of this mixture with one part DuPont 3602 S lacquer thinner (viscosity reading is 18 to 22 seconds in a no. 2 Zahn cup). Stir thoroughly.

   3.4 Wait 1 to 2 hours from time of mixing before using. This provides time for complete chemical induction.

   3.5 Set the air pressure at the spray gun at 45 psi (310 kPa). For pressure feed sys-

tems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.

3.6 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.

3.7 Spray one full wet coat to give a dry film thickness of 0.7 to 1.0 mil (18 to 25 µm).

3.8 Clean the equipment immediately after use with DuPont 3602 S lacquer thinner.

3.9 Air dry 2 hours or force dry 20 minutes.

4. Wet sand the primer with no. 400 grit or finer sandpaper. Feather the edge into the surrounding area.

5. Dry the surface. Using a clean cloth soaked with cleaner, remove any sanding dust.
   - Metal or plastic—use DuPont 3939 S lacquer and enamel cleaner.
   - Fiberglass—use solution of 1 part water and 1 part isopropyl alcohol (IPA).

NOTE: See **Subject 110** for topcoating instructions.

General Guidelines

This section provides instructions for applying a topcoat of DuPont® enamel to full panels or the entire cab. For spot repairs or touch-ups, see **Subject 120**.

⚠ CAUTION

Only experienced, qualified persons using proper equipment should attempt repainting or touch-up painting. Incorrect application of chemicals or paint could damage the surface or impair the finish.

Do not mix additives with the finish coats unless they are specified by the finish-coat manufacturer. See **Specifications, 400** for a summary of the products used in this procedure.

Before applying any topcoat:

1. Prepare the surface for topcoating. See **Subject 100** for instructions.
2. Clean all cracks and surfaces with dry compressed air.
3. Using a tack cloth, wipe all surfaces to be painted.

After topcoating, remove the masking as follows:

- After normal air drying—remove all masking when the surface is reasonably dry.
- After forced drying—remove the masking immediately after the finish has been baked.
- After two-toning—remove the masking used for the first coat as soon as it has set up, usually in about 35 to 40 minutes. Follow the same procedure for the second color.

Imron 5000 Topcoating

Imron 5000 is a single-stage, low VOC, high-solids polyurethane enamel. It provides a durable, high-gloss surface with good chemical resistance. It requires the addition of an activator.

⚠ WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator approved by NIOSH or MSHA (TC-19C), while spraying Imron 5000, and until the work area has been exhausted of all vapor and spray mist. Breathing paint vapor or spray mist can cause personal injury.

MIXING

1. Stir the Imron 5000 enamel thoroughly.
2. Mix three parts Imron 5000 enamel with one part of DuPont 193 S or 194 S activator. No further reduction is necessary for application.

NOTE: The pot life of the mixture is about 2 to 4 hours at 70°F (21°C), unless an accelerator is added.

3. If faster curing time is desired, add DuPont 389 S fast-dry accelerator. Add up to 2 ounces (60 mL) to 1 gallon (3.8 L) of mixed material.
4. Mix thoroughly and strain.

NOTE: The viscosity of the mixture is about 9 to 20 seconds in a no. 3 Zahn cup, depending on the color. Adding reducer could affect the color match on some metallics.

APPLICATION

1. Set the air pressure at the spray gun to 60 to 65 psi (410 to 450 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.
2. Apply the topcoating.
   - 2.1 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.
   - 2.2 Using a cross-coat technique, spray one medium-wet coat in a north-to-south direction
   - 2.3 Allow 5 to 10 minutes drying time between each application. Do not sand.
   - 2.4 Apply a second medium-wet coat in an east-to-west direction.
   - 2.5 A third medium-wet coat may be needed for good coverage of some colors.
3. To air dry, allow 2 to 4 hours with accelerator 389 S, and 6 to 8 hours without the accelerator.

   To force dry, wait 15 minutes following the application of the final coat, then dry for 30 minutes at 140 to 180°F (60 to 82°C).

4. To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied. Avoid contacting the freshly painted surface with masking paper.
5. Clean the equipment immediately after use with DuPont 3602 S lacquer thinner or 8685 S reducer.

RECOATING OR DECORATING

Two-toning, striping, or lettering may be applied in 4 to 6 hours if DuPont 389 S accelerator is used. Wait 10 to 12 hours if no accelerator is used.

Decals may be applied in 12 to 16 hours if 389 S accelerator is used. Wait 24 hours if no accelerator is used.

For topcoats cured over 72 hours, scuff-sand with no. 400 grit sandpaper and wipe with a clean tack cloth before recoating, striping, lettering, or applying decals.

Imron 6000 Topcoating

Imron 6000 is a two-stage, high-solids polyurethane enamel. It provides good cover with one cross-coat of the base color followed by one coat of Imron 6000 clear coat. Both the base color and clear coat require the addition of an activator.

⚠ WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator approved by NIOSH or MSHA (TC-19C), while spraying Imron 6000, and until the work area has been exhausted of all vapor and spray mist. Breathing paint vapor or spray mist can cause personal injury.

MIXING

1. Stir the Imron 6000 base color thoroughly.
2. Mix three parts Imron 6000 base color with one part DuPont 193 S or 194 S activator. No further reduction is necessary for application.

NOTE: The pot life of the mixture is about 2 to 4 hours at 70°F (21°C), unless an accelerator is added.

3. If faster curing time is desired, add DuPont 389 S fast-dry accelerator. Add up to 2 ounces (60 mL) to 1 gallon (3.8 L) of mixed material.
4. Mix thoroughly and strain.

NOTE: For solids, the viscosity of the mixture is about 20 seconds in a DuPont M-222 (M-50) cup; for metallics, it is about 18 seconds.

APPLICATION

1. Set the air pressure at the spray gun to 60 to 65 psi (410 to 450 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.
2. Apply the topcoating.
   - 2.1 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.
   - 2.2 Apply one cross-coat of the Imron 6000 base color.
   - 2.3 Flash 10 minutes minimum. Do not sand.
   - 2.4 Mix three parts DuPont 3440 S or 3480 S clear with one part DuPont 193 S or 194 S activator.
   - 2.5 Apply one coat of the activated DuPont 3440 S or 3480 S clear.
3. To air dry, allow 2 to 4 hours if DuPont 389 S accelerator is used, and 6 to 8 hours if no accelerator is used.

   To force dry, wait 15 minutes following the application of the clear coat, then dry for 30 minutes at 140 to 180°F (60 to 82°C).
4. To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied. Avoid contacting the freshly painted surface with masking paper.
5. Clean the equipment immediately after use with DuPont 3602 S lacquer thinner or 8685 S reducer.

RECOATING OR DECORATING

Two-toning, striping, and lettering may be applied in 4 to 6 hours if DuPont 389 S accelerator is used. Wait 10 to 12 hours if no accelerator is used.

Decals may be applied in 12 to 16 hours if 389 S accelerator is used. Wait 24 hours if no accelerator is used.

For topcoats cured over 72 hours, scuff-sand with no. 400 grit sandpaper and wipe with a clean tack cloth before recoating, striping, lettering, or applying decals.

General Guidelines

This section provides instructions for making spot repairs or touch-ups with DuPont® enamels. Buffing may correct minor imperfections; more serious repairs require surface preparation before a topcoating can be applied. For striping, lettering, or decal application after the repair is complete, see **Subject 110**.

1. Preparation materials specified for one type of surface should not be used for any other type of surface. See **Specifications, 400** for a summary of the materials used in this section.
2. Limit intermediate coatings, such as primers, to the brand and type specified by the finish-coat manufacturer.
3. Do not mix additives with the finish coats unless they are specified by the finish-coat manufacturer.

⚠ CAUTION

Only experienced, qualified persons using proper equipment should attempt repainting or touch-up painting. Incorrect application of chemicals or paint could damage the surface or impair the finish.

Buffing Minor Imperfections

1. Clean the area carefully with a mild detergent and rinse.
2. Remove imperfections using ultra-fine or micro-fine sandpaper (1500 or 2000 grit) and water. Rinse the area with clean water, then dry.
3. Buff the area.
   - 3.1 Use a clean foam pad at low speed (about 1600 rpm) with one of the following products:
     - DuPont 1500 S
     - Meguiar's No. 2
     - 3M Finesset Two 5928
   - 3.2 Using medium pressure, buff slowly in an overlapping pattern until the imperfection has been eliminated. Repeat as necessary.
   - 3.3 Rinse the area with clean water, then dry.
4. Polish the area.
   - 4.1 Apply one of the following products with a clean pad (3M Waffle Pad):
     - DuPont 3000 S
     - Meguiar's No. 9
     - 3M 5996
   - 4.2 Using medium pressure, work small areas using an even, overlapping pattern until the gloss is restored. As the polish dries and the gloss appears, ease the pressure on the polishing pad. Repeat as necessary.

Preparing for Topcoating

1. Wash the entire panel with mild detergent. Dry with a clean, lint-free cloth.

⚠ WARNING

Solvents are flammable. Keep them away from heat, sparks, and open flame. Keep the container closed. Use only with adequate ventilation. Avoid breathing the vapor, or headache, nausea, and impaired reaction time and coordination may result.

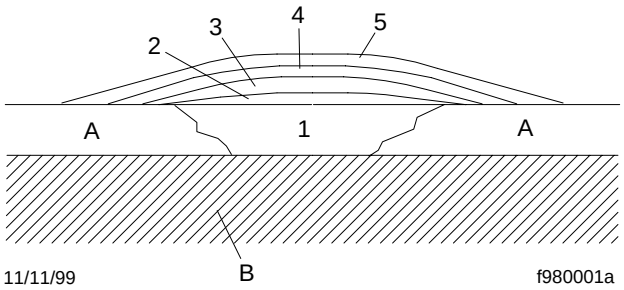
2. Clean the area to be repaired with DuPont 3939 S solvent and quickly wipe the surface with a clean, lint-free cloth before the solvent dries. Remove all traces of wax, polish, grease, and silicones.
3. Sand or grind all dents and scratches.
4. Wet sand and the area being repaired with no. 320 grit or finer sandpaper, or a 3M Scotch-Brite® or similar non-iron abrasive pad. Feather the edge.
5. Remove the sanding dust. Use the same solvent and wipe-on, wipe-off method used earlier to clean the area.
6. Mask all areas that will not be painted.
7. Clean all cracks and surfaces with dry compressed air.
8. Using a tack cloth, wipe all surfaces to be painted.

Spot Repair

⚠ WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C) when mixing or spraying primer, and until the work area has been exhausted of all vapor and spray mist. Breathing paint fumes can cause serious personal injury.

9. Prime all bare metal and feathered areas with DuPont primer. See **Fig. 1**.
   - Steel and aluminum — use Corlar 824 S epoxy primer.
   - Fiberglass — use Corlar 825 S epoxy primer.



NOTE: Scale exaggerated for clarity. The number of layers depends on the specific application.

A. Existing Paint
B. Panel Material (substrate)
1. Primer
2. First Color Topcoat
3. Second Color Topcoat
4. Third Color Topcoat
5. Clear Coat

Fig. 1, Spot Repair Cross-Section

9.1 Stir primer thoroughly.

9.2 Mix two parts Corlar epoxy primer with one part DuPont 826 S activator.

9.3 Reduce three parts of this mixture with one part DuPont 3602 S lacquer thinner (viscosity reading is 18 to 22 seconds in a no. 2 Zahn cup). Stir thoroughly.

9.4 Wait 1 to 2 hours from time of mixing before using. This provides time for complete chemical induction.

9.5 Set the air pressure at the spray gun to 45 psi (310 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.

9.6 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.

9.7 Spray one wet coat to give a dry film thickness of 0.7 to 1.0 mil (18 to 25 µm).

9.8 Clean the equipment immediately after use with DuPont 3602 S lacquer thinner.

9.9 Air dry 2 to 4 hours or force dry 20 minutes.

10. Wet sand the primer with no. 400 grit or finer sandpaper. Feather the edge into the surrounding area.
11. If the original paint was Imron 6000, hand-rub the area around the spot repair with a medium grade compound to ensure a seamless finish.
12. Remove the sanding dust. Use the same solvent and wipe-on, wipe-off method used earlier to clean the area.
13. Wipe the repair area with a tack cloth.
14. If the finish is old, apply one coat of DuPont 222 S adhesion promoter over the entire repair area.

14.1 Set the air pressure to 35 psi (240 kPa) at the spray gun.

14.2 Flash for 5 to 10 minutes at 70°F (21°C) before topcoating.

Topcoating a Spot Repair

⚠ WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator approved by NIOSH or MSHA (TC-19C), while spraying topcoating, and until the work area has been exhausted of all vapor and spray mist. Breathing topcoating vapor or spray mist can cause personal injury.

Imron 5000 Topcoating

1. Mix the Imron 5000 polyurethane enamel.

1.1 Stir the Imron 5000 enamel thoroughly.

1.2 Mix three parts Imron 5000 base color with one part DuPont 193 S or 194 S activator. No further reduction is necessary for application.

1.3 Mix thoroughly and strain.

2. Set the air pressure at the spray gun at 60 to 65 psi (410 to 450 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.

3. For metallic topcoats only, apply one coat of DuPont 500 S urethane clear.

3.1 Mix eight parts of 500 S urethane with one part 193 activator.

3.2 Reduce the activated 500 S urethane mixture 50 percent with 8685 S reducer.

3.3 Apply a medium-wet coat of the reduced 500 S urethane over the entire repair area, and well beyond where the color will be applied.

3.4 Flash 3 minutes before applying the Imron 5000 topcoat.

4. Apply the solid color or metallic topcoating.

4.1 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.

4.2 Spray one medium-wet coat over the primed area.

4.3 Flash 5 to 10 minutes.

4.4 Apply a second medium-wet coat. Extend the spray area slightly to taper the edge and avoid a visible ring.

4.5 A third medium-wet coat may be needed for good coverage of some colors. Allow each coat to flash before applying the next coat.

NOTE: A mist coat of five parts of color to three parts of 8022 S is recommended when applying metallics. Hold the gun about 18 inches (45 cm) from the surface.

5. Blend the repair area into the OEM finish.

5.1 Lower the air pressure to 15 to 20 psi (100 to 140 kPa) at the spray gun.

5.2 Empty the spray cup and refill it with DuPont 8022 S reducer or a blend of 8022 S and 8093 S.

5.3 Carefully blend the edge of the repair with even coats to melt in the overspray.

5.4 Spray one or two medium coats of the reducer over the entire area.

5.5 If a haze appears around the edge after the reducer has dried, lightly rub the edge with DuPont 1500 S one-step polish.

6. To air dry, allow 2 to 4 hours if DuPont 389 S accelerator is used, and 6 to 8 hours if no accelerator is used.

To force dry, wait 15 minutes following the application of the final coat, then dry for 30 minutes at 140 to 180°F (60 to 82°C).

7. To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied. Avoid contacting the freshly painted surface with masking paper.

8. Clean the equipment immediately after use with DuPont 3602 S lacquer thinner or 8685 S reducer.

Imron 6000 Topcoating

1. Mix the Imron 6000 polyurethane enamel.

1.1 Stir the Imron 6000 base color thoroughly.

1.2 Mix three parts Imron 6000 base color with one part DuPont 193 S or 194 S activator. No further reduction is necessary for application.

1.3 Mix thoroughly and strain.

2. Set the air pressure at the spray gun at 60 to 65 psi (410 to 450 kPa). For pressure feed systems, set the fluid delivery at 12 to 16 ounces (350 to 470 mL) per minute.

3. Apply the topcoating.

3.1 Hold the spray gun about 10 to 12 inches (25 to 30 cm) from the surface.

3.2 Apply one cross-coat of the Imron 6000 base color over the primed area. No flash time is required before applying a clear coat.

3.3 Flash 10 minutes minimum. Do not sand.

Spot Repair

3.4 Mix three parts DuPont 3440 S or 3480 S clear with one part DuPont 193 S or 194 S activator.

NOTE: For best results, apply the clear coat over the entire panel. If a blend of the repair area is attempted, apply the clear coat only over the repair area, overspraying the edge slightly.

3.5 Apply one coat of the activated DuPont 3440 S or 3480 S clear.

4. Blend the 3440 S or 3480 S clear into the surrounding topcoat.

   4.1 Set the air pressure to 25 psi (170 kPa) at the spray gun.

   4.2 Apply one coat of 3401 S blending clear over the repair area only to the overspray edge.

   4.3 Flash 2 minutes. Repeat if necessary.

5. To air dry, allow 2 to 4 hours if DuPont 389 S accelerator is used, and 6 to 8 hours if no accelerator is used.

   To force dry, wait 15 minutes following the application of the final coat, then dry for 30 minutes at 140 to 180°F (60 to 82°C).

6. To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied. Avoid contacting the freshly painted surface with masking paper.

7. Clean the equipment immediately after use with DuPont 3602 S lacquer thinner or 8685 S reducer.

General Information

If corrosion appears around the rivets on an aluminum cab, the rivets must be replaced as part of the surface corrosion repair.

Use only the DuPont products specified in each step. See **Specifications, 400** for a summary of the products used in this procedure.

⚠ CAUTION

Only experienced, qualified persons using proper equipment should attempt repainting or touch-up painting. Incorrect application of chemicals or paint could damage the surface or impair the finish.

⚠ WARNING

Wear a positive-pressure, supplied-air, vapor and particulate respirator, approved by NIOSH or MSHA (TC-19C) when mixing or spraying primer or topcoat, and until the work area has been exhausted of all vapor and spray mist. Breathing paint vapor or spray mist can cause personal injury.

Surface Preparation

1. Wash and dry the cab with a mild detergent.
2. Wipe all areas to be repaired with a clean cloth soaked with DuPont Prep-Sol 3919 S.
   - 2.1 Work on small areas at a time, wetting the surface liberally.
   - 2.2 Quickly wipe the surface with a clean cloth before the solvent has a chance to dry. Change cloths frequently.
   - 2.3 Remove all traces of wax, polish, oil, grease, and silicones.
3. Using a no. 11 tool bit (0.191-inch/4.85-mm diameter), drill out the rivet heads in the corroded area. Remove the rivets.
4. Sand the corroded areas.
   - 4.1 Using no. 220 to 320 grit sandpaper, sand the corroded or otherwise exposed areas on the aluminum skin (substrate).
   - 4.2 Feather the edges by hand or with an oscillating sander (DA).
5. Sand the entire area to be painted. Using a sanding block and no. 400 sandpaper, remove the gloss to improve adhesion of the primer and topcoat.
6. Using a clean cloth soaked with DuPont 3939 S lacquer and enamel cleaner, remove any sanding dust.
7. Install new 3/16-inch-diameter rivets in the clean, drilled holes.

IMPORTANT: Make sure both the bare metal and new rivets are treated with metal conditioner.

8. Treat all bare metal and new rivets with metal conditioner.
   - 8.1 Mix one part of DuPont 225 S aluminum cleaner with two parts of water in a plastic container. Do not use a metal container.
   - 8.2 Apply the cleaner with a cloth or sponge. Work the surface with a stiff plastic brush or 3M Scotch-Brite® pad. Do not use any pads containing iron.
   - 8.3 While the metal is still wet, wipe thoroughly with a clean, dry cloth. Allow the surface to dry before applying the conversion coating.
9. Apply a conversion coating to all bare metal.
   - 9.1 Pour DuPont 226 S aluminum conversion coating into a plastic container. *Do not dilute.* Using a 3M Scotch-Brite or similar non-iron abrasive pad, apply the conversion coating to all bare metal surfaces.

     Work only as much area as can be coated and rinsed before the solution dries.
   - 9.2 Leave the coating on the surface for 2 to 5 minutes. Then, rinse off the solution with cold water, or mop with a sponge or cloth rinsed frequently in clean water.

     If the metal surface dries before rinsing, reapply the conversion coating, leave it on for 2 to 5 minutes, then rinse thoroughly.

9.3 Wipe the surface dry with a clean cloth, or air dry.

10. With paper and tape, mask all areas that are not to be painted. Prime immediately.

Prime Coat

1. Clean all cracks and surfaces with dry compressed air.
2. Using a tack cloth, wipe all surfaces to be painted.
3. Prime all bare metal and feathered areas with DuPont Corlar® 824 S epoxy primer.

   3.1 Stir Corlar 824 S primer thoroughly.

   3.2 Mix two parts Corlar 824 S primer with one part DuPont 826 S activator.

   3.3 Reduce three parts of this mixture with one part DuPont 3602 S lacquer thinner (viscosity reading is 18 to 22 seconds in a no. 2 Zahn cup). Stir thoroughly.

   3.4 Wait 1 to 2 hours from time of mixing before using, to provide time for complete chemical induction.

   3.5 Spray one full wet coat to give a dry film thickness of 0.7 to 1.0 mil (18 to 25 µm).

   3.6 Clean equipment immediately after use with DuPont 3602 S lacquer thinner.

   3.7 Air dry 2 to 4 hours or force dry 20 minutes.

Topcoat

Imron 5000® is a single-stage, low VOC, high-solids polyurethane enamel. It provides a durable, high-gloss surface with good chemical resistance. It requires the addition of an activator.

MIXING

1. Stir the enamel thoroughly.
2. Mix three parts Imron 5000 enamel with one part of DuPont 193 S or 194 S activator. No further reduction is necessary for application.

NOTE: The pot life is about 2 to 4 hours at 70°F (21°C), unless an accelerator is added.

3. If faster curing time is desired, add DuPont 389 S fast-dry accelerator. Add up to 2 ounces (60 mL) to 1 gallon (3.8 L) of activated material.
4. Mix thoroughly and strain.

NOTE: The viscosity of the mixture is about 9 to 15 seconds in a no. 3 Zahn cup, depending on the color. Adding reducer could affect the color match on some metallics.

APPLICATION

1. Set the air pressure at the spray gun at 50 to 60 psi (345 to 414 kPa) for solid colors, and 65 psi (448 kPa) for metallics. For pressure feed systems, set the fluid delivery at 12 to 16 ounces (355 to 473 mL) per minute. See **Specifications, 400**.
2. Apply the topcoating.

   2.1 Hold the spray gun about 8 inches (20 cm) from the surface.

   2.2 Spray one medium-wet coat over the primed area.

   2.3 Allow 5 to 10 minutes drying time between each application.

   2.4 Apply a second medium-wet coat. Extend the second coat beyond the edge of the first coat to provide the correct taper and avoid a visible ring.

   2.5 A third medium-wet coat may be needed for good coverage of some colors.

3. To air dry, allow 2 to 4 hours if DuPont 389 S accelerator is used, and 6 to 8 hours if no accelerator is used.

   To force dry, wait 15 minutes following the application of the final topcoat, then dry for 30 minutes at 140 to 180°F (60 to 82°C).

4. To prevent tape marking, remove all masking tape and paper immediately after the final coat is applied. Avoid contacting the freshly painted surface with masking paper.
5. Clean the equipment immediately after use with DuPont 3602 S lacquer thinner or 8685 S reducer.

RECOATING OR DECORATING

Two-toning, striping, or lettering may be applied in 4 to 6 hours if DuPont 389 S accelerator is used. Wait 10 to 12 hours if no accelerator is used.

Decals may be applied in 12 to 16 hours if DuPont 389 S accelerator is used. Wait 24 hours if no accelerator is used.

For topcoats cured over 72 hours, scuff-sand with no. 400 grit sandpaper and wipe with a clean tack cloth before recoating, striping, lettering, or applying decals.

Equipment Application Parameters

Equipment Application Parameters		
Parameter	**English Units**	**Metric Units**
Atomizing Air		
Primer	45 psi	310 kPa
Enamel	60–65 psi	410–450 kPa
Fluid Delivery	12–16 oz/min	350–470 mL/min
Booth Temperature	75°F	23°C
Spray Gun Distance	10–12 in	25–30 cm
